BEEF-WOOD, from the Casuarina muricata, a hard, close-grained, reddish wood, variegated with dark and whitish streaks. It is chiefly used in England in forming borders to work in which the larger woods are employed. It is procured from N. S. Wales, and is imported into the United States in considerable quantities, for various purposes where a hard, heavy wood is required; the Tenasserim coast can furnish almost any quantity of this timber, which is very little used there. Roxburgh says it resembles toon in appearance. The Burmese call it by the same name as the pine.—*Faulkner; Mason.*

BEEGAH or Bigha, a land measure in use in India, but varying in length. In Northern India it is 3025 square yards, or five-eighths of an acre. In Bengal, 1000 square yards, or little more than one-third of an acre. There is a kuch-ha and a puckha beegah, the former one-third or one-fourth of the latter. The following are some of the local beegahs in every 100 acres:—

Farrakhabad,	175·12·0	Azimgurh, Ghazipur,	154· 6·8
Gorakhpur,	192·19·7	Bijnore,	187·19·5
Allahabad, Azimgurh,	177· 5·15	Upper Doab (Kuchha),	582· 3·0

The smallest beegah, says Sir John Malcolm, may perhaps be computed at one-third, and the largest at two-thirds, of an acre. The common beegah in Central India is sixty guz square, which, taking the guz at thirty-two inches, is fifty-three yards one foot. This makes the contents 3200 English yards, very nearly two-thirds of an English acre. But the guz used in land measure is often not more than twenty-eight inches, which reduces the beegah to about half an acre.—*Malcolm's Central India*, ii. p. 35; *Elliot, Supp. Glos.* pp. 53, 54. See Khiraj; Weights and Measures.

BEEGHOTO, a tract of country occupied by the Ahir and the Chauhan Rajput. It includes Rewapee, Bawul, Kanon, Patody, Kot Kasim, and part of the Baraitch jaghir.

BEEJARA SULA. SANSK. Cashew-nut.

BEEL-JHUN-JHUN. HIND. Crotalaria retusa.

BEEMAH, a tributary to the Kistna river. It rises in lat. 19° 5′ N., long. 73° 33′ E., in the table-land of the district of Poona, 3090 feet above the sea, and runs S.E. into the Kistna, length 510 miles. It receives the Goor, 100; Neera, 120; Seena, 170; Tandoor, 85 miles. About 29,000 square miles drained. At Coreygaum, where it is enclosed by trap banks, it runs with great violence in the rains. Before it joins the Kistna, it runs through the stratified, fossiliferous rocks of the centre of the Peninsula.

BEEMBOO. BENG. Coccinia Indica.

BEEN or Vina, a sort of sitar, but having two dried hollow pumpkins (Cucurbita melopepo, *Willde*) fixed to the end of it, with five or seven steel strings; described by Sir William Jones in the Asiatic Researches.

BEENA, a form of polyandric marriage in Ceylon, in which the wife continues to reside with her brothers, and her husband takes up his lot with her.

BEER. SIND. A berry growing in Sind, which is pounded, mixed with water, and parched in pots, and used as a substitute for gram.

BEER, a fermented liquor made from the malt of barley, and flavoured with hops. At nearly all periods in the world's history, and among nearly all nations, the art of making a fermented drink from some kind of grain appears to have been known; but of all the cereals, barley is the best adapted to the making of beer. Beer used in India is mostly imported from Great Britain, in hogsheads and in bottles. Captain Ouchterlony, about 1850, established an experimental brewery in the Neilgherry hills. It is still brewed there, also at Bangalore, Simla, Kussowlee, and other places, and used extensively by the local residents, who, apart from the difference of price, prefer it to English-brewed ale. The natives of India only sparingly drink the British beers, but all the hill races brew beers for themselves. In the United Kingdom and Ireland, about 50 gallons per head per annum are consumed. The Kakhyen prepare Sheroo from rice; it resembles small beer. The Lepcha, Lushai, and Naga have a similar beer. The Barman con-gee is a beer which the Khyen and Karen also use. The Naga also prepare moad from rice; and the Khamti and Singpho of the Hukong valley distil a spirit called Sahu.—*Tom. Un. Rev.; Ind. Daily News.* See Ale.

BEERA or Beeree. HIND., Pan-ka-beera. A small packet of betel leaf folded up to contain spices, catechu, calcined shell-lime, and pieces of the areca or betel-nut.—*Tod's Rajasthan*, i. pp. 327, 413.

BEERA. BENG. Asclepias rosea.

BEERSHEBA is 20 miles south of Hebron. Its name means 'the well of an oath, or the well

of seven,' because here Abraham made an alliance with Abimelech, king of Gerar, and gave him seven ewe-lambs in token of that covenant to which they had sworn (Gen. xxi. 28). A Roman garrison was here in the time of Eusebius and Jerome. The limits of the Holy Land are often expressed in Scripture by the terms 'from Dan to Beersheba,' the former being the northern, the latter the southern, extremity of the land.

BEERTIA. BENG. Panicum Italicum.

BEER-us-SOMAL, country of the Somali to the south of Cape Guardafui.

BEESHA ELEGANTISSIMA. *Hasskarl.* A tall, slender bamboo of the mountains of Java, up to 4000 feet.—*V. Mueller.*

Beesha Rheedii, *Kunth.*

Bambusa baccifera, *Roxb.*
Melocanna bamusoides, *Spreng.*
,, Rheedii, *Stend.*

Bish-Bans, . . . BENG. | Pagu-tullu, . . RAKHOI.
Beesha, . . . MALEAL. |

A bamboo growing in the peninsula of India, Bengal, and Chittagong.

Beesha stridula, *Moon.* The Ochlandra stridula, *Thw.*, is very common about the low country in the south of Ceylon, at Badagam, and elsewhere, called Batta; the leaves make an excellent thatch.

Beesha Travancoria, *Bedd.* The Irul of the Tamil people. This magnificent species of elephant grass is abundant on the S. Travancore and Tinnevelly mountains, at 3000 to 5500 feet elevation, where it covers many miles of the range, often to the entire exclusion of all other vegetation; in open mountain tracts it generally only grows from 6 to 8 feet in height, but is close and impenetrable, elephants even not attempting to get through it; inside sholas and their outskirts it grows to 15 feet high, and is much more straggling. —*Roxb.* ii. p. 197; *Thw. Zeyl.* p. 376; *Beddome, Fl. Sylv.* p. 234.

BEESWAX.

Mom; Peela mom, . HIND. | Ten Mazhacu, . . TAM.
Lilin, ... MALAY. | Mynum, ... TEL.

Beeswax is more or less yellow, and has an odour of honey; it is brought into the market, after allowing the honey to drain from the honeycomb, and then boiling the combs in water, frequently stirring to prevent burning. The wax thus obtained is melted a second or a third time, and pressed through hair bags of increasing fineness, allowing the molten substance to drop into cold water to firm it and prevent sticking. Another process, however, is to put the combs into a pot with water and nitric acid, one quart of the former to one ounce of the latter, and after boiling it allow them to cool; the pure wax floats on the surface, and two layers of dregs settle, the inferior one being almost worthless. Wax is sometimes adulterated by peasemeal. Beeswax is exported from India. In the Indian Archipelago the natives collect the wax from the nests in the forests, disregarding the honey, which is little in quantity, and worthless. The islands of Timor and Timor Laut afford beeswax in sufficient quantity to form an important article of export. It is a considerable article of exportation from the islands of the Archipelago, chiefly the wilder part of them, where the consumption is small. In the eastern parts of China, where the product of the tallow tree (Stillingia sebifera), and beef and hog's tallow in the south, are used in the manufacture of candles, wax is only employed to incase the tallow or lard, which, from the heat of the climate and its unclarified condition, never becomes hard. About 130 tons are annually taken to Britain from Africa, America, and India, and sold at £5 to £7 the cwt. Beeswax and camphor are exported largely from Bintulu and Serekie, at which towns these commodities are collected by the Mahomedans.—*Morrison; Crawfurd; Low's Sarawak; Poole's Statistics; Balfour's Commercial Products.*

BEETLE, the Chargol of the Hebrews. Beetles belong to the Coleoptera class of insects; they are very numerous in tropical India. The blistering beetles of India are species of Mylabris; their market value in Britain is low, only 5s. 8d. the pound. The largest beetles are only found within the tropics, those of the Eastern Archipelago being the largest of all. Mr. Wallace in eight years collected about a thousand species there. The Longicorns, strangely mottled, spotted and rugose, abound where timber trees have been recently felled; their antennæ are sometimes excessively long and graceful. The family Buprestidæ generally rest on the midrib of a leaf, and the naturalist often hesitates before picking them off, so closely do they resemble pieces of bird's dung. Many of the family Curculionidæ have the wing-cases and other external parts so excessively hard, that they cannot be pinned without first drilling a hole to receive the pin. Dung-beetle is the name given in India to the dung-feeding Lamellicorn beetles. They roll up pieces of excrementitious matter into the form of balls, in which they enclose their eggs, and the balls serve for the food of their young. The balls are sometimes one or two inches in diameter, and the beetles stand on their fore feet, head down, and pushing from behind with their hind legs, roll them along and lodge them in deep holes. One of these, the Ateuchus sacer, was revered by the ancient Egyptians as one of their sacred animals; and its image, carved in stone or metal, has frequently been found rolled up in the Egyptian mummies. The Necrophori, or sexton beetles, enter the bodies of small animals to lay their eggs in them. They burrow underneath the creature and let it sink into the earth. They bury horse and cow dung similarly. The Anthribidæ family also are very abundant in the Eastern Archipelago. They rival the Longicorn beetles in the immense length of their elegant antennæ. The Eupholi of the Papuan islands and the Pachyrhynchi of the Philippines are veritable living jewels, golden and green, with Buprestidæ, long-horned Anthribidæ; numerous Curculio, queer-shaped Brenthidæ; velvety brown or steel-blue Cleridæ; the yellow or whitish-coloured Elater or click beetle, and brilliant, metallic and leaf-hunting Carabidæ. The Copridæ and Dynastidæ correspond to the dung beetles; some of them are of great size, with immense horn-like protuberances on the head and thorax of the males, and combined with their polished or rugose metallic colours, render them perhaps the most conspicuous of all the beetle tribe. Musk beetles of many sorts, scarlet Telephori, countless Chrysomela, Hispa, and Coccinella, with strange Heteromeræ and grand Prionidæ and Lamiidæ.

Indian Beetles, is an article of commerce. It consists of the beautiful wing-cases or elytræ of the Buprestis, one of the Coleoptera. They are of a brilliant metallic green colour, and are imported

into Britain principally from Calcutta, as ornaments of khuskhus fans, baskets, etc., and on muslins to enrich the embroidery. The beetles' wings in Akyab are called Chenk Poorie and Thungon Poorie.—*Wallace, Trop.* p. 94; *Hooker, Him. Journ.; Hart.*

BEET-ROOT, Beta vulgaris.

Bette rave, Bette rouge, FR.	Barba-bietole, . . . IT.
Rothe rube, Mangold, GER.	Acelga, ... SP.
Muli, ... HIND.	

This important plant belongs to the natural order Chenopodiaceæ, which also includes spinach, orach, mercury, goose-foot, etc. Beet, under its German name of Mangel-wurzel, has afforded a new source of sugar. White Sicilian beet is mainly used for salads, spinage.

Beet Sugar, from a variety of beet-root, is now almost exclusively consumed in Austria, Belgium, France, Germany, Russia, Sweden, and largely in Britain. In Middle Europe, the average yield is 14 tons of sugar beet to the acre, and 14 cwt. of raw sugar. Imperial beet yields 10 to 20 per cent. sugar, identical with that from sugar-cane. A deeply-stirred drained soil, rich in lime, brings the saccharine variety of beet to the greatest perfection. In middle Europe, in 1880, about one-sixth of all the arable land was devoted to beet. Germany is credited with being likely to produce 510,000 tons; France with 435,000 tons; Austria and Hungary, 415,000 tons; Russia and Poland, a crop of 240,000 tons; other and smaller countries, 100,000 tons; and this will bring the grand total up to 1,700,000 tons.—*Grocer; von Mueller.*

BEG. TURK. A great man, a lord; in India, an appellation of all Mahomedans of Moghul, Turk, and Persian descent. It appears as Bey and Bai, and in the feminine as Begum. In Turkey and Turkish Arabia, Ya Bei! 'O my lord,' is prefaced to every sentence. The Shammar Arabs pronounce the word Beg, which the Constantinopolitans soften into Bey. In Chinese Tartary the Dzassaks receive pay and gifts and send tribute annually by Begs, who proceed to Pekin according to rollster, so that the whole shall have one tour in six years. These travel at the State's expense, the weight of baggage carried for them being regulated by their rank, hereditary or fortuitous. The same order of attendance at Pekin and the hunting caps is observed by the Kalkas, Alashan, and tribes of the Edsinel, and by those of Koko-Nor.—*Layard's Nineveh*, i. p. 106.

BEGADA. TEL. Nauclea purpurea, *Roxb.*; Anthocephalus Indicus, *Rich.*

BEGAMI. HIND. A good quality of rice.

BE-GAR. HIND. In India, forced labour for the repair of roads, tanks, forts, barracks, and for carrying baggage. Begari, a person so compelled to labour. The labourers are usually non-Aryans, Pariahs, and tanners. The last vestige of it, as exercised by the Government of India, was in the formation of the road leading through the Himalaya mountains to Tibet.

BEGATI KANDA. TEL. Amberboa Indica.

BEG-BANAFSHA. HIND. Root of a small plant brought from Dehli, used as a perfume in medicine, and in compounding perfumes. See Bekh.

BEGBIE, Major-General Peter James, an officer of the Madras Artillery. He arrived in India on 3d August 1822, and served in the first Burmese war, and in the Nanning expedition. He translated Beeker's Art of bringing Horse Artillery into action, De Brack's Cavalry Outposts, Migout and Berger's Essay on Gun Carriages, and he compiled the Services of the Madras Artillery.

BEGGARS, from poverty and under religious vows, are numerous throughout British India, as the Mahomedan Fakir, the Hindu Bairagi, Sanyasi, Gosai, Jogi, Satani, Jangam, Dasari, Budu-budike, Gondaliga, Domba, Panasu-makkalu or Hale-makkalu, Kalawar, Pichigunta, Mylari, Korna, Viramusti.

The Satani Hindu sect have several subdivisions; a few of their number are engaged in tillage.

The Jangam, priests of the Lingaet, wear the lingam and a necklace of Rudraksha beads; they do not permit any one but a wearer of the lingam to touch them; they smear their bodies with the ashes of cow-dung. They are permitted to marry.

The Dasari (dasa, servant of the deity) are Vaishnava devotees; in Mysore they are said to be a very bigoted and dissolute set of fanatics.

The Budu-budike are worshippers of Hanuman, the monkey-god; they pretend to consult birds and reptiles, and through them predict future events. They are of Mahratta origin, as also are the Gondaliga musician worshippers of Durga, who, at marriages, sing, and play musical instruments.

The Panasu-makkalu or Hale-makkalu are a class or caste of mendicants, who only accept charity from their own caste. Their chief locality is a village in one of the Bangalore taluqs, from which once a year they go their rounds to collect money in their beat.

The Komati, or Vaisya trading community, have a Hale-makkalu called Kanchala Viraru; they wear red clothes, and a breastplate with a likeness of Vira-bhadra. They receive one fanam annually from each Komati, and fees on marriages.

The Kurubaru or shepherd, the Agasa or washerman, the Siva-charu, Ganda golleru ryots, who wear the lingam, the Gangdigaru Ukaliga, the ordinary farmers in Mysore, and the leather-working Madigaru, have each their own Hale-makkalu. The Komati Hale-makkalu owe their origin to a sacrifice in the month Phalguna of the year Prabhava 2628 after the Kaliyuga, when all the household of Kusuma Chetti, to avoid giving their daughter in marriage to king Vishnu Vardhana of Rajamahendrapura, burned themselves. Malla, their servant, followed their example, and his descendants are the Hale-makkalu of the Komati.

Beggars of India mostly belong to sects of religionists,—Hindu, Buddhist, and Mahomedan,—who throw themselves on the charity of the world, to show their trust in God.

The Bahu-daka begs his bread from door to door.

Dori wala, of the Panjab, stretches a rope in front of a range of shops, and will not quit the place till relieved.

Tasma-wala, of the Panjab, ties a leathern strap round his neck, as if to strangle himself, and lies down on his back, fluttering the hands and feet as if in the agonies of death, till paid.

Dandi wala carry small bats (danda) in their hands, which, if not paid, they strike together, and abuse the shopmen with scurrilous language.

Uri-mar will sit down before a shop all day until paid.

Gurzmar and Churimar are Mahomedans, who carry a mace or knife, with which they wound themselves or others when urging for alms.

The Buddhist priests of Burma move daily through the towns and villages in their neighbourhood, tinkling a bell, but otherwise not asking for food for their monasteries.

Priests of Japan beg for public objects from passers-by. A small booth is erected at the roadside, and each donor's name is written on a little wooden tally, and suspended on one of the posts placed for the purpose along the road. In the Chinese province of Shantung, men who wish to live by mendicancy, voluntarily permit their legs from the middle of the calf to be mortified off. Many die in the process, but those who survive are congratulated by their friends at having acquired a means of livelihood.

Hindu ascetic mendicants wear clothes of a dull orange colour, the 'Bhugwa' tint. Three religious garments, with a begging pot, razor, sewing needle, waistband and bathing cloth, are peculiar to the Bhikshu, or Hindu mendicant ascetic. The begging pot of a disgusting Hindu sect in the Benares district of northern India, is the calvarium, or top of the human skull. A common begging pot is the half of a double cocoa-nut. The offspring of a common woman is compared to the contents of a begging pot,—Fakir ki jhule men tukra kon dala?—Who placed the portion into the fakir's begging pot, who can tell?—*Lockhart's Med. Mis.* p. 261; *Mysore Census Rep.* See Alms; Ascetics; Kashgul-i-Ali; Mendicants.

BEGGUD. Guj., Hind. Tinfoil.

BEGHRAM, in lat. 34° 53′ N., and long. 69° 19′ E., 25 miles from Kābul, and 2 miles west of Jalalabad, a ruined city, with walls 60 feet broad, of unburned brick. Masson supposed it to have pretensions to be the ruins of Alexandria ad Caucasum. Its ruins have yielded great quantities of coins to Masson and others. In the first year, 1865 of copper, and a few of silver, with rings, signets, and other relics; in the next year, 1900; in the next, 2500; in the next, 13,474; and finally, in 1837 it yielded 60,000 Greek and Roman, Græco-Bactrian and Bactrian, Indo-Parthian and Indo-Scythian, Sassanian Hindu and Indo-Mahomedan, which Professor Wilson utilized in his Ariana Antiqua, in elucidating the history of Afghanistan, Central Asia, and India. According to tradition, it was a Greek city overwhelmed by some natural catastrophe. The present Hindus call the site Balram.—*MacGregor*, pp. 202–3; *Masson's Journeys*, iii. p. 150. See Nagrahara; Opian.

BEGONIA, a genus of plants belonging to the Begoniaceæ. About 30 species have been found in the East Indies. B. Malabarica, laciniata, porrecta, diversifolia, discolor, dipetala, picta, and pedunculosa, may be named. The great yellow-flowered begonia is abundant in the Bablang pass in the Sikkim Himalaya, and its juicy stalks make sauce; the taste is acid, and very pleasant. The remarkable variegation of their large one-sided leaves renders some of them favourite foliage-plants. Among the more beautiful are B. rex, B. Griffithii, B. argentea, B. xanthina, and several garden hybrids. B. discolor, Ch'un-hai-t'ang, Chin., is an ornamental plant of China.

B. geniculata, Ramput udang udang, Malay. Its leaves are used by the Malays for cleaning and taking out rust from the blades of krisses.

B. reniformis. A herbaceous succulent plant; flowers of a pale pink colour, and fragrant. Native of the moist forests of India.—*Jack, Calcutta Journ. Nat. Hist.* v. p. 347.

BEGOON. Beng. Egg plant, Solanum melongena.

BEGTI, the Cockup. This, with the Sudjeh and Tupsi, are the fishes most largely used by Europeans in Calcutta.

BEGUM, Beebee, Bee, Nissa, Khānum, Khatoon, and Banoo, are respectful terms added to Mahomedan women's names in India. Many towns and hamlets are designated from this title,—Begum bazar, a suburb of Hyderabad, in the Dekhan; Begumabad, Begamgunge, Begumpett, a hamlet near Secunderabad. Mahomedan ladies of rank have ever been desirous of forming towns.

BEGUM SAMROO, a native of Kashmir, who succeeded to a principality by the demise of her husband, supposed to have been a European, of a name or appellation resembling Summers. She bequeathed her kingdom to the East Indian Government, and died on the 27th January 1836. See Thomas; Samroo.

BEHAR, now a province of British India, was a part of the ancient kingdom of Magadha, first held by the Barhadratha of the Indu, the Chandravansa, or Lunar race, and succeeded by other six dynasties, from B.C. 1400 to B.C. 56. The Magadha kingdom flourished from the 4th century B.C. to the 5th century A.D. It is supposed to have attained its greatest splendour in the time of Seleucus Nicator, who invaded it, and appointed Megasthenes as his ambassador at Palebrotha. The Magadha rulers encouraged arts and learning, and colonized Java and Bali, in the Archipelago. Behar was the cradle of Buddhism, and sent its missionaries to Ceylon, Tibet, Tartary, and China; and it has many Buddhist remains at Gaya and other places. From the beginning of the 13th century A.D., it continued under Mahomedan rule until 1765, when the British succeeded. It comprises the districts of Bhagulpur, Champaran, Gaya, Monghir, Purniah, Patan, Santal Parganas, Saran, Shahabad, and Tirhut; has an area of 42,417 square miles, and a population of 19,736,101 souls, of whom three-fourths are Hindus and Mahomedans. The principal aboriginal tribes are the Bhar, Cheru, Dhangar, Kanjhar, Kharwar, Kol, Mala Naiya, Nat, Paharia, Santal, and Tharu. North Behar, the ancient Mithila, corresponds to the modern Tirhut and Purniah districts. The name is supposed to be from Vihara, a Buddhist monastery. Under the British, it is one of the four provinces under the rule of the Lieutenant-Governor of Bengal, the other three being Bengal proper, Orissa, and Chutia Nagpur.—*Wilson's Glossary; Journ. B. As. Soc.* 1864; *Imp. Gaz.*

BEHAT, near Saharunpur, in the Doab. A submerged ancient town was discovered near this by Sir H. P. Cautley.—*Prin. Ind. An.*

BEH-DANA or Bihi-Dana. Pers. The seeds of the quince. They are demulcent and cooling, very mucilaginous, and are used in sherbets.

BEHEMOTH, an animal noticed in Job xl. 16, Psalm i. 10, Isaiah lxxiii. 22, xxxv. 11. 'Behold, now, behemoth, whom I made with thee, he feedeth on grass like the ox.' It is supposed to be the hippopotamus.

BEHENTA. Uria? A timber tree of Ganjam

and Gumsur. Its timber is used for axle-trees, oil presses, and rice pounders. It is also burnt for firewood, the tree being very common. The bark and leaves are used medicinally.—*Macdonald.*

BEHERA. Some of the Joodi and Johya inhabit the range called in the native annals Juddooca-dang, and by Baber, the hill of Jud, skirting the Behut. Behera city is often mentioned in the Yadu Bhatti annals. It was one of their intermediate places of repose on their expulsion from India and migration to Central Asia. Its position was minutely pointed out by the emperor Baber (p. 259), who, in his attack on the hill-tribes of Jit, Goojur, Gukker, etc., adjoining Kashmir, 'expelled Hati Gaker from Behreh, on the Behut river, near the cave-temples of Garkotri at Bikrum.' Baber (p. 294) also found the Jit masters of Sialkot—*Tod's Rajasthan*, ii. p. 233.

BEHIKAR. Hind. Adhatoda vasica.

BEHISTUN. This name is generally written Bisutun in the maps; it is now given to a small village, 21 miles west of Kirmanshah, on the frontier of Persia. It is at the foot of rocky mountains, which are covered with bas-reliefs. The inscriptions are in the Bactro-Medo, or Persian cuneiform character of the Achæmenidæ. The most important is a list of the Iranian nations subject to Darius in the Naksh-i-Rustam, which the Persians attribute to the chisel of their famous sculptor Ferhad. Enormous marble capitals of columns are to be seen at Behistun. There are two tablets, the one containing a mutilated Greek inscription, declaring it to be the work of Gotarzes; the other, a Persipolitan sculpture, adorned with nearly 1000 lines of cuneiform writing, exhibiting the religious vows of Darius Hystaspes after his return from the destruction of Babylon, on the revolt of its Udapati or governor, Nebuchadnezzar, the son of Nebunet. Both C'tesias and Isodore mention a statue and pillar of Semiramis at Baptane, but the sculptures of Semiramis and an inscription in Syriac characters have wholly disappeared. Baghistan is traditionally described as the pleasure-grounds of Semiramis; but D'Anville suggested the identity of Behistun with the Baghistane of the Greeks, and there are good grounds from the ancient notices of this place, for supposing him to be correct. An oriental writer of the 15th century described the rock of Behistun from his own observation, as though it were sculptured in the form of a minaret. Certainly nothing of the kind now remains. The inscription set up here by Darius Hystaspes, commemorates his restoration of the Zoroastrian faith, after its overthrow by the Turanian magi, and also of the text and commentary of the Zendavesta itself, which had been neglected or proscribed. The inscriptions on the tablets of Darius Hystaspes are in the old Persian language, in the Babylonian, and also in the language of the Scythians in the Medo-Persian Empire. The Scythian portion of those inscriptions is distinctly of the Scythian, that is, Turanian group, as spoken in the 5th century B.C., though the people by whom it was spoken are believed by Professor Oppert and Mr. Norris to have been Medians. This Scythian part of the Behistun inscriptions bears a special relationship to the Ugro-Finnish family, which Dr. Caldwell considers to resemble the Dravidian dialects, and thinks that the ancient Scythic race, by which the greater part of Central Asia was peopled, prior to the irruption of the Medo-Persians, belonged to the Ugrian stock, and not to the Turkish or Mongolian.—*Sayce*, vii. 79; *Oppert, Records of the Past*, vii. 109; *Layard's Nineveh*, ii. 168; *Ferrier, Journ.; Bunsen*, iii. 457; *Rawlinson.*

BEHJUR. Beng. A mixture of barley and peas.

BEHKUL. Hind. Prinsepia utilis.

BEHMAN. Hind. Withania somnifera.

BEHMEN, also Lal Behmen, the dried roots of two varieties of a composite plant, chiefly obtained from Kābul. Used by the natives as a tonic in debility, in doses of 4 drachms; also in impotence, and as a deobstruent. Was formerly employed in European medicine as an aromatic stimulant.

BEHOOR, a village between Fort Saint David and Pondicherry, at which Major Lawrance, in August 1752, entirely routed the French army.

BEHOOYA. Beng. Cyperus difformis.

BEHRAM, a Parsee or Zoroastrian, who dwelt at Nowsaree, a town about 20 miles from Surat. He wrote the Kissi-i-Sanjan, a history of the Parsee migrations.

BEHUL. Hind. Grewia oppositifolia.

BEHURA. Hind. Terminalia bellerica.

BEHUSSEJ. Arab. Viola odorata.

BEHUT, a name of the Jhelum river, called also Vehut and Vitashta. It is the Hydaspes of the Greeks. As it passes through Srinagar, the capital city of Kashmir, it is in December about 70 yards broad, and from 6 to 12 feet deep, and runs about half a mile an hour. In May it rises 25 or 30 feet. It is navigable all through the valley, and on reaching the Panjab takes the name of Jhelum. In the Panjab its bed is about 750 feet above the sea. It is to the east of the Indus river, to which it runs almost parallel, but it is smaller. Behuth is said to mean unbegotten.—*Rennell*, p. 99.

BEIAT, a Persian tribe in Khorasan.

BEIGLERBEG, or, as Meninski writes it in his Institute, Beglerbeg, signifies 'lord of lords,' is a Turkish title given to the ruler of a province. Under him are the hākim or governor of a large city, the zabit or chief magistrate of a town, and the ked khuda, principal 'house-holder;' also the Kalāntăr or būzūrg, the person who, in a village, exercises authority over the other inhabitants.—*Ouseley's Tr.* i. p. 194.

BEILSCHMIEDIA FAGIFOLIA. *Nees.* A very large tree of the dense moist forests in the plains of South Canara, not much above the sea level. It has been found also in North Canara, and on the Silhet mountains in Northern India. The tree grows to an immense size, and the timber is used for building purposes. Two other species inhabit Northern India.—*Beddome, Fl. Sylv.* 185.

BEILSCHMIEDIA ROXBURGHIANA. *Nees.* Laurus bilocularis, *Roxb.*, a tree of Tipperah, one of the Lauraceæ.—*Roxb.; Voigt.*

BEIROUT was taken from the Saracens by Baldwin, the first king of Jerusalem, in A.D. 1111, but retaken 1187. Ten years afterwards, the Christians again captured it, and it was frequently ravaged during the crusades. Subsequently it fell into the hands of the Druses, from whom it was taken by the Turks, who still retain possession of it. It is the ancient Berytus. It is situated on the western extremity of a triangular point of land, projecting into the sea about four miles beyond the line of coast. It stands on a

gentle rising ground close to the sea-shore, and is about three miles in circumference.—*Robinson's Tr.*

BEIS, one of the thirty-six royal races of Rajputs who give the name to Beiswara.

BEIT, also written Bate and Bete, an island in the Gulf of Cambay, occupied by the Badhail race. It was taken possession of by the pirates of Jugut, after they had been defeated by Kutub Shah in A.D. 1482. Beit fell, after having fought twenty naval engagements.

BEI-VURMA BEWA. CAN. Azadirachta, *sp.*

BEKH. PERS. A root of any plant, but particularly if used medicinally; thus—

Bekh-Anjabaz. Red-coloured root of a plant brought from Dehli; considered cooling.

Bekh-i-Badyan. Fœniculum vulgare.

Bekh-i-Banafsha. Viola serpens.

Bekh-Karafs. Apium involucratum; Apium graveolens.

Bekh-Karpas, root of a small plant from Dehli.

Bekh-Kasni. Cichorium intybus.

Bekh-i-Marjan. Red coral.

Bekh-Mihaq. Glycyrrhiza glabra.

Bekh-i-Nilofar. Nelumbium speciosum.

Bekh-i-Pan. Root of Chavica seriboo, *Miq.*

Bekh-i-Sosan, HIND. Iris florentina.

Bekh-i-Zafran. Aristolochia rotunda.

Bekh-i-Zanjabil-i-Shami. Elecampane.

BEKHOOR-MIRIAM. ARAB. Cyclamen Europæum.

BEKHUL, also Bekhli. HIND. Prinsepia utilis.

BEKRA. MAHR. Tetraceros quadricornis.

BEKUK. In the beginning of the 18th century, an impostor made his appearance at Dehli, who produced a pretended new Scripture, written in a language of his own invention, framed from those spoken in ancient Persia, and founded a sect, in which the teachers were called Bekuk, and the disciples Ferabūd.

BEL. HIND. Any climbing plant; a tendril.

Bat-bel. Cissampelos Pareira.

Bel-ka-bij, sugar-cane, cut up for setts.

Bel-Kambi. Acacia amara.

Bel-ke Buchla ki bhaji. Basella alba.

Bel-ki pat. Leaf of Ægle marmelos.

BEL. HIND. A place where sugar-boiler pans are placed. Bel-Karahi, a sugar-boiling caldron.

BEL, also Belgar. HIND. The Ægle marmelos, or Bengal quince. The fruit contains tannin, either pure or in combination; a large amount of mucilage; a concrete essential oil; and an aromatic as well as a bitter principle. A sedative or narcotic property would also appear to exist in one or other of these. The fruit, a little unripe, is given in diarrhœa and dysentery. The decoction of the dried fruit is aromatic, slightly bitter and astringent, gummy and mucilaginous, something like a mixture of a decoction of quince and pomegranate, but bearing an aroma peculiar to the Bel. When made into jam, and eaten at meals, like marmalade, every morning, it is found very useful to women and children, whom it is injurious to accustom to continual purgation. With Hindus the leaves are sacred to Matajee (from the milk of whose breast this tree is believed to have sprung up), and they are offered to Mahadeva. The oath of Bel-bandhar, or 'the pledge of the Bel,' is one of the most sacred a Hindu can take. When this oath is taken, some of its leaves are filled with turmeric, and interchanged with solemn pledges by the parties.—*Roxb.*; *Genl. Med. Top. of Ajmir*; *Malcolm's Central India*, i. 196.

BEL. HIND. A hoe. Beldar, a labourer. The beldar of Northern India are of the Kachi, Kurmi, and Chamar races. In Southern India they are of the Wadara tribes. See Beldar.

BEL, Belos or Belus, a Babylonian deity. Bel of Babylon was the Assyrian Bilu, and the Hebrew Baal, equal to lord. The older Bel was called in Akkadian, Mul or Mul-ge, the Lord of the Abyss, and presided over the earth and underground world. The younger Bel was called Bel-Merodach. The Babylonian trinity was Anu, Bel, and Hea.

Hurman Bel, supposed by Movers to be the serpent of Bel, is explained by Bunsen to mean the combater of Bel, or struggler with Bel, called in the Canaanitish dialect Yesrael or Israel. He was the struggler with El, God, the Hercules Palamedes of the Greeks.—*Bunsen*, iv. 284; *Sayce*, p. 164.

BELA. HIND. Jasminum zambac; in Bengal, Sapium bacciferum.

BELA. HIND. Alluvial soil on the banks of a river.—*Powell.*

BELA, the chief town of Las, in Baluchistan, is built on a strong and rocky site on the northern bank of the Purali river. It is the Arma-Bel of the ancient Arab authors; also called Kara bela. It is now decayed, but coins, trinkets, and funereal jars are found near; and in the neighbouring hills are numerous caves and rock-cut temples, now ascribed to Farhad and fairies, but are the earthly resting abodes of former chiefs and governors; also near, are old Mahomedan tombs. One-third of the houses are occupied by Hindus.—*Elliot's India*; *Masson's Journeys*, ii. p. 28.

BELADUR. ARAB. Semecarpus anacardium.

BELADURI, author of an account of the early Arab invasions of Kandahar. He was so styled because addicted to the use of an intoxicating confection made from the Beladur.

BELAGANI or Balagami, a village in the Shimoga district of Mysore, celebrated for its ruined temples, with sculptures of high finish, and many inscriptions. It was the capital of the Kadamba dynasty as early as the 12th century.

BELALA or Belall, a dynasty in the Peninsula of India, whose sway at one time extended over the whole of Karnata, Malabar, the Tamil country, and part of Telingana. They claimed to be Rajputs of the Yadu branch. This dynasty ruled for 256 years in Warangal, until its capture by Mahomedans, A.D. 1323, on which two of its officers established their rule at Vijianagar.

BELAM-KONDA-SULA MANI. MALEAL. Pardanthus Chinensis, *Ker.*

BELAMUDAGAM. MALEAL. Scævola belamudagam, *Linn.*

BELAN, the ancient Amana, a large village in a valley of the Mount Amanus, about three hours' riding from Alexandretta. The pass of Belan, in the mountain called Pulæ Syriæ by the ancients, was traversed by Darius a few days before the battle of Issus. It is in the route from Anatolia and Syria.

BELANDA, a tribe in Kedah.

BELANUS. According to Colonel Tod (Tr. 253), the Syrian Bal and Belanus is the Bal-Nath (god) of the Saura, whose grand temple of Somnath is the counterpart of the Syrian Balbec, Soma-Nath

being merely a figurative appellation of Bal, as the ruler of the lesser orb, Soma or the moon.

BELASCHORA. MALEAL. Lagenaria vulgaris.

BELASPORE, a town and a district in the Chatisghar division of the Central Provinces, of which it is the most northerly. The chief town is built on the south bank of the river Arpa. The population of the district is 785,000 souls, in an area of 8800 square miles.

BEL-BANDHAR. HIND. The leaves of the Bel or Ægle marmelos and turmeric placed on an idol; a form of oath, taking these leaves off, and swearing by them. See Bel.

BELBUSSAN CHARREE, of the Astracan steppe, is a species of Galeodes.

BELDAR, a delver, a digger, from bel, HIND., a hoe, and dar, PERS., holder. This race migrate from place to place as work is heard of. They are stone-cutters, construct dry walls and wells. They have no houses, but dwell in small tents. Those from Poona wear enormous turbans, containing about 80 yards of cloth. They speak Mahratti, also Hindi. They worship Marri Ai or the Death Mother, who is known also as Sitla or small-pox, Mata, Ai, Devi, Bhawani. They sacrifice rams. They marry when they have the means, when young, bury the dead, and offer water libations and rice on the third day. They do not eat beef, but eat mutton. A few can write. They claim to be dissimilar from the Waddaru, with whom they neither eat nor intermarry. The Waddaru have two sections, one of them earth-diggers, who eat rats. The other are stone-cutters, and cart stones from quarries.

Beldar of the Uriya are tank-diggers by profession, and are all under the command of a chief called a jemadar. Under the jemadar are a number of naiks, each of whom has the command of a gang. These gangs have no settled home, but wander about the district wherever they can get work.—*Wils.*

BELEE WAULKEE. CAN. Terminalia arjuna. Belelah, PERS., Myrobalan of T. bellerica.

BELEMNITES. Lung-kuh, CHIN. Fossils, very common in the limestones of Trichinopoly, and in the Himalaya, of the genera Belemnites, Belemnitella, Acanthoteuthis, Belemnoteuthis, and Conoteuthis. Belemnites are officinal in Arabic medicine.—*Honigberger*, p. 242.

BELERIKA. MALEAL. White var. of Calotropis gigantea.—*R. Brown.*

BELGAUM, a revenue district of the Bombay Presidency, lying between lat. 15° 22′ and 16° 56′ N., and long. 74° 4′ and 75° 35′ E., with an area of 4591 square miles, and a population of 938,750 souls. The country is about 3000 feet above the sea, and the rivers Kistna and Malparbha flow through it to the east. The people are largely agricultural, of the Srawak or Jain faith, Hindus of the saiva, vaishnava, and lingaet sects, and with 91,386 Mahomedans. The Mhar race are the village watchmen. The district was transferred from the Peshwa to the British under the treaty of Poona of June 1817.

A temple in the Parasgad district is a place of pilgrimage, on a hill sacred to the goddess Yellama, visited in the full moon of November and April, commemorative in November of the death of Yellama's husband, and in April of his return to life. At one moment the pilgrims raise a deep wail, and the women break their glass bangles, in sympathy with the goddess in her widowhood.

Belgaum town, with its adjoining suburb of Shahpur, is 2260 feet above the sea, from which it is distant 70 miles. It is within 20 miles of the Western Ghats, and the rocks are limestones, sandstones, and clay-slates upraised by granite in highly vertical strata. The average fall of rain, 1850 to 1856, was 52·40 inches. It is a large British cantonment, and its climate is pleasant. Natives of India, to distinguish it from other towns of the same name, style it Shahpur-Belgaum.

BELGAUM WALNUT, fruit of Aleurites triloba. This is the Mollucca tree which produces the 'Lumbang nut.' The tree is very prolific. The nuts yield a very large percentage of oil, and, strung upon a thin strip of bamboo and lighted, will burn like a candle.—*Trans. Agri-Horticultural Society.*

BELI. HIND. Ribes leptos.

BELI, a monarch of India to whom the god Vishnu as Vamana appeared. See Vamana.

BELIKH-ZICHI. AR. Cucurbita citrullus, *L.*

BELILLA. MALAY. Mussœnda frondosa.

BELL.

Cloche, Sonnette, . FR.	Campana, . . . IT., SP.
Glocke, Schelle, . GER.	Manni, ... TAM.
Gant'hi, . . . HIND.	

Bells are largely used by Hindu, Buddhist, and Christian worshippers, about their temples and churches. The old bell of Moscow is 'Tzar Kolokol,' the king of bells. It is said that Moscow at one time had 1706 large bells, one of these being of such dimensions as to require four and twenty men merely to pull the clapper. Its weight was 288,000 lbs., or something over 120 tons. This huge mass fell from its supports, and was recast in 1654. It fell again, however, and was again broken up and recast, but with a vast quantity of additional metal, and the outcome was the great King, the 'Tzar Kolokol,' which stands 19 ft. 3 in. high, and measures 60 ft. 9 in. round, and is 2 ft. thick in solid metal, and the money value estimated at nearly £67,000. Its total weight is about 198 tons. It was long believed that the bell had been raised into some kind of belfry, but that it fell and buried itself in the earth. Experts, however, after careful examination, came to the conclusion that it never was removed from the mould in which it was cast, and which was in an enormous cavern under the Kremlin. A piece was chipped out of the 'Tzar Kolokol,' which was said to weigh eleven tons, or considerably more than half the weight of the Great Paul bell, and more than twice as large as the famous old bell of St. Paul's, which, according to tradition, once saved the life of a sentinel on guard by making itself audible as far as Windsor.

St. Paul's great bell was originally cast in the reign of Edward I., and was hung at Westminister Hall gate to tell the judges the time of day. It was at first called 'Edward of Westminster,' and afterwards 'Westminster Tom.' It was transferred to St. Paul's by William III., and was brought thither on New Year's Day, 1699. Since that time it has been twice recast, with additional metal.

Big Ben of Westminster weighs between 13 and 14 tons. Great Peter of Yorkminster was the heaviest bell previous to the time of Big Ben. Peter was founded in 1845, and weighed 10 tons,

thus eclipsing Great Tom of Oxford with a weight of about 7½ tons.

Great Paul, the new bell for St. Paul's, is by far the largest ever yet produced in England. A mass of upwards of 20 tons of metal was poured into the mould, and the bell, somewhere between 17 and 18 tons in weight, was brought to St. Paul's in May 1882.

Among the large bells cast of late years, Canada boasts one for the Roman Catholic cathedral of Montreal. It weighs 13 or 14 tons.

Clarke, in his Travels, gives an interesting account of the bells of Moscow, and of the 'king' in particular. The large bell near the cathedral is only used upon important occasions, and yields fine solemn tones. When it sounds, a deep hollow murmur vibrates all over Moscow, like the fullest tones of a vast organ, or the rolling of distant thunder. This bell is suspended in a tower called the belfry of St. Ivan, beneath others, which, though of less size, are enormous. It is 40 ft. 9 in. in circumference, 16½ in. thick, and weighs more than 57 tons. Of the great bell of all he says, 'It is truly a mountain of metal. They relate that it contains a very large proportion of gold and silver, for that while it was in fusion the nobles and the people cast in as votive offerings, their plate and money. The natives regard it with superstitious veneration.' It is white and silvery in appearance. The Emperor Nicholas had the bell raised to a granite pedestal, and there it stands now, its interior, to which access is gained through the fracture in its side, being used as a chapel.

Bells are well, and numerously, cast in all parts of the S.E. of Asia. In Burma, those in the small pagodas in form have their inferior part less widened than the bells of Europe, and they are cast with a large hole in the centre of the upper part; no tongue is hung in the interior, the bell being sounded by striking its outer surface below with a deer or elk horn. The bell at the Shooay Dagon pagoda in Rangoon was cast in 1842. Its weight is 42 tons 5 cwt. 40 lbs. (94,682 lbs.); its height, 9½ cubits; its diameter, 5 cubits; its thickness, 15 inches. Whilst the materials were being melted, devout persons threw in copper, silver, and gold in great quantities, increasing the weight by one-fourth. The bell at Mengoon, in Burma, is 18 ft. high, besides 7 ft. for hanging apparatus; it is 17 ft. in diameter, and 10 or 12 in. thick. Its weight is supposed to exceed 200,000 lbs. = 88 tons 7 cwt. 106 lbs. Considerable quantities of gold and silver were flung into the melting mass. The biggest bell in Burma is on a low circular terrace north of the temple at Mengoon. Its external diameter at the lip is 16 ft. 3 in., and its interior height 11 ft. 6 in.

A large bell is in a small monastery not far from Pekin; it weighs 53½ tons, and has on it several thousand Chinese characters in basso-relievo, constituting a Buddhist classic, which the priests, when they retire into seclusion for three years, commit to memory.

It has been asserted that Pekin has or had no less than seven, weighing considerably over 50 tons each. One bell has been reported the largest suspended bell in the world, and second only among all bells to the huge creation of Moscow.—*Bishop Bigandet, Legend of the Burmese Buddha.*

BELL, Dr. ANDREW, was the first superintendent of the Madras Military Male Orphan Asylum, when it was opened in 1789. He was the founder of the Bell and Lancaster system of teaching.

BELLA-BEK of the Waddar, Felis chaus.

BELLADONNA. Tien-kia, Chin. Atropa belladona. The deadly nightshade.

BELLA GADA. Tel. Ceropegia juncea, *R.*

BELLARY, a town and military cantonment in the centre of the Peninsula of India, equidistant from the Bay of Bengal and the Arabian Sea. The town is in lat. 15° 8′ 51″ N., and long. 76° 57′ 15″ E. It gives its name to a revenue district, which has the Mysore territory on the south and west, that of Hyderabad on the north, and Cuddapah district on the east. Since the 14th century, this district has successively been under the rule of the Vijianagar dynasty, of the Adal Shahi kings, of the Mahratta Sivaji and the Peshwas (1640), of the Moghul emperors of Dehli, of the Mahomedan rulers of Mysore, of the Nizam of Hyderabad, and finally of the British, to whom it was ceded by the Nizam in 1803. The population in 1871 was 1,668,000 souls, 92 per cent. being Hindus of the Saiva, Vaishnava, and a few of the lingaet sects. A small colony of the Beder race occupy the sanatorium hill of Ramandrug, and the Korcha-wanlu are a predatory race in the plain. The ruins of the ancient capital of Humpi are near. The country is a plain about 900 to 1200 feet above the sea, with solitary granite hills projecting from the red and black soil. The climate is very arid, the rainfall about 22 inches, but it has the rivers Tumbudra, Pennar, Hagri, Vedavati, and Chitravati; several anicuts have been built across the head of the Tumbudra, and watercourses have been led along its banks, particularly at Chitwadaghi Humpi (the ancient Vijianagar), Seiragūpah, and Rampūr. The principal reservoir is at Bookapatnam, formed by embanking the gorges of a range of hills through which the river Chitravati flows. The tanks of Daroji, Anantapur, and Shinganinalla are next in importance; but there are many ancient bunds, which were breached during the native governments, and have not been restored. About 1,037,634 acres are of the regur or black soil. Earth salt is made throughout the district; iron is largely made at Sundoor. The underlying rock in the Bellary and Cuddapah districts is granite or gneiss.

BELLA SHORA. Male. Lagenaria vulgaris.

BELLAWAN. Duk. Semecarpus anacardium.

BELLERIC MYROBALAN. See Myrobalan.

BELLEROM. Tam. A wood called in Malabar and Canara, kyndle. It resembles the angely wood. The Company's cruiser Aurora was built of this wood, procured from the forests in the north of Malabar.—*Edge, M. and C.*

BELLEW, HENRY WALTER, a medical officer who served in the Crimea in 1855, in the war against Russia, and afterwards entered the E. I. Company's service in the Bengal army, and from 1856 was employed almost exclusively on the N.W. frontier of India, in Kashmir and Afghanistan. In 1857, was a member of General Lumsden's mission to Kandahar, and wrote the journal of the mission. In 1865, published a topographical history of the Yuzufzai district; in 1868, a pamphlet, 'Our Panjab Frontier,' advo-

cating reconstruction of the British N.E. boundary, and occupation of the frontier highlands. In 1868, published a grammar and dictionary of the Pushto.

BELL METAL.

Klokspys, . . .	Dut.	Kolokinaja-mjed,	Rus.
Metal de Fonte, .	Fr.	Campanil, . . .	Sp.
Metal de cloches, .	,,	Venjalam, . . .	Tam.
Glockengut, . .	Ger.	Kantan, . . .	Tel.

An alloy, consisting of three parts of copper and one of tin, of which bells are made.—*M'Culloch.*

BELLOWS. Eng. Pankha, Hind. For household fires of India, the bamboo blow-pipe is employed. The blacksmiths of India use sheep-skins sewed, with a cleft, edged with wooden rods, which the bellows-blower opens, raises, and depresses. The Chinese bellows consist of forcing air-pumps, two cylindrical tubes of wood, of about eight inches diameter, about five feet long each, and placed vertically in the earth, contiguous to each other, with pistons inserted in each, which are alternately depressed, in the manner of churning, by a bellows-man sitting beside them. The air is pressed out of a lateral tube in each, and communicates with the forge. Above these tubes are two apertures furnished with valves to admit fresh supplies of air. Such double-nozzled bellows are in use by the Burmese, the Malays, and the Hovas of Madagascar. Those of Burma are of two bamboos four inches in diameter and five feet long, with pistons clothed with a bunch of feathers or other soft substance.—*Peschel; White's Voyage.*

BELL PEPPER, Capsicum grossum.

BELLUM. Tel. Coarse sugar, goor, jagari.

BELNA. Hind. A roller press to extract juice from the sugarcane; also a machine for cleaning cotton from its seed.

BELOO. Tel., Uria? A tree of Ganjam and Gumsur; extreme height 30 feet, circumference 3 feet. Its wood is sometimes employed for making carts; the leaves are used for making the umbrella-hat which is worn on the head by the ryots and coolies.—*Captain Macdonald.*

BELOSTOMA INDICUM, an aquatic species, attains a size of nearly three inches.

BELTANE feast was on May-day, but the word was also applied to fires kindled in honour of Bel on other days, as on Midsummer Eve, All-Hallow E'en, and Yule or Christmas.

BELUGA CATODON, *Pallas*, is placed by Gray, Gerard, Lesson, and Lacepede, as of the genera Physeter, Delphinus, Delphinapturus, and Catodon, one of the Delphinidæ found in the North Pacific, North Atlantic, and Arctic Ocean.

BELULI. Can. Allium sativum, garlic.

BELUMBU. Duk. Averrhoa bilimbi.

BELUR, an ancient city in the Hassan district of Mysore, but now only with about 3000 inhabitants. It is called in the Puranas, Velapura, and is known to the people as Dakhina Varanasi, or southern Benares. Its celebrated temple of Chenna and Kesava is adorned with carvings and sculptures from the master hand of Jakana Charya. It was erected and endowed about the middle of the 12th century, by a king of the Hoysala-Ballala dynasty, on the occasion of his conversion from the Jaina faith to vaishnava Hinduism.—*Imp. Gaz.*

BELUR TAGH is one of the many names given to the Kouen Lun chain, which forms the northern boundary of western Tibet; it is not less elevated than the Himalaya, and is covered throughout a great part of its length with perpetual snow. Dr. Thomson reached its axis in the Karakoram pass, elevated 18,300 feet. The Kouen Lun chain has been called the Belur Tagh or Bulut Tag, which Captain Cunningham regards as synonymous with the Balti mountains. It is also called Mustagh, Karakoram, Hindu Kush, and Tsun lung or Onion mountains, because of a species of Allium growing there. Its continuation is the Pamir range. At the present day, the old indigenous inhabitants of that district, and generally those of Kashgar, Yarkand, Khoten, Turfan, and the adjacent highlands, are Tajak, who speak Persian, and who are all agriculturists. The Turkoman either came after them and settled at a later period, or else they are aborigines whom the Aryans found there; but its slopes are the primeval land of the Aryans. —*Ch. Bunsen*, p. 406.

BELUTA POLA-TALI. Maleal. Crinum Asiaticum, Beluta-champagam, Mesua ferrea.

BELVIDERE, a house in Bombay, called Mazagong House, once occupied by Mrs. Draper, the Eliza of Sterne's letters. She left her husband about A.D. 1770.

BELWA, a race in Mysore who collect the juice of the palmyra, speaking Malealam.

BEM-NOCHI. Maleal. Vitex negundo. Bempavel, Momordica dioica. Bem-tamara, Nelumbium speciosum, *Willd.*

BEN. Burm. Cannabis sativa.

BEN. Hind. Eremurus spectabilis.

BENA of Kurawar. Moschus moschiferus, *Linn.*

BENA. Beng. Ardropogon muricatus.

BENABA, also Bia and Bibla. Duk. Pterocarpus marsupium.

BENA-JONI. Beng. Sporobolus diander.

BENARES, a holy city of the Hindus, is built on the left bank of the Ganges, between the Barna Naddi on the N.E., and the Asi Naddi on the S.W., and extends along the river bank for nearly 3 miles. In 1872, its population was 175,188 souls. It is in lat. 25° 18′ 31″ N., and long. 83° 3′ 4″ E. The people call it Kasi, but it is also called Varanas or Varanasi, also Ati Mukta. It is famed for its artistic work in clays, metal, stone, wood, and alloys. Benares town gives its name to a revenue division of the N.W. Provinces of India, which has the districts of Azamgarh, Basti, Benares, Ghazipur, Gorakhpur, and Mirzapur, of 18,314 square miles, and a population in 1872 of 8,179,307 souls, of whom 90 per cent. are Ahir, Baniya, Brahman, Chamar, Kayasth, Kurmi, and Rajput. The people are largely agricultural, growing rice, wheat, barley, oats, peas, cotton, bajra, sorghum, maize, pulses, indigo. Benares town has many temples and shrines, and Hindus resort to it in pilgrimage. The river Ganges bends round the town, and the view from the river is a beautiful prospect. The Hindu temple of Vis-Eswara has been for many centuries the chief object of veneration at this town. The old temple, described by Tavernier, 1680, was partially destroyed by the Mahomedans in the reign of Aurangzeb; the present was built up by Ahalya Bai, a Mahratta princess, and is remarkable for the beauty of its minute architectural embellishment. The thick plates of pure gold with which its dome is covered, were a bequest of Ranjit Singh. The old temple was in the form of a St. Andrew's cross. Benares has been by turns Brahmanical, Buddhist, Saiva-Hindu, Sakta-Hindu, Vaishnava-Hindu, and Jaina; but at

present it is a great Saiva city, and the emblems of this deity's worship are multitudinous. Durga also, and likewise Ganesh, Surya, Vishnu, Rama, and Parasnath, all have shrines. But, though now pre-eminently a Hindu city, with many tol or seminaries, it is celebrated amongst Buddhists as the place where their great teacher first expounded his doctrine, or, as they express it, where he first began to turn the wheel of the law. This was one of the four great events in the life of Buddha; and the stupa which was built upon the spot was esteemed as one of the four great monuments of Buddhism. This stupa, now called Dhamek, is situated about 3½ miles to the north of the city, amidst an extensive mass of ruins, which are surrounded on three sides by large artificial lakes. From Benares have emanated, and still emanate, almost all new opinions on questions of Hindu theology, Hindu philosophy, and Hindu jurisprudence. The verdict of the Benares authorities is final in the Hindu world. There, Sankara Acharya won a great Saivite controversial victory; there, disguised as a Hindu boy, Faizi became initiated in the Hindu Shastras; there, at the fountainhead, did Aurangzeb try to diffuse the leaven of Mahomedanism; and there the Benares college has been erected by the British, to enlighten and form the native population with new ideas in their heads, and new institutions.

The length of the city along the river front is about 4¾ miles. The houses are built of stone, and some of them are three or four storeys high, and tastefully ornamented on the outside. The ghats, or bathing-places, are large buildings many storeys high, with handsome verandas and majestic portals; but their distinctive characteristic is seen in flights of wide stairs. The manufacture of gold and silver brocade in Benares is famed. The looms are very simple in their construction. The gold and silver pass through many hands before they are formed into thread. Brocades (kimkhab), gold woven scarves (dopatta), and silks are consigned from this city, together with a kind of yellow silk dhoti called 'pitambar,' and a dark-blue silk with white spots called 'bund;' also the silk sari or scarves, exclusively for women's wear, forming both a skirt and a scarf. Its lacquer ware is good. Two kinds of resin are used; one called rahl, is sold at eight annas the seer, and is said to be brought from Mirzapur. The finer lacquer is made of a resin called gaharba, for a seer of which one rupee and two annas are paid. There is a Maharaja of Benares; his family was founded by Munsa Ram, zamindar of Gungapore, who died in 1740, and was succeeded by raja Bulwunt-Singh, who joined Shah Alam and Shuja-o-Dowla in their invasion of Bengal in 1763. He joined the British camp, with the emperor, after the battle of Buxar, and in the arrangements made with the emperor in 1764, his zamindari was transferred from Oudh to the British Government. The insurrection of Vazir Ali occurred on the 14th January 1796. In March 1862, the Maharaja received the assurance, by sunnud, that in the event of failure of natural heirs, Government will permit and confirm any adoption of a successor made by himself or by any future chief of his state, that may be in accordance with Hindu law and the customs of his race. The Maharaja receives a salute of 13 guns.—*Aitcheson's Treaties*, p. 41; *Schlagentweit; Schonberg's Tr. in India and Kashmir*, i. p. 99; *Tr. of a Hindu; Arch. Surv. Report, B.A.S.J.* xxxii. of 1864; *Imp. Gaz.*

BENAUDHA or Benawat, a tract of country in N. India, which includes the western part of Jounpur, Azimghur, and Benares, and the southern part of Oudh. Some authorities say it extended from Baiswar to Bijapur, and from Gorakhpur to Bhajpur, and that it comprised 52 parganas, governed by a panth of 12 rajas, the Garhwar of Bijapur, the Khanzada, Bachgoti, and others.

BENCOOLEN was a principal settlement of the British, till surrendered to the Dutch in 1825 in part, for possessions in the Strait of Malacca.

BENDA-KAI. Tam. Abelmoschus esculentus.

BENDAMIR, a small town of sixty houses, which takes its name from a dyke or bund, constructed in the 10th century by Amir Azam Delemi. A flat bridge of thirteen arches is thrown over the stream, the waters of which form a beautiful cascade just beneath it. As the bed of the river is very deep, seven other dykes have been constructed in its lower course, to procure water for the irrigation of the fields. It has been made famous by the bewitching strains of Moore, whose language surpasses the reality, though, in the spring-time, Bendamir is doubtless a lovely spot:—

'There's a bower of roses by Bendemeer's stream,
And the nightingale sings round it all the day long;
In the time of my childhood 'twas like a sweet dream
To sit in the roses and hear the birds' song.
That bower and its music I never forget;
But oft, when alone in the bloom of the year,
I think, Is the nightingale singing there yet?
Are the roses still bright by the calm Bendemeer?
"No! the roses soon withered that hung o'er the wave;
But some blossoms were gathered, while freshly they shone,
And a dew was distilled from their flowers, that gave
All the fragrance of summer, when summer was gone.
Thus memory draws from delight, ere it dies,
An essence that breathes of it many a year;
Thus bright to my soul, as 'twas then to my eyes,
Is that bower on the banks of the calm Bendemeer."'

—*De Bode's Travels*, pp. 169–70; *Pottinger's Travels*, p. 239; *Ouseley's Travels*, ii. p. 326.

BENDI. Mahr. Thespesia populnea.

BENDKAR of Keonjhur, scattered throughout the southern Tributary Mahals, are colonies of an aboriginal people, often mentioned in the Hindu classics, and named Savara, Saura, or Saur, and supposed to be the Suari of Pliny, and Sabaræ of Ptolemy. The Bendkar are said to be numerous in Lehera, in Bamra, and elsewhere in the Tributary States. A paper in the Asiatic Researches of 1842 notices the Bendkar, in the Kolehan district, a clan or tribe, not exceeding 250 or 300 in number, residing entirely in a range of hills, called the Bendkar Booroo, to the north of Keonjhur and Jamdapir, the southern border of the Kolehan district. The country inhabited by this tribe is exceeding wild, being in fact one mass of almost impenetrable jungle. The Savara who occupy the country between the Kandh Maliahs or hill tracts and the Godavery, retain a primitive form of speech; but the Bendkar Savara have no language of their own, and no tradition that they ever possessed one. The form of speech used is Uriya; and those living in mixed villages conform to many customs of Hindu Uriyas of inferior castes. They worship a female divinity, whom they call Bansuri and Thakurani, to whom annually they offer goats and fowls; but every ten years each community of Bendkar offers a buffalo, a boar, a

sheep, and twelve fowls. In marriage, the girl is brought by her friends to the bridegroom's house. The young couple make two and a half turns round a pot of water, in which are mango leaves. They are then bathed together, and their hands tied together, and the ceremony is at an end. The dwellings of the Bendkar are constructed of branches and leaves, and covered with grass. Their ordinary food consists of edible roots which they find in the jungle, with berries and wild fruits, such diet being varied and improved occasionally by the produce of the chase. Their husbandry is merely scratching up the surface of the ground. Their scanty crops are raised in little plots on the hill-sides, near watercourses. They barter their maize, grain, or rice with the lowland villagers. The Bendkar burn the dead, with the head to the north. In this they vary from the Kol, who affect the south; and the hill Bhuiya, who honour the west.—*Dalton's Ethnol.; As. Res.* 1842.

BENDO, a light wood of Java, useful for canoes.

BENDU. TEL. Æschynomene Indica, *L.*

BENEDICT GOES, in 1603, undertook a journey with the specific object of determining whether the Cathay of old European travellers and modern Mahomedans was or was not a distinct region from China.—*Yule, Cathay*, i. p. cxlii.

BENG. TAM. Bignonia suaveolens.

BENGAL is the country through which the rivers Brahmaputra and Ganges flow to the bay to which it gives its name, and it gives its name also to the presidency in the Government of British India, which includes Bengal or Lower Bengal, the North-West Provinces and Oudh, the Panjab, Assam, and Ajmir, each with a local government of its own, but all subject to the general control of the Governor-General of India in Council. The area that these five provinces occupy is 591,766 square miles, and in 1878 their population was 133,024,614 souls. Also, the military forces distributed through these five provinces are known as the Bengal army, and form a large portion of the army of India, under a Commander-in-Chief, who has the supreme direction also of the armies of Madras and Bombay. The Bengal or Lower Bengal region now to be noticed is administered by a Lieutenant-Governor. It lies between lat. 19° 18′ and 28° 15′ N., and long. 82° and 97° E., with an area of 203,437 square miles. The census for 1881 gives a population of 68,750,443, as against 62,724,840 in 1872, showing an advance of 9·6 per cent. Bengal, 35,954,874; Behar, 22,897,212; Orissa, 5,184,066; Chutia Nagpur, 4,714,291. In all Bengal, the Mahomedans are 19,553,831; Hindus, 38,975,418; Christians, 90,763; Buddhists and Jains, 84,974. It is bounded on the north by Assam, Bhutan, and Nepal. On the east an unexplored mountainous region separates it from China and northern Burma. It has Burma, the Bay of Bengal, and the Madras Provinces on the south, and the plateau of the Central Provinces and districts of the N.W. Provinces are on its west. In this area are included the four provinces under notice, viz. Bengal proper, Behar, Orissa, and Chutia Nagpur. *Bengal* is flat, and intersected by the watercourses formed by the branching of the Ganges and Brahmaputra and their tributaries. The climate is comparatively equable; the rainfall ranges from 60 to 100 inches; and Calcutta mean temperature is 78°. The district between the Ganges and the Brahmaputra, extending northwards to the foot of the Himalaya, is a slightly higher tract of country, and specially suited for the growth of fibrous plants, for which the neighbourhood of Rungpur is greatly celebrated. In the districts immediately east of the Brahmaputra, including Dacca and Sylhet, the greater portion of the surface is occupied by the rich plains of Mymensing and Sylhet, through which the river Soornia meanders. The old channel of the Brahmaputra, now nearly dry, winds along by Dacca from the eastward. This tract affords a great variety of produce, such as cotton, sugar-cane, rice, and other grains.

Behar is that portion of the Gangetic plain between the Himalaya and the plateau of Central India, which is terminated at one end by the N.W. districts of Ghazipur and Gorakhpur, and at the other by the passes of Rajmahal. This tract of country comprises the Patna and Bhagulpur divisions. The people are a more manly race than the Bengali; they speak Hindi dialects; and the proportion of Mahomedans amongst them is comparatively small.

Orissa is a narrow littoral strip of country running down between the hills and the Bay of Bengal. Its people speak the Urya language, closely allied to but distinct from Bengali, and their character and manners are in many respects peculiar.

Chutia Nagpur is a table-land lying south of Behar. It is a hilly and sparsely-populated region, and not very fertile. Its eastern districts, Manbhum and Singbhum, are partly inhabited by Bengali. In Hazaribagh, Hindustani people are found, but in the west and south the people are mainly aboriginal, belonging to Kol and Dravidian tribes. The elevation of Chutia Nagpur is 3000 feet, with hills running east and west, but of little height. Sirgujah is mountainous, rising 600 to 700 feet above the level of Chutia Nagpur. Mynpat is a table-land about 30 miles south-east from Sirgujah town, and about 3000 or 3500 feet high. Palamow district is very mountainous. Hazaribagh town, 24° N., 85° 54′ E., 1750 feet. The slope of country S. towards Sumbulpore, and even depressed towards the Mahanadi, Sumbulpore town being only 400 feet. The Orissa table-land then rises on the southern side of Mahanadi, in some places to 1700 feet, backed by the chain of East Ghats. Amarkantak is a jungly table-land, lat. 22° 40′ N., long. 81° 5′ E., 3500 feet.

Bengal proper, Behar, and Orissa are in the valleys of the rivers Ganges, Brahmaputra, and Mahanadi. They are fertile, and yield every vegetable product which can feed and clothe a people, or enable them to trade with foreign nations. Amid the hilly spurs and undulations, coal occurs in vast areas, with iron and copper ore and limestone. Salt is made along the coast line. The great rivers afford facilities for the carriage of their agricultural and mineral wealth, and their annual inundations in Lower Bengal spread a top-dressing of virgin soil over thousands of square miles.

Its early history is obscure. The rajas of Bengal, capital Kanauj (Gaur?), who have been identified as the first rulers, were the family of Bhupala. Abu'l Fazl, however, enumerates three dynasties as prior to this family. The first of the Vaidya

BENGAL.

rajas was Sukh Sen, in A.D. 1063. Its last Hindu king was Lakshmanan. He had been placed on the throne in infancy, and during his long reign had been a just and liberal ruler. In A.D. 1203, Bengal was overrun by Bakhtiar, a general of Mahomed Gori, and Lakshmanan escaped to Orissa. From that time till the 18th century, it was held by Mahomedans, sometimes, as from 1199 to 1330, under the Moghul emperor of Hindustan; then for two hundred years independent; and again under the Dehli empire, until treaties entered into by the British with the emperor of Dehli, in 1765, placed Bengal and Behar under the administration of the British East India Company. Orissa was occupied, and in 1854 a Lieutenant-Governor was appointed.

The Mahomedan sovereigns were:—

Bengal was amongst the first of the places of India with which the English East India Company traded. In 1599, an association was formed in London to trade with the East Indies, and on 31st December 1600 they obtained an exclusive charter of privilege, constituting them a body politic and corporate, by the name of 'The Governor and Company of Merchants of London trading to the East Indies.' In 1613, they were ordered by Jahangir to settle in Surat. In 1634, Shah Jahan issued a firman for two English factories to settle in Bengal; and subsequently, in gratitude for the benefits derived by one of the ladies of the zenana of Prince Shuja from the medical skill of Mr. Boughton, Shah Jahan granted the privilege to the English of free trade in Bengal. The first factory of the company had been at Masulipatam, but in 1625 it was removed to Armegon, and subsequently (1639) Mr. Day removed it to a village in the territory of the raja of Chandragiri, and erected a factory there, which was first called Fort St. George, and is known now as Madras. The regular connection of the Company with Bengal, however, did not commence until 1642, when a factory was established at Balasore, and in 1652 permission was obtained for unlimited trade without payment of customs dues, on an annual payment of Rs. 3000. In 1661, Charles II. granted a new charter, vesting the Company with power to make peace and war, and to send to England unlicensed traders; but a fresh charter issued in 1693 limited the Company's powers to twenty-one years. In 1698, a rival company was formed, called the new or English Company; but in 1702 this amalgamated with the old or London Company, and the two parties styled themselves the United Company of Merchants trading to the East Indies. During the administration of Shaiasta Khan, subadar of Bengal, the English were subjected to much oppression. Shaiasta Khan exacted a duty of 3½ per cent. on their merchandise, and his officers arbitrarily extorted large sums from the factors, till, in 1685, it was resolved to seek redress by force of arms. The hostilities of the English exasperated the Emperor Aurangzeb, who ordered that they should be expelled from his dominions. The Company's factories were seized, and their affairs were brought to the brink of ruin, when negotiations for peace were set on foot, and a reconciliation was effected.

In 1698, the English obtained permission from Azim-us-Shan, grandson of Aurangzeb, and governor of Bengal, to purchase the towns of Chuttawutty, Govindpur, and Calcutta.

In 1756, Suraj-ud-Dowla became subadar of Bengal. He had previously manifested aversion to the British, and the Governor of Calcutta having refused to deliver up one of the principal officers of finance under the Nawāb's late uncle, the Governor of Dacca, whom the Nawāb had resolved to plunder, Suraj-ud-Dowla attacked and captured Calcutta on 5th August. One hundred and forty-six British fell into his hands, and were thrust into a guard-room, since called the 'Black Hole,' where all, save twenty-three, perished in the night. On 2d January 1757, Calcutta was retaken by a force which had been despatched from Madras under Clive and Admiral Watson, and on the 4th of February the Nawāb's army was surprised and defeated by Clive. Overtures were then made by the Nawāb, and on 9th February 1757 a treaty was concluded, by which the Nawāb agreed not to molest the Company in the enjoyment of their privileges; to permit all goods belonging to the Company to pass freely by land or water without paying any duties or fees; to restore the factories and plundered property; to permit the Company to fortify Calcutta, and to establish a mint. Three days afterwards, a contract with the Nawāb, offensive and defensive, was signed. War having broken out between France and Great Britain, Clive attacked the settlement of Chandernagore, on which Suraj-ud-Dowla furnished the French with arms and money, and was preparing to make common cause against the British. At this juncture a confederacy was formed among Suraj-ud-Dowla's chief officers to depose him. The British joined this confederacy, and concluded a treaty with Mir Jafar Ali Khan, and at the battle of Plassey, which was fought on the 23d June 1757, the power of Suraj-ud-Dowla was completely broken, and on the 29th June, Jafar Ali was installed by Clive as subadar of Bengal.

In 1759, the Shahzada, afterwards Shah Alam, in consequence of some dispute with his father, the emperor Alamgir II., fled from Dehli, and entered into a league with the subadars of Oudh and Allahabad for the conquest of the Lower Provinces. The prince advanced into Behar with about 40,000 men, and laid siege to Patna. Mir Jafar was greatly alarmed by the prince's advance, and at his solicitation Clive marched with all the force he could assemble to the relief of Patna; but ere he reached that place, the prince's army had almost entirely dispersed. On Clive's return, the nawab Mir Jafar granted him as a jaghir, the quit-rent, about three lakhs per annum, which the Company had agreed to pay for the zamindari of Calcutta.

To meet his pecuniary engagements, Mir Jafar

had recourse to the severest exactions. He resigned himself to unworthy favourites; and it became necessary to depose him in favour of his son-in-law, Mir Kasim Ali Khan, with whom a treaty was concluded on 27th September 1760, by which the British obtained possession of Bardwan, Midnapur, and Chittagong. But serious disputes arose between Mir Kasim and the British regarding the right of the servants of the Company to trade, and to have their goods passed free of duty, which led at last to war. In 1764, Mir Jafar Ali agreed, in addition to the sums for which he had contracted in the recent treaty, to pay five lakhs a month towards the expense of the war then being carried on against the Wazīr of Oudh, so long as it lasted. Mir Jafar died in January 1765, and was succeeded by his son, Najam-ud-Dowla, with whom a new treaty was formed, by which the Company took the military defence of the country entirely into its own hands, and, among other conditions, the Nawāb bound himself to appoint, by the advice of the Governor and Council, a deputy to conduct the government, and not to be removed without the consent of the Council.

Najam-ud-Dowla died on 8th May 1766, and was succeeded by his brother, Syf-ud-Dowla, a youth of sixteen. Syf-ud-Dowla was succeeded in 1770 by his brother, Mubarak-ud-Dowla, with whom a new engagement was made. By this engagement the Nawāb's stipend was fixed at 31,81,991 rupees. This is the last treaty which was formed with the Nawāb. The office of subadar had now become merely a nominal one, all real power having passed into the hands of the British. In 1772, the stipend was reduced to sixteen lakhs a year, at which rate it is paid to this day.

Bengal was declared to be the chief presidency on the 16th June 1773. By the treaty of 22d February 1845 with Denmark, the British Government obtained possession of Serampore; and now, excepting the small settlement of the French nation at Chandernagore of 3 square miles, all Bengal is under British supremacy. But in 1876 there were in Bengal 150,000 estates on the roll, besides a vast number of petty revenue-free estates.

Bengal proper has an area of 84,198 square miles, with a population of 36,564,708, or 433 to the square mile. For administrative and revenue purposes it is arranged into 28 districts, viz.:—Bakarganj, Bankura, Bardwan, Birbhum, Bogra, Calcutta, Chittagong, Chittagong Hill Tracts, and Hill Tipperah State, Dacca, Darjiling, Dinajpur, Faridpur, Hugli, with Howrah, Jalpagori, Jessore, Kuch Behar, Maimansinh, Maldah, Midnapur, Murshidabad, Nadiya, Noakhali, Pabna, Rajashahi, Rangpur, Sylhet, Tipperah, and the Twenty-four Parganas.

The Hindus of Aryan descent are about 2½ millions; the aboriginal tribes, 387,157; and semi-Hinduized aborigines, 5,110,989 souls, are—

Baidya,	68,353	Chandal,	1,620,545
Kayasths,	1,160,478	Goalee,	625,163
Rajputs,	117,508	Jalya,	361,917
Brahmans,	1,100,105	Kaibartha,	2,000,000
Baniya and Ganda Baniya,	127,178	Kamar, blacksmiths,	250,285
Bagdi,	680,278	Kumhar, potters,	281,758
Baori,	199,968	Poda,	293,121
Chamar and Muchi,	393,490	Rajbansi (739,886), with Pali of Dinajpur and Maldah, and Koch of Rangpur,	1,000,000
Sad-gop,	630,000	Santal,	139,761
Sunri, vintners,	430,582	Teli, Tili, Kalu,	572,659
Tuar,	331,661	Vaishnav,	428,000
Weavers,	963,176		

The Kaibartha and the Sad-gop are the chief cultivators. The languages spoken are Bengali, Urdu, and English.

Behar has an area of 42,417 square miles, with a population of 19,736,101, or 465 to the square mile. For administrative purposes it is arranged into ten districts,—Bhagalpur, Champaran, Gaya, Monghir, Patna, Purniah, Santal Parganas, Saran, Shahabad, and Tirhut. The more important of its castes and tribes are—

Brahmans,	853,662	Musahar,	426,908
Rajputs,	1,013,676	Ahir or Goala,	?
Koeri,	985,538	Babhan,	1,001,369
Kurmi,	650,839	Kayasth,	208,935
Santal,	485,948	Dosadh,	893,989
Chamar or Muchi,	711,721	Pasi,	122,520
Bhuiya,	214,742		

Orissa has an area of 23,901 square miles, with a population of 4,317,999, or 181 to the square mile. Its four districts are Balasore, Cuttack, Puri, and Tributary States, and its principal castes and tribes—

Brahmans,	359,799	Hindu descent,	71,315
Karan, Kayasths,	123,434	Mahomedans,	74,466
Chasa,	808,515	Gaur or Goala,	225,533
Aboriginal tribes,	367,308	Khandait,	447,688
Semi-Hinduized ,,	572,595	Santal,	77,727
Hindus,	3,231,799		

The *Chutia Nagpur* area is 43,901 square miles, and its population 3,825,571, or 87 to the square mile. Its five districts are, Hazaribagh, Lohardagga, Manbhum, Singbhum, and Tributary States. Its population chiefly consists of—

Hindus,	1,750,000	Mundah,	190,095
Aborigines, viz. Kol,	1,250,000 292,039	Dhangar or Uraon,	208,343
Santal,	220,096		

The Mahomedans in Bengal in 1871 numbered 19,553,831; but this multitude is composed of many elements, masses of the aboriginal races as well as of the Hindus of Aryan descent having been forcibly compelled to profess the Musalman creed. Of that number, sixteen and a half millions are in Bengal proper; two and a half millions in Behar. In Chutia Nagpur and in Orissa they are few; but in the Bogra district they form 80 per cent. of the population; in Rajashahi, 77 per cent.; and in Pabna, 69 per cent. In the districts of Chittagong and Noakhali they form three-fourths of the population. Wherever they form a principal part of the population, they are the cultivating classes; and all the sailors of the eastern districts are Mahomedans. The Europeans and non-Asiatics are 17,135; and Eurasians, 20,279.

The Hindu population of Bengal are dark; and some are very dark, and have thick lips, with features either aboriginal or Indo-Chinese. Some have curly hair, as if related to the black, woolly-headed aborigines, who may have stretched across from the Rajmahal to the Garo hills; others of the Bengal people, especially the Urya, with the Bhuya, seem rather to have straight hair, with high cheek-bones, and complexions not very dark, suggesting an Indo-Chinese element stretching from Burma across the Sunderbuns (*C.* p. 106). Though good-looking, the mass of the Bengali are small and effeminate in appearance, remarkable

for timidity and superstition, as well as for subtlety and art. Their villages are composed of thatched cottages, scattered through woods of bamboos or of palms; their dress is the old Hindu one, formed by one scarf round the middle, and another thrown over the shoulders. They have the practice, unknown in Hindustan, of rubbing their limbs with oil after bathing, which gives their skins a sleek and glossy appearance, and protects them from the effect of their damp climate. During many ages the Bengali had been trampled upon by men of bolder and more hardy breeds. Courage, independence, and veracity are qualities to which his constitution and his situation are equally unfavourable. His mind is weak, even to helplessness, for purposes of manly resistance; but its suppleness and its tact move the children of sterner climates to admiration, not unmingled with contempt. Large promises, smooth excuses, elaborate tissues of circumstantial falsehoods, chicanery, perjury, forgery, are the various weapons offensive and defensive of the lower Ganges. All its millions do not furnish one sepoy to the native army. In Bengal and Behar, the work of labourers is done by Bhui, Rajwar, Chandal, Dosad, Hari, Bhumali, and other aboriginal tribes.—*C.* 124.

When the Aryans advanced from the westward to the plain of Bengal, it appears to have been occupied by a race of which the present non-Tibetan tribes of Assam and the Himalayan and Vindhyan range are remnants. The Bengalis, however, have never been wholly absorbed by the intruding race, though somewhat modified. In Silhet and Assam, in particular, the Bengalis retain the stamp of the double origin, and considerable numbers of the original race are still found intermixed. The principal remnant are the Koch'h; but there are also the Kachari (Bodo, Boro, or Mech), Dhimal, Raba, Hajong, Batar or Bor Kebrat, Polloh, Gangai, Maraha, Dhanuk. They are spread eastwards along the skirts of the mountains of Bhutan and Sikkim as far as Aliganj, and the skirts and low valleys of the sub-Himalaya, beyond Sikkim, contain other tribes of the same race. Including these already enumerated, Mr. Hodgson ascertained the presence of twenty-eight tribes between Assam and Kumaon, or from the Bonash to the Kali. Of these the most numerous were the Bodo or Kachari. The Koch'h and Bodo or Kachari tribes, of all the prior races, were the latest dominant ones of the Gangetic race in Bengal.

The agricultural products are rice, wheat, barley, maize, pulses of kinds, mustard, turnips, plantains, radishes, cucurbitaceous plants, Lagenaria, Luffa, Trichosanthes anguina, species of arum, sweet potatoes, capsicum, sugar-cane, ginger, turmeric, Piper betel, Areca catechu, tobacco, linseed, opium, indigo, jute, tea, silk. Rice has three harvests in one year, viz., boro or spring rice, in low marshy land, sown in October and reaped in May; aus or autumn rice, sown on high ground in April or May, and reaped in August and September; aman or winter crop, the last, is grown on low land, and is by far the largest crop. It is sown in May or June, transplanted and reaped in November, December, and January. Rice is the principal, often the sole, article of food throughout Bengal proper; pulses, vegetables, spices, oil, salt fish, and condiments being only used as a relish. The consumption varies from two-thirds to three-fourths of a seer per head per diem= 1¼ to 1½ lbs. In the mountainous districts the pulses and millets are the chief articles of diet.

Bengal suffered in the year 1770 from famine, more widespread and terrible than any which has ever befallen any other British possession, and which Colonel Baird Smith deemed to have been the most intense that India ever experienced. Dr. Hunter states the number of deaths on that occasion at ten millions.

Bengali is a highly cultivated language of Hindi origin, largely stocked with pure Sanskrit words. It is spoken throughout Bengal proper. Tirhuti on its N.E. border has a great affinity with Bengali. Bengali is the language of many millions of souls, and restricted solely to the geographical limits of Bengal, and from the cultivation which has been given to it, well deserves to be ranked as a separate language. It is spoken by about forty millions of people in the delta of the Ganges and to the west. Professor Müller mentions that nine-tenths of the Bengali and of the Hindi tongues are composed of words taken from the Sanskrit. He regards it as the modern Sanskrit, standing to its parent, the old and classical Sanskrit, almost in the same relation as the modern High German to the old High German, as the modern Italian to the language of Rome. See India.

BENGAL, several plants, fruits, and animals, with which the British first became acquainted in Bengal, have the name of that province as a prefix.

Bengal almond, Terminalia catappa.
Bengal cat, Felis leopardus Bengalensis, *Desm.*
Bengal currants, fruit of Carissa carandas.
Bengal fig tree, Ficus Bengalensis.
Bengal Florikin, Sypheotides Bengalensis, *Gmel.*
Bengal gram, also chick-pea, Cicer arietinum.
Bengal madder, Rubia cordifolia.
Bengal langur, Presbytis entellus.
Bengal monkey, Inuus rhesus, *Jerdon.*
Bengal porcupine, Hystrix Bengalensis, *Blyth.*
Bengal quince, Ægle marmelos.
Bengal root, root of Zingiber casumunar.

Bengal army is the political designation of that part of the military forces of the British Indian Empire, occupying Bengal, Assam, Arakan, the N.W. Provinces, with Oudh and the Panjab. It is distributed amongst races speaking the Persian, Pushtu, Panjabi, Hindustani, Hindi, and Bengali languages, besides the Oorya language in Orissa, and the Rakhooi in Arakan. It is composed of Europeans of the United Kingdom and of the natives of N. and N.W. India; Hindus of high caste, Hindus of low caste; Mahomedans from Hindustan, from the Panjab; and Pathans or Afghans from beyond the N.W. borders; also Sikhs, Rajputs, Gurkha, and Dogra. A revolt of the Bengal native army was commenced at Berhampore by the 19th Ben. N. I. on the 26th February 1857, and it was reorganized on the 9th September 1859. See Army.

BENGAL, Bay of. This great bay lies between the Peninsulas of India and Malacca. It receives many great rivers,—the Ganges, Brahmaputra, Irawadi, Sitang, Salwin, Moulmein river, Godavery, Krishna, Koladyn, Mahanadi, and has a coast line of about 2800 miles. Pliny does not make mention of any voyages of the Romans to the Gulf of Bengal or to the Malay Peninsula, although it is clear from Strabo, who wrote before Pliny, that the Ganges had been sailed up as high as Pali-

brotha. Ptolemy's Geography, said to have been composed about 60 years after Pliny, mentions the diamonds found on the banks of the Mahanadi or Sumbulpore river; also speaks of Arcati, the capital of the Soræ (or Sora-mandalum, from whence corruptly Coromandel), Mesolia, the district which contains Masulipatam; the river Cauvery, under the name of Chabaris. Ptolemy scatters islands over the Bay of Bengal, probably meant for the Andaman and Nicobar Islands, and mentions that most of them were said to be inhabited by anthropophagi, an idea continued by modern navigators. The Bay of Bengal is liable to be swept by hurricanes, which travel quite across the bay. Every few years there occur severe cyclones and advancing storm-waves. Of the latter, that of 1832, which swept over the islands of the delta up to Saugur, was attended with great loss of life; as also was a cyclone in 1859, another in 1864, with a storm-wave which submerged islands, and rushed along the coast in the vicinity of Masulipatam; and another in 1876.—*Rennell's Memoir*, p. 39.

BENGALI-SAN. HIND. This is identical with the Saka solar year. See Era; Fasli.

BENGAN. HIND. Solanum melongena, the egg-plant. Valayati bengan is the tomato.

BENGAN, a mountainous district in Mindoro, occupied by a Negrito race.

BENI. ARAB. When the Bedouin Arabs speak of tribes, they say Beni, which signifies the sons of some person; thus Beni Leghat means the tribe of Leghat. The word is ibn, a son, and is written bin when preceded by a proper name, and followed by the name of the father, as Hasan bin Muhammad, Hasan son of Muhammad.

BENINCASA CERIFERA. *Savi.* Gourd.

The Seeds.

Peh-kwa-tsze, . . CHIN.	Maghz - i - kaddu, Kunda, . . . PERS.

This is one of the Cucurbitaceæ. It has large white flowers. The rind of the fruit is used as a bottle. The fruit of one variety of it forms the sounding body of the sitar; and that of another variety is used as floats for swimming rivers. Its young fruit is eaten by the people in their curries, and is often candied. The fruit is remarkable for having its surface, when ripe, covered with a white waxy exudation, which smells like rosin. Chinese gardeners make its fruit grow to a great size. In India, the tallow gourd is presented to a Hindu wedded pair. A wild variety, Teta-laoo, BENG., is poisonous.—*Williams; Voigt; Roxb.; Stewart.* See Cucurbitaceæ; Gourds.

Benjamin is a word of Hebrew origin, which has in the lapse of time been adopted for several substances now in use. In Upper India, it is the name given to the gum-resin of Boswellia thurifera, but in commerce it is generally applied to the resin of the Styrax benzoin, which grows in Siam and Java, in Sumatra, in the country of the Batak race, and in Borneo on the northern coast of the Brunai territory. The balsam is obtained, in Sumatra, by incision in the trunk of the tree, practised after it has attained the age of five to seven years. The juice which first exudes is the purest and most fragrant; it hardens on exposure to the air, and becomes brittle and semi-transparent. The resin is white and transparent at first. About 3 lbs. are given by each tree for six years. The white benjamin, termed 'Cowrie luban' in India, is a superior kind, generally met with in the form of dry, hard, grey masses, rather shining, brittle, formed of ovoid, whitish tears, like stripped almonds. The best comes to India from Sumatra. It is much used as a perfume, and as incense in places of worship, in the composition of frankincense, and in the manufacture of the pastilles called ud-batti. Benzoic acid is procured from this substance.—*Stat. of Com.; M'Culloch's Dictionary; Crawfurd, Dict.; Cat. Exhib. of* 1862; *Ainslie; Marsden's Sumatra*, 155–56; *O'Sh.* 430. See Benzoin; Resins; Styrax benzoin.

BENJAMIN, the Jewish traveller, Rabbi Benjamin of Tudela, travelled in the East between 1159 and 1173, when already the empire of the Abbasside Khalifs was rapidly declining, and the Turks were gaining the ascendency at Baghdad. He would appear not to have proceeded beyond Kish island. He describes it as the great emporium to which Indian merchants brought their commodities, and the traders of Mesopotamia, Yemen, and Persia, all sorts of silk and purple cloths, flax, cotton, hemp, wheat, barley, millet, etc., which form articles of exchange. He refers to the pearls of the Bahrein islands, and to the pepper, cinnamon, ginger, and many other spices of S. India. He places the island of Kandy at 22 days beyond Kish, and China 40 days beyond Kandy.

BENJAPATSJA. MALEAL. Tiaridium Indicum.

BENKAR. HIND. Hiptage madablota.

BENKATAN, a tribe on the E. coast of Borneo.

BENNETT. In 1851, J. W. Bennett published a Selection of Rare and Curious Fishes found on the coast of Ceylon. Bennet, F. D., author of A Whaling Voyage round the Globe. Bennet, George, author of Wanderings in New South Wales, Batavia, Pedir coast, Singapore, and China; also Gatherings of a Naturalist in Australasia, London 1860.

BENOUDHA, the country between Allahabad and Surwur, the present country of Gorakhpur.

BEN-TEAK, Lagerstræmia microcarpa.

Ven-taku, . . . CAN.	Nana, ... MAHR.
Bandara, . . . MAHR.	Bellinger, . . MALEAL.

This tree is common in the Wynad and on the Western Ghats; wood prized for making coffee cases, and much used by the native carpenters for house-building and masts for dow, pattamah, and other country vessels. It grows 90 and 100 feet long, and from 12 inches to 3 feet in diameter; it is perfectly straight, and without branches, excepting at its top; the leaves are small and very thick. This wood is not so durable as the poon; it is very much lighter in colour, and in this respect much resembles the American red oak.—*Edye, M. and C.; M'Ivor.*

BENT GRASS, species of Agrostis.

BENTHAM, a Bengal civil servant, who largely extended the knowledge of the botany of India. He published many memoirs on botanical subjects, also the Florula of Hong-Kong, and monographs of Scrophularinæ and Labiatæ.—*And.*

BENTHAMIA FRAGIFERA, the Thurnel of the Panjab, is found in Nepal and in the Sutlej valley between Rampur and Sungnan, at an elevation of 6000 feet. The wood is small; fruit is large, of the shape of a strawberry, edible, and is used as a preserve. B. floribunda extends from the eastern Himalaya to the Sutlej.—*H. et Thom.* 105, 193; *Cleghorn, Report*, 64; *Hogg, Veg. King.* p. 367; *Powell, Panjab Products.*

BENTINCK, LORD WILLIAM, G.C.B., an officer of the British army who was governor of Fort St. George, Madras, from the 30th August 1803 to the 11th September 1807. He was subsequently in military employ in Spain during Great Britain's war with France. On the 4th July 1828 he assumed the office of Governor-General, which he held until the 20th March 1835. He afterwards entered the Commons House of Parliament for the town of Glasgow, and died 17th June 1839. During his administration as Governor-General, he appointed Captain Sleeman for the suppression of thugi; sati, also, the self-immolation of Hindu women with the dead bodies of their husbands, was prohibited. Education was fostered, many English schools established; there was laid the foundation for the extensive employment of natives in the administration of justice; and in his time, also, a Legislative Council was established at each presidency. The only war that occurred was against the raja of Coorg, who by his insane-like atrocities drew upon himself the arms of British India.

BEN TREE. In India, the Moringa pterygosperma; in Egypt, M. aptera.

Ben Nut Oil.

Morunghy yennai,	TAM.	Sahujna, ...	HIND.
Morunga noona, .	TEL.		

This oil is the product of the nuts of the Moringa aptera. It is valuable on account of the lengthened period which it may be kept without contracting rancidity. In the West Indies the oil is used for salad oil. It is employed by watchmakers, and for retaining the aroma of delicate flowers. The oil is inodorous, and is therefore used by perfumers in the manufacture of scented oils. The seed of M. pterygosperma also yield an oil. M. pterygosperma is common in all parts of S. Asia; the flowers, leaves, and fruit are eaten by the natives; and the rasped root is used by Europeans as a substitute for horse-radish, to which circumstance it owes its common name of 'horse-radish tree.'—*Mason; Faulkner; Hogg.*

BENTUL. MALAY. A vegetable of Bawean.

BENU MASH. PERS. Phaseolus max.

BENZA, P. M., a native of the Ionian Islands, a Madras medical officer. He wrote on the geology of the country betwixt Madras and Neilgherries, via Bangalore; also on the geology of the Neilgherry and Koonda mountains, and notes on the geology of the Northern Circars in 1835.—*Buist's Catalogue.*

BENZOIN, Liquid.

Ngan-sih-yu, . .	CHIN.	Shwui-ngan-sih-hiang,	CH.

An oil, like treacle, sold in China in small bottles or in the pericarp of a fruit. It resembles balsam of Peru.—*Smith.* See Benjamin.

BEO. HIND. Gracula religiosa.

BEOHAR, Bepar. HIND. Money-lending, traffic, trade. Bepari, a shopkeeper.

BEP-THAN. BURM. In Amherst, a timber used for making handles for spears and swords; it is a superior wood, and looks like white Jarrool. A timber of same name in Tavoy is used for building; and the Bep-won, BURM., of Tavoy is a timber used for building.—*Captain Dance.*

BER. HIND. Amongst Rajputs, a feud.

BER. HIND. Zizyphus flexuosa, jujuba, nummularia and vulgaris.

BERA. HIND. Nima quassioides; also Glochidion, *sp.*; also Ficus Indica.

BERA. HIND. A raft or float, on which is placed a paper or tinsel boat, with the face of a female and the crest and breast of a peacock at the prow. It is set afloat with lights and music on Thursday evenings, on the rivers of Bengal, by Mahomedans, in honour of Khajah Khizr. The last Thursday of the month Bhadon (August—September) it is deemed particularly acceptable as an offering in fulfilment of a vow made in the bygone year.—*W.*

BERA. HIND. A small packet of betel-nut, catechu, quicklime, aniseed, coriander seed, cardamums and cloves, wrapped up in betel leaf. It is a masticatory used on ordinary occasions, but is also presented as a ceremonial part of a visit either to Hindus or Mahomedans.

BERAD. MAHR. A predatory tribe in the south Mahratta country, inhabiting the hills and thickets, and subsisting by chase and plunder. Wilson says they are the same as the Ramusi, but this does not seem correct. They may be the Bedar.—*Wilson's Glossary.*

BERAM. MALAY. Elephant. Beram rambut, hair of the elephant's tail.

BERAR, a province in the northern and central part of the Peninsula of India which belongs to the Hyderabad state, but was assigned by the Nizam to the Government of India to meet the pay of the Hyderabad Contingent, subject to the condition that the surplus revenue shall be paid to Hyderabad. The province is administered by a Commissioner, under the Resident of Hyderabad. It is in a broad valley lying between the Satpura range on the north and the Ajunta range on the south. It has several large towns, Akola, Akote, Amravati, Ellichpur, and others; and its population in 1867 was 2,231,565 souls in an area of 17,728 square miles. The first inroad of Mahomedans into the Dekhan was led through Berar by Ala-ud-Din, A.D. 1294; and several dynasties, the Bahmani, the Imad Shahi, the Nizam Shahi, the Mahratta Peshwas, the Dehli empire, and the Asof Jahi of Hyderabad have since held it. In 1867 the principal creeds and castes were :—

Christians, . . .	903	Vaisya, . . .	28,018
Jews, ...	16	Sudra, . . .	1,441,271
Parsees, ...	75	Out-castes, . .	301,379

		Julnee, ...	2
		Monghey, ...	332
		Madgi, ...	1,718
		Paradhi, ...	5,268
Kalanki, ...	46		

The *Kshatriya* pretend to Rajput descent. Mahrattas of no particular family usually call themselves Thakur; even a Kunbi will occasionally try to elevate himself thereby; while the Purbho, Kayasth, and other castes of mixed origin and good social status are constantly invading the Kshatriya military order. The distinction is also claimed by the rajas of the Satpura hills, who assert that they are Rajputs depressed by the necessities of mountain life, whereas they are Gond or Kurku elevated by generations of highland chieftainship.

Under the heading *Vaisya* are placed all the commercial classes of Hindus, the north-country Marwari and Agurwalla, with those who are known by the general term Baniya, and a few castes like the Komati from the south, or the Lar, who do not seem to be well known out of Berar.

The *Sudra* caste in Berar, as in Mysore, all eat together, although they do not intermarry. The Kunbi and Mali eat flesh, drink liquor moderately; and their widows may always remarry if they choose, excepting the widows of Deshmukhs, who adopt high caste prejudices. The *Koshti* is a weaving caste. The *Banjara* were comparatively numerous in Berar; their occupation as carriers is rapidly going, and during their transitional stage they give a good deal of trouble to the police. The *Bhui* has recently been supposed to belong to a widely-spread primitive tribe; the *Garpugari* live by the profession of conjuring away hailstorms. The *Vidur* and *Krishnapakshi* are the same. They are descendants of Brahmans by women of inferior caste, and Krishnapakshi is only an astronomical metaphor for describing a half-breed, the term meaning literally 'dark-fortnight,' and referring to the half-darkened orb of the moon. All the Sudras of this part of India are of non-Aryan origin. The *Mhar* have been taken to be the same with the Dher, a very useful and active tribe. The *Mang* appear to be the lowest in the social scale; they are tanners, curriers, shoemakers. The paucity of the *Khakrob* or *Bhangi*, who are so numerous in Northern India, is a serious sanitary difficulty. The *Kaikari* are a tribe formerly well known for their thieving habits. The *Ramusi*, a predatory race, speak Telugu in their families, and are doubtless from Telingana. The original *Purdhan* among the Gond answered to the Bhat among the Hindus, but many seem to have settled in the plains as a separate class of Gond.

The *Kunbi*, in Berar, allot themselves into eleven classes:—Mali, Ful Mali, Jerat Mali, Haldi Mali, Wanjari, Gantadi, Sagar, Atole, Telale, Vindesa, Pazni.

With the exception of the Haldi Mali and Pazni, they have roti vya whar amongst each other, but not beti vya whar, *i.e.* they eat with each other, but do not intermarry. The Kunbi and Mali alone, of the Sudra people, are 834,588 souls.

The *Dhangar* sheep farmer race are of two sections, the Kota Pullia Dhangar, who keep sheep, and the Barji Hatkar, or 'shepherds with the spears.' The latter still hold much land on the borders of the Nizam's territory, and, until the British domination, were notorious for pugnacity and rebellion, and they still continue a quarrelsome and obstinate race. They are supposed to have come from Hindustan in twelve tribes, and been impelled by the Gonds towards Hingoli and Bassim, which locality got the name of Barah Hatia, or the twelve tribes. They now occupy the hills on the north bank of the Pyn Ganga. To die in the chase or in war is deemed honourable, and the Hatkar who are so killed are burned. The Hatkar are fine able-bodied men, independent and arrogant; many of them never shave or cut the hair of their face.

The *Bhui* are in number 17,980.

The *Banjara*, 51,982, most of whom belong to the Bhukyava tribe, supposed to have been Rajputs from Central India.

The *Aboriginal* races in Berar, 163,059 in number, are as under:—

Gond, ...	68,542	Andh, ...	28,037
Bhil, ...	2,279	Nihal, ...	2,591
Ramusi, ...	7	Korku, ...	28,709
Koli, ...	21,224	Kurki, ...	8
Arakh, ...	384	Kolam, ...	9,969
Lajar, ...	1,309		

Of the aborigines, the *Gond*, *Kurku*, and *Bhil* are the only completely preserved specimens of tribes. The two first retain their languages, while the *Bhil* tongue seems to have become extinct very recently in Berar, its disuse being probably expedited by their general conversion to Mahomedanism.

The *Gond* of Berar inhabit the Melghat and a strip of wild country along the Wardha river. They arrange themselves into thirteen sections, viz.:—

Manes.	Kahilwar.	Jaduwar.	Khatulia.
Gowari.	Thotli.	Kohalin.	Thakur.
Rajgond.	Pardhan.	And.	Buchadi.
Dalwe.			

The men and women of the Gond never associate at work, but labour apart. A Gond desirous of having a wife, and having resolved on a particular girl, takes with him a band of his comrades to the field where the women are at work, and he suddenly, alone, runs towards and attempts to capture her. His comrades will not, however, aid him to carry off the girl, unless he succeed in touching her hand before she reach the village shelter. By touching the girl's hand, the marriage contract is sealed, and cannot be broken; nevertheless the women often fight every inch of the ground, inflict the most serious hurt, and sometimes shameful defeats, continuing the contest even after the bridegroom has touched the bride's hand, and, if the village skirts be reached, the men turn out to aid the women, and pursue the attacking party back to their own village.

The *Bhil* of Berar occupy the eastern slopes of the Gawilghur range to its western extremity, and stretch far westwards in Kandesh. They belong to the Turvi clan; all now are Mahomedans.

The *Koli* are in two distinct tribes, but they are agricultural, and there are several substantial potails amongst them.

The *Andh* are also called Pradhan, and are said to be helot Gond; but they are cultivators, and do not eat animals that die.

The *Kolam* are a Gond tribe who have settled to agriculture.

The *Lajar* are woodcutters in the Satpura range.

The *Nihal* are a helot class among the Gonds.

BER-BAIT, MALAY, means to make Pantuns. A pantun consists of four lines; the two first consist generally of a simile or natural image, and the two last a moral drawn from the simile. The Malays take great delight in listening to two poetical champions pantuning at each other, till one is obliged to give in from want of further matter.—*Journ. in Arch.* v.

BERBER, a race occupying the northern parts of Africa. In the Berber group of languages, all that is not Arabic in the kingdom of Morocco, in the French provinces of Algeria, in Tunis, Tripoli, and Fezzan, is Berber. The language also of the ancient Cyrenaica, indeed of the whole country bordering the Mediterranean between Tripoli and Egypt, is Berber. The extinct language of the Canary Isles was Berber; and, finally, the language of the Sahara is Berber. The Berber languages in their present geographical localities are essentially inland tongues.—*Latham, Rep. Br. Ass.*, 1847.

BERBERAH, or Maratha, is described as a subdivision of Abhira; it is the Barbarike of Arrian's Periplus.

BERBEREH, the Mosallyon of the author of the Periplus, is a seaport in Africa, directly south of Aden, in lat. 10° 25′ 45″ N., and long. 46° 6′ E. It was the grand mart of the ancients on this coast, and is still the great outlet for the commerce of north-eastern Africa. It has a large trade in sheep, cattle, ghi, coffee, various gums and resins, and in ostrich feathers. An annual fair is held from October to April, the inhabitants meanwhile living in tents to the number of 20,000, bartering their goods with merchants of Muscat, Bahrein, Bussora, Porebunder, Mandavie, and Bombay, or carrying them over to Aden, where a ready market exists for their produce.—*Horsburgh, Blackwood's Magazine.*

BERBERIS, a genus of plants belonging to the Berberaceæ. The genus has about 60 species in China, Japan, and in India. Amongst them are B. angulosa, aristata, Asiatica, concinna, insignis, lycium, macrosepala, Nepalensis, ulicina, umbellata, vulgaris, Wallichiana, xanthoxylon. Three medicinal substances are obtained from species of this genus, —an extract known as Rusot, a tincture, and Berberine, which is the active principle of these. But it is a troublesome and an expensive process to extract it pure. It is very bitter, yellow, not easily soluble in water, more readily in spirits of wine. In Europe it has been used chiefly as a tonic in indigestion, in doses of one to six grains, but has been given up to ten grains. B. Asiatica and the B. aristata are generally used. It is from the roots of these species that the bark is stripped for making the tincture. B. concinna, *Hook. et Thom.*, B. angulosa, *Wall.*, grows at Ramri and Pindari, 9000–12,500. A small shrub only a foot and a half high, flowers solitary, red fruit, the leaves and stems very spiny. In the Ryott valley in Sikkim, at Laghep, Iris was found by Dr. Hooker abundant, and this small bushy Berberry with oval eatable berries. B. insignis, a plant of the Sikkim Himalaya, forms a large bush with deep green leaves seven inches long, and bunches of yellow flowers. B. Kunawarensis is found in Kunawar, and employed for making Rusot.—*Hooker, Journ.* i. 364, ii. 197; *Ind. Ann. Med. Sci.* 1856, 379; *H. f. et Th.*

BERBERIS ARISTATA. *D.C.* Barberry.

Wood—Dar huld; Dar chob, PERS.
Extract—Haziz-Hindi, AR.; Rusaut; Rusot, HIND.

This plant is widely distributed over the mountains of India, and assumes many various forms, which has led to botanists giving it a host of specific names. It is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 6000 to 10,000 feet; also on the Neilgherry and Pulney hills at from 6000 to 7000 feet, and at Newera Elia in Ceylon. The berries are much esteemed in the countries where they grow for their agreeable acid flavour. A yellow dye is obtained from the root.—*Cleghorn, Panjab Report; Ind. Ann. Med. Science.*

BERBERIS LYCIUM. *Royle.* Barberry.

Kau-ki, ... CHIN.	Chitra, ... HIND.
Raisin Berberry, . ENG.	Kashmal; Sumlu, . ,,
Ophthalmic, ,, . . ,,	Sambal, ... ,,

The root—Ti-kuh-pi, . . CHIN.

This is found on the Himalaya at 3000 to 9000 feet, at Masuri and Kaghan, but not west of Hazara. It is considered by Dr. Royle to be the Lycium of Dioscorides; its fruit is dried for currants. 'Zirishk tursh' and its yellow-juiced root and wood yield the extract called ras, rasaut, rasot, or raswat, used as an external application in ophthalmia. It is likewise considered an extremely valuable febrifuge. It is prepared by digesting in water sliced pieces of the root, stem, and branches in an iron vessel, boiling for some time, straining, and then evaporating to a proper consistence. It is principally manufactured at Nepal and the Doon; sold at 8 annas the seer. Wood too small to be of much use, except for firewood. —*Powell; Cleghorn, Panj. Rep.; Hook. et Thom.*

BERBERIS NEPALENSIS. *Spr.*

Ber. miccia, *Ham.*	Ber. pinnata, *Roxb.*
,, acanthifolia, *Wall.*	Mahonia Nepalensis, *D.C.*
,, leschenaultii, ,,	Ilex japonica, *Thunb.*

This shrub is found on the Neilgherry, Pulney, and Travancore hills, at an elevation of from 5000 to 8000 feet. It is also on the Himalaya, Bhotan, Garhwal, and Khassya mountains. The wood is small, and of little use. See Dyes.

BERBERIS SINENSIS, *Smith*, the Kau-kih of the Chinese. This and B. aquifolium furnish the drug of China called Kau-kih and Tu-kuh-pi. This is a plant of northern China; berries of a dark purple.—*Drury; Smith.*

BERBIANG. KYAN. Brother-making. See Brother; Ber; Sahibah.

BERCHEMIA FLORIBUNDA. *Wall.* The Zizyphus floribundus, *Wall.*, is a plant of the

Khassya hills, Nepal, and Kamaon. The fruit of a Panjab species is eaten by goats and men. B. aculeatus is common in the Holy Land, and called Christ's thorn, from the tradition that the platted crown of thorns was made of its twigs.—*Voigt.*

BERDA. MAHR. Terminalia bellerica.

BERDURANI, a tribe of Afghans on the north-eastern part of Afghanistan, occupying the lower course of the Kābul river, and the parts between the Indus, the Hindu Kush, and the Salt Range, touching the Ghilzai on the west, the Siahposh on the north, and the people of India on the east, the Indus being their boundary; but Peshawur is a Berdurani town. They were once a great tribe, but were removed from eastern Afghanistan to Herat by Nadir Shah.—*Papers, East India, Cabul, and Afghanistan*, p. 133.

BEREKEDE, a branch of the Asir tribe of Arabs, said to lend their wives, like the Jakuri Hazara.—*Sale's Koran.* See Polyandry.

BERENICE, a seaport established by the Ptolemys on the Red Sea, from whence goods brought from the east were conveyed by caravans 255 miles to Coptis on the Nile, and thence to Alexandria. The entire distance from Coptis to Berenice occupied twelve days. The ruins of Berenice were discovered by Captains Moresby and Carless at the bottom of the inlet known as the Sinus Immundus or Foul Bay.—*Ind. in 15th Cent.* See Saba.

BERFA. HIND. Populus balsamifera.

BERGAMOT, also Bergamotte, a name of the lime tree, Citrus limetta; also of the small pear-shaped fruit of the tree, and also of an essential oil obtained from the rind of the fruit. To prepare this oil, rasp the rind, express the raspings between flat porcelain slabs, allow the oil to settle, and then filter. The exquisite flavour of this oil is injured by distillation. It is used chiefly as a perfume; colour yellow; sp. gr. 0·888; freezes at 32°. More than 22,000 lbs. of this essence was imported into England in 1848.—*Beng. Phar.* p. 378; *Simmonds*, p. 566; *Hogg*, p. 140.

BERGERA KONIGII. *L.* Curry leaf tree.

Murraya Konigii, *Spreng.*

Karia-phalee, . . BENG.	Kareyapela, . MALEAL.
Karripak-ka-jhar, HIND.	Kristna nimbu, SANSK.
Kudia nim, . . ,,	Kara-pinchee-gass, SINGH.
Gandla, Gardala, . KANG.	Kari-vepelli maram, TAM.
Barsanga, . . MALEAL.	Karivepa, . . . TEL.
Kare-bepon, . . ,,	

A tolerably-sized tree, common throughout British India and Ceylon. It is cultivated generally in gardens for its pinnate-shaped leaves, which retain their fragrance when dry, and are used to flavour curries, mulligatawny, chutnies, etc., and are mixed in the curry pastes and powders prepared in India for transmission to England and other parts of the world. The mixture of the leaves not only imparts a peculiar flavour to these condiments, but adds a zest to them. It flowers in February and March; fruit of a deep purple colour; wood hard and close-grained. Medicinally, the leaves are considered stomachic and tonic; used raw in dysentery, and when roasted, are administered in cholera, in decoction to stop vomiting, also in fomenting. The bark and root are employed as stimulants.—*Royle.*

BERGERA NITIDA. *Thw.* The Meegong-karapinchee-gass, SINGHALESE, is a moderately-sized tree, not very uncommon in the warmer parts of Ceylon.—*Thw.* i. p. 46.

BERHAMPUR, a municipal town and military station in Ganjam, in lat. 19° 18′ 40″ N., and long. 84° 47′ 50″ E. It stands on a rocky ledge surrounded by an extensive plain, bounded on the W. and N. by a range of hills from 5 to 10 miles distant, and open to the S. and E. The district yields sugar; also silk cloth manufactured from Bengal and Chinese cocoons.

BERHAMPUR, a civil station in the Murshidabad district of Bengal, in lat. 24° 6′ 30″ N., long. 88° 17′ 31″ E., with a population of 27,110. It is built on the left bank of the Bhagirathi river, and is 118 miles from Calcutta. In the beginning of the nineteenth century, General Stewart resided here. He was wont to offer puja to Hindu idols, and to worship the Ganges. Like Job Charnock, he had married a Hinduani. It was here that, on the 25th February, the first overt act of the mutiny of 1857 occurred, in the 19th Regiment Bengal Native Infantry.—*Tr. of a Hindu*, i. pp. 68, 69; *Imp. Gaz.*

BERI, a caste in southern India following trade, and claiming to belong to the original Vaisya section. They also call themselves Chetti, or more correctly Sheti, from the Sanskrit Shreshthi, a merchant. The Beri belong to the left-hand sect, and are distinct from the Komati or Chetti of the right-hand division.—*Wilson's Glossary.*

BERI. HIND. Zizyphus flexuosa; also Z. nummularia.

BERI. HIND. Iron fetters for prisoners or quadrupeds.

BERI. HIND. A basket used to raise water for irrigation, made of leather or bamboo. It is suspended by four ropes, and swung by two men; it has various names in different parts of the country.

BERI, also Bhéri and Rana Bhéri. HIND. Leonotis nepetæfolia, *R. Br.*

BERIA, a robber tribe of Central India.

BERI-BERI, a fatal disease, often attended with swelling and burning in the feet and paralysis; first written on by Dr. J. G. Malcolmson, Madras Medical Service, 1835.—*Dr. Buist's Catalogue.*

BERING. HIND. Nima quassioides.

BERJA or Buroja. HIND. A resin from the Pinus longifolia; is rich in oil of turpentine, yielding 15 to 20 per cent., and since 1860 the natives of Najibabad and Bijnore and of the towns of Murutt and Roorkee, have distilled turpentine from it. The resin brought from the hills is sold at the markets along the foot of the ghats at Rs. 3 to Rs. 4½ per maund. At Najibabad, 19 miles from the hills, the resin sells at Rs. 5 to Rs. 5½ the maund; the turpentine distilled there at 8 to 12 annas the quart bottle; and the residue, after distillation, called soondrus, is sold on the spot for Rs. 3 the maund. This soondrus is the unrectified rosin of commerce, and is technically known as Colophane. The resin is collected by cutting triangular notches in the trees, leaving a hollowed-out space at its foot as a receiving bowl, which is filled and emptied two or three times in the year. About 1000 to 1200 maunds are brought annually to Kamaon. Each tree yields from 5 to 10 seers.

BERLI. MAHR. Caryota urens.

BERNADOTTE, king of Norway and Sweden, commenced life in the French army, and, when serving in India, he was taken prisoner by the British in a night sorti from Cuddalore in the month of June 1783.

BERNARDINO. Fray Gaspar de San Bernardino,

of the order of St. Francis, in 1611 undertook a journey by land from India to Portugal by way of Mombas and Socotra and the Persian Gulf. His narrative bears witness of the complete revolution which had taken place in the course of the trade between India and Europe, through the Euphrates valley and Syria.—*Birdwood.*

BERNIER, FRANCIS, was born at Angers, in France, about the year 1625. In 1654 he visited Syria, and passed into Egypt, residing a year at Cairo, where he suffered from the plague. Thence sailing down the Red Sea, he passed to India, landing at Surat in the latter days of Shah Jahan. He states that by the time of his arrival at the court of Shah Jahan, the various robbers whom he had met on the road had left him little money. He remained in India ten years (1658–1670?), during eight of which he was the physician of Aurangzeb, whom he accompanied to Kashmir in December 1664. About the end of February 1659, while Bernier was on his way to Dehli, he met Dara Shikoh fleeing towards Ahmadabad, after his defeat by his brother Aurangzeb. Dara's wife had been wounded in the battle, and Bernier turned back as far as Ahmadabad to attend upon her. His history of the revolution was translated into English with his Voyage to Surat; London, 1671 and 1675.—*Elph.* p. 536.

BERONDA, or Baraunda, belongs to a very ancient family of the Rajbansi caste of Rajputs. Under the rule of the Bundela chiefs, the state seems to have been held under a sunnud from Hurdi Sah. Its area, 275 square miles; population, 24,000; revenue, Rs. 45,000.

BEROSUS, a learned Chaldæan priest who lived in the time of Alexander. He visited Babylon soon after the Macedonian conquest, and he mentions a legend that the first dawn of civilisation was in southern Babylonia, and that the teachers of mankind came from the shores of the Persian Gulf. He took from the sacred books of Babylon the Chaldæan account of the Deluge, which he introduced into the history that he wrote for the use of the Greeks. It says that Obartes Elbaratutu being dead, his son Xisuthros (Khasisatya) reigned eighteen sares. Warned by Chronos (Ea) of the coming Deluge, he obeyed the injunction to build a vessel five stadia long, and five broad, in which he embarked his wife, his children, and intimate friends.

BERRAWI, a district of Kurdistan, on the Zab river. It is a long valley, and has sixteen villages of Kaldi Christians, each with priests.—*MacGregor.*

BERRYA AMMONILLA. *R.* Trincomalee wood.

Somendilla, . . . SINGH.	Tircanamalay chettu, TEL.
Halmililla; Hamaniel, ,,	Sarala devadaru, . ,,
Tircanamalay maram, TAM.	

This is a native of Ceylon, but has been introduced into the continent of India. The wood is annually imported from Trincomalee, by which appellation it is known in the Madras market. It is of a pale red colour, highly esteemed for its lightness and strength; is straight-grained, slightly pliant, tough, and little affected by the atmosphere. It is employed in the construction of the massoola boats of Madras, also for the spokes of wheels, for helves, handles, planes, frames, poles, and shafts of carriages. It is inferior to sal for spokes, and to the babul for some other purposes, but it is comparatively light, and easily worked. Dr. Helfer mentions this tree as growing on King's Island opposite Mergui, and as a light, strong, and valuable wood. Flowers small, white, with gold-coloured anthers. The tree yields the best and most useful wood in Ceylon for naval purposes. It grows straight for twenty to forty feet high, and from twelve to thirty inches in diameter. Mr. Edye said that this may be considered superior to any wood for capstan bars, cross and trussel trees, cask staves, battens for yards, fishes for masts, boat-building, etc. And he added that at Madras it was highly valued for coach-work; from the toughness and fineness of its grain it answers all the purposes of ash in England. Its specific gravity is 80·0; unseasoned it weighs 58 to 60 lbs. the cubic foot, and 50 lbs. seasoned. It is largely imported into Madras from Ceylon, in logs from 18 to 25 feet long, and 2½ to 5 feet in girth.—*Drs. Mason, Wight, Cleghorn, and Helfer; Mr. Edye; Mr. Rohde; Mr. Mendis; M. E. J. R.; Thwaites; Roxb.; Voigt; Beddome, Fl. Sylv.* part v. p. 58.

BERRYA MOLLIS. *Wall.* Petwoon of the Burmese is found on elevated ground of British Burma. Wood red, much prized for axles, the poles of carts and ploughs; also used for spear handles. A cubic foot weighs 60 to 62 lbs. In a full-grown tree, on good soil, the average length of the trunk to the first branch is 50 feet, and average girth measured at 6 feet from the ground is 7 feet. It sells at 12 annas per cubic foot.—*Dr. Brandis.*

BERRY-RAIN. On the 8th September 1873, in a shower of rain which fell on some villages on the north of Purniah, small berries fell. They were green, mottled with white streaks, and had a slight point. The outer skin or husk was thin, and came off readily. It resembled a pea in dividing into two parts. It was so full of oil that it burned with a clear flame, though green. See Blood-rain.

BER-SAHIBAH of Borneo. Brother-making. See Ber Biang; Brother.

BERSU. HIND. Leptopus cordifolius.

BERTHA, in Rajputana, a form of land-tenure. The ryots or peasantry are distinguished into Koohrya and Perja. The former are settled in Bertha proprietory, or other rent-free lands, and are not liable to be called on by Government for any services except the repair of roads, and attendance in the army upon particular occasions. The Perja, who occupy lands actually belonging to the prince, though perhaps in the immediate possession of jaghirdars, are, on the contrary, obliged to perform various services, both at the call of the jaghirdar and of the prince.—*Tod.*

BERTHOLLETIA LANCEOLATA. *D. C.*

Reshami, Reshambuti, Sarmei, . .	HIND.
Leaves—rasanna (kura sanna), . .	,,

The Indian variety of this annual plant grows abundantly in many parts of the plains up to Peshawur, in places forming thickets, up to four and five feet high. Dr. Royle pronounces the leaves to be an excellent substitute for senna; remarkable for growing with their edges vertical, and for having both sides covered with stomata. Dr. Honigberger says that they are seldom used by the hakims.—*Stewart; Honigb.* p. 243; *Royle*, p. 456; *Ill. Him. Bot.* p. 19.

BERU. DUK. Pens, writing reeds.

BERWAJA. HIND. Calligonum polygonoides.

BERYL is found in the Siberian Altai range,

but many are brought from Khotan, Ilchi, the Chinese provinces, and Ceylon. There is a beryl mine at the village of Paddioor or Patialey, about forty miles E.N.E. of the town of Coimbatore, where it is found imbedded in a vein of magnesian limestone, traversed by hornblende rock. Beryls are also found in the sands of the Irawadi. The beryl and emerald in component parts are the same, viz. silica, alumina, and glucina, coloured by the oxide of chrome. The only important difference is their colours, the emerald being of its own peculiar green, which it derives from a small proportion of chrome. Beryl retains its surface polish more perfectly than almost any other material. The Romans cut it in facets and in the form of a sexangular pyramid. The constituents of the beryl and emerald are:—

	Beryl.	Emerald.		Beryl.	Emerald.
Glucina,	15·50	12·50	Oxide of iron, ...	1·00	
Silica,	66·45	68·50	Lime, ...	0·25	
Alumina,	16·75	15·75	Sp. gr.,	2·76 to 2·73	
Oxide of chrome,	0·30		Hardness,	7·5 to 8·00	

Beryl is also said to be found at Vaniambadi, at the northern base of the Neilgherry mountains.

BES or Bais. HIND. of Hazara. Salix, *sp.*

BESAN. HIND. The flour of a pulse, such as that of gram, Cicer arietinum, compounded into a cosmetic powder, with aromatics and the flour of several pulses; is also made of pea-meal and orange-peel, and used as a detergent for cleaning the hair.—*Powell; Simmonds.* See Abir.

BESCHI, a missionary of the Church of Rome, who long resided amongst the Tamil races of the Peninsula of India. He was styled by the Tamil people, Virama-muni or Virama-munivar, the heroic devotee. He composed a poem in the style followed by Kamban, and called it Tembāvani, giving the biblical narrative of Christ, the Virgin, and Joseph.

BESH. PERS. More; hence Beshi, increase. Besh Kimat, of high price.

BESHULYO-KURUNEE. BENG. Cocculus cordifolius.

BESISI or Besisik, a Malay tribe in Kedah, in the Malay Peninsula.

BESSI of Sumatra, fruit of Averrhoa bilimbi.

BESSUS, the murderer of Darius. He was put to death in a cruel manner. His body was fastened to the ground, and the boughs of two trees were bent, and, after being fastened to one of his limbs, allowed to spring back to their natural position. They tore him asunder. This fact is mentioned by Plutarch. This mode of executing criminals was occasionally adopted in Persia, and till recently in Nepal.—*Malcolm's Persia*, i. p. 73.

BEST, CAPTAIN, a scientific officer of the Madras Engineers. *Ob.* 1851. He wrote an account of the Guntur famine of 1833 in the Mad. Lit. Trans. 1844; On the Embankments of the Godavery, in a Blue Book of 1851; On Rain Gauges, and the Registration of River Freshes, in the Mad. Lit. Trans. 1844, No. xxx. 178.—*Dr. Buist's Catalogue.*

BESTA or Bestaru. KAR., TEL. A caste of fishermen in Madras and Mysore, to which the palanquin-bearers usually belong. — *Wilson's Glossary.*

BET or Bed. HIND. Rattan, Calamus rotang; any cane. Bet-i-Majnun, also Khilaf-i-Balki, also Leila-o-Mujnun, Salix Babylonica. Bet ka P'hal, fruit of Calamus viminalis.

BET or Bent. PANJ. Land along a river subject to periodical inundation.

BETA, the beet plant genus. The leaves of B. cicla or white beet are used as salads, and their midrib as a substitute for asparagus. B. maritima, or sea beet, requires a sandy soil; used as spinach, or a pot herb. The red beet and mangel-wurzel afford abundance of amylaceous and saccharine matter. B. Bengalensis, the Paluk Sag or Palung Shak of Bengal, is cultivated in Bengal and the Northern Circars, and its leaves are used by natives in their curries; when boiled it resembles spinach in flavour. The leaves shoot out again after being cut down.—*Roxb.; Voigt; O'Sh.* See Beet.

BETA VULGARIS. *Linn.* Beet.

Shul, Sælk, Sælg, ARAB. | Paluk, Chakunda, PERS.

There are three varieties,—viridis, green; rubra, red-rooted; and alba, white. The plant is largely cultivated in India as a vegetable. See Beet.

BETADA SWAMAMKI VRIKSHA. CAN. Mimosa xylocarpa.

BETA-GANNAPPA. TEL. Nauclea cordifolia.

BETALA, in Hindu mythology, the chief of the Bhuta.

BETCH, a branch of the Kuki in Cachar.

BETE of Ternate. Caladium esculentum.

BETEEKH. ARAB. Cucumis melo.

BETEL BOXES are in use in all parts of the S.E. of Asia, of gold, silver, or other metal; and in peninsular India, about one-fifth of the people have one always in their pockets. In Burma the framework of these boxes is formed of thin strips of bamboo plaited into the shape of a box; the basket-work foundation is then coated with Theetsee varnish, painted and varnished. Every Burman has one or more of these boxes, to hold his betel, cigars, money, etc.; and their women, in addition to the above purposes, use them as jewel and dressing cases. Pagan, in Burma, is celebrated for their manufacture. Inferior sorts are made all over Pegu and in the Shan states. The higher classes of Burmese use boxes of silver, whilst the nobles of the court of Ava use gold.

BETEL LEAF.

Tambul,	ARAB.	Betela,	MALEAL.
Lau-yeh, Ku-tsing,	CHIN.	Barg-i-tambul,	PERS.
Tu-pih-poh,	,,	Tambula,	SANSK.
Pan,	GUJ., HIND.	Vettilei,	TAM.
Suro, Sirih, Sireh,	JAV.	Tamalapaku,	TEL.

The Piper betel belongs to the pepper family of plants, and furnishes the celebrated leaf of the S.E. Asiatics, in which they enclose a few slices of the areca nut and a little shell-lime. This they chew to sweeten the breath and keep off the pangs of hunger. It is also slightly narcotic. It is very easily reared in the Indian Archipelago, but in the Peninsula of India it requires manuring, frequent watering, and great care; and in the northern parts of Hindustan it becomes an exotic, very difficult to rear. The plant affords leaves fit for use in the second year, and continues to yield for more than thirty, the quantity diminishing as the plants grow older. In the Tenasserim Provinces, the Karens plant the vines on their uplands, where there are tall forest trees. The branches are lopped off, leaving only the topmost boughs, and the vines readily climb up and weave their dark glossy leaves all over the summits, making a betel vine farm a most beautiful object. Karen boys and maidens engage in this leaf harvest with great

zest; and it is not uncommon for young men, in seeking companions, to inquire who are the most agile climbers of poo-lah, or betel-leaf trees. The Karen forests produce a wild species of Piper, the leaf of which is used as a substitute for the common betel leaf. The leaves are taken the utmost care of by the dealers, and are moved every day, lest one leaf should touch another decayed one; the decayed parts are carefully clipped away with scissors.—*Mason; Roxb.*

BETEL-NUT, Areca nut, Penang nut.

Fooful, . . ARAB., PERS.	Kramuka, Guvaka, SANSK.
Sooparee, . GUJ., HIND.	Puwak, ... SING.
Jambi, Penang, JAV., MAL.	Paaku, ... TAM.
Araca, . MALEAL., PORT.	Vukka, Wakka, . TEL.

The betel, or areca, or Penang nut palm, is grown in many parts of the East Indies and the Eastern Archipelago, from the Red Sea to the Pacific Ocean, and many of the people use the kernel of its fruit as a masticatory. It is the Areca catechu; is of elegant growth, and rises with a very erect and slender trunk to a height of forty or even sixty feet, the summit terminating in a tuft of dark green foliage; the trunk is seldom more than eighteen inches to two feet in circumference. The tree produces fruit from the age of five to its twenty-fifth year; it begins to blossom in March and April, and the nuts are fit to gather in the months of July and August, and are fully ripe in September and October. Fourteen pounds is the average annual produce of a single tree. The nuts vary greatly in size, and their quality depends solely on the amount of astringent matter they contain, a point which is judged of by cutting them. If the white or medullary portion, which intersects the white or astringent part, be small, has assumed a bluish tinge, and the astringent part be very red, the nut is considered of good quality; but when the medullary portion is in large quantity, the nut is considered more mature, and not possessing so much astringency, is esteemed less valuable. The ordinary nuts have a thin brown rind, and in size are intermediate between walnuts and hazel-nuts. Their general substance is of a faint oily grey colour, thickly marked with curly streaks of dark brown or black. Betel-nuts are made into necklaces, rulers, tops of walking-sticks, and other small objects. The best betel-nut of the Madras Presidency grows in the Nuggur district of Mysore, and in Travancore. It occurs in the market sliced and in whole nuts, also boiled and raw, or split and dried hastily over a fire, or dried slowly in that manner. That used by families of rank in Travancore is collected while the fruit is tender; the husk or outer pod is removed; the kernel, a round, fleshy mass, is boiled in water. In the first boiling of the nut, when properly done, the water becomes red, thick, and of a consistence like starch, which is afterwards evaporated into a substance like catechu, and is indeed known by that name. The boiled nuts being then removed, are sliced and dried, the catechu-like substance is rubbed over them, and, on being dried in the sun, they assume a deep black colour. Whole, unsliced nuts are also similarly treated. Nuts are fit for the slicing process in the months of July and August. Ripe nuts preserved in the pod are also in use. Nuts for exportation to Trichinopoly, Madura, and Coimbatore, are prepared in thin slices, and coloured or left in their natural hue. For Tinnevelly and other districts, the nuts are simply dried. The quantity of nuts produced on the coast of Sumatra is stated at 80,000 pikuls. The quantity imported annually by the Chinese amounts to 45,000 or 48,000 pikuls, exclusive of that brought there from Cochin-China. The nut is carried by the people of the East in pouches, and presented to guests in the houses of the rich, on silver trays, wrapped in gold and silver leaf, and in this form becomes an essential part in all ceremonial visiting. Indeed, among some of the inhabitants of the Eastern Archipelago, to refuse to accept betel-nut when offered, would give irreconcilable offence. It is believed to sweeten the breath, strengthen the stomach, and preserve the teeth; and when chewed with betel leaf, the Piper betel, *Linn.*, gives the saliva a red colour, which it imparts to the lips and gums. But only some nations chew it with the betel leaf; others add to it lime, tobacco, catechu, gambir (an extract from the foliage of Uncaria gambir, *Roxb.*), and the leaves of various species of pepper. White areca nuts form an article of trade with Burma from Penang and Acheen. Ordinarily, in Malabar, they are dried or cut into two or three slices; nuts are exported in their pods to Bombay. 2000 candies on the average are annually exported from Travancore. The number of the trees of the betel palm in Travancore alone is calculated at 10,232,873. In China they are met with both cut and whole, and the imports are mostly the growth of Java, Singapore, Sumatra, and Penang.

BETEL-NUT CRACKER. Soroto, HIND. In very general use among the natives who are consumers of betel-nut; used in cracking the nut. This instrument appears never to have been imitated by British manufacturers. It is of steel, and ornamental.

BETHAL, also Pethal, HIND., of Chenab, Juniperus squamosa.

BETHANY, a small village, now called Al Azirizah, about two miles from Jerusalem, on the eastern side of the Mount of Olives. On the summit of the Mount of Olives, within the area of a mosque, is a small circular chapel, covering the stone which bears the footprint shown as that of our Lord.—*Skinner's Journey*, i. p. 215.

BETHEL of Genesis xxviii. 2, 19, a compound word, El of the Greeks (Yl in the Hebrew and Phœnician), *i.e.* God, the Strong, whence comes Elohim, literally the gods; and the Græco-Phœnician Bætylia, or sacred stones, supposed to have fallen down from heaven (Diopeteis), perhaps aerolites, which were honoured and held sacred on account of a divine power supposed to be inherent in them. Jacob rose from his dream exclaiming (ver. 17), 'How holy is this place; this is none other but the house of God. And Jacob took the stone that he had made his pillow, and set it up for a pillar, and poured oil upon the top of it, and called the name of the place Beth-el.' Bethel of the Hebrews, Bagistan of the ancient Persians, and Allahabad of the Indian Mahomedans, all mean the house or place of God. Bagistan, from Baga, God, and sthana, place.—*Bunsen*, iv. 242–3.

BETONICA OFFICINALIS. *Smith.*

Hoh-hiang, . . . CHIN. | Betony, Bishopwort, ENG.

Tops and leaves are warm anti-emetic, *Smith.*

BETOOA, also Betoya and Betosag. BENG. Chenopodium viride; White goosefoot.

BETTAMU or Bettapu, Calamus rotang, *L.*

BETTIAH, a town in the Champaran district

of Bengal, situated on the Hara river, in lat. 26° 48′ 5″ N., and long. 84° 32′ 40″ E. The Maharaja of Bettiah resides here. Mr. Hodgson notices three tall pillars or columns in North Behar, two of the pillars surmounted by a lion, and each having an inscription upon the shaft. These are at Mathiah near Bettiah, Bahra and Rediah. The Bettiah inscription is precisely the same as that of Dehli and Allahabad. The language of inscription—Pali, and character Old Pali. Date—315 B.C. The Buddhist king mentioned is Piadasi, or Asoka.—*Hodgson*, iii. p. 482, iv. p. 125.

BETUL or Baitul, a district lying entirely in the hill country, comprising the westernmost section of the great Satpura plateau. Beyond its western border the Berar country begins. It lies between lat. 21° 20′ and 22° 35′ N., and long. 77° 13′ and 78° 35′ E. The district must have been the centre of the first of the four ancient Gond kingdoms of Kherla, Deogarh, Mandla, and Chanda; but except an occasional mention in Farishta, no historical information as to the Kherla kingdom remains. It yields coal. Population in 1872, 284,055. The agricultural population consists of Mahratta, Kunbi, Pardesi, Kurmi, Desi or Dolwar Kunbi, the Bhuiyar, Mali, Kerar, Gond, Kurku, Bhil, Bharia, Gaoli, Bhuya, Mhar. The Gond have about twenty tribes and twelve sects.

BETULA, the birch genus; one of the Betulaceæ. In Nepal are B. nitida, alvoides, utilis, and acuminata, and B. cylindrostachya and B. nitida are also plants of Kamaon. The white birch yields a bark which the Kamtschadales chop up with the eggs of the sturgeon, and use as food. The sap is acid, and an agreeable beverage, and may be kept for years without undergoing fermentation. The bark of a species in Northern India is used to dye chintz red? B. acuminate, *Wall.*, grows 60 feet high at 3000 to 10,000 feet elevation in Kangra and Nepal, in the Himalaya. The wood is hard, strong, and durable.—*V. Mueller.*

BETULA BHOJPUTRA. *Wall.* Paper birch.
B. Jacquemontii, *Spach.*

Shak-shin, . . . BHOT.	Tagpa of . . LADAKH.
Burj, HIND. of Pangra.	Bhurjamu, Barjapatri,
Burjri, Burzal, . ,,	TEL.
Shag, Shakh, KANAWARA.	

The Indian paper birch was found by Dr. Wallich on the alps of Garhwal and Kamaon, in the Sutlej valley between Rampur and Sungnam, at an elevation of 10,000 to 13,000 feet; and it is a plant of Tibet, Kaghan, Pangi, Busahir, and Lahaul. It is nearly allied to Betula papyracea of North America. So long ago as the age of the Hindu dramas, about the beginning of the Christian era, the Hindus used the inner bark of this birch as paper. In the drama by Kalidasa of the Hero and the Nymph, Hind. Th. i. p. 216, Urvasi says:—

'. . . I grieve that he should deem me
Cold and unfeeling. I cannot now appear
Before I meet these charges; some reply
I'll make, a bhurja leaf, and will inscribe
My thoughts on it, and cast it in his way.'

It grows to a higher elevation than most other trees, generally above coniferous forests. The tree at times reaches 6 or 10 feet in girth and 35 feet high. The wood is used for ploughs, small bridges, etc., at altitudes and in tracts where other trees are scarce. Mr. Watson told Dr. Stewart that it is good for turning; and in Kanawar poles of it are used for carrying and swinging a heavy kind of ark in religious processions, which implies some strength and elasticity. In Ladakh the striking part of the stick for polo, hockey on horseback, is made from it. The bark peels off in large sheets, and is used also for umbrellas, and for lining the flexible tubes of hookahs. Every consignment of the ornamental papier maché ware of Kashmir reaches the Panjab packed in wrappers of birch bark. Hindu pilgrims visiting the shrine of Amrnath in Kashmir divest themselves of their ordinary clothes before entering the shrine, covering their bodies with the bharj-patra. The leaves or bark are used to cover the baskets of Ganges water sold by itinerant pilgrims. In Kangra, 'being sacred,' the bark is used for funeral piles. In Kashmir and Kamaon it is found very durable put under the earthen roofs; and it is largely used for packing apples, pomegranates, tobacco, and drugs, writing paper. It sells for three rupees a kharwar (ass-load) in Kashmir, according to Lowther. The price in Chumba was stated to be ten to sixteen seers for a rupee. Longden mentions that the old bridge at Koksar (now replaced by a more civilised one) was made of birchen twigs.—*J. L. Stewart; Royle, Ill. Him.Bot.* p. 383; *Eng. Cyc.; Elliot's Fl. Andh.; Powell, Econ. Prod. Panj.; Cleghorn, Panj. Rep.*

BETURUNGU. BENG. Peristrophe tinctoria.

BET-YA. BURM. Urtica heterophylla; also Tragia involucrata.

BEUM. TEL. Husked rice.

BEVOIBETTA PEAK, in lat. 11° 21′ N., long. 76° 43′ E., in the Neilgherry hills, is S. of the Dodabetta peak. The top of the peak is 8488 feet above the sea.—*Baikie.*

BEYA. SANSK., JAV., MALAY. Cowries.

BEYAH, according to Rennell, anciently called Beypast'ha, is the Hyphasis of Alexander.—*Rennell, Memoir*, p. 102.

BEYPOOR, 5½ miles S. of Calicut, at the N. side of the river of same name; at its mouth is the western terminus of the Madras S.W. Railway. Beypore river has 8 or 10 feet on the bar at high tides.

BEYT, or Bate, an island on the S. coast of Kattyawar, in the Gulf of Cutch, about 5 miles long. The town and fort are on its W. side. The fort is in lat. 22° 26′ 30″ N., and long. 69° 5′ 34″ E. It was taken possession of by the pirates of Jugut, after they had been defeated by Kutub Shah. In A.D. 1482, Beyt fell, after having fought twenty naval engagements. Beyt fort was taken from the Waghirs and destroyed by the British on the 15th October 1859, and its fort and principal temples blown up. It has many pagodas for the worship of Krishna, and is largely visited by pilgrims.

BEZOAR, Serpent stone.

Bezoars are intestinal concretions, some of the monkey; also of the wild boar, called pig stone; of the Indian hog, called Malacca stone, or lapis Malaccensis, or yellow bezoar, and Ceylon bezoar, lapis porci Ceylanici, which was larger and not so

scarce; also the ox bezoar; that from the goat of Peru is known as the western bezoar; the ibex produces the oriental bezoar, also called the green resinous bezoar; the camel bezoar; the serpent stone is fabled to be from the cobra; and that of the bezoar of France from the viper. There are also hairy bezoars, agagrophilos, concretions obtained from the horse, ox, and sheep, and other quadrupeds. These form in the stomachs and intestines from the accumulation of hairs swallowed by the animals in licking themselves. The hairs become felted together in balls. The word is pa-zahr, from pao, to purify, and zahr, poison. Bezoar, from the mountain goat, the boz-i-kohi, is the most esteemed in Persia. Indeed, the name was at first applied to a concretion found in the stomach of a goat in Persia. Bezoar was formerly much prized as medicine in Europe, sometimes selling for ten times its weight in gold; but since its constituent parts have been ascertained, it has ceased to be sought after. The composition differs often in the same kind of animal, as well as in dissimilar species. Oriental bezoar is formed of bile and resin; other fictitious kinds are found to be made of hair, others of wood, and some principally of magnesia and phosphate of lime. The true bezoar from Persia is counterfeited so well by pipeclay and ox-gall, that even those have been deceived who procure the genuine from the animal. The genuine throws off only a small scale when a hot needle is thrust into it; and put into hot water it remains unchanged; when rubbed on chalk, the trace should be yellow, but green on quicklime. The cow bezoar is valued in the Chinese market at from $20 to $25 a catty, and is used by the Chinese solely as a medicine. The little which is brought there is from India. In China they are called Niu-hwang; also Chau-pau, also Chah-tah. The dog bezoar is called Kau-pau, and that of the horse Mah-meh. In the interior of the Rajang district, in Borneo, are two species of monkey, which produce the batu nakit, or bezoar stone. One is large and black, with a long tail, called nakit. The other is large and red, but has no tail, and is called basi. In one out of 10 or 20 of these two monkeys, are found the bezoar. Honigberger mentions that Padzahr siah, PERS., kani zahr mohra, HIND., is a dark green serpentine; and a specimen in the Madras Museum, brought from Dehli by Mr. Charles Gubbins, as zahr mohra, is undoubtedly this mineral. Bezoar is brought to Bombay from Gujerat and Malabar in small quantities, and is chiefly re-exported to China. Ainslie mentions that it is brought to India from Ceylon, Bussora, and the seaports in the Gulf of Persia as a medicine. Bezoar is supposed by the native practitioners to possess sovereign virtues as an external application in cases of bites of snakes, stings of scorpions, hydrophobia, etc. Bezoars do not deserve the least confidence. The fadaniya bezoar of the Panjab are intestinal calculi, consisting of phosphate of lime, etc. They occur there in the intestines of various animals. — *Honigb.; O'Sh.; Crawfurd; Powell, Handbook; Morrison; Tavernier; Ouseley; Williams; A. Moquin Tandon.*

BEZOMMAR is the seat of the Patriarch, or spiritual head of all the Armenian Catholics in the East. He is assisted by several bishops, and about twenty or thirty monks.—*Robinson*, ii. 45.

BEZWARA, a small town on the banks of the Kistna, and 45 miles from its mouth, in lat. 16° 30½′ N., long. 80° 39′ E. It is surrounded by high hills, in which are a large number of Buddhist rock-cuttings, cells, caves, and steps, and is supposed to be the Dhanakaketa of Hiwen Thsang. There are also many ancient Hindu pagodas. Wherever excavations have been made, ancient Buddhist and Brahmanical remains have been discovered. This town is the head of the network of canals forming the irrigation system of the Kistna district.

BGHAI, one of the great sections of the Karen race, the other two being the Sgau and the Pwo. The Bghai clans are the Bghai-ka-ten, Bghai-ko-hta, Bghai-muh-htai, Laimay, and Manu Manan.

Bghai tribes occupy all the country from the Sitang to the Salween rivers, and from the mouth of Thouk Ye-khat creek to near the British boundary and the Shan state of Mo-bhya. They speak two distinct dialects, the Bghai and that of the Red Karen, both of which are more nearly related to the Sgau than the Pwo, there being no final consonants in either. They dwell south of the Ka. They are more savage than the other Karen tribes, and they make forays and kidnap their neighbours. Each village has a single raised and palisaded and fenced house, with a walk down the centre, and with a hearth for each family, and one with 75 hearths has been seen. A stranger can only approach with a guide. On his arrival, a place is pointed out for him to sit, and if he move, he is speared as an enemy. A ladder during the day-time leads to a trap-door. They are known as the Bghai by the Paku and Sgau. They bury their dead in coffins like those of the Chinese, made of a single log of wood, with a hollow place for the corpse.

The *Bghai-ka-ten* wear a tunic with perpendicular red bands on a white ground, and are named by the Burmese, according to their localities, Leik-bya-gie and Leik-bya-gnai, or great and little butterflies. The other division wear short white trousers, and are again subdivided into the Bghai-muh-htai, the eastern Bghai or Red Karen, who dwell beyond the eastern mountains in the valley of the Salween; and the Bghai-ko-hta, or Upper Bghai, because they reside on the rivers above them, but to these the Burmese give the name of Ka-yen Ayiang, or Wild Karen. They rear the silkworm. They eat dog's flesh without salt, and rice without vegetables. They are wretched barbarians.

The *Laimay* or Black Necks, is a small Bghai tribe N.E. of Tounghoo, whom the Bghai call Pray. Manu Manan are called by the Red Karen, Pray. They dwell between the Sgau and Red Karen.

Bghai-muh-htai, or Karen-ni, the Red Karen call themselves Ka-ya, their term for a man. The Shan call them Yang-laing, which also signifies Red Karen. The men wear short white trousers, with perpendicular black or white stripes, or black ground with red or white stripes. The women have a red or black turban, with a square cloth tied by the two corners over the right shoulder, like a Roman toga. They also have a petticoat. The men go armed, and each has a pony. Every Red Karen has his back tattooed with radiating lines; it is their mark of manhood. They dwell on a table-land several thousand feet high, undu-

lating, with good soil and many springs. Their country is the finest in southern Burma, and their villages amount to about 200, with from 100 to 400 houses in each. They are skilled in the arts, are vigorous, hoe their land, and use cattle with panniers. They use spirituous liquors largely. Many of the population are slaves. The Karen-ni are civil, good-tempered, and intelligent, but they evince great ferocity in their forays.

The *Lwai-lohug* is a Karen tribe dwelling south of the Ka-khyen, on the edge of the table-land west of lake Nyoung-Ywe, two degrees north of Tounghoo. They dress like, and are doubtless a branch of, the Red Karen.

Ying-ban is a tribe supposed to belong to the Red Karen, whose dress and language they use. They dwell about 100 miles north of Tounghoo.—*Mason, Burma*, pp. 89–91, 641.

BHABAR. HIND. Urtica heterophylla; also Andropogon involutum and Eriophorum cannabinum.

BHABAR. HIND. In Baitool, light black soil.

BHABAR, a sloping tract of country under the Siwalik hills, from 10 to 20 miles broad. The slope of the ground varies from 17 to 30 feet per mile, diminishing rapidly after the first few miles. The soil in many parts consists of a rich black mould, at the extreme north and south verges of the forest. There are occasional patches free from trees, but covered with high grass, and many spots afford good pasturage; the Bhabar is almost destitute of trees valuable for timber; and water is at such depth below the surface, that all attempts to dig wells have been fruitless. It forms the southern portion of Kamaon, and is there 10 to 11 miles broad, and it runs between the mountains and the Terai. On the south is a line of springs which marks the northern boundary of the Terai district. Up to 1850, the Bhabar was an almost impenetrable forest, given up to wild animals; but since then a large population has entered the hills.

BHABOOT. HIND. Ashes of dried cow-dung, which Hindus smear over their foreheads and bodies. See Atit.

BHABRA, near Bairath, on the road between Jeypore and Dehli. A sculptured stone was got here. It contains an edict of king Pyadasi, and specifically refers to the precepts and doctrines of Bhagavat Buddha.—*Prinsep's Tibet*, p. 155.

BHABRI. HIND. Amarantus anardana.

BHABRIA, a section of the Koli race, dwelling from Baroda north to Mahee Kanta.—*Wils.*

BHABRU. SANSK. A sacred name of Siva.

BHADA. HIND. A grass which grows in poor soil; it makes excellent fodder.

BHADARIA, a tribe of mendicants of Brahmanical descent, who profess astrology.—*W.*

BHADAURIA, a branch of the Chauhan Rajputs residing in the provinces of Agra and Etawa, and in other places along the Jumna, whence the tract is termed Bhadawar. The raja of the district claims descent from an ancient family, the members of which enjoyed high consideration at the court of Dehli from the reign of Akbar; and his pretensions are admitted by the surrounding rajas, who yield him precedence, and accept from him the tilaka or frontal mark on their accession.—*Wilson, Glossary.*

BHADON, the fifth month of the Hindu luni-solar year, August and September. On the 3d of this month, amongst Rajputs, there is a grand procession to the Chougan; the 8th, or Ashtami, is the birth of Krishna. Rajputs have several holidays in this month, when the periodical rains are in full descent; but that on the last but one (Súdi 14, or 29th) is the most remarkable.—*Rajasthan*, i. p. 581. See Nat'hdwar.

BHADRA-KALI, SANSK., from Bhadra, goodness, and Kali, one of the names of Parvati; in this form she is one of the Gramma-devata or village deities, and as such receives bloody offerings, and assists in the practice of sorcery and witchcraft.

BHADRA MUSTE. SANSK. Also Bhadra tunga gaddi, TEL. Cyperus hexastachyus.

BHADRAPADA, a Hindu month when the sun is in the sign Sinha, corresponding to the Tamil month of Auvani. See Varsha.

BHADRASENA, king of Magadha, one of the Sisunaga dynasty, B.C. 400.—*Bunsen*, iii. 538, 542.

BHAEE. DUK. Sterculia colorata.

BHAEOUL. HIND. Seemingly Grewia oppositifolia. It grows in the ravines of Simla, and at higher and colder situations. The ropes made from it are strong and durable; during the depth of winter the villagers feed their cattle on the leaves, which sell from three to five annas per load of 25 to 45 seers. It supplies a crop of twigs annually.

BHAGA, a mountain river of Kangra; it unites with the Chandra to form the Chenab.

BHAGADATTA, a king of the Yavana, who submitted to king Jarasandha.

BHAGALPUR, a town in Bengal on the right bank of the Ganges, with a population of 69,678 in 1872. It gives its name to a district of 4268 square miles, and a population of 1,826,290 persons; the soil of the district has been injured by changes in the bed of the Kusi (Cosi) river. Besides the Hindus and Mahomedans, there are 335,137 Goala, 16,468 Santal and other aboriginal races. The Oswal clan of Rajputs have two temples in the chief town. The sacred hill of Mandargiri is fabled to cover the body of the giant who was decapitated by Vishnu when he was trying to destroy Brahma, Vishnu, and Siva. It is a place of Hindu pilgrimage. It suffered from famine in 1770, 1775, 1779, 1783, and 1865–66.—*Imp. Gaz.*

BHAGANA. SANSK. The circumference of a circle. Independently of astronomical purposes, the Hindus frequently divide the circumference of the circle into twelve rasi or signs, subdivided sexagesimally into Bhaga, Cala, Vicala, etc., *i.e.* degrees, minutes, seconds, etc. Bhagana means also a revolution.—*E. Warren, Kala Sanhita.*

BHAGAR. HIND. Eriophorum cannabinum.

BHAGAT or Bhakt. HIND. A term amongst the vaishnava, now usually applied to a Hindu religious puritan, who is initiated by a necklace of beads round the neck, and a circle on the forehead. After initiation, the puritan abstains from flesh and spirits. Bhagat or Bhakt also simply means a follower or worshipper, as Siva bhagat or Vishnu bhagat, a worshipper or follower of Siva or of Vishnu. Bhagat is also a title given to the head of the math or temple of Kanoba. He works himself into a state of hysteria on the Jan'm Ashtami, and the people, believing him to be then possessed by Krishna, worship him with incense and prostration, and present sick people to be touched and cured.—*Wilson.*

BHAGATIYA, a caste in Agra, Etawa, Cawn-

pur, and as far east as Ghazipur, where they number more than 100 families; they pass their time in buffoonery, singing and dancing.—*Sherring's Hindu Tribes*, p. 276.

BHAGAVAN or Bhagwan, a name of deity, denoting God. The derivation means the primary cause of creation. Bhagwan is the name by which all Hindus recognise the Supreme Being.—*Taylor.*

BHAGAVATA, an extinct Vaishnava sect, who wore the usual marks, the discus, club, etc., of that divinity, and likewise reverenced the salagram and tulasi. The Bhagavat of the present day is one who follows particularly the authority of the Sri Bhagavat Purana. The name is from Bhagavat or Bhagavata, divine.

BHAGAVAT-GITA. SANSK. From Bhagavat, divine, and gita, a hymn, *i.e.* divine song; a Sanskrit poem in the form of a metaphysical dialogue between Arjuna and Krishna. It is an episode in the Mahabharata. It contains many fine passages, in which Krishna gives an exposition of the pantheism of the Brahmans and of the Hindu mystic theology. The Brahmans regard it as only inferior to the Vedas. It is the most intelligible and most interesting of all the Sanskrit writings. It is written in splendid metre, and belongs to a literary age. It is recognised by all Hindu sects and schools. It propounds an eclectic system. Its two leading doctrines are the adwaita philosophy of Vyasa, and the supreme importance of quietism, resembling the Stoic philosophy of the Greeks. Its author is unknown, but he was probably a Vaishnava Brahman, and its date was probably the second or third century A.D. It is later than the six Darsanas or philosophical schools. The poem is divided into three sections, each containing six chapters, the philosophical teaching in each being somewhat distinct; but the main design of the poem is to inculcate the doctrine of Bhakti (faith), and to exalt the duties of caste above all other obligations, including those of friendship and kindred. The sentiments expressed in it have exerted a powerful influence throughout India for the past 1600 years. It was early translated by Mr. Wilkins, subsequently by Mr. J. Cockburn Thompson; and there are translations into German, French, etc. Warren Hastings wrote the preface to Wilkins' translation of it. The Bhagavat Gita, the Mahabharata, and the Ramayana are to the Hindu all that the Bible, the newspaper, and the library are to Europeans. Dr. Lorinser, in an appendix to his edition of the Bhagavat Gita, compares, in parallel passages, portions of this book with that of the Christian New Testament. He is of opinion that the doctrines in this book are not only an eclectic mixture of different Indian philosophies, but have also a strong infusion at least of ideas and sayings taken over from Christianity. He is satisfied that it dates after Buddha; and there are strong reasons to believe that its composition must be attributed to a period terminating several centuries after the commencement of the Christian era. Lassen infers its age to have been in the 3d century after Christ. It is in the Gospel of John, the Acts of the Apostles, and Revelation, that the correspondence is apparent, though also Paul's Epistles to the Thessalonians and to Philemon, and the Epistles of Peter, are noticeable.—*Ind. Ant.* Octr. 1873.—*Dowson; W. Taylor; Elph.* pp. 93, 155.

BHAGAVAT PURANA, one of the sacred books of the Hindus, styled Purana, of which there are eighteen. The Vishnu Purana is that best known. The Bhagavata Purana teaches vaishnava doctrines. It is so named from its being dedicated to the glorification of Bhagavata or Vishnu. It consists of 18,000 slokas, distributed amongst 332 chapters, divided into 12 skandhas or books; and it exercises a more direct and powerful influence upon the opinions and feelings of the people of India, than perhaps any of the Puranas. Its tenth book narrates in detail the history of Krishna, and has been translated into all the languages of India. It is understood to have been written by the grammarian Vopadeva or Bopa-deva, who lived about the 12th or 13th centuries, at the court of Hemadri, raja of Devagiri (Deogarh or Dowlatabad).—*Growse*, p. 50; *Dowson.*

BHAGAVATI, SANSK., in Hindu mythology, is the wife of Bhagavan. Bartolomeo says that her figure was on the gold pagoda coin, and gave it its name.

BHAGDAR. GUJ. The headman of a village commune.

BHAGHELCUND, 'the land of the Bhaghel,' also known as Rewa; a territory in Central India, whose princes are of the Bhaghel or Bhaghela race. It lies between lat. 22° 40′ and 25° 10′ N., and long. 80° 25′ and 82° 45′ E. The Bhaghel, according to Wilson, are a branch of the Sisodhiya Rajputs of Gujerat, who migrated eastwards. Subdivisions of the tribe, under different denominations, are widely spread through Bundelkhand, Allahabad, Benares, Gorakhpur, Cawnpur, and Farrakhabad. They are also said to be of the Chauhan race, descended from Komarphal (died A.D. 1166), sovereign of Gujerat. In Gujerat there are many petty chieftains of this tribe, as Lunawarra, Mandvie, Mahera, Godra, Dubboye, etc. Another account makes the Bhaghela Rajput race descendants of Sid Rae. They also occupy Pitapur and Theraud in Gujerat. Tod says the Bhaghela Rajputs are a branch of the Solanki kings of Anhalwara.—*Tod's Rajasthan.*

BHAGIRATHI, a branch from the Ganges, in Bengal, which Hindus regard as the sacred channel of that river. It leaves the Ganges in the Murshidabad district; and at the town of Nadiya it is joined by the Jilingi, and the Hoogly is formed. Its course is frequently changing and sandbanks forming. The Bhagirathi river of Garhwal rises from the Gangotri peak, and is one of the headwaters of the Ganges, and joins the Aleknanda at Deo Prayag, to form the Ganges. The people identify that with the branch thrown off by the Ganges at Chhapgati, 1000 miles below. Bhairoghati is in a deep gorge, at the confluence of the Bhagirathi with the Jahnavi, and is visited by Hindu pilgrims from all parts of India.—*Imp. Gaz.*

Bhagirathi Peak, in lat. 30° 56′ 5″ N., and long. 78° 59′ 1″ E., in Garhwal, near the origin of the Bhagirathi river, is 21,390 feet G. T. S. in height. Herbert and Hodgson call this peak the 'Pyramid,' and give lat. 30° 54′ 6″ N., long. Gr. 79° 2′ 8″ E., height 21,379 feet.—*Schlag.*

BHAGMUTTY, a river of Nepal. Katmandu, the capital, is built at the junction of the Bhagmutty and Bishmutty.

BHAGNUR, rich alluvial lands under the Jumna.

BHAGTEEA, a dancing boy dressed up as a dancing girl.

BHAGWANA. See Baluchistan.

BHAGWARI, Guj., also Nirwa. Lands held in commune in Gujerat, Kaira, and Ahmadabad.

BHAGWEE, a cloth dyed with red ochre, used by fakirs.

BHAI. Hind. Brother, comrade, fellow-townsman, fellow-countryman, from which are many compound words: Bhai-band, relatives, connections, fellow-townsmen; Bhaiyachara or Bhai-bhant, lands held in common by relatives; a village commune owned by descendants from a common stock. Latterly, the title of Bhai was in practice frequently given to any Sikh of eminent sanctity, whether his ancestor had been the companion of a guru or not. The Behdi and Sodhi, however, confined themselves to the distinctive names of their tribes, as the Behdi called themselves Bâba, and the Sodhi sometimes arrogated to themselves the title of guru, as the representatives of Govind and Ram Das. Bhaiad, a brotherhood; a term given to the kinsmen of a Jharejah chief.—*Elliot, Sup. Glos.* p. 64; *Cunningham's Hist. of the Sikhs*, p. 65.

BHAI BHAGTOO, the founder of the Kythul family; he was a useful partisan of Lord Lake, but was subsequently reduced to comparative insignificance under the operation of the British system of escheat. Dhurrum Singh, the ancestor of the respectable Bhai of Bagreean, between the Sutlej and Jumna, was likewise a follower of Hur Rai.

BHAI-BIRRUNG, the seed of a plant brought to Ajmir from Haraoti, considered warm, and used in mesalih, and in prescriptions to promote digestion.—*Genl. Med. Top.* p. 126.

BHAI-BYA. Burm.? In Amherst, a timber used for house posts, commonly called white Jarool.—*Captain Dance.*

BHAIMI. Sansk. The 11th of the Hindu month Magha, on which day offerings are made in honour of Bhima.—*W.*

BHAINS. Hind. A male buffalo. Mhains, the cow.

BHAINSH. Hind. Salix tetrasperma.

BHAIRAVA. Sansk. The fear-exciting, from Bhaya, fear. Bhairavi, the wife of Bhairava. Bhairava is a title of Siva in his destructive character, a terrific deity, only to be satisfied by blood. According to Major Tod, there are two Bhairava, the fair and the black (Gora and Kala), who in the field of battle are the standard-bearers of their mother Kali. The sable deity is the most worshipped. The dog is sacred to him, and in sculptures he is commonly represented on one. He is also called Bajranga, or of thunderbolt frame. Mr. Ward states that under the name of Bhairava, Siva is regent of Kashi (Benares). All persons dying at Benares are entitled to a place in Siva's heaven; but if any one violate the laws of the Shastra during his residence, Bhairava grinds him to death. At the Lat of Bhairava at Benares, the Kan-phata jogi ascetics officiate as priests. A temple is dedicated to Bhyru and his wife Jayisuri at Loni, about twelve miles from Poona, to which people bitten by snakes are brought, and Hindus believe that they invariably recover. Bhyru will not even permit the nim tree, used as a preservative against the bites of snakes, to grow near the place, as all persons so bitten are under his special care. In the temple of Kylas at Ellora is a beautiful sculpture of him, bearing in his hands the damara, the hooded snake, and apparently a richly-sculptured sceptre. —*Cole. Myth. Hind.* p. 73. See Bhairavi.

BHAIRAVA JAP or Bhairava Jhao. At some distance to the north of the Jaina temples of Girnar, and above them, on the verge of the hill, stands a huge insulated rock, the Bhairava jap, or 'Leap of Death,' otherwise styled the Raja-mela-vana-pathar, the 'desire-realizing rock,' whence Hindus have often been tempted to throw themselves down, in the hope of a happy future. Laying a cocoa-nut on the dizzy verge of this rock, the victim attempted to poise himself upon it, and in another instant he was beyond humanity's reach, and his body a prey to the vultures that soar under the lofty cliff. Such suicide has long been forbidden; but only about A.D. 1850, three Kunbi, keeping secret their intentions, ascended and made the frightful leap; some Rabari had also determined to do the same, but were restrained.

Postans says the Girnar rock bears three inscriptions. The most ancient, which occupies the eastern side, are the edicts of king Asoka. The celebrated edicts are very perfect. — *Postans' Western India*, ii. p. 41; *Cal. Rev.*, 1848; *J. B. As. Soc.* vii. pp. 217-262. See Asoka; Girnar.

BHAIRAVI, fierce attendants on the goddess Kali; also ascetic female Hindus in Bengal, who personate Sakti. They take a vow of celibacy. Many of them are influenced by a sincere and enthusiastic devotion, but their reputation is not high.

BHAIRAVI CHAKRA. Sansk. Bhairavi, a name of Durga, and chakra signifies a circle or wheel. See Bhairava.

BHAIRIYA, or Redia, a small, dissolute, and disorderly caste, who wander about in the company of dancing women, and are notorious thieves and scoundrels. They are in many of the districts of the Bengal Provinces, and in Cawnpur.—*Sherring's Hindu Tribes*, p. 276.

BHAJA, four miles south of the great Karli cave in the Bhor Ghat. It is famed for its Chaitya cave excavated in the rocks. Its date is supposed to be before the Christian era.—*Ferg.*

BHAJI. Hind. Greens.

BHAJRUBHAL. Beng. Mellivora Indica, *Jerdon.*

BHAKRA. Hind. Tribulus lanuginosus, T. terrestris.

BHAKRI, a yellow earth used in coarse dyeing at Multan.

BHAKSHI. Hind. of Kangra. Gardenia tetrasperma.

BHAKTA MALA, a work in which is embodied the legendary history of all the most celebrated Bhakta or devotees of the Vaishnava order. It was originally written in a Hindi dialect, by Nabha Ji, about A.D. 1580, but was added to by Narayan Das, who probably wrote in the reign of Shah Jahan. This, termed the Mala, was added to in A.D. 1713 by Krishna Das, the additions being named the Tika.—*Wilson.*

BHAKTI, in Hinduism, signifies a union of implicit faith with incessant devotion. The doctrine of the Bhakta was an important innovation upon the old Vedic religion. The object of the Vedas, as exhibited in the Vedanta, seems to have been the inculcation of fixed religious duties as a general acknowledgment of the supremacy of the deities, or of any deity; and, beyond that, the necessity of overcoming material im-

purities by acts of self-denial and profound meditation, and so fitting the spiritual part for its return to its original source. This system was diffused throughout the old pagan world. But the fervent adoration of one deity superseded all this necessity, and broke down practice and speculation, moral duties and political distinctions. In the Bhagavat Gita, Krishna is made to declare that, to his worshipper, such worship is infinitely more efficacious than any or all observances, than abstraction, than knowledge of the divine nature, than the subjugation of the passions, than the practice of the Yoga, than charity, than virtue, or anything that is deemed most meritorious. An important consequence results from these premises,—that as all men are alike capable of feeling the sentiments of faith and devotion, it follows that all castes become by such sentiments equally pure. Amongst the Vantswara sectarians founded by Chaitanya, all persons of all castes are admitted into the sect, and all are at liberty to sink their civil differences in the general circulation of mendicant and ascetic devotees, in which character they receive food from any hands, and of course eat and live with each other without regard to former distinctions. In like manner, as followers of one faith, all individuals are equally entitled to the prasad, or food which has been previously presented to the deity; and it is probably the distribution of this, annually, at Jaganath, that has given rise to the idea that at this place all castes of Hindus eat together. See Pran-Pralap.

BHAL, or Bhal Sultan, a tribe of proprietory Rajputs in Secunderabad, Balundshahr, Hatras, and Tuppul in Alighur. The tract about Balabhipura and northward is called the Bhal.—*Elliot; Tod.*

BHALATAKI. HIND. Semecarpus anacardium.

BHALIKA, contemporary with Dhritarashtra and the five Pandu brothers. Bhalika means the Bactrian, from Balkh, the later form of the name of that city.

BHALOO. HIND. A bear. Bhalloo Soor, Arctonyx collaris, *Cuv.*

BHAMADATTA, a king of Kalinga, supposed to be the Brahmadatta, who after Buddha's death received the tooth relic at Kalinga.

BHAMAH, a race in the valley of Nepal, supposed to be an offshoot of the Newar. The Bhamah shave the head, like the Bhutia.

BHA-MANDALA. SANSK. A nimbus, an aureole.

BHAMTI, also Bhamatya; in Berar, Bhamwatya, a pickpocket, a thief.

BHAN. HIND. Populus Euphratica; grows in N.W. Himalaya and in Sind, used for rafters and turnery; also Rhus cotinus; its leaves are used as a tan.

BHAN-BHWAY. BURM. In Tavoy, a wood used for house posts, like sissoo.

BHAND. HIND. Geranium nodosum.

BHANDAK, a town 18 miles N.W. of Chanda, in the Central Provinces. The architectural remains in and around it consist of temple-caves, and in the Winjhasani and Dewala hills, the foot-print of Bhima, on the latter hill, the temple of Bhadravati.

BHANDAR, a mixture sacred to Kandoba, of powdered turmeric and another substance.

BHANDAR, a cocoa-nut tree toddy drawer.

BHANDARA. HIND. A treasury, a store, a reservoir; a guarantee, an assurance.

BHANDARA, in lat. 21° 9′ 22″ N., and long. 79° 41′ 43″ E., is the chief town of a district of the same name in the Central Provinces, through which the Wainganga flows. The population of the district in 1877 was 593,624. The aboriginal races are Gond, Kurku, Kol, Dher or Mhar, Kunbi, Ponwar, Koli, Mali, Goali, Kalar, Dhimar. The district is infamous for divorces, in which the women take the lead. The pat or concubinage is largely followed. The lingam and many animals and reptiles are worshipped. There is a large tomb near the village of Murmari, about 10 miles from Bhandara, where rest the remains of an English lady. It is held in great veneration by the surrounding villages.—*Cent. Prov. Gaz.*

BHANDER. HIND. The desert S.W. of Rajputana. See Mewar.

BHANDIBAJAN. HIND. Sageretia Brandrethiana.

BHANG. HIND.

Subjah, Subji, Sidhi, HIND. | Sukho, Sawia, . SINDH.
Banghi, . . TAM., TEL. |

The larger leaves and capsules of the dried hemp plant, Cannabis sativa. They are used by the natives of S. Asia for making an intoxicating drink bearing the same name, also for smoking; and the powdered leaves are used in infusion and in sweetmeats as an intoxicating drug. The hemp plant in tropical countries also exudes a gum, a very powerful stimulating narcotic, which it does not produce in cold countries. It is the charras of India. The dried leaves partake of this narcotic principle, and are used all over India to produce intoxicating effects. They are used for making the conserve or confection termed Majoon. Bhang is cheaper than ganjah, and, though less powerful, is sold at such a low price that for one pice enough can be purchased to intoxicate a 'habituated person.' Sidhi, Subji, or Bhang (synonymous) are used with water as a drink. It is generally used in a liquid form, and is fiercely intoxicating. One recipe, which is thus prepared, is,—hemp leaves, washed in water, 3 drachms; black pepper, 45 grains; cloves, nutmegs, and mace, of each 11¼ grains. Triturate the ingredients with eight ounces of water or milk, or with the juice of water-melon seed, or cucumber seed, and strain. Spices render it more inebriating. Another recipe is,—about three tola weight (540 troy grains) are well washed with cold water, then rubbed to powder, mixed with black pepper, cucumber, and melon seeds, sugar, half a pint of milk, and an equal quantity of water. This composition is chiefly used by the Mahomedans of the richer classes. Sidhi washed and ground, mixed with black pepper, and a quart of cold water added, is the favourite beverage of the Hindus, especially the Brijobassi, and many of the Rajputana soldiery. Under the Burmese Government at Tavoy, no one was allowed to cultivate the plant without a licence from Government. Sometimes a general permission was given, and at other times a general prohibition would be issued. Throughout India, bhang is one of the exciseable articles, and the plants are taxed for revenue.—*Williams' Middle Kingdom*, p. 106; *Powell's Handbook*, 296; *O'Sh.* p. 582. *Faulkner; Herklots; Mason.*

BHANGAR BIJ. HIND. Asphodelus fistulosus.

BHANGI. HIND. Scavenger.

Halal-Khor, . . . HIND. | Lal Begi, Khak-rob, HIND.
Mehtar Chuhra, . . ,, | Toti, . . . TAM., TEL.

A person acting as a scavenger in a household. They are often Mahomedans, and often of the tanner or Madega caste. They are found all over India, well to do, earning very large incomes, but they are becoming fewer daily, because many emigrate, and, under British rule, educate their children for higher avocations. The descriptions given of them by Wilson and Elliot are no longer applicable. One man in a small hamlet in Berar was earning Rs. 37 monthly.

BHANGI. HIND. A labourer who carries burdens with a shoulder-pole like a milkmaid; also the shoulder-pole with slings from which boxes are suspended. In the Karnatica, Tamil, and Telugu countries it is called Kavadi, changed by the British to Cowrie. In the Panjab, dandy poles, bhangy poles, and shafts are made of the timber of Acer cultratum, Bambusa arundinacea, Betula bhojputra, Cotoneaster obtusa, Ficus Indica, Fraxinus floribunda, Fraxinus xanthylloides, Grewia oppositifolia, Lagerstroemia parviflora; Quercus dilatata, Quercus semecarpifolia, Taxus baccata, and Alnus campestris.

BHANGRA. HIND. Eclipta erecta; Viscum album, Verbesina prostrata, Cleome pentaphylla.

BHANGURIA. HIND. A branch of the Gaurtaga tribe in Bulandshahr.—*Wilson.*

BHANPOORA. Near this is a small rivulet, called the Rewa, coming from the glen of the pass near which is the mausoleum of Jeswunt Rao Holkar, adjoining the scene of his greatest glory. —*Rajasthan*, ii. p. 719.

BHANR or Bahana Bhanr, also Bhand, in Northern India, mimics, buffoons, and jesters, mostly professing Mahomedanism. They are present at all joyous festivals, such as a marriage, or the birth of a son, and contribute their jokes, just as the Gaunharins contribute their dancing and song.—*Elliot; Sherring's Hindu Tribes.*

BHANSARA, a branch of the Ahir tribe.

BHANT. SANSK. Clerodendron infortunatum.

BHANTA. SANSK. Solanum melongena.

BHANWAR. HIND. Ipomœa sessiliflora.

BHANWAR, a rite which forms part of the marriage ceremony of Hindus, in which the bride and bridegroom circumambulate the sacred fire.

BHAO. MAHR. A brother, a cousin, an honorific adjunct to names, as Sadaseva Rao Bhao, who fell at Panipat, 6th January 1761. A daughter-in-law. Bhao Begum, the Begum daughter-in-law.

BHAORA, a scattered tribe in the Peninsula of India, who snare game and wild beasts. They are styled Pardhi by the Canarese, and Harn Pardhi, and Harn Shikari in the Dekhan, and the British style them the Shikari and hunter race. See Bawari. They snare wild animals, which they bring for sale into towns. They also capture the larger beasts of prey. They work in certain tracts of country, which they call their jungle, each body keeping to their own circle.

BHAOTA. HIND. A banner, a flag; frequently used, as Angriz ka bhaota kaim,—May the English flag remain secure.

BHAR. GUJ. A measure of weight in Gujerat, about 960 lbs.

BHAR. MALAY. A slab of tin.

BHAR, also written Bhur, an aboriginal race in the Benares district, of whom the Raj-bhar, the Bharat, and Bharpatwa are sections, though they do not eat together nor intermarry. They are said to have ruled in the tract from Gorakhpur to Bundelkhand and Saugor, and many old stone forts there are ascribed to them; but in that part of India they are now filling the meanest situations. On the hills to the east of Mirzapur, the principalities of Korar, Kurrich, and Huraha are, however, each held by Bhur rajas. Many of their old stone forts, embankments, and excavations are in Gorakhpur, Azimghur, Jonpur, Mirzapur, and Allahabad, and remnants of the people are still there. The celebrated fortress of Vijayagarh is still recognised as a Bharawati fort; and a pargana in Benares is called Bhadoi, properly Bhar-dai. Professor Wilson supposes it possible that the name comes from Bharata, an ancient dynastic name of India.—*Wils. Glos.; Elliot*, p. 83.

BHARADI, the Hindu goddess of learning, a name of Saraswati.

BHARADWAJA is mentioned in the Ramayana as a sage residing at Prayaga, the modern Allahabad, where a temple dedicated to him still exists on the high bank of the Ganges. In the Mahabharata, Bharadwaja is described as residing at Haridwar, and as the father of Drona, the military preceptor of the Pandava and Kaurava princes. He is also the parent of Arundhati, the wife of Vasishtha. Sir H. Elliot suggests that there may have been two saints of nearly the same name, Bhāradwaja and Bhāradwaja? In Sanskrit, the long ā indicates descent, as Sāgara from Sagara, Bhāgirathi from Bhagiratha. In the same way, Drona the son of Bharadwaj is called Bhāradwaj in the Mahabharata. See Hindu.

BHARANGI. HIND. Verbesina prostrata. The bark of the stem of this small plant is considered warm, and is used to promote digestion. —*Gen. Med. Top.* p. 126.

BHARANGI CHETTU. TEL. Clerodendron, *sp.* Bharga and Bhargni are explained to be Clerodendron siphonanthus, but evidently refer to another species of Clerodendron called Gantu bharangi, q.v.

BHARAO, HIND., from Bharava, a field of a size to require a bhara of seed. It is a term in use in the Himalaya.

BHARATA was the founder of a dynasty in the vicinity of the Indus. He was the son of raja Dushyanta and Sakantala, and was of Aryan descent. He established a kingdom amidst an aboriginal population. The original seat of the race was at the site now occupied by the ruins of Takht-i-Baki, in the country of the Yuzufzai, to the north of Peshawur. There is, however, no reliable information extant as to the extent of the kingdom he founded, but to this day India is known to the Hindus by the name of Bharata-varsha, or the country of Bharata, also called Bharata Kshetra and Bharat K'handa. Bharata is said to have been the first to establish a raj in India, but this probably means merely a new dynasty. Under this name, Bunsen, however, supposes two historical accounts. The first Bharata, a supposed son of Bhumanya, he thinks is the name of the primitive race who settled in central Hindustan, the Madhyadesa or Aryavarta. The Bharata kingdom, he thinks, seems to have been established between B.C. 2600 and 2200, when the country was over-

whelmed by the Panchala, and it was followed by an interregnum, B.C. 589. Wheeler also says that Bharata, son of Dushyanta, was of the Aryan race, and established the Bharata kingdom in Hindustan, amidst a preceding people. Some authors in Europe have lately endeavoured to apply the term Bharata to the entire of what is now India, but it probably varied in extent with the usual fortunes of nations. Under its third king, Sahotra, this kingdom became aggressive, but it ended with Samvarama about B.C. 2200, by the Bharata kingdom being overwhelmed by the advance of the Panchala, and driven westward.

After the inroad of the Panchala, a period of 300 years of anarchy ensued. From about B.C. 1900, the Panchala and Kuru became supreme, then the Pandava power. But about B.C. 1100 a bloody struggle occurred between the Kaurava and Pandava, from which a third interregnum ensued, which lasted 120 years. This period of anarchy was called the Kali yoga, B.C. 986 (886?); a new realm was founded in Magadha, and lasted down to Asoka II., B.C. 225, under various dynasties, viz.:

I. Barhadratha,	B.C. 986–647	IV. Seshnaga,	B.C. 446–379
II. Pradotya, .	,, 646–579	V. Nanda, .	,, 378–313
III. Bimbasara,	,, 578–447	VI. Maurya, .	,, 312–225

The above is from Bunsen's Egypt, pp. 590-592 of vol. iv.; but at another place he names the Barhadratha dynasty 220 years of Somapi, B.C. 886–647, twenty kings, down to Ripunjaya; Pradotya dynasty, B.C. 646–579.

A. Bhattya dynasty, B.C. 578–447, total 132 years.

1. Bhattya, B.C. 578–527, murdered by his son Ajita Satru.
2. Ajita Satru, B.C. 526–495, murdered by his son Udaya-bhadra.
3. Udaya-bhadra, B.C. 494–479, murdered by his son Anu-radhaka (Munda).
4. Anu-radhaka, B.C. 478–471, murdered by his son Nagadasaka.
5. Nagadasaka, B.C. 470–447, murdered by his successor of the house of Seshnaga (Sisunaga).

B. Seshnaga Kshatriya.

1. Seshnaga, B.C. 446–427.
2. Kalasoka, B.C. 428–401.
3. Bhadrasena, nine brothers, B.C. 400–379; the last of the brothers, named Pinjamakha, was dethroned by Nanda.

C. Nanda and his sons.

1. Nanda, not a person of princely extraction, headed a revolt against Pinjamakha, captured Pataliputra, and became king, B.C. 378.
2. Nanda's younger brother dethroned and murdered by Chandragupta, B.C. 313.

D. House of Maurya.

1. Chandragupta's accession, B.C. 312–289.
2. Vindusara, B.C. 288–261.
3. Asoka (the great), B.C. 260–225.

E. Partition and downfall.

The Seshnaga family descended from a mother of inferior rank. She had been the head of the dancers of a king of Likhavi at Vaisali, and subsequently became his wife. Seshnaga's son is properly the first Asoka; but the Brahmans, from hatred towards the second, who was the great patron of the Buddhists, called him only Kaka-Varna, the raven-black. It was he who removed the royal residence from Rajagriha in the south to Pataliputra. He was succeeded by his eldest son, Bhadrasena.

Nanda was a man of great courage, who headed a commotion in his own village.

Chandragupta (Sandracottus) was present with the army of Porus when the latter was murdered by Eumenes, the general of Eudemus II., in B.C. 317. He headed the popular party, and marched towards the Ganges. His kingdom extended from the Indus on the north, to the mouth of the Ganges and Telingana, also westwards to Gujerat, —the whole of Aryavarta. He died B.C. 289.

Asoka, the great Buddhist king, was crowned at Pataliputra in the third year of his reign, B.C. 258–259, and openly seceded from the Brahmanical to the Buddhist religion. He seems to have been converted by the son of his brother, whom he had murdered. He is said to have erected 84,000 Buddhist sanctuaries, partly temples (chaitya), partly tumuli (stupa or topes), and inscribed on rocks and pillars earnest inculcations of Buddhist doctrines.—*Bunsen*, ii. 547, iii. 539, 585, iv. 590–592.

BHARATA, one of the four sons of Dasaratha and Kaikeyi, and elder brother of Rama. Bharata's mother secured the exile of Rama, but it was arranged that after the expiration of 14 years Rama should ascend the throne, and Bharata govern Kosala in Rama's name.—*Garrett.*

BHARATA, the eldest of the hundred sons of Reshab'ha (Rooshabha), prince of Himahwa, to whom Bharata succeeded. Bharata resigned the throne to his son Samati, and retired as an ascetic to Salagrama. He regarded the soul as distinct from matter, and the gods and kings as in reality the same. From this, apparently, he disregarded caste distinctions.—*Garrett.*

BHARATI. SANSK. Speech, or its goddess; perhaps Bharadi, a name of Saraswati, the goddess of learning. The prevailing title of the later Sringagri gurus.

BHARE. HIND. A thatch grass.

BHARHUT, a village 120 miles to the S.W. of Allahabad, and 9 miles due south of the Sutna station of the Jubbulpur railway. It is in the state of Nagode in Central India, and is said to be the site of an old city named Bhaironpur, which embraced all the villages round. The ruins of a great Buddhist tope of the year B.C. 250–200 were discovered here in 1873 by General Cunningham.

BHARI. HIND. Cajanus bicolor.

BHARIYA. In Northern India, braziers, iron-workers, and metal founders, though connected by their avocation with the Thatheras and Kaseras, are nevertheless a distinct caste, and do not intermarry with either.—*Sherring's Tribes*, p. 322.

BHAROCH, known to Europe as Broach, was the Bhrigu-Kach'ha of the ancient Sanskrit, the Bharu-kach'ha of old inscriptions, and the Barygaza of Ptolemy and the Periplus. See Broach.

BHARPATWA, a branch of the Bhar tribe.

BHARPUNJA. HIND. A person who is a grain parcher.

BHARTAVA, a husband amongst the races in Malabar who follow the law of descent from the female side.

BHARTPUR, a town and fortress which gives its name to a State in Rajputana lying betwixt lat. 26° 43′ and 27° 50′ N., and long. 76° 53′ and 77° 48′ E. Its area is 1974 square miles; and in 1875 its population was 743,710. Its princes, nobles, and most of its people are of the Jat race. Its town of Kaman is sacred to the Hindus, Krishna having resided there. Deegtun is noted

for its elegant banwan or palaces. Near Khambar are three colossal Pandaon images of Baldeo, his wife, and Yudishtra, with another supposed to be a Jaina saint, and two enormous monolith columns. At Khanwa, Baber fought a great battle with Rana Sanga of Udaipur. The Bhartpur territory has been repeatedly overrun by contending races. The Jat principality was founded by a freebooter named Birj, who held the village of Sinsunni in the pargana of Deeg, and the power of this state was extended during the decline of the Moghul empire, by his great-grandson, Suraj Mull, who was killed in 1763. Suraj Mull left five sons, three of whom administered the state of Bhartpur in succession. During the rule of the third son, Namul Singh, the fourth son, Ranjit Singh, rebelled, and called in the aid of Najjaf Khan, who stripped the family of all their possessions except the fort of Bhartpur, which was held by Ranjit Singh. After much internal and external trouble, Sindia gave back to the family at first eleven, then three parganas, which now form the state of Bhartpur. In 1803, the chief, Ranjit Singh, entered into a treaty with the British; but he gave shelter to Holkar when pursued by Lord Lake after the battle of Deeg, and on refusing to deliver him up, Lord Lake's army stormed it four times unsuccessfully, on the respective occasions of the 9th and 21st January, 21st and 22d February 1805. On these assaults the losses appear to have been 456, 573, 894, and 987; total, 2910; and 15 officers killed and 95 wounded. But the chief then agreed to expel Holkar from his territory, and a new treaty was entered into. The raja died in 1825, leaving his young son, Bulwant Singh, to the care of Sir David Ouchterlony. But his cousin Doorjun Sal set aside the young sovereign, and murdered the uncle guardian.

The British Indian army, on the 10th December 1825, again assembled to besiege it. It comprised 25,295 regulars, and 1705 irregular cavalry, with 112 guns, howitzers, and mortars, and the Commander-in-Chief, Lord Combermere, commanded. The force of the enemy consisted of 20,000 Rajput, Jat, and Afghan. The fortress fell on the 18th January 1826. The British loss was 103 killed and 466 wounded. The enemy lost about 7000. Lord Combermere was made Viscount, and the prize-money amounted to 48 lakhs of rupees. 61,472 shot and shells were fired in the 26 days from 24th December 1825 to 18th January 1826. The races in northern India, owing to the failure of the attempts in 1803, had been in the belief that it was impregnable. The Maharaja has received a sunnud, conferring on him the right of adoption, and to a salute of seventeen guns. The revenue is Rs. 21,00,000. Bhartpur pays no tribute and no contribution to any local corps or contingent. The army consists of 3368 infantry, 2214 cavalry, and 313 artillery.—*Treaties*, iv. 121, 132. See Jat.

BHARTRIHARI, a celebrated poet and grammarian, who is said to have been brother of Vikramaditya. He wrote three Sataka or Centuries of Verse, called Sringara-sataka, on amatory matters, Niti-sataka on polity and ethics, and Vairagya-sataka on religious austerity. The last are said to have been written when he had returned to a religious life, after a licentious youth. They were translated into French in A.D. 1670; into Latin by Schiefner and Weber; into German by Bohlen and Schütz; into French by Fauche, and the erotic verses by Regnaud; and into English by Professor Tawney. Bhartrihari also wrote a grammatical work of high repute, called Vakya Padiya (Pradipa); and a poem, called Bhatti-kavya, is also attributed to him. His Vakya Pradipa, or metrical maxims on the philosophy of syntax, are the best known. They are often cited under the name of Harikarika, and have almost equal authority with the precepts of Panini. His Sataka or Centuries of Verse are also much admired. He is said to have become disgusted with the world on account of the infidelity of his favourite wife. He abdicated the throne, and ended his days at Benares in devout contemplation. He is also said to have been put to a cruel death by his brother Vikramaditya. His aphorisms are also entitled Karika. —*Garrett; Dowson.* See Bhatti.

BHARTRIHARI JOGI, an order of Hindu mendicants, who say that they were instituted by Bhartrihari, brother of Vikramaditya. They are reckoned as jogis, because Raja Bhart, it is asserted, was a disciple of a jogi. They carry a musical instrument in their hands, on which they play, while they sing the exploits of Raja Bhart. Their abode in Benares is principally at Raori Talao. There are many of the sect in the city. They walk about wearing the gerua-vastra, or reddish cloth worn commonly by devotees. At death they are buried.—*Wilson; Sherring*, p. 261.

BHARWAR, a tribe keeping goats, sheep, and camels, and living on their produce.

BHARWI. HIND. Imperata Kœnigii.

BHARWUTTIA, a manifestation of lawlessness almost peculiar to Kattyawar (voluntary outlawry), not yet extinguished in the province.

BHARYA, also Bharja. HIND. A Hindu wife; a second wife after the Patni or first wife; a Nair woman.

BHASAN, a class of Sudras in the Khassya hills.

BHASHA. SANSK. A language, a dialect, from Bhash, to speak. The terms Bhasha and Prakrit mean vernacular tongues. Do-basha, lit. two languages. Do-bashi, an interpreter, an agent. Bhashya, from Bhasha, a tongue; a lingual treatise. One of these treatises was written by Vallabha Acharya.—*W.*

BHASKARA. SANSK. From Bhas, light, and Kri, to do or make. A treatise on the sun, its true nature, in the Mimansa-Upanga. Also a name of the sun as the light maker. Bhaskara-Saptami, a Hindu festival in honour of the sun, held on the seventh of the month Magha (Jan.–Feb.).

BHASKARA CHARYA, a celebrated astronomer, born about A.D. 1065, who resided at Beder in the 11th century. He applied his mind chiefly to numerical science. He was a Brahman, and had only one child, a daughter, named Lilavati, to whom he dedicated his work, the Bija-ganita, and singularly it came to be called by his daughter's name. Its date is SS. 1036 = A.D. 1114. His Siddhanta Siromani (Head Jewel of Accuracy) is an astrological work, published SS. 1050 = A.D. 1128; and he died soon after, aged 65. He has had no rival in India in mediæval or modern times. Part of it was translated by Colebrooke. He has been supposed to have been acquainted with the principle of the Differential Calculus; and Dr. Spottiswoode considers that the formula which he establishes, and his method of establishing it, bear a strong analogy to the

corresponding process in modern astronomy.—*Garrett; Elph.* i. 30; *Dowson.*

BHASMA. HIND. Bhasnuam, SANSK. Ashes. Bhasma-st'hnana, smearing the body with ashes of cow-dung, a common practice of Saiva mendicants.

BHAT. HIND. Paddy; boiled rice. Curry-bhat, ANGLO-BENG., Curry and rice. Doodh-bhat, rice and milk. A nursery rhyme, in Calcutta, goes:—

'Kitsha kitsha kowa k'hai.	Baba k'hai chori.
Doodha bhata Baba k'hai.	Masalah ka thori.'

BHAT. HIND. The Bard.

Phatis, ... GR.	Vates, ... LAT.
Parat, ... HEB.	Bhatta, ... SANSK.
Bardeit, . . . HIND.	

The Bhat is the court minstrel of India, the almanac maker, the chronologist, the family bard, the astrologer, the genealogist. They are found all over India, but are numerous in and near Rajputana. The Birm-bhat and Jaga-bhat, the former at weddings, and the other at festive occasions, recite the deeds of ancestors; the latter keep the family records of Rajputs; but Brahmans often take their work, as in Rohilkhand. The Bhat, or bard of India, are of three sorts, the Magadha or historians, the Sata or genealogists, and the Bandi or court minstrels, whose duty in older times it was to salute the king or chief in the early morning, wishing him long life and prosperity. The bards, from their sacred character, were often employed as convoys of travellers and their property, in tandas or caravans. Throughout Rajputana, they are regarded as a sacred order, and as the hereditary guardians of history and pedigree. They chant their own verses, or legends from the mythology of India.

According to one fable of their origin, Mahadeva created a Bhat to attend to his lion and bull, but the bull was daily killed by the lion. On which, Mahadeva, tired with daily creating a bull, formed the Charan, equally devout as the Bhat, but of bolder spirit, and gave him charge of the animals, from which date the bull was never destroyed by the lion.

In the west of India, where the bard is identified with the Charan, his personal security was held sufficient for the payment of a debt or the fulfilment of an engagement, its violation being followed by the voluntary death either of the Bhat himself or of some member of his family, the retribution of which falls upon the defaulter.

When the Rajputs were driven westwards into their present lands, Brahmans do not seem to have accompanied them, or perhaps at the time the Brahmans were not numerous in Rajput territories, and Bhat and Charan took their places. As priests, genealogists, chroniclers, and bards, they exercise a powerful influence over the Rajput race. The Bhat, as chroniclers and bards, share power and sometimes office with the Charan, but seldom sacrifice themselves. Amongst the lower tribes of Hindus, the Bhat enjoys great and exclusive influence. They give praise and fame to those who are liberal to them, while they visit with satire others who neglect or injure their order, reproaching them with spurious birth and inherent meanness. The exactions or largesses exacted by the Bhat and Charan from the Rajput races on the occasion of marriages, were exorbitant, until about the year 1840, it was arranged that fees should be paid on a scale proportioned to means.

Bhat take the honorary title of Rao. In Oudh, the Bhat, Birm-bhat or Badi, and the Jaga-bhat, number 64,429, and they claim a Brahmanical origin. In Rajputana, every family of any pretensions retains one or more bards; and no person can go abroad without bards to proclaim his titles, achievements, or those of his forefathers, which is done in a loud tone, and the bards vie with each other in composing extravagant epithets. No person can enter a room, rise or go out of it, without suitable proclamation from the bards present. Some are good at improvising, and on occasions deliver extempore orations in verse, and chanted in wild measures, when their words have a great effect on their hearers. They occupy the exact position of the bards of Europe, inciting to peace, to war, to love, to generosity, as occasion demands.

The Birm-bhat are hired on particular occasions to recite the traditions of a family; the Jaga-bhat being the chroniclers of the family by hereditary descent, and visiting the members periodically, to take note of all occurrences regarding them. Both classes are as much dreaded for their rapacity as respected for their reputed sanctity. In some places in Upper India, the Bhat are found forming village communities, and branching into various subdivisions; some have become converts to Mahomedanism. The Bhat of the village establishment appears to be of an inferior class.

The Bhat are more immediately connected with the Rajput clans, and the Charan with the Kat'hi. The two castes will eat of each other's food, but will not intermarry. The women of the Charan and Bhat are clothed in long flowing black garments, and have a sombre if not actually horrid appearance. They do not wear many ornaments, and are not restricted from appearing in the presence of strangers; accordingly, in passing a Charan village, the traveller is sometimes surrounded by women, who invoke blessings on his head by joining the backs of their hands and cracking the knuckles of their fingers in that position over their heads. Their dress consists of a gogra or petticoat, made very full; the neck covered with a choli, which descends below the hips, and covers the stomach, but is open behind, where it is fastened with two strings; a wide muslin scarf, attached to the gogra, passes round the body and the head, completely concealing the wearer from view.—*D. J.* vii.; *Hindoos*, p. 75; *Wilson's Gloss.; Heber*, ii. p. 453; *Tod; Elliot's Suppl. Gloss.; Malcolm's Central India.*

BHAT. HIND. A soil to the north of the Ganges, highly retentive of moisture. Bhata or Bhatu, in Gujerat, is land subject to inundation.

BHATA or Batta. HIND. An additional allowance, or extra pay to servants, or soldiers, or officers; a ploughman's wages in kind.—*W.*

BHATA. HIND. Crotalaria burhia.

BHA-TA-KA. BURM. In Tavoy, a wood used for common carpentry.—*Captain Dance.*

BHATARKA, the founder of the Valabhi dynasty.

BHATGAON or Bhatgong, a district and town of Nepal; though the least considerable of the three chief towns in point of size, yet its buildings in general have a more striking appearance. Bhatgong lies nearly 8 road miles S. of Khatmandu. Its ancient name was Dhurmapatan, and it is called by the Newar race, Khopodaire; by them it

is also described to resemble in figure the dumroo, or guitar of Mahadeo. It is the favourite residence of the Brahmans of Nepal, containing many more families of that order than Khatmandu and Patan together.

BHAT-GAUR, a subdivision of the Gaur Rajputs.

BHATI, a tribe in the Lahore division of the Panjab. They were Yadubansi Rajputs, who in Akbar's time became Mahomedans.

BHATIA, between Multan and Alor, supposed by General Cunningham to be the city which Alexander built among the Sogdi. It was taken by assault in A.H. 393, or A.D. 1003, by Mahmud of Ghazni, after an obstinate defence, in which raja Bajjar, or Bijé Rai, was killed. Amongst the plunder, Mahmud obtained 280 elephants. — *Cunningham, Ancient Geog. of India*, p. 256.

BHATIYA, HIND., also Bhati and Bhatua. The poorest kind of soil in Sagur and Bundelkhand; it is of a reddish colour, and is mixed with kankar and stones. Shallow in depth, and generally exhausted after the third year, after which it requires a four years' fallow. Only the poorest grain and millets will grow upon it.

BHATKAL, a small seaport town of 5246 inhabitants, in North Canara, known to the Europeans of the 14th to the 16th centuries as Baticala, Battecala, and Baticalloa. The Mahomedans here are the Naoait, a Sunni sect.

BHAT-KATAI, also Bhat-katia. SANSK. Solanum Jacquini, *Willde;* also S. Xanthocarpum and Argemone Mexicana.

BHATKOORAL. HIND. A hard, close-grained wood, of a light grey colour, and not heavy. Scarce in the Santal jungles. Well adapted for timber bridges, where strength and toughness require to be combined with lightness.— *Calc. Engineers' Journal.*

BHATMIL. HIND. Argemone Mexicana.

BHAT-NAGAR. HIND. A tribe of Kayasths, originally from Bhatner.—*Elliot.*

BHATNAIR, a town and fort in the north of Bikanir, in lat. 29° 34′ 55″ N., and long. 74° 20′ 45″. See Bhatti.

BHAT-NIGGI. HIND. Wikstræmia salicifolia.

BHATOTAR. HIND. Lands allotted to bards.

BHAT-SHOLA. BENG. Æschynomene Paludosa.

BHATTA. SANSK. A sage; a Brahman acquainted with Sanskrit literature; literary title conceded to learned Brahmans who commit one of the Vedas to memory, so as to be able to recite the whole without book. In some parts of South India, it especially designates a Brahman who professes a knowledge of the Vedas, or belongs to a family in which they have been taught. Bhatta Acharya, a teacher of Sanskrit literature, is a title which is given to Hindu scholars who not only learn one of the Vedas by heart, but study the meaning of each verse and word, so as to be able to explain it orally. They are now very few. About 1870 there were only three or four at Benares; but they are highly respected, and on certain occasions regularly worshipped as incarnations of Vrihas-pati, the Pandit of the gods.— *Elliot; Wilson; Garrett.*

BHATTA, Batta, or Battak, a Sumatran race addicted to eating human beings. They occupy the valley of Mandeling and to the west, and the easterly portion of them are under the dominion of the Dutch. The language they use is said to be different from the Malay, and to have several dialects; but it has an alphabet invented by themselves, and in this matter they are perhaps the only human beings who have advanced to a knowledge of letters, but continued to eat each other. The writings of Marco Polo show that so long ago as A.D. 1290, they were known to be addicted to indulgence in this propensity; and Sir Stamford Raffles, in 1820, after visiting Tampanuli Bay, was informed that for a person convicted of adultery, of midnight robbery, prisoners of war, a person intermarrying with another tribe, a person treacherously attacking a village, a house, or another person, the punishment was to be cut up and eaten alive. Marsden, in his History of Sumatra, notices them. The most recent traveller, Professor Bikmore, from America, who was in Sumatra in 1865, mentions that they are an inland people, the Malays from Menangkabau having spread and occupied all the coasts. He says they believe in evil spirits and omens. On the Dutch acquiring the possession of the plain of the Mandeling valley, the Batta dwelling there were compelled to abandon their cannibalism, but all beyond Dutch territory the race still pursue their old customs. He had not, however, been able to verify that part of Sir Stamford Raffles' information which includes marrying into another tribe as incurring the penalty. The raja of Sipirok assured the Dutch governor at Pedang that he had eaten human flesh at least forty times, and that he relished it above everything that he had ever tasted. — *Bikmore's Travels*, p. 418; *Marsden's Sumatra.*

BHATTA MURTI, a distinguished Telugu poet who resided at the court of Krishnaraya. He wrote the Narasa Bhupaliam during his patron's life, but his chief poem, the Vasu Charitramu, after that patron's death. It contains florid descriptions of scenery and love affairs, and is much esteemed.—*Garrett.*

BHATTA NARAYANA, author of the Veni-Sanhara, a Sanskrit poem.— *Ward*, iv.

BHATT'HI. HIND. A distillery, a still, a boiler, a kiln, a forge.

BHATTI or Bhatti-Kavya, by Bhartrihari, is a poem in 22 cantos relating the adventures of Rama. It has been partly translated into German by Schütz.—*Dowson.* This Bhartrihari was a grammarian and poet, son of Sri Dhara Swami, not the celebrated brother of Vikramaditya.—*Ward*, iv. p. 387.

BHATTI, a Rajput tribe of Yadubansi descent. They are the rulers of Jeysulmer, which they founded A.D. 1156, and gave their name to the country between Hissar and the Garah, called Bhattiana. The tract from Loni to Kasna was called Bhatner after them. Some of them became converts to Mahomedanism after Timur's invasion. Shortly after that event, a colony migrated from near Bhawalpur under a leader Bersi, and captured Bhatner from a Mahomedan chief.—*Elliot.* The Jit and the Bhatti seem to have been so intermingled that distinction is now impossible. The Jit who resisted the advance of Mahmud of Ghazni, in a naval warfare on the Indus, are supposed by Colonel Tod to have, long prior thereto, established themselves in the Rajputana desert as well as in the Panjab, and to have had great political power, as they were reckoned one of the

thirty-six royal races. In A.D. 1205, which was twelve years after the conquest of India by Shahab-ud-Din, the Jit of the northern desert attempted to wrest Hansi from the Mahomedan empire, and Kutub-ud-Din, his successor, conducted in person the war against the invading Jit. When the dethroned queen Razzia sought their protection, they joined all their forces with their Scythic brethren the Ghikar, and marched with the queen at their head to meet her foes, but she fell in battle in the attempt to regain her kingdom. Again, it is mentioned that in A.D. 1397, when Timur invaded India, Bhatner was attacked for 'having distressed him exceedingly on his invasion of Multan,' when he 'in person scoured the country, and cut off a tribe of banditti called Jit.' The Bhatti of Jeysulmer retain their Hindu notions, though with some degree of laxity, from their intercourse with the Mahomedans on the northern and western frontiers; while those who long occupied the north-east tracts towards Phoolra and the Garah, on becoming proselytes to Islam, ceased to have either interest in or connection with the parent state. The Bhatti did not enjoy the same martial reputation as the Rahtor, Chauhan, or Sisodia, but he was deemed to equal if not surpass the Kachwaha, or any of its kindred branches, Nirooka or Shekhavat. He is not perhaps so athletic as the Rahtor, or so tall as the Kachwaha, but is generally fairer than either, and possesses the Jewish features of the Bikanir Rajputs. The Bhatti intermarries with all the families of Rajwara, though seldom with the ranas of Mewar. The late Juggut Singh of Jeypore had five wives of this stock. The dress of the Bhatti consists of a jāmah, or tunic of white cloth or chintz, reaching to the knee; the kamrband, or ceinture, tied so high as to present no appearance of waist; trousers very loose, and in many folds, drawn tight at the ankle; and a turban, generally of a scarlet colour, rising conically full a foot from the head. A dagger, shield, and sword complete the dress. The Bhattiani wear a fine woollen brilliant red gogra or petticoat, and scarf thirty feet in width. They also wear the chaori, or rings of ivory or bone, which cover their arms from the shoulder to the wrist, of value from sixteen to thirty-five rupees a set; and silver kurri (massive rings or anklets) are worn by all classes, who deny themselves the necessaries of life until they attain this ornament. The poorer Rajputni assist in the husbandry. The Bhatti is addicted to the immoderate use of opium, or umlpani 'infusion,' and the pipe. The Bhatti annals may be divided into four distinct epochs: 1st, that of Heri, the ancestor of the Yadu race. 2d, Their expulsion, or the voluntary abandonment of India by his children, with their relations of the Hericula and Pandu races, for the countries west of the Indus: their settlements in Marust'hali; the founding of Guzni, and combats with the kings of Room and Khorasan. 3d, Their expulsion from Zabulist'han, colonisation of the Panjab, and creation of the new capital of Salbahanpur. 4th, Their expulsion from the Panjab, and settlement in Mer, the rocky oasis of Maroo, to the erection of Tunnote in the Indian desert, in A.D. 731. The Bhatti are a branch of the Yadu or Jadoo race, whose power was paramount in India three thousand years ago; and the prince now governing this distant corner of India, claims descent from those Yadu kings who ruled from the Yamuna to the 'world's end' at that remote period. Colonel Tod is of opinion that the Yadubhatti is the original Yuti colony from central Asia, and that the Jit prince of Salpur was the predecessor of the Yadubhatti races.—*Tod's Rajasthan*, vol. ii. pp. 212, 285. See Sabagræ.

BHATTIAH, a mercantile race, supposed by Colonel Tod to have been one of the equestrian order converted into the commercial. The habits of the Bhattiah are like those of the Arorah, next whom he ranks as to activity and wealth. The Arorah and Bhattiah have commercial houses at Shikarpur, Hyderabad, Bombay, Surat, and Jeypore.

BHATTIANA, a tract of country in the Panjab, forming part, since 1835, of the Hissar and Sirsa districts. It takes its name from the Bhatti Rajputs. In 1795, George Thomas, who had got possession of Harrianah, obtained an influence over the Bhatti, but after the victories of Lord Lake in 1803 it passed under British rule.

BHATTYA, a Brahmanical dynasty of five kings of Magadha in ancient India, who reigned from B.C. 578 to B.C. 447, all parricides. See Bharata.

BHATU, a wandering tribe of gymnasts in the south of India. They are not numerous; they are known as Dumur in the Canarese districts, as Kollati in the Dekhan, Dumbram in Tamil, and Dumberwar in Telugu, and as jugglers and tumblers. Their young women are prostituted, or are devoted at Chinchor as Murli girls, and they reverence the idols at Triputty and Gudaloor (Cuddalore)? They keep no idols, do not respect Brahmans, and they bury the dead.

BHATULA. HIND. A hard bread from the grains of 'arhar,' 'chenna,' and 'mung,' used only by the very poor.—*Elliot.*

BHATWA. PANJ. Chenopodium vulgare and Ch. album.

BHAU. MAHR. A brother, a cousin; a title of respect, as Hari-bhau. A daughter-in-law, also a bride; bridal fees given to a zemindar by a ryot on the marriage of the ryot's daughter.

BHAU BIJA. A Hindu festival about the end of October, on the second day of Kartik, in commemoration of Yama having dined with his sister. On this festival, Hindus visit their sisters' houses, and make presents to them. Among the Brahmans, their wives and sisters worship their husbands and brothers.

BHAUCHYA, one of the 14 Hindu patriarchs who are supposed to preside successively over the 14 Manwantara of the Calpa.

BHAU DAJI, a learned orientalist, a native of Western India, of the middle of the nineteenth century. He was born near Sawantwaree in the Konkan, and educated for the profession at the Elphinstone and Grant Medical Colleges. He has written on female infanticide. He founded the Bombay Reform Association; and the Boards of Education, museums, and learned societies owe much to his exertions.

BHAU-GARDI. MAHR. Any terrible defeat.

BHAUMA, one of the names of the planet Mars; in Hinduism, the analogue of Mars.

BHAU MALLANG, lat. 19° 6′ N., long. 73° 12′ E. A hill 10 miles N.E. of Panwel, in the Konkan. Top of the hill is 2250 feet above the sea.

BHAUNAGAR, a seaport town, capital of a

native state in Gujerat, with an area of 2784 sq. miles, and a population, in 1875, of 403,754, consisting chiefly of Vaishnava and Sumast Hindus, Jains, and Mahomedans. The ruler, styled Thakur, is a Gohil Rajput. In the eighteenth century the family aided in the suppression of piracy in the Gulf of Cambay. The Thakur has powers of life and death over his own subjects. The capital has a good and safe harbour.—*Imp. Gaz.*

BHAUR. See Theatre.

BHAUTTOOI. BENG. Chrysopogon acicularis.

BHAVA or Babo, A.D. 1550, author of the Babo Prakasa, a Hindu physician who lived in the middle of the 16th century. He compiled a book for the use of practitioners, in which he gave a summary of the practice of all the best writers on medicine, and named the book after himself; it is written in a clear style, and is still greatly valued by the physicians of Northern India as a practical work on Hindu medical science.

BHAVABHUTA, a celebrated Sanskrit scholar and dramatist, with the literary title of Srikanta, he in whose throat eloquence resides. He was a Brahman, born in Beder or in Berar in the 8th century, but resided at or near Ujjaiyani. He was of the Kasyapa tribe or gotra. He describes nature in her magnificence. Some of his dramas were translated into English by Professor Wilson. He wrote the Uttara Rana Charita, a Sanskrit drama, history of Rama to the death of Ravana, and Maha-Vira Charita to the end of his life. In his drama of Malati and Madhava, he has made powerful use of the Aghòri in a scene in the temple of Chamunda, where the heroine of the play is decoyed in order to be sacrificed to the dread goddess Chamunda or Kali.—*Ward*, iv.; *Garrett; Dowson.* See Kala Priyanath.

BHAVANJI CHETTU. TEL. Psoralea corylifolia.

BHAVAYA, an itinerant actor, musician, dancer.

BHAWA. HIND. Cathartocarpus fistula.

BHAWAN. HIND. A house, a temple, a palace.

BHAWANI, written Bowany, a tributary of the Cauvery river. It rises among the hills on the western side of the Koonda, runs eastwards along the foot of the Neilgherry mountains, and is joined by the Moyar, which, together with the Pykarra, rises in the Neddawattum range, and, joining the Bhawani at Danikan Cottah, the Bhawani enters the Cauvery.

BHAWANI, also written Bhavani, wife of Siva, a Hindu goddess, to whom also the names Aparajita, Chandika, Durga, Kali, Maheswari, Parvati, Prakriti are given, according to her worshipper's opinions of her character. Durga and Bhavani are two names of Prakriti, the symbol of created nature, and as Parvati, Kali, Durga, and Bhavani, the wife of Siva bears a strong resemblance to the Isis of Egypt, to the Juno of Homer, to Hecate, to the armed Pallas, and to the Lucretian Venus. As Kali, she is the agent for her husband's decisions. She is often depicted with the pasa or string in her hands, for binding and strangling incorrigible offenders. As Durga, or active virtue, she destroyed the Asura. Bhavani, in the form of Parvati, is nature personified, in which character she is fabled, in one of the hypotheses of the Hindus, to have been the mother of Brahma, Vishnu, and Siva, and to have divided herself and become their sakti. The Saiva Hindus are worshippers of Siva and his wife Bhavani conjointly, and adore the lingam and yoni in the compound type of god and goddess. Bhavani and her consort Siva are extensively worshipped in the south of India, have a multitude of small temples, but there is little or no reverence. It would seem as if a Scythic and an Egyptian goddess, with their respective attributes and mixtures of war, love, philosophy, physiology, cosmogony, and final judgment had been amalgamated. As a war goddess, Bhavani is often invoked. Tod tells us that, in the belief of Rajputs, the double-edged sword presented by Gorakhnath in the forest of the Tiger mount, could, with the proper incantation, sever rocks. It is surmised to be the identical blade which is yet annually worshipped by the sovereign and chiefs on one of the nine days sacred to the god of war,—a rite completely Scythic. The genealogists of the family repeated to him the incantation. It is: 'By the preceptor Gorakhnath, and the great god Eklinga, by Takyac the serpent, and the sage Harita, by Bhavani, strike!' This goddess is supposed to have inspired Sivaji to murder Afzal Khan, the general of the king of Bijapur. At a conference, Sivaji struck Afzal Khan with a wagnak, and finally despatched him with the beautiful Genoese blade called Bhawani, which he always wore. That sword, down to the time of the British supremacy, had a little temple for itself in the palace of Sivaji's descendants, and it was annually worshipped by them and their household, not as a mere act of veneration for their ancestor's trusty sword, but because it was the chosen instrument of a great sacrifice; and the attendant who watched it used to say that no doubt some of the spirit of Bhawani must still remain in it. Many towns and rivers are named after her.—*Tod's Rajasthan*, i. 226; *Cole. Myth.* p. 96; *Moor, Hindu Pantheon; Sir William Jones; Paolino's Voyage.*

BHAWAR or Bhavar. HIND. Lowlands in the Terai, at the foot of the Himalaya. In the N.W. Himalaya, a forest tract below the Siwalik range. This term is not used in the Panjab. Qu. Bhabar.

BHAYEL RAJPUTS of Mewar (Bhayel, rocky hills), are descendants of Sujjun, a Puar Rajput.

BHEDAN or Basaikela, a very old Gond chiefship, now attached to the Sumbulpore district. During the 1857 mutiny the chief joined the rebels, and was killed in action.

BHEDI. BENG. A dyke, an embankment.

BHEKKAR. HIND. Adhatoda vasica.

BHEKRA. MAHR. Tetraceros quadricornis.

BHEL. HIND. Andromeda ovalifolia.

BHELA. HIND. Semecarpus anacardium.

BHELA, an ancient Hindu writer on medicine.

BHENDI, also Benday Kai. TAM. Abelmoschus esculentus. The capsules, when green, are boiled whole and eaten, or sliced and put into soup or curries; the inside is filled with albumen, and, when dressed, not unpleasant. The seed is sometimes laid upon toast with butter, pepper, and salt. Another species, A. moschatus, has a smaller capsule; the seeds when rubbed between the fingers have a strong scent of musk. The Arabs flavour their coffee with them.

BHENG. HIND. Nelumbium speciosum.

BHERA GHAT, on the Nerbadda, near Jubbulpur (10 miles), on the line of the railway to Bombay. Marble is plentiful, and easily accessible, and

has been used in a limited degree at Jubbulpur, sometimes to make lime, and other times for metalling roads. It is made up into images by natives, but does not take a good polish. A block was sent to the late Paris Exhibition, and pronounced to be equal to Italian marble for statuary purposes. At this place the river winds between perpendicular rocks of the magnesian limestone, the Marble Rocks, which in one part approach so close as to get the name of the Monkey's Leap.

BHERANDA. Beng. Castor-oil plant.

BHERBAND. Hind. Argemone Mexicana.

BHERI. Tel. Leonotis nepetæfolia, *R. Br.*

BHERIJA or Bheriga. Hind. Canis lupus, the wolf; also pronounced in the various dialects, bhera, bhara, bharya.

BHERLI. Mahr. Caryota urens.

BHERRA, Hind., also Bharra. Wheat and other grain sown together.

BHET, Hind., also Bhent. Land alongside a river, subject to periodical inundation.

BHEWNDI, a district in the vicinity of Bombay, in which reside many christianized Koli.

BHI. Hind. Cydonia vulgaris, quince.

BHIA, the marmot of the Bhot.

BHIDAIRA, the root of a small bush found in Ajmir, and brought from Dehli; has little taste; used in medicine. Women take it during pregnancy, believing it can cause the womb to rise out of the pelvis when tardy in so doing.—*Gen. Med. Top.* p. 129.

BHIHAR, a tribe which, according to local tradition, appears to have been one of the aboriginal races of Rohilkhand and the Upper Doab. They were expelled from Nerowlee Buhjoee and the neighbouring districts by the Bir-Gujar Rajputs. In the Doab they are commonly called Beimhar, and in Rohilkhand, Bihar.—*Elliot*, p. 68; *Wilson's Glossary.*

BHIKH. Hind. Alms. Bhikhshu or Bhikkari, a beggar. Three religious garments, a begging pot, razor, sewing needle, waistband, and bathing cloth, are peculiar to the Bhikshu or Hindu mendicant ascetic. The Bhikshuka in Sanskrit, in Pali, Bhikhkhu, is a mendicant who foregoes three objects of human existence,—pleasure, wealth, and virtue,—and remains constantly occupied with devotion; to abstain from all wrongdoing, call nothing his own, and to suppress desire, anger, pride, and covetousness. For the support of existence, he is to apply for alms at Brahman, Kshatriya, and Vaisya houses, after their cooking fires have been extinguished and the people have eaten; to reside but one night in a village, and not more than four nights in a city. Bhikshuni is a woman who follows the life of a Buddhist devotee; a nun. Bhikshu-griha is a cell in which Buddhist ascetics dwell.—*Garrett.*

BHIL, one of the races who early occupied India. According to Malcolm, in a Sanskrit vocabulary at least 700 years old, the term Bhil occurs to denote a particular race of barbarians, subsisting chiefly on plunder, and found more particularly in the mountainous woody tract of the Nerbadda. But there is still earlier mention of them in the Mahabharata, in which the Bhil are minutely described, and a long fabulous account given of their origin. The Caba race, now almost extinct, was famed, even in the days of Krishna, as the savage inhabitants of Saurashtra. It was a forester Bhil who mortally wounded Krishna, having mistaken him for a deer. When the Bhil was expressing his contrition for the unintentional act, he was forgiven, with the remark that it was only retributive justice, as 'in a former birth,' as the godlike Rama, Krishna had slain him. Thus Rama appears as the subjugator and civiliser of these indigenous tribes, of whom the Caba are described as plundering Krishna's family after his decease. The Bhil have been forced by the later immigrants into the forest tracts, like many such tribes in Central India, as the Kol, Gond, Mina, Mera, Chuar, Sarja, Ahir, and Goojur; many of them dwelling in the forest tracts of the Son, Nerbadda, and Mahanadi, the mountains of Sarguja, and Chutia Nagpur; many of them still only little removed from savage life, and with dialects as various as their manners.

The Bhil occupy parts of the Vindhya and Satpura ranges which form the western boundaries of Malwa and Kandesh. Their favourite abodes are the woody and rugged banks of the Tapti, the Mahi, and Nerbadda; but from lat. 20° to 25° N., and long. 73° to 76° E., is partly occupied by them, as also the neighbouring hills, where they extend in one line along the mountains to the furthest limits of Dongarpur. As a distinct tribe, they are found in the block of hills surrounding the fortress of Asirgarh, and on one side they are bordered by the Koli, and on another by the Gond of Gondwana. They occupy the petty states of Dunduka, Rompur, and Gogo, between the Mahi and the Nerbadda, and Nerbadda and Tapti, and Rajpipla N.E. of Surat.

The northern part of the chain of ghats, and the country at its base, is inhabited by the Bhil; that part to the south of Bauglan and the country at its base, as far south as Bassein, is inhabited by the Koli. The Bhil possess the eastern part of the range, and all the branches that run out from it towards the east, as far south as Poona; they even spread over the plains to the east, especially north of the Godavery, and the neighbourhood of the Warda. On the north, they extend beyond the Tapti and Nerbadda. Both the Bhil and the Koli are numerous in Gujerat. South of Poona the Bhil are succeeded by the Ramusi, a more civilised and subdued tribe, with thievish habits. To the north of Poona, in Kandesh, Malwa, and Mewar, are the chief Bhil localities. The Ramusi do not extend further south than Kolapore, or further east than Hyderabad city. The Bhil who find their way to the western coast, are known as the Dubla, or the Kala Puruj, or black men. They are to be seen in outlying portions of the Indore and Gwalior territories, in Dhar, Bakhtigarh, Jharna, Ali Rajpur, Jobat, Kattiwara, Ratanmal, Mathwar, Dahi, Nimkhera, Bara Barkhera, Chota Barkhera, Kali Baori, Barwari, Jamnia, Rajgarh, Kothide, Garhi, and Bharudpura. Mr. Forbes, a recent writer, described the Bhil as wearing few clothes, of diminutive stature, with swift and active habits, independent in spirit; eyes which bear an expression of liveliness and cunning; bold in assault, but rapid in flying to the jungles; formidable in anarchy, but incapable of uniting amongst themselves; and as by far the most numerous of the predatory races who in former days resided in the hills between Gujerat and Rajputana, and disturbed the country. Their arms are bows and arrows; they are averse to

industry, addicted to drunkenness, and quarrelsome when intoxicated. Until the middle of the 19th century, the national weapon was the Kumpta or bamboo bow, the string being a thin slip of its elastic bark. The Bhil, from ancient times, use the fore and middle fingers of their right hand to the string of their bow, holding the arrow between the two fingers. Their readiness to become predatory has marked them as bold, daring marauders, occasionally mercenaries, but invariably plunderers. They were cruelly dealt with by the Mahratta and Mahomedan governments, and were several times severely punished by the British; but by the middle of the 19th century they became more peaceable, and many of them came to the plains to live as cultivators and agricultural labourers. They came prominently and unfavourably before their British rulers in the early part of the 19th century. During the contests for supremacy in Kandesh between the Mahrattas and the Moghul, from which, in A.D. 1803, a fearful famine resulted in the country north of Ahmadnaggur, the whole of the Bhil race formed into gangs of plundering assassins, and resettling them occupied the British Government from 1825 to 1833. The Bhil clans are now in a state of great moral transition.

It was part of the ceremony of installation of Rajput princes, for a drop of blood to be taken from the toe or thumb of a Bhil or Mina to mark the tika on the chieftain's forehead. Amongst the Mina, the right of giving the blood is claimed by particular families; but this rite has been largely discontinued. The Bhil have now no separate language.

The Bhil child is named as soon after birth as possible, and the name given has generally some connection with the hour and date of its birth. If no Brahman is available, the ceremony is performed by the paternal aunt of the child, in which case it is named after the day of the week on which it was born. The parents give a feast, and distribute presents of clothes to female relations at the Holi next after the birth. The head of a male child is shaved when two or three months old. Betrothal, as a rule, takes place before the girl arrives at a marriageable age. The father of the boy seeks out a bride for his son, and arranges the dapa, or price of the girl, with her parents. This being agreed to, the girl is placed on a stool, under which six pie are thrown. One rupee, one pice, and a little rice are then put in her hand, which she throws over her shoulder, and the ceremony is completed. Marriage generally takes place as soon as the girl arrives at puberty; but it is not at all unusual for virgins of a mature age to be espoused, in which case marriage follows as soon as practicable. A Brahman usually officiates, but sometimes an elderly member of the bride's family. When the guests have assembled, the clothes of the young couple are tied together, and they walk hand in hand round the party, an offering being made to the patron saint, Gotamji, whose image is to be seen in a niche of the wall of most Bhil houses. The bride is then placed on the shoulder of each of her relations in turn, and danced about till exhausted. Polygamy is allowed, but a Bhil generally contents himself with two wives. On the death of an elder brother, the next takes his widow or widows, without the usual marriage ceremonies. An elder brother cannot take a younger's widow, who, if there is none younger still to espouse her, and she has no property of her own, must return to her parents, or be supported by her husband's next of kin until she can find another husband in another got or clan. If, however, a widow has a grown-up son, she stays with him. A woman is very particular in her relations with the opposite sex after marriage, but not so usually before. The fine imposed upon an adulterer is 240 rupees, and this is given as compensation to the husband, who may discard his wife or not as he likes. For the seduction of a virgin the fine is 60 rupees, which is given to her parents, and the man compelled to marry the girl. These cases are always adjudicated by a panchayat.

The Bhils invariably burn their dead; but in the case of the first victim to an attack of smallpox in the pal, the body is buried for a space of time to propitiate Mata, and if within a certain time no one else dies of the disease, it is disinterred and burnt. The corpse is generally burnt if possible near a river, and the ashes, with the exception of a bone or two, thrown into it; two or three days afterwards, an earthen pot containing rice is placed on the spot; but if the cremation took place some distance from a river, the ashes are simply heaped up and the pot of rice placed on the top. The bones recovered from the ashes are subsequently thrown into either the Samlaji river in Mahikanta, the Gotamji in Banswara, or the Mahi, where it flows by the temple of Baneshwar in Dungarpur, all of which are considered sacred; for until a bone or two of the deceased find their resting-place in one of these sacred streams, the spirit is supposed to remain on earth and haunt the surviving relations. A few days after the death, one of the deceased's relations often announces that he has been told in a dream that the spirit rests on a certain hill, when the relatives erect a platform there, and deposit on it a quantity of liquor and rice. Ten or twenty days after the cremation, the friends of the deceased assemble at the house of the next of kin, who spends some 40 rupees' worth of liquor on the occasion. On their arrival a quantity of Indian corn is set to cook; and in the meantime the company shave one another and drink the liquor provided. When the corn is ready, the host gives each a dhak (Butea frondosa) leaf full of it, and dismisses them.

The symbols of worship are cairns, usually on the hill-tops; the worship of Siva and his consort, as symbols of terror and darkness; the construction of stone platforms, on which stand blocks of stones smeared with red paint; the sacrifice of animals and horse effigies. The cairns are piles of loose stones, on which are arranged a number of stone or burnt-clay effigies of the horse; oil-lamps are burnt on them in fulfilment of vows, and pieces of cloth are generally hung over them. The first of all goddesses in the tracts is Samuda Mata, whose sthan is near the village of Dhelana, about eight miles north of Khairwara. Mahadeo and Hanuman are worshipped everywhere. Local deities are also numerous. The effigies of the horse are small, hollow clay images, with a hole behind, through which the spirits of the deceased are supposed to enter and travel up to paradise. On arrival there, the horse is made over to propitiate the local deity, and swell his train of war-horses. These effigies are mostly found on hill-

tops, placed by persons who have purchased them at certain shrines, where they are made. There is a tradition among the Bhils that human sacrifices were offered up in ancient times, but there is no trace of the practice at the present day. Goats now form the sole sacrifices, and are eaten by the worshippers after Mata is supposed to be satisfied. The priests, called waiti and jogi, are Bhils. They eat and drink with the rest.

They believe in ghosts and departed spirits. They wear charms and amulets on the right fore-arm to keep spirits at a distance. Witchcraft is firmly believed in; there are bhop or witch-finders in every large pal. Before a woman is swung as a witch, she is compelled to undergo the ordeal of plunging her hand into boiling oil, or of keeping her head under water until an arrow shot from a bow is brought back by one of the spectators. If she pass through this unharmed, she is released, otherwise she is swung. The process of swinging is conducted by first tying a bandage of red paper over the victim's eyes, and then swinging her head downwards from the bough of a tree until she confess or die. If she confess, she is taken down, and either killed with arrows, or turned out of the pal. The Bhil believes to a limited extent in transmigration of souls, particularly of bad spirits, and that the spirits of the dead haunt places they lived in during lifetime. Eclipses and other celestial phenomena he believes to be the gods diverting themselves, and he adopts, without well knowing why, the Hindu rite of making hideous noises during an eclipse. A cat crossing a Bhil's path when starting on any particular business, will send him home again at once. The Holi Dasera and Dewali festivals are strictly kept; the first especially is the occasion of much drunkenness and excesses. It is kept up for ten days or more; dances take place; rude jests are made, and the women attack and stop travellers till they release themselves by paying a fine. At all festivals and before a fight, the men dance the ghanna ring dance. The drummers stand in the centre, and the dancers revolve in a circle with sticks in their hands, which they strike alternately against those in front and behind. Time is kept with the drum all through, and as the performers get more excited it becomes lively, and they jump about wildly; their long hair falls down, and every now and then one of them disengages himself and dances a pas inside the circle.

Bhil houses are comfortably and fairly built of interwoven bamboos or loose stones, and are often capacious and tiled. They are invariably constructed on a small rising ground or slope of a hill; and each homestead generally consists of several houses for cattle and grain, all within a single enclosure. The furniture comprises a charpoi, large pots for the storage of grain, and a bamboo cradle. The men wear nothing but a dirty rag round the head (the hair being plaited and fastened with a wooden comb), and a waist-cloth of limited length. They are usually bare-footed; are very fond of earrings; the whole lobule of the ear is often bored along the edge, and loaded with little rings; but the favourite ornament is a large ring which passes behind the ear from top to bottom. The richer men are fond of jewellery, and silver waistbelts, etc., are by no means rare. Those who can afford it possess guns and swords, but the national weapons are bows and arrows. The bow is made entirely of bamboo, except two links of gut which fasten on the string, likewise made out of split bamboo. The arrow is a reed tipped with an iron spike; the quiver a piece of strong bamboo matting. The women often wear on their arms and legs the lac and glass churis of the poorer Hindus, but their peculiar bracelets and bangles are made of brass. Four rings of this metal are generally worn on each arm and leg, and there is also a W-shaped ornament worn by married women on the ankle. The young women wear only necklets of beads, and children are kept without dress almost to the age of puberty. All cases and quarrels amongst Bhils are settled by a panchayat, and a fine is the invariable punishment. The fine for murder is 240 rupees; and until this is paid a blood-feud is carried on between the relatives of the murderer and his victim. A man suspected of treachery is indiscriminately plundered and ejected from the pal, but he can re-establish himself by paying the fine awarded by a panchayat on his case.

Fights between one clan or village against another are generally indulged in to avenge a murder or affronts, or to assert some right. Before active measures are taken, the patriarch of the village or pal is consulted, and if he decide for war, the Kilki, or Bhil assembly call—a peculiar whirring noise made by placing the hand in front of the mouth—is sounded, or the drum beaten, which gathers all the inhabitants of the pal together, male and female, in an incredibly short space of time. Drinking is then deeply indulged in, and, when worked up to a sufficient state of excitement, they sally forth with their women in front, and on arrival at their opponents' pal an encounter is soon brought about by means of a shower of stones and abusive language, in which the women take a prominent part. When opposed, the women of both parties draw on one side, and the fight commences with bows and arrows. The women on the other side give any wounded man drink or any assistance he may require, and it is a point of honour not to injure the wounded in any way while the fight is going on. After the fight, a panchayat assembles, and the feud is generally closed by the payment of a fine, in which case the opposing parties make friends by drinking opium out of each other's hands. The Bhils principally subsist on the produce of their cultivation and of their cattle, of which large numbers are kept. They also cut and sell grass, and manufacture baskets, screens, and winnowing-fans out of bamboos. They are still to a certain extent predatory, but a great improvement in this respect has taken place of late years. The jogi of some pals are said to occupy themselves in making a coarse description of blanket. The staple commodity is Indian corn. The ground is merely scratched below or near the hut of the labourer, and the seed thrown in broadcast. The fields are surrounded by temporary hedges of thorn bushes to keep off animals. Irrigation from wells is not undertaken by Bhils; but for the cultivation of rice, walls of loose stones, earthed up with soil, are built across the narrow valleys in the hills, and a series of terraces thus formed. The following gods were worshipped by the Bhils of Jebuah:—

Kali, on many occasions.
Hati-powa, at the Dewali and Dasara feasts.

Waghacha-Kunwar, to protect them against wild beasts.

Halk Mata, for success in predatory journeys.

Khorial Mata, for protection of cattle from plundering and sickness.

Devi Kanail, for a good harvest.

Behyu Baji, for rain.

Ghora Raja, against plunderers.

Hallam, by the Malwa Bhils at the annual pilgrimage to the large hill of Retna Wal in Bariya.

Chamconda Mata, goddess of harvest, and the first of every grain is offered to her.

Havin Wana Mata, against murrain and lameness among cattle.

Sita Mata, and Ghona and Bhadri Bae, goddess of smallpox.

Bhulbag Mata, during epidemics, in cholera.

—*Sir J. Malcolm, Tr. R. As. Soc.* i. p. 70; *Elphinstone's India*, pp. 366-7; *Malcolm's Central India*, i. p. 518; *Coleman; Elliot; Wilson's Glossary; Tod's Travels*, pp. 34-39; *Tod's Rajasthan*, i. p. 724, ii. p. 217; *Treaties*, iv. 454; *Latham; Wheeler's India*, p. 85; *Friend of India; Forbes' Rasamala; Captain C. E. Yate in Rajputana Gazetteer.*

BHILALAH, a tribe of Central India, claim a descent, by their father, from the Rajputs, their mother being of the Bhil tribe.—*Malcolm*, i. 550.

BHILSA, a town in India, in lat. 77° 50′ E., and long. 23° 39′ N. It is famous for Buddhist topes. There are five or six groups of topes, containing sixty distinct and separate examples. The Sanchi group has several topes. The largest of them is a stupa, raised to mark a sacred spot, and is not a daghoba or shrine containing a relic. At Sonari, 6 miles distant, is a group of eight topes; at Satdhara, 3 miles further on, is a tope 101 feet in diameter, and a smaller one from which relics of Sariputra and Moggilana have been obtained. A numerous group is at Bhojpur, 7 miles from Sanchi, and 5 miles west of Bhojpur. At Andher, a little village 10½ miles S. of Bhilsa, and 5 miles W. of Bhojpur, is another. Their age is supposed to be between 250 B.C. and A.D. 100. The principal of the remains is known as the great tope at Sanchi. The smaller ones are known from General Cunningham's descriptions in his Bhilsa Topes.—*Cunningham; Fergusson.*

BHILU. Burm. Amongst the Burmese Buddhists, a spirit, a ghost.

BHILWAN, also Bhilwara, a district in Central India, taking its name from the Bhil race.

BHIM or Bheem, a prince of Mewar who was celebrated for activity, and could, while his steed was urged to its speed, disengage and suspend himself by the arms from the bough of a tree. To one of these experiments, however, he owed his death, as he dislocated his spine in a feat of strength.—*Tod's Rajasthan*, i. p. 392.

BHIMA, the second of the five Pandava brothers. He was of great bodily strength, ferocious courage, wrathful and abusive, and a gross feeder. He fought in the Mahabharata war against the Kaurava, and killed several of his opponents. On the eighteenth and last day of the fighting, he struck down Duryodhana by a foul blow, for which his incensed brother Yudishtra struck him, and angered Arjuna and Bala Rama.—*Taylor; Garrett; Dowson.*

BHIMAH, a river of the Mahratta country, which joins the Kistna. It is often confined to a narrow bed, as at Korygaon. Bhima Terai is the valley of the Bhima river, famed for its breed of hardy ponies or small horses. The breed is known in Northern India as the Bhimrathali. Mawa, the horse which bore Holkar in many a desperate strife, was of this breed. The head is a model, exhibiting the highest quality of blood,—ears small and pointed, eyes full and protruding, and a mouth that could drink out of a teacup. This is the type of the Bhima Terai breed.

BHIMAL. Hind. Species of Grewia.

BHIMA-RATRI, the 7th night of the 7th month of the 77th year of a man's age, lunar reckoning, after which a Hindu is exempted from all instituted observances, it being considered the end of his natural life. He would then be in his 75th solar year.—*Wilson.*

BHIMB. Hind. Coccinea Indica.

BHIM GORA, in the Saharunpur district of the N.W. Provinces, lat. 29° 56′ N., long. 78° 14′ E., has a kund or sacred pool, a place of Hindu pilgrimage, on a perpendicular rock 350 feet high.

BHIM-RAJ, Hind., Edolius paradiseus, is the mocking-bird of Europeans.

BHIM-SEN'S GADA, an ancient stone pillar at Allahabad, which has four inscriptions engraved on its surface. See Lat.

BHIM TAL. See Lake.

BHIN AUNLAH. Duk. Phyllanthus niruri.

BHINDA PURUB, a sacrificial ceremony, till recently practised in Dholbhum.

BHIRA, a town on the left bank of the Jhelum; Old Bhira, on the opposite bank, is a mound of ruins, also called Jobnathnagar, which General Cunningham supposes to be the ancient capital of Sophites or Sopeithes, the contemporary of Alexander, where the camps were formed of Craterus and Hephæstion, holding both banks to await the arrival of the fleet of boats. It is three days' boating distance from Mong, the ancient Nikæa, where Alexander defeated Porus. Bhira, also, until it was supplanted by Pind Dadan Khan, had always been the principal city in this part of the country. At Bhira, the Chinese pilgrim Fa Hian crossed the Jhelum in A.D. 400; and against Bhira, eleven centuries later, Baber conducted his first Indian expedition.—*Cunningham, India*, 155.

BHIRBUTI. Hind. A beautiful scarlet-coloured insect resembling a piece of scarlet velvet. They are collected during the rains. They yield an oil, and have a use similar to the Cantharis as a blister and irritant.—*Powell.* See Insects.

BHIRMI-SUGAN, leaves of a small plant brought to Ajmir from Dehli, employed in making scents. Bhirmi-Vidaya, leaves of a climber from Mount Abu, very stimulating, and in Ajmir used in the 'seet,' a disease simulating catalepsy.—*Gen. Med. Top.* p. 129.

BHIS, Hind., also Basend, Bhisend. The edible root of the lotus, or the fibres of the stem.—*W.*

BHISHMA, whose early name was Santanavu, was son of Santanu, raja of Hastinapur. When old, raja Santanu wished to marry a young and beautiful girl, but her parents objecting, on the ground that even if there were children, Santanavu would succeed to the kingdom, Santanavu made a vow to them, saying, 'If you will give your daughter in marriage to my father, I will never accept the kingdom, or marry a wife, or become the father of children by any woman; so that if your daughter bear a son to the raja, that son shall succeed him in the kingdom.' This stern vow procured him the designation of Bhishma, or 'the dreadful.' He educated Dhritarashtra,

Pandu, and Vidura, and afterwards made Drona the preceptor of the Pandava and Kaurava; and at a meeting of council he proposed that the kingdom should be divided between the two parties. In the battle that ensued, he led the Kaurava race, and on the tenth day he was mortally wounded by Arjuna. The Bhishm-ashtami festival, on the 8th day of the moon, is in honour of the childless Bhishma, in which libations of water are made to his spirit, also offerings of sesamum seeds and boiled rice, saying, 'I present this water to the childless hero Bhishma, of the race of Vyaghrapada, the chief of the house of Sankriti. May Bhishma, the son of Santanu, the speaker of truth and subjugator of his passions, obtain by this water the oblations due by sons and grandsons.'—*Garrett; Dowson.*

BHISTEE, ANGLO-HIND., properly Bahishti, a water-carrier who conveys water in a skin slung from his shoulders, resting over his loins. The water-skin is called a Mashak. The Pakhali, another water-carrier, carries water in skins, pakhal, slung across a bullock.

BHISTU DHARI, a sect of the Dadu Panthi who follow the avocations of ordinary life. They burn their dead at dawn.

BHITAR. HIND. The ground on which a house stands; the Kampong of the Malay, or compound of the British. In Urdu it is the angan.

BHOG, HIND., also Bhoga, Bhogam, and Bogam. Enjoyment, fruition, use; anything that may be used, Savedha or Nirvedha, *i.e.* with or without obstruction. Bhogi Pandikai, the festival of enjoyment, the Tamil New Year, when good wishes and new year's compliments and gifts are interchanged, and Indra worshipped. Bhogamu, TEL., also Bhogam Vadu, a common woman.

BHOGA, food offered to an idol. Bhoga-mandap, that part of the temple of Jaganath where the food to be offered to the idol is cooked. Bhoga-murtti, an idol carried about in processions in lieu of the principal idol, which is never taken from the shrine.

BHOGRA. HIND. Cleome pentaphylla. MAHR., the Casearia elliptica.

BHOI or Bhooee, in Telingana and in the southern parts of India, a race who are palanquin-bearers, also fishermen. See Bhui.

BHOI-WANLU, also called Ur-Bhoi-wanlu, mercenary soldiers in Southern India, who serve native chiefs. They are never found in the ranks of the British army. There are a few of them in every large town in the south.

BHOJ, the last of the great Pramara race of Hindus who ruled over Ujjein and Dhar. He was a great patron of learning. His name is famous in the literature of India. Bentley fixed his era between A.D. 982 and 1082; but Wilford supposes him to have died between A.D. 977 and 982. The name of Bhoj, the Pramara, is very celebrated in the annals of India, but there appear to have been more than one of this name or title. The Dhar ruler has been supposed to be the same as Vikrama, or to have been a contemporary. The nine learned men, the nine gems, are said to have flourished during his reign, or that of Vikrama, which was the golden age of Hindu literature; but all connected with Bhoj is uncertain, even his position as a patron to literature.

BHOJA, a Yadava prince who reigned at Mrittikavatti, on the Parnasa river, in Malwa.—*Garrett; Dowson.*

BHOJPATRA. HIND. Betula bhojpatra.

BHOJPUR, a ruined town where remains of Buddhist topes stand, on the southern end of a low range of hills, 6 miles S.S.E. of Bhilsa, and 7 miles E.S.E. of Sanchi.—*Cunningham.* See Bhilsa.

BHOKUR. HIND. Cordia latifolia, *Roxb.*

B'HOLA NAT'H, or the 'Simple God,' is one of the epithets of Siva, whose want of reflection is said to be so great, that he would give away his own divinity if asked; from bhūlna, to forget.

BHOLSERI. DUKH. Mimusops elengi.

BHONSLA, the family surname of the Mahratta rulers of Poona, Sattara.

Shah Ji Bhonsla, ...	A.D. 1634
Sivaji, son of do, . . .	born 1627, died 1680
Sambaji, son of Sivaji, reigned . .	1680 to 1689
Their successors, the Peshwa, were—	
Balaji Vishwanath.	
Balaji, 1st Peshwa, ...	1718
Baji Rao, 2d do., ...	1721 to 1740
Balaji Baji Rao, 3d do., ...	1740
Madhu Rao, 4th do., ...	1761 to 1772
Narayan Rao, 5th do., assassinated .	1772
Madhu Rao Narayan, 6th do., . .	1774 to 1795

Baji Rao II., the 7th and last do., 1795; defeated and deposed, 1818; died at Bithur, near Cawnpur.

The family rule over Kolhapura.—*Imp. Gaz.*

BHONSLA, the family surname of the Mahratta ruler Sivaji, was also that of the ruling dynasty of Berar.

Parsoji, the founder of the Bhonsla dynasty of Berar, was a private horseman from the neighbourhood of Sattara. Though bearing the same surname as the family of Sivaji, there is no proof that he was of the same descent. He attained distinction, and was one of the first to join raja Saho; when he returned from Dehli, he was further advanced by that prince, and was invested with the right of collecting all the Mahratta dues in Berar and the forest country farther to the east. His cousin Raghoji, who was a favourite of raja Saho, and married to his sister-in-law, was raised to his station on his death, in preference to Parsoji's son, who ought to have succeeded him. In 1734 Raghoji Bhonsla was nominated Sena Sahib Suba, or General of the Mahratta Confederacy. In 1745 the head of the family became the undisputed ruler of Gondwana. Raghoji II., who succeeded his father in 1788, had previously shot his own brother Sabaji. Raghoji II., after a reign of 30 or 40 years, died on the 22d March 1816, leaving but one son, Parsoji, who was imbecile in mind and body. After some opposition, Mudhaji, known as Apa Sahib, son of Venkaji, was declared regent, and sedulously courted the British alliance. In January 1817 he proceeded to Chanda, and during his absence from Nagpur, Parsoji died, murdered, as it was subsequently learnt, by Apa Sahib's secret orders. The latter, as nearest heir, now became raja of Nagpur. Avowedly a warm friend of the British, he privately intrigued against them in all directions, until November following, when he threw off the mask and declared hostilities. The battles of Sitabaldi and Nagpur followed, in which he was signally defeated, and was forced personally to surrender, and to agree to terms which rendered him wholly dependent on the British. In January 1818 he was permitted to resume the government, but immediately recommenced his intrigues.

Apa Sahib's repeated treachery having proved him unworthy of trust, the British Government decreed his deposition, and placed Raghoji, a grandson of Raghoji II., at the head of Nagpur state. On the 12th May 1818, Apa Sahib fled from the place allotted to him, to the Sikh territories, and he ultimately died, in 1840, almost forgotten, at Jodhpur. The family became extinct during the administration of Lord Dalhousie, on the demise of Goozur, grandson of Raghoji, who in 1818 had been seated on the throne when Mudhaji (Apa Sahib) was deposed. After the defection of Apa Sahib in 1817, the administration was, at first, conducted by British officers; but in 1826, on the raja coming of age, the territories were handed over to him, the British Government retaining in their own hands certain districts for the payment of the military force of Berar. In 1829 these also were given up, a treaty having been made with the Governor-General, whereby, in lieu of the native contingent, a sum of 8 lakhs of rupees was to be paid to the British Government.—*Elphinstone*, p. 642. See Mahratta Governments; Sivaji.

BHOOA. HIND. See Insects.

BHOOI-DAGDHA. HIND. A place of cremation.

BHOPA. A hereditary guardian of the Mahadeo temple. The chief of Almod, in the Hushangabad district, is one of the Bhopa. Bhopi, also Bhopya, the priest of a village temple, generally a Sudra.

BHOPAL, a feudatory state in Malwa, in Central India, in alliance with the British Government. It is bounded on the N. by Gwalior, N.E. and S.E. by the Saugor and Nerbadda territories, S.W. by the possessions of Holkar and Sindia, and N.W. by those of Sindia. It lies between lat. 22° 32′ and 23° 46′ N., and long. 76° 25′ and 78° 50′ E.; is 157 miles long from E. to W., and 76 broad from N. to S., with an area of about 8200 square miles, and a population of 769,200 in 1875. Its army is 694 horse, 2200 foot, and 57 guns. The family are of Pathan descent, belonging to the Abdul Aziz Khel of the Dowlatzai sept of the Orakzai; Dr. Hunter says the Mirazai Khel. It was formed into a principality by Dost Muhammad, in the service of Aurangzeb, on whose demise, Dost Muhammad established his independent authority, and died in 1723, aged 66. Several changes in the succession occurred; and during the Mahratta rule the country was harrassed by that race, and overrun by Pindari. When Colonel Goddard, in 1778, marched through the territory, *en route* to Bombay, its ruler treated Goddard with great kindness, and this has never been forgotten by the British. And again, in 1809, the Nawab urged Colonel Close to grant British protection. Since 1817 the alliance has been intimate. About 1818 the Nawab was accidentally shot, and his widow, Kudsia Begum, retained the control until 1837, when his son-in-law, Jahangir Mahomed, husband of his daughter, Sikander Begum, was appointed. On his death in 1844, Sikander Begum reigned till her death in 1868. Her daughter, Shah Jahan, ruled till her death. Sultan Jahan Begum married in 1874. These ladies abandoned the Gosha customs of their religion, transacted ably all business in public; and during the revolt in 1857 Secunder Begum adhered firmly to the British, for which she was rewarded by the grant of the pargana of Bairseah, and created a knight of the Star of India. She died in 1868, and was succeeded by her daughter, Shah Jahan Begum. Her consort was Nawab, Wala Jah, Amir-ul-Mulk, Syud Muhammad Siddiq Husain Khan, Sahib Bahadur. —*Aitcheson's Treaties*, iv. p. 309.

BHOPAL AGENCY is a British political department in relation with Kilchipur, Bhopal, Rajgurh, Nursingurh, Kurwai, Muksudingurh, Mahomedgurh, Basoda, Pathari, Larawut, Gwalior districts; Seronje. The three petty chiefships, Kurwai, Mahomedgurh, and Basowda, are immediately dependent on the British Government itself. The relatives of other chiefs, with their immediate suzerain, have been mediated and guaranteed by the British Government.—*Treaties.*

BHOPAWAR, a British political agency which superintends four petty feudatory states, viz. that of Jobut, whose chief is a Rahtor Rajput, with a population of about 7000, chiefly Bhils; Mutwara, also with a Bhil population; Khattewarra and Ruttonmul; Mota Burkhera; Kali Bouri. The guaranteed states are Alirajpur of Dhar, Jabooa, Nimkhera or Tirla, Chota Burkhera or Sorepur, Mota Burkhera, and Kali Bowri.—*Aitcheson*, iv. 405.

BHORA. BENG. Mangrove; Rhizophora mangli; R. mucronata.

BHOR GHAT, in lat. 18° 44′ N., long. 73° 22′ E., in the Dekhan, the principal pass on the route from Bombay to Poona. It has been formed into part of the Great Peninsular Railway line. The top of the ghat is 1798 feet above the sea. See Railway.

BHOSE. ANGLO-BENG. An honorific suffix to several Kayasth families in Bengal; properly Basu.

BHOT. This word, according to Latham, under the appellations of Bult in Bultistan, But in Butan, Bet in Tibet, or in such words as the Bhuteya or Bhotiya, in ethnology, comprises the Little Tibetans, the natives of Bhot-pa or Ladakh, the Tibetans of Tibet proper, and the closely allied tribes of Butan. Balti or Baltiyul is called Palolo or Balor by the Dards, and Nang Kod by the Tibetans. It is preserved, he says, in Ptolemy in Byltæ. The country is frequently called Skardo or Iskardo, from the name of its fort and capital. Balti proper is a small table-land, and, with that of Deotsu, is about 60 miles long and 36 broad; the mean height of its villages above the sea is about 7000 feet. The Balti, the people of Little Tibet, the Byltæ of Ptolemy, though Tibetan in language and appearance, are all Mahomedans, and differ from the more eastern Tibetans of Le (who call themselves Bhotia, or inhabitants of Bhot), by being taller and less stoutly made. Their language differs considerably from that of Le, but only as one dialect differs from another. The Bhot of Ladakh is strong, hardy, short, and square, with a decidedly Mongol physiognomy, by which is meant a flat face, broad cheek, depressed nose, very large ears, oblique and narrow eye, curtained at the corners, black hair and low stature, their average height being 5 feet 6·1 inches. The skulls are less Mongolian, having a capacity of 72 cubic inches, 80 cubic inches being a fair capacity for a European. The grand Lama is a Bhot. As a general rule, the Himalaya mountains divide Hindustan from Bhotland, but there are Bhot in several parts south of the crest of those mountains in Garhwal and Kamaon. The people of Le, the eastern Tibetans, call themselves Bhotia, or inhabitants of Bhot. They are not so tall, and are stouter made than the Tibetans of Balti or Little Tibet. Bhotiya dialects vary in Mana, Niti,

Milam, Darma, and Byans; but they are all closely allied to the Tibetan now spoken in Hundes.—*Thomson's Tr.* 247; *Latham's Ethnol.*; *A. Cunningham.*

BHOULIYA is a light Bajra boat, varying in dimensions between the Dhengi or passenger boat and a middle-sized Bajra. It is in general use on the Ganges, alike for a suburban trip or for a long up-country journey. See Boat.

BHOWNAGGAR, in long. 72° 21′ E., and lat. 21° 47′ N., a seaport in Kattyawar, 9 miles N.W. of Gogo. The principal taluqdars are the Nawab of Junagurh, the Jam of Navanaggar, the Rawal of Bhownaggar, the Rana of Porebandar, the Raj of Drangdra, and the Thakur of Murvi. Junagurh, the most important, is held by a descendant of Sher Khan Babi, a soldier of fortune, who seized it in the general anarchy which preceded the subversion of the Moghuls. 20 miles to the west are the ruins of Balabhipura, a submerged town covered with 18 feet of alluvium. Half the towns and villages around are built from the bricks and carved stones of this ancient city.—*Dr. Nicholson in Bombay Times*, February 1852.

BHRAMARA MARI. Tel. Clerodendron serratum. The Telugu word signifies bee-killer.

BHRAMUK. Beng. Helianthus annuus.

BHRATAR. Sansk. Brother; he who carries or assists.

BHRATHI-DWITYA. Sansk. A Hindu festival on the second of the month Kartik, on which Hindu sisters entertain brothers, in memory of Yamuna entertaining her brother Yama. It is the 'brother' festival of the Hindus, and is held on the second day of the new moon following the Kali Poojah or Diwali. A brother goes to his sister's house, and receives from her unhusked rice, doorva grass, and sandal, with good wishes, which the brother reciprocates.—*Wilson.*

BHRIGU, a Hindu sage, mentioned in the several Puranas. He is said to have lived on Mount Mandara, and is described as wearing a shred of cloth only around his loins, with a pilgrim's staff and beggar's dish in his hand. Bhrigu, Vasishtha, and Atri are three of the great saints or sages called Prajapati or Brahmadika, that is, mind-born sons of Brahma, variously described as 7, 9, 10, and even 21 in number.—*Williams' Story of Nala*, p. 214; *Ward*, iv. p. 23. See Brahmadika.

BHRIGU, a name of the planet Venus.

BHRIGU-BANSI, a tribe of Rajputs claiming descent from Parasu Rama, the stem of the Barhoulia clan.

BHRINGAR. Beng. Verbesina prostrata.

BHRINGI, the skeleton attendant on Siva.

BHU, in Hindu astronomy, seems to imply the middle place. Bhu-chacra, when applied to the celestial sphere, means the equinoctial line. Bhu-carna, the radius of the equator. Bhu-paridhi, the same as Bhu-chacra.

BHU. Beng. Contraction of Bhum, the earth.

Bhu, also Bhumi, also Bhum. Earth, land, soil, ground, hereditary landed property. Bhu-danam, a gift of land. Bhu-pati, a landholder, a prince. Bhumia, a proprietor.

Bhu, Bhuvar, Swar, earth and sky and heaven.

Bhu-ada, scarlet garland flowers, Hedychium angustifolium; also Abelmoschus esculentus.

Bhu-Devi, also Bhuma Devi, also Prit'hivi, in Hindu mythology, names of the earth, and fabled to have been married to Prithu, the first king who taught the mode of cultivating the ground; hence the earth is called Prit'hivi. Bhu-Devi is the terrestrial name of Parvati, as goddess of the earth. As the names of Diana were varied to suit her various forms, she being Luna in heaven, Proserpine or Hecate in hell, so her archetype, the Hindu Parvati, is the heavenly Bhavani, on earth Bhu Devi, and Patala-Devi as consort of the regent of the infernal regions. Bhu-Deva, as spouse of the earth goddess, is a name of Siva.

Bhoi Mung, Arachis hypogæa, ground nut.

Bhuin-Champa, Kæmpferia rotunda.

Bhuin-Dagdha, lit. earth burning. Gifts of Hindus at marriages and funerals, from the ceremony of burning earth prior to their presentation.

Bhuin-Dalim, Careya herbacea.

Bhuin-Dūmūr, Ficus repens.

Bhuin-Jamba, Premna herbacea.

Bhuin-Kamri, Ipomœa Gangetica.

Bhuin-Kumra, Batatas paniculata, also Trichosanthes cordata.

Bhuin-Koit, Feronia elephantum.

Bhui-Koli, a tribe of the Koli race of the west of India. They and other non-Aryans devote their women to the gods, and style them Murli, Jogni, and Basavi; the deities to whom those near the Bhima are devoted are Yellamah and Mata.

Bhui-Mung, ground nut, earth nut.

Bhuin-Okra, creeping vervain, Zapania nodiflora.

Bhuin-Pat, creeping Dentella, Dentella repens.

Bhui-Phul, also Bhonphor, Phelipæa calotropidis.

Bhui-Sing, Arachis hypogæa, ground nut.

Bhui-Sunn, Crotalaria prostrata.

Bhu-Kumbum, earthquakes.

Bhu-Kupittham, Feronia elephantum.

Bhu-Loka, earth. See Loka.

Bhuchakra Gadda, also Nela gummudu. Batatas paniculata, *Ch.*

BHUDUCK, or Badhak, a predatory race of the Nepal Terai.

BHUGRI. Hind. An inferior kind of date boiled in oil and water and dried; used in Multan and the Derajat; also the Ber fruit dried.

BHUI, Bhuiya, or Bhuya, a very numerous tribe dwelling all along the borders of Bengal, Orissa, and part of Behar. Colonel Dalton thinks they were once the dominant race in Assam; they seem, he says, to have been the prior occupants of Bengal, and to have no connection with the Bhumi or Boyar. They appear to be the original occupants of much of the lower country to the south of the Chutia Nagpur plateau, great part of Singbhum, and Bowani, and the borders of Orissa. They have been partly driven from a portion of their country, and they are partly dominated over by Kol, themselves probably impelled south and east by pressure from the north and west. But they are still very numerous in all the districts and petty states thereabouts, and are found more or less all the way across the lower hill country to the borders of Behar, close up to Gya, where they are succeeded by the Kahar as palanquin-bearers. The Bhuya are the palanquin-bearers of Chutia Nagpur. Major Tickell describes them as originally rich in cattle; and Mr. Campbell deems it possible that the Hindus have changed them to Goali, who are the most numerous Hindu race in Bengal and Orissa. They are a dark-complexioned race, with rather high cheek-bones, but not otherwise peculiar, and approximate in appearance to the Urya. Those in the hills towards the Behar border have

a darker complexion. They have no language of their own, but speak Urya on the Urya borders, Bengali on the borders of Bengal, and Hindi further north.—*Campbell; Dalton.*

BHUIHER, a very primitive small tribe of a few hundred families met with in Palamau and Jashpur, but who must not be confounded either with the Bhuiya or the Boyar. They are very dark, heads altogether round as bullets, projecting jaws and lips, scarcely any prominence of nose, pigs' eyes, large bodies, and small limbs; no muscular development, short of stature, not one of them more than five feet, very filthy in their persons, with diseased skins and sore eyes.—*Dalton*, 133.

BHUIN-HAR, also Bhoon-har, a Hindu agricultural tribe, numerous in the districts of Gorakhpur, Azimgarh, and Benares. The raja of Benares is of this race. They claim Brahmanical descent, and style themselves Thakur, with names of subdivisions common to them and Sarwaria Brahmans, as Sandal, Gautam, Dikshit, Upadhyaya, and Panday; and those which have no distinct appellations have titles connecting them with the same stock, as the Sankarwar, who take the title of Misr, the Donwar, that of Tewari, etc. No Brahmanic honours are, however, paid by any caste to the Babhan or Bhuin-har. They have some curious rules, within which they and Rajputs may take food from one another, and in Chutia Nagpur they claim to be Rajputs. The names of their clans are almost without exception framed from the Rajputs. Their customs present a striking similarity to those of the Kshatriya class, and in fact, except their own assertion, there seems to be not one single reason for believing the curious statement made by Mr. Campbell in his Ethnology of India, that there is 'no doubt that this class' is formed by an intermixture of Brahmans with some inferior caste.—*Campbell; Wilson; Sherring.*

BHUI VANSA, a zamindari race, called Khurda raja and Bhui Vansa, who ruled in Orissa from 1580 to 1804, when Mukund Deo was deposed.

BHUIYA, a race in Keonjhur and Bonai, divided into four clans,—(1) the Mal or Desh Bhuiya, who call themselves, and are called, the Desh-lok, or the people of the country, (2) the Dandsena, (3) the Khatti, and (4) the Raj-kuli Bhuiya. They are anxious to oblige, and have customs of primitive simplicity. There are 60 chiefs in the Pawri Desh or Bhuiya highlands, and a knotted string passed from village to village will rouse the whole of them.—*Dalton's Ethnology.*

BHUJ, in lat. 23° 15′ N., long. 69° 48½′ E., capital of the province of Cutch. The Dak bungalow is 281 feet above the sea, and the hill fort is 678 feet by trigonometric measurement. Bhuj is on a plain at the foot of the hill, on which there is a snake temple. It was taken by Sir W. Keir's army on the 23d March 1819. Its three principal temples are Suvarna Raya, Kalyan Eswar, Swamandap. A large number of articles in gold and silver are annually made. The silver and gold used are very nearly pure. The charge is at the rate of 8 annas per tola weight. A stone procured from the Hubba hills is polished at Bhuj, and is used as a substitute for marble in the decoration of temples.

BHUJAPATRI. Tel. Betula bhojpatra.

BHUKHA MATA. In a temple at Udaipur is a picture so called, personifying Famine. Her necklace, like that of her lord Siva or Mahadeo, is of skulls. Two persons are represented lying near who have died of famine, and a beast of prey is approaching to devour them. The words mean hungry mother, gaunt famine.—*Tod.*

BHUKRI. Hind. Tribulus alatus, T. lanuginosus.

BHUKSA, a forest tribe under the hills from Purunpur Subna on the Sapda to Chandpur on the Ganges. They claim to be Puar Rajputs expelled from Dhar, and had taken refuge, first in Oudh, and finally in the hills bordering on Kamaon. They are divided into 15 clans,—12 superior, 3 inferior.—*Wilson's Glossary.*

BHULAM. Tel. Aloe littoralis.

BHULEA and Sansu are silk cloths much used by the women of Nepal.

BHULL. Like all large rivers which flow for a very lengthened course through an alluvial soil, the Indus throws up patches of alluvial deposit at its mouth. In Sind these are called Bhull, and they are of great value in the cultivation of the red rice of the country. They are swampy, and exist on both sides of the principal mouths of the Indus, in the Gora baree and Shahbunder parganas, but produce a considerable portion of the rice consumed in Sind.—*Simmonds*, p. 293.

BHULLEH, a clan of Agnicula Rajputs.

BHUM. Sansk., Hind. The land, earth; Bom, Pers. Bhumia, a landlord. Bhumiawat, a general plundering. Bhum-bhai, a landowner in a village.

Bhum Bakeswar, a group of hot sulphur springs on the banks of the Bakeswar streamlet, in the Birbhum district of Bengal, lat. 23° 53′ 30″ N., long. 87° 24′ 35″ E.; Fahr. 128° to 162°. About 120 cubic feet per minute are ejected from the hottest well.

Bhumha, the tutelary divinity of a village, or its boundaries.

Bhumhari, freehold land tenures in Chutia Nagpur.

Bhumi, a man of the soil.

Bhumi, in Hindu astronomy, the terrestrial globe, supposed to be in the centre of the universe.

Bhumi savana, proper, natural to the earth.

Bhumi savana dina, a natural day.

Bhumi-Daha, being reduced to earth, being burned as a Hindu.

Bhumi Jombuka, Gunta baringa.

Bhumi-Nim, Bonnaya serrata.

Bhumi Kumara, Trichosanthes cordata.

Bhumi Tylum, naphtha, petroleum, earth oil.

Bhumowra, Cornus capitata.

Bhum-Phor, earth-splitter; Philipæa calotropidis, Tulipa stellata.

Bhumidevi, the goddess of the earth, and Vishnu's secondary wife.

Bhumiya, in Muttra district, an altar or shrine of the village deity; it is an oblong low structure of masonry.

BHUMIA. Hind. From Bhum, land. A landed proprietor in Rajputana; the allodial proprietor of Mewar, offshoots of the earliest princes. The term Bapota implies the inheritance or patrimony; its holder, if a military vassal, is called Bhumia, meaning one actually identified with the soil (Bhum). The Bhumia of Rajasthan is the Mahomedan wuttun-dar, or meeras-dar, and the Caniatchi of the Tamils. The Bhumia is vested with the rights of the crown, in its share of the bhog or rent. But when their own land is in the predicament called gulthas, or reversions from lapses to the commune, he is seised in all the rights of

the former proprietor; or by internal arrangements, they can convey such right by cession of the commune. The Bhum is exempt from the jureeb or measuring rod; it is never assessed; and his only sign of allegiance is a quit-rent, in most cases triennial, and the tax of khur-lakur, a war imposition, since commuted for money. These allodial tenants are the yeomen of Rajasthan, and, as in the districts of Komulmer and Mandelgurh, constitute the landwehr, or local militia. The Rajput vaunts his aristocratic distinction derived from the land, and opposes the title of Bhumia Raj, or government of the soil, to the Banya Raj, or commercial government, which he affixes as an epithet of contempt to Jeypore; where 'wealth accumulates and men decay.' Bhum rakhwali, or land [in return for] 'preservation,' is one kind of Bhum; the crown itself holds bhum rakhwali on its own fiscal demesnes, consisting of small portions in each village. In S. 1782, the turbulent Bhumia on the western frontiers were checked by the Rajput chiefs on their borders, and the Sindil, the Deora, the Bala, the Bora, the Balecha, and the Soda were then compelled to servitude. The ancient clans, prior to Sanga Rana, had ceased, on the rising greatness of the subsequent new division of clans, to hold the higher grades of rank, and had, in fact, merged into the general military landed proprietors of the country under the term Bhumia. These Bhumia, the scions of the earliest princes, are to be met with in various parts of Mewar; those of high antiquity were defended from oppression by the rocks and wilds in which they obtained a footing, as in Komulmer, the wilds of Chuppun, or plains of Mandelgurh, long under the kings, and where their agricultural pursuits maintained them. Their clannish appellations, Kombawut, Loonawut, and Ranawut, distinctly show from what stem and when they branched off; and as they ceased to be of sufficient importance to visit the court on the new and continually extending ramifications, they took to the plough. But while they disdained not to derive a subsistence from labouring as husbandmen, they never abandoned their arms; and the Bhumia, amid the crags of the alpine Aravalli, where he pastures his cattle or cultivates his fields, preserves the erect mien and proud spirit of his ancestors, with more tractability, and less arrogance and folly, than his more courtly but now widely separated brethren. They form a considerable body in many districts, armed with matchlock, sword, and shield. In Mandelgurh, where their own interests and the prince's unite, four thousand Bhumia could be collected. They held and maintained without support the important fortress of that district, for their prince, during half a century of turmoil.—*Tod's Rajasthan*, i. 169, 498.

BHUMIJ, literally earth-born, prior inhabitants of Orissa, with whom the Uraon or Ho or Kol mixed when driven eastward. Bhumij are the majority of the population in all the estates of the Manbhum district to the south of the Kassai river. As they approach the confines of Chutia Nagpur, they appear to be called indifferently Mundah or Bhumij, and these intermarry. More to the east, the Bhumij have greatly assimilated to the Bengali; many have acquired estates and influence as Sirdar Ghatwali, the hereditary guardians of the passes. They tenaciously cling to their national songs and dances. Bhumij are to be found in Mohurbunj and Keonjur, and it is this branch of the Mundah race which has spread farthest in an eastern direction. The Bhumij of the lower part of Singbhum and Manbhum are tolerably civilised. All the wild tribes of Central India worship relatives immediately after death, and the Bhunjia, Bhumij, and Kol tribes, practise the ceremony whereby the soul of a man just deceased is attracted or conjured into some tangible thing, which is brought back into the house soon after the funeral, apparently that the soul may thenceforth be worshipped as a household spirit. Traces of this superstition may be found all the world over. It is practised by Hindus. Herodotus and Homer show its antiquity. Captain Burton mentions it in Africa. The Bhumij, dwelling between the Kassai and Subarnarekha rivers, are the original inhabitants of Dhalbhum, Barabhum, Patkum, Bagmundi, and still form the bulk of the inhabitants. Many are Sirdar Ghatwali, and well off, and those dwelling amongst the Bengali still retain their dancing customs.—*Cent. Ind. Prov. Com. Rep.* pp. 5, 9; *Dalton*, pp. 147, 156; *Campbell*, p. 35.

BHUMTAS. HIND. Salix tetrasperma.

BHUNDARA, a district in the Nagpur division of the Central Provinces, situated on the Wainganga, east of Nagpur. It has an area of 1748 square miles, and a population of 626,000. Some noble specimens of the Kuttung bamboo are to be found in the Lanjee jungles north of Bhundara, on the Deo and Son rivers, also in Seroncha, and (though smaller) in the cantonment of Jubbulpur.

BHUNGHE. BENG. Corchorus olitorius.

BHUNIYA or Bhuiya, a tribe in varied stages of civilisation, and of varied religious development. Buchanan Hamilton found them in Bhagulpur, Bihar, and Dinajpur, and he considered them to be the remains of the armies of Jarasandha. Some of the tribe live strictly as Hindus; while others eat beef, pork, camels, horses, asses, rats, cats, fowls, lizards, and worship the Vira or spirits of their deified heroes. Mr. (Sir George) Campbell considered them to be part of the Bhui tribe of the northern parts of the Madras Presidency; and Colonel Dalton regards them as part of the Bara-Bhui tribe who at one time ruled in the valley of Assam. In northern and eastern Bengal, and in Chutia Nagpur, they are so humble as not even to cultivate their own fields. Yet the landowners surrounding Parasnath hill, though claiming to be Kshatriya, are undoubtedly Bhuiya, being almost black, with coarse negro-like features. The Bhuiya are numerous in Singbhum. Tradition says they were once dominant in the western and southern parts of that country, but were subjugated by the 'Ho' (Kol). Colonel Dalton says they are the monkey-like tribes who aided Rama. Hanuman, the general of the ape army, was Pawan-Ka-put, 'the son of the wind;' and the Bhuiya to the south of Singbhum call themselves Pawanbans, the children of the wind. They are a dark-brown, well-proportioned race, with black, straight hair, plentiful on the head, but scant on the face; of middle height, light-framed like the Hindu, but with figures well knit, and capable of enduring great fatigue. The nose is but slightly elevated, still neither so depressed nor so broad at the root as the generality of Turanian noses. They sometimes call themselves Khandaits, and

claim to be of the same family as the Or-Khandaits or Paiks of Orissa, and assume the Brahmanical cord. They are the earliest known settlers in parts of Singbhum, Gangpur, Bonai, Keonjhur, and Bamra, and are almost the only class possessing proprietary right under the chiefs. The chiefs of these estates now call themselves Rajputs; but the country for the most part belongs to the Bhuiya sub-proprietors. They are a privileged class, holding as hereditaments the principal offices of the state, and are organized as a body of militia. The chiefs have no right to exercise any authority till they have received the 'tilak,' or token of investiture, from their powerful Bhuiya vassals. They have their own priests, called deori, and their sacred groves, called Deota Sara, dedicated to four deities, Dasum Pat, Bamoni Pat, Koisar Pat, and Boram, the sun deity. In each village there is, as with the Oraons, an open space for a dancing ground, called by the Bhuiya the Darbar; and near it the bachelors' hall, called the Dhangar bassa, or Mandarghar, as here the young men, Dhangar, must all sleep at night, and here the drums, Mandar, are kept. Some villages have a Dhangarin bassa, or house for maidens, which they are allowed to occupy without any one to look after them. Whenever the young men of the village go to the Darbar and beat the drums, the young girls join them there, and they spend their evenings dancing and enjoying themselves, without any interference on the part of the elders. The Bhuiya dances have their peculiar features, but compared with the lively and graceful movements of the Kols, they are very tame performances. —*Dalton, Ethnol. of Beng.* 140.

BHUNJA, also variously styled Bhar-Bhunja, Bhurji, Bhar-Bhuja, Bhad-Bhuja, Bar-Bhunja, Bhujari, and Bhunjari. The word is derived from Bhunna, to parch. Rice, peas, gram (a kind of pulse), and other kinds of grain, are parched by them, and sold in the bazars.—*Sherring*, 303.

BHUN KADUM. HIND. Verbascum thapsus.

BHUPALA, the first recorded dynasty of rajas of Bengal.

BHU-PHALLI, a small scandent plant, abundant about Ajmir. It contains a great quantity of mucus, and is used largely as an aphrodisiac, rubbed up with water and strained. It is also considered cooling, and is used in prescriptions as such.—*Gen. Med. Top.* p. 127.

BHUR. HIND. Sandy hillocky soils, the tibba of the Panjabi.

BHUR. HIND. A thatch grass, growing in the jungles of N. India to a height of 9 feet.

BHUR, an aboriginal race in parts of Oudh, Benares, and Behar, and in Palamow, known by tradition as one of the oldest of Indian races.—*Campbell.* Properly Bhar.

BHURA. HIND. A thick, coarse haircloth, also goat's hair.

BHURA, a wedding ceremony of Mahomedans on the third day after Shabgasht.

BHURANYU, in Hindu mythology, a golden-winged falcon who stole the sacred Soma.

BHUR-BHUVA-SVAR. SANSK. Air, earth, and sky. See Gaetri.

BHURJ. HIND. Betula bhojputra.

BHUR-KURI. MAHR. Wrightia tinctoria.

BHURLA or Bulla, Terminalia bellerica.

BHUR-LOKA. SANSK. The sphere of the earth, comprising its oceans, mountains, and rivers.

BHURUNDI. TEL. Tiaridium Indicum.

BHUSA. HIND. Bran of wheat, chaff, or cut straw, or leaves, etc., for feeding cattle.

BHUSANDI, in Hindu mythology, a famous crow.

BHU-SARKARA, or Morinika and Putta Tige. TEL. Niebuhria oblongifolia, *D. C.*; Capparis heteroclita, *Roxb.* ii. 570. The sweet tuberous roots, dried and reduced to powder, are used medicinally for making a cooling drink.

BHUSKI. HIND. A carbonate of soda.

BHUT. HIND. Soy bean? Soja hispida?

BHUT, a spirit, generally an evil spirit, and usually represented by a stone in a forest; commonly coupled with the Preta. In the south of the Peninsula of India, the people recognise the amiable Kannimar, or virgin spirits; the various ammans, with Bhagavati, Chakkamal, and Dwara Pati, are village gods; and Samaladevi is the cholera goddess. Necromancers employ Karuppan, Maden Patchee, and Irulappen, and Kollevai Pai is the will-o'-the-wisp. The Khatari Bhudam, Pesasam, Mohini, Jadamuni, and Etchilpai are other good and evil spirits. See Bhut-Bali.

BHUT, also Bhuta. HIND. Zea mays, Indian corn.

BHUTALA BHAIRI. TEL. Bhatamkusam. SANSK. Croton oblongifolium, *Roxb.* iii. 685. The Telugu name signifies demon-driver or devil-goad, and sticks made of it are carried as a protection against evil spirits.

BHUTAN, on the N.E. of British India, is situated between lat. 26° 30′ and 28° N., and long. 88° 45′ to 92° 25′ E., and occupies from the southern declivities of the great central ridge of the Himalaya mountains, to the level ground in front of that portion of their inferior chain which constitutes the natural northern boundary of the Assam valley eastwards from Sikkim to where the Brahmaputra passes through the mountains. Bhutan is bounded on the north by Tibet, on the west by Sikkim, on the south by the British territory, and on the east by several independent mountain tribes. It consists of a number of rough transverse chains of hills at right angles to the parent range, which forms the backbone of Asia. Between the ridges are precipitous valleys, at the bottom of each of which a mountain stream runs. The first intercourse of the British with Bhutan commenced with the expedition sent in 1772 for the relief of the raja of Koch-Bahar. The Buteah being driven out of Koch-Bahar, and pursued into the hills, threw themselves on the protection of Tibet. The Tesoo Lama, then regent of Tibet, and guardian of the Grand Lama of Lassa, addressed the Government of India on their behalf. The application was favourably received, and a treaty of peace was concluded on 25th April 1774. From that year, with the exception of two unsuccessful commercial missions in 1774 and 1783, there was little intercourse with Bhutan, until the British occupation of Assam, which connected the British and Bhutan frontiers. From that time there had been a continued series of aggressions by the Buteah on British territory, followed by reprisals on the part of the British Government, and the occupation of the Doars or passes which lie at the foot of the Buteah hills. During the 18th and 19th centuries, missions were sent to Bhutan under Mr. Bogle, Captains Turner and Pemberton, and Mr. (Sir) Astley Eden; but the ruling race and the

people are faithless and immoral, and the intercourse ended by the British annexing the marches or Doars on the 11th November 1865.

The upper classes, and particularly the highest officers, are described as shameless beggars, bullies and sycophants, while the lower classes are characterized as tolerably honest and truthful. They weave a coarse cloth, make paper from the bark of the Diah tree; distil a spirit from wheat, rice, and millet, and indulge freely. Chastity is little regarded, and very little practised. The custom of a community of wives between brothers, five or six cohabiting with one woman, obtains here as well as among other countries in the hills. The women are indelicate and immodest, but polyandry prevails far more extensively in the northern and central portions of Bhutan than in the southern. Mr. Eden says the intercourse between the sexes is, in reality, promiscuous. On the death of any head of a family, however numerous his children, and whether male or female, the whole of the property becomes escheated to the Deb or Dharma. The spiritual ruler, or Dharma raja, is supposed to be an incarnation of Buddha. The Deb raja is chosen from amongst the chief officers of the country, and is supposed to vacate the government after three years; in practice, however, he holds office as long as he has power to do so. Below the Deb and Dharma rajas are the spiritual council, composed of twelve Buddhist monks, and the secular council, consisting of six Zimpé. Subordinate to the Deb are the Para Pilo or Penlo, who has the management of the country west of the Tchinchoo river, and the Tongu Pilo of the country to the east towards Assam. Each of these Pilo has under him six Soubahs, or Commissioners of Division.

The *Ghylong* or Lama priests are estimated at 1500 to 2000, and there are many nuns.

The *Lhopa* race are quarrelsome and cruel, but not brave. They have invariably black hair, which is cut close to the head. The eye is small, black, with long pointed corners. Their eyelashes are so thin as to be scarcely perceptible, and the eyebrow is but slightly shaded. Below the eyes is the broadest part of the face, which is rather flat, and narrows from the cheekbones to the chin,—a character of countenance far more strongly marked in the Chinese. Their skins are remarkably smooth, and most of them arrive at a very advanced age before they can boast even the earliest rudiments of a beard; they cultivate whiskers, but the best they produce are of a scanty straggling growth. Many of these mountaineers are more than 6 feet high.

The *Changlo* are a branch of the Lhopa of Bhutan. The Changlo dialect has a considerable amount of glossarial peculiarity with Tibetan, but in other respects it is entirely Tibetan, softened and slightly changed in phonology. The Changlo dialect is spoken along that portion of the northern frontier of the valley which extends from the Binji Doar to the confines of the Kuriapera Doar, or from about 90° to 92° of east long. Neither its northern limit nor the numbers speaking it have been ascertained. The inhabitants of this tract occupy the lesser elevation of the southern Himalaya range, and are, generally speaking, agricultural. Their physical appearance exhibits a few shades of distinction noticeable between them and the tribes of the Sub-Himalaya. They are smaller, less muscular, and the hue of their skin possesses a deep isabelline tint. From the latter circumstance, probably, they derive their appellation, the term Changlo meaning black.—*Bogle, Turner, and Pemberton's Embassies; Aitcheson's Treaties*, i. pp. 105, 142, vii. p. 360; *Prinsep's Tibet*, p. 17; *Fraser's Him. Mts.* p. 335; *Gerard's Kunawar; Hook. Him. Mts.; Jour. Ind. Arch.*, 1853.

BHUT-ANJAN, also Bhowra. Hind. A large black bee, fabled to be enamoured of the lotus.

BHUTA SHUDDHI. Sansk. Bhuta signifies the four elements, and Shuddhi, purification. A Hindu purificatory rite.

BHUT-BALI, offerings to malignant spirits, ghosts, or goblins. Offerings to demons or spirits at funerals. Offerings to all creatures. On the 14th of the dark half of Aswin, Hindus make offerings to malignant spirits. Bhuta-devata is an evil being worshipped as a divinity. Bhut-khet is a field or land granted to the Pahan for the cost of sacrifices offered to propitiate the evil spirits.

Bhut Bamian, literally, idol-Bamian; a name of Bamian.

Bhutni Sajji, literally, devil's soda.

BHUT-BHERUBI. Beng. Premna barbata.

BHUTRAJ. Beng. Adder's tongue, Lygodium flexuosa.

BHUTTA or Bhoota. Hind. An ear of Indian corn, Zea mays.—*W.*

BHUTTER or Puther, and Iyen are two titles of Tamil Brahmans in Travancore.

BHUT-THA, a large tree of Akyab, plentiful in Ramree and Sandoway districts.—*Cal. Cat. Ex.*

BHUTTIAH, a Rajput race, formerly martial, now traders, and like the Arorah, and both these have commercial agencies all over India. See Battia; Bhattiah.

BHUTTOTE, Thug designation of the strangler.

BHU-TULASI, Ocimum basilicum; O. pilosum.

BHU-TULSI. Beng. Salvia plebeia.

BHUVA-LOKA. Sansk. The higher regions, from Bhuva, the sky, and Loka, a world. The atmosphere or firmament. Mahar-loka, the region above the pole-star, tenanted by saints. Bhuvana Cosa and Bhuvana Sagara, Hindu books on geography. See Loka.

BHUVANESWARA, the ancient Eskamra of Orissa, a great seat of the Saiva sect, and largely visited by pilgrims. For six centuries it was the capital of the Kesari or Lion dynasty of Orissa kings, from about A.D. 500 to 1104. 7000 shrines once clustered round the sacred lake, and 500 or 600 still remain, some of them of exquisite design and ungrudging artistic toil.—*Dowson; Imp. Gaz.*

BHYACHARA. Hind. The land tenure by village communities. Bhyad brotherhood is the term employed to designate the minute subdivision of fiefs which obtains in all Rajput states.

BHYENG-TSENG. Burm. In Amherst, a close-grained, compact, grey wood, fit for general purposes.—*Captain Dance.*

BHYNEE. Can. Caryota urens; its sap is abundant, and is converted into toddy and arrack.

BHYNSROR is the tract named Puchail, or the flat, between the river Chambal and the pass, and contains about twenty-four villages, in the lordship of Bhynsror. According to the local tradition of some of the wild tribes, its more ancient name was Bhadravati, the seat of the Hun race; and the

traces of the old city, in extensive mounds and ruins, are still beheld around the more modern Bhynsror. Tradition adds that the Chirmitti, the modern Chambal, had not then ploughed itself a channel.—*Tod's Rajasthan*, ii. p. 713.

BIA. HIND. Pterocarpus marsupium.

BIADIAH. HIND. Green turbans.

BIANA, a chieftain of Biana, Dahima, was one of the most powerful vassals of the Chauhan emperor, Pirthi raja. The brothers of this house held the highest offices under the emperor, and the period during which the elder Kaimas was minister, was the brightest in the Chauhan dynasty.—*Tod.*

BIAR. PANJ. Of Mehra forest, near Abbottabad, Hazara; it is Pinus longifolia, and P. excelsa.

BIAZ. HIND. Interest of money.

BIBA BIBA. CAN. Holigarna longifolia.

BIBACHA. HIND. Brassica Griffithii.

BIBASIS, a name of the Beas.

BIBI. HIND. Lady. Bibi Sahib, ANG.-HIND., properly Bibi-sahibah, an Englishwoman, the mistress of a house. Bibi, Begum, Dorasani, Thakurani, are courteous titles of Indian ladies.

BIBLA, of the Baori race, the Bibia bag of Northern India, is the smaller leopard. F. pardus.

BIBLA-HONI. MAHR. Pterocarpus marsupium.

BIBLE, from the Greek Biblos and Latin Biblum, a book. Christians divide their sacred book into two portions, the Old and New Testaments. The former contains the writings of Moses and other prophets, and is the canonical book of the Semitic religion of the Jews or Hebrews; the latter contains the doctrines of Jesus Christ, but both books are canonical in the religion of Christians. The two books of the Old and New Testament are reverenced but not read by the Mahomedans of the S. and S.E. of Asia; and the possessors of the Taurait, Anjil, Zabur, and the Koran, viz. the books of Moses, the Evangels, the Psalms, and the Koran, are all styled Ahl-i-Kitab, or People of the Book, *i.e.* people possessing a revealed religion. The Old Testament is supposed to have been mostly written in Hebrew, from which it was translated into Greek. The New Testament of the Bible was written, it is supposed, originally in Greek, but the book has now been translated into all the European, and most of the Semitic, Aryan, Mongol, and Polynesian tongues, and largely distributed. The Old Testament, too, has been, in parts, turned into the vernacular tongues of the East Indies, and the whole of the two books have appeared in Arabic. It is related that Philadelphus sent Aristæus, a man whose wisdom had gained his friendship, and Andræus, a captain of the guard, both of them Greek Jews, with costly gifts, to Eleazer the high priest of Jerusalem, and asked him to employ learned and fit men to make a Greek translation of the Bible for the library at Alexandria. Eleazer named seventy elders to undertake the task, and they held their first sitting at the king's dinner-table; and Menedemus, the Socratic philosopher, the pupil of Plato, who had been sent to Philadelphus as ambassador from Eubæa, was also present. The translators then divided the work among themselves; and when each had finished his task, it was laid before a meeting of the seventy, and then published by authority. Thus was said to have been made the Greek translation of the Old Testament, which, from the number of the translators, is called the Septuagint; but a doubt is thrown upon the whole story by the fables which have been mingled with it to give authority to the translation. During 1870 to 1881 a committee in England revised the New Testament. In the 2d century there is said to have been an Indian translation of the New Testament St. Chrysostom (Evang. Joan. Homil. I. cap. i.) says the Syrians too, and Egyptians, and Indians, and Persians, and Ethiopians, and innumerable other nations, translating into their own tongues the doctrines derived from this man, barbarians though they were, learned to philosophize.

Nadir Shah, in 1740, ordered Mirza Mehdi to translate the four Gospels, but it was done in a very faulty manner. A Georgian translation was printed at Moscow in 1743. The Armenians have it in their tongue; the Nestorians and Jacobite Christians use the Syriac Bible, and it is in the vernacular of all the nations of Europe.

The first versions printed in India of any of the Christian Gospels in the Persian and Hindustani languages, were in 1805 at the College of Fort-William. The Persian was superintended by Lieut.-Colonel Colebrooke, and that in Hindustani by William Hunter. Thomas Jarrett translated the Gospels into Western Malay; Pūrūsh Ram, into the Uriya; Vydya Nath, into Mahratti, under the superintendence of Dr. William Carey. The Old and New Testaments, in whole or in part, have now been translated into 72 of the languages of the East Indies.

In Malay it was published in the Arabic character, in 5 vols. 8vo, in 1758, under the direction of Jacob Mossel, Governor-General of the Dutch possessions in the East Indies.

The immense numbers of Malayan Bibles and other religious books that have been circulated throughout the Moluccas, have produced a uniformity of idiom which greatly facilitates communication not only between Europeans and natives, but between the natives of the different islands themselves. Indeed, the Malayan language here assumes a degree of importance which is unknown to the other European establishments in the Archipelago. It becomes in a great degree the language of general society, as Dutch is rarely spoken except by individuals born in Europe, who are few in number. A constant correspondence is also kept up in Malayan between the Government and Orang Kaya of the interior. Under these favourable circumstances, the Malayan dialect of the Moluccas affords a facility in expressing ideas which is unknown to the westward, where the language is only spoken generally by uneducated people, a circumstance which may eventually lead to the

Amboyna dialect becoming the general medium of communication throughout the Archipelago. A similar result followed on the translation of the Koran. It gave the purest Arabic a hold.

Since 1811, Bible Societies for the distribution of this sacred book have been formed in most of the Protestant countries of Europe.—*Indian Antiq.* 1873; *Cust, Modern Languages*, p. 196; *Sharpe's History of Egypt*, i. pp. 308, 309.

BIBLIOTHECÆ SANSKRITÆ, a catalogue by Professor Gildemeister, published in 1847, of authors, Indian and European, who have edited or translated Sanskrit works, or treated of Sanskrit literature.—*Cal. Rev.*

BICHE DA MAR. Holothuria, *sp.*

Hoy-shun, . . . CHIN.	Holothurion, . . LAT.
Swalloe of traders, ENG.	Suala, ... MALAY.
Sea-slug, Sea cucumber, ,,	Tripang, ... ,,
Beche de mer, . PORT., FR.	Balate, ... PHIL.

Species of Holothuria are found in most of the shallow seas of the Malay and Philippine Archipelagos, near Ceylon, Mauritius, Zanzibar, Polynesia, in the upper part of the Gulf of Siam, and are so abundant on the northern coast of Australia, that the people of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages thither in quest of it. Its only market is that of China, to which many hundred tons are yearly sent, for the consumption of the curious epicures of that country. The fishery of the trepang is to China what that of the sardine, tunny, and anchovy is to Europe. It is for the most part caught by hand, for it has little power of locomotion, but in deep water, sometimes by diving. The great sources of wealth of the Aru Islands are the pearl and trepang banks, on the eastern side of the group. These extend the entire length of the islands, and are often several miles in width, being intersected by deep channels, some of which will admit vessels of burden. The greater portion is caught in shallow water, where it can be picked up off the bank without diving. It is produced in the greatest abundance on small coral islands, especially those to the south and east of the Sulu group. The trepang on that coast is of several varieties. It is sometimes two feet long; but its common length is from four to ten inches, and its diameter two or three. Its tentaculæ are short, and when the animal is captured, are folded up under its body. The trepang is first thrown into a kettle filled with boiling sea-water, after a few minutes it is removed and gutted. It is then thrown into a second kettle, where a small quantity of water and the parching rind of a mimosa produce dense vapours. This is done to smoke the trepang for better preservation. Finally, it is dried in the sun, or in case of bad weather under a shed. For a long time the Chinese were the sole carriers of the article, but foreigners now engage in the trade. A great deal of this article is imported into Macao, in junks and Portuguese vessels. In the market it appears hard and rigid, and has a dirty brown colour; when brought to the table, it resembles pork rind in colour and consistency. The Chinese use it by itself, or as an ingredient in other dishes, and consume large quantities, under the belief that it is an aphrodisiac. The varieties into which they divide it are above thirty, varying in price from $80 down to $1½ per pikul, but unless one is well acquainted with the article, it is impossible to distinguish them. In the Chinese tariff, all the sorts are arranged under the two heads of black and white.—*Jour. Ind. Arch.* iv. p. 480; *Hon. Mr. Morrison's Compendious History; Crawfurd's Dictionary; Faulkner.* See Holothuria; Trepang.

BICHHATI, also Bich-taruka. BENG. Silver weed, Argyreia speciosa. Bich'huti, Tragia involucrata, *Linn.*

BICHU. HIND. Martynia diandra.

BICHUA, Bichhata. HIND. The Himalayan nettle. Urtica heterophylla. Urtica interrupta. The name is from Bichu, a scorpion.

BICHUA. HIND. A dagger with a waved blade.

BIDABAD, all of it was formerly a place of refuge. See Bast.

BIDAL. BENG. Bauhinia variegata.

BIDARA, KARN., also Bidi Kaiavaru, a troop of grain-carriers.

BIDARIKAND. HIND. Root of Pueraria tuberosa, in Ajmir, considered of a warm nature, and used among a great number of ingredients of many prescriptions.—*Gen. Med. Top.* p. 126.

BIDASPES, Bedaspes, or Hydaspes of the Greeks, the modern Behut, the ancient Vitasta.

BIDDARI. SANSK. Gmelina Asiatica.

BIDDAT. ARAB. In Mohamedan law, points of religion neither directly enjoined nor yet forbidden by Mahomed.

BIDDHU-KURNU. BENG. Clypea hernandifolia.

BIDEN, CHRISTOPHER, author of Naval Discipline, or a View of the Necessity for a Law establishing an efficient Naval Discipline in the Merchant Service. He was for many years master attendant at Madras.

BIDENS. *Smith.* The Kwei-chin-ts'au of the Chinese. A composite plant, one of the Shan-yoh or mountain drugs of the Chinese. It has sialogogue properties.—*Smith.*

BIDGIRAMMI. MAL. Linseed.

BIDHATA PURUSH, the Hindu god of fate.

BIDHAY. BENG. The signal for taking leave, often accompanied by a gift.

BIDPAI or Pilpai is the name given to the author of the oldest known collection of tales, but no edition of them is in existence. Tradition says that they were written in Sanskrit by a Brahman of this name, for the benefit of Dabishlim, his king, and to them almost all the fabulous relations of other countries have been clearly traced by Mr. Colebrooke, the Baron de Sacy, and Professor H. H. Wilson. The Bidpai collection is traditionally said to have been since reproduced in the Panchatantra, or five chapters, also known in India as the Panchopakhyana, or "Five Collections" of 80 stories, which are supposed to have been in prose, written by Vishnu Sarma for the education of a king's sons. Panchatantra means literally Pentateuch, or the Pentamerone, or Quinque Partitum. Its five chapters relate to the dissensions, and the acquisition, of friends; inveterate enmity; loss of advantage and inconsiderateness. The book has many aphorisms to guide a person in life. Another collection, called the Hitopodesa, *i.e.* Salutary Advice, was originally written in the Sanskrit language in prose and verse. It is a collection or selection of tales drawn from the fables of Bidpai,

the source also of the Panchatantra, and has been translated into most of the languages of British India, also into English by Dr. Charles Wilkins, Sir William Jones, and Francis Johnston. It is full of maxims and worldly advice; it is as interesting as the Proverbs or Ecclesiastes, and is probably as old as those two works. It opens with a reference to Ganesha, the Hindu god of wisdom, and the story relates to king Sudarsana of Patalipútra and his intractable sons. Both these books have been published in Britain and Germany, and there are English, German, French, and other translations of them. They were translated into Pehlavi in the time of Nushirwan, in the 6th century; from that into Arabic, by Abdallah-ibn-al-Makaffa, about the middle of the 8th century, and his book is known as the Kalila-wa-Damna. This was in the reign of the Khalif Al-Mansur in the 8th century. The Kalila-wa-Damna had 18 chapters, and must have been from another or from a larger collection. Then, about the close of the 9th century, into Persian, by Rudaki, who received 80,000 dirhems for his labours. About the middle of the 12th century (A.D. 1150), in the time of Bahram Shah, a Persian prose translation was made, and a subsequent second translation was made, by Kashifi, and named the Anwar-i-Soheili. A Greek version was made by Simeon Seth, at the command of Alexis Comnenes, and they appeared since in Hebrew and Aramaic, Italian, Spanish, and German. The first English edition was in the 16th century; then in French in 1644 and 1709; and they are the foundation of Æsop's fables. In these tales and fables the Hindus appear to have been the instructors of all the rest of mankind. The complicated scheme of story-telling, tale within tale, like the Arabian Nights, seems also to be of Hindu invention, as are the subjects of many well-known romances, both oriental and European.—*Elph.* pp. 156, 157; *Chips*, iii. 145, also iv.

BIDUANDA KALLANG, a race who, with the Orang Sleetar, dwelt in Singapore till removed from it by the British, when they occupied the island in 1818. They speak Malay with a guttural accent. They are now dwelling in the Malay Peninsula.

BIDURU NANA BIYYAM, TEL., Euphorbia thymifolia, *L.*, has the signification of 'green or raw rice of Biduru.' The term pachchi arisi, TAM., 'raw rice,' is applied to several of the smaller species of Euphorbia.

BIGANDET, Roman Catholic Bishop of Ramatha, who resided for many years in Burma and the Malay Peninsula. He published in 1858 a legendary history of Gaudama, and subsequently a revised edition of it, which Lieutenant Gauvain translated into French.

BIGHA, Bhiga, or Beegha, a land measure varying in extent in different parts of India. The standard bigha of the Revenue Surveys of the North-West Provinces is equal to 3025 square yards, or 5-8ths of an acre. In Bengal, the bigha contained only 1600 square yards, or little less than one-third of an acre. In Benares, it was, at the time of the settlement, determined at 3136 square yards. In other parganas it was 2025 to 3600, or to 3925 square yards. A kacha (immature, crude, small) bigha is in some places a third, in others only a fourth, of a full or standard bigha. Akbar's bigha of 3600 square gaz=2600 square yards=0·538, or somewhat more than half an acre on the above estimation.

In the N.W. Provinces of India it is nearly five-eighths of an acre. In the Lower Provinces it is 120 feet square, or 4800 superficial feet, nearly one-third of an English acre. Tod says that in Rajputana 120 are = 40 acres. Sir H. Elliot specifies the following as some of the variations found in the Upper Provinces for 100 acres, viz.:—

	Bigha.	Biswa.	Kitta.
Farrakhabad, ...	175	12	0
East and South Gorakhpur, . .	192	19	7
Allahabad and part of Azimghur, .	177	5	6
Part of Azimghur and Gazipur, .	154	6	8
Bijnur, ...	187	19	15
In the Upper Doab (Kachhu), . .	582	3	0

In Cuttack, the bigha is now considered to be an English acre. The Mahratta bigha is called twenty pand, or 400 square kathi or rods, each five cubits and five hand-breadths; as the rod varies so does the bigha; under the Adal Shahi dynasty it was equal to 4683 square yards, or only 457 square yards less than an English acre. The Gujerat bigha contains only 284⅔ square yards.—*Wilson's Glossary*, p. 85; *Elliot, Supplement; Tod's Rajasthan*, i. p. 553; *Carnegy.*

BIGNI. HIND. Celtis Caucasica.

BIGNONIA. This genus of plants is one of the Bignoniaceæ, and 18 species occur in China, the Moluccas, Assam, Morung, Peninsula of India, and Malacca. Amongst them are B. adenophylla of Burma, B. undulata of Hindustan and Gujerat, B. multijuga of Sylhet and Penang. The leaves of B. chica yield a red colouring matter. Several species in Burma and Tenasserim are not yet specifically identified. They are called by the Burmese, Lain-bha, Kyoun-douk, Than-day, Thuggai-ni, and Thau-thet-ngai. Bignonia coronaria, a large tree with white flowers; very plentiful in the Tharawaddy and Pegu districts; affords from the inner bark material for rope.

Bignonia chelonoides, *Linn.*

Stereospermum chelonoides, *D. C.*

Padal, Sammi, . HIND.	Pathiri maram, . TAM.
Keersel, Tuatuka, MAHR.	Tagada, Kaligoru, . TEL.
Padri maram, . MALEAL.	Kalighutru, Kalugoru, ,,
Pu-padria maram, TAM.	Pamphoonea, . . URIA.

This is found in various parts of the Madras Presidency, both above and below the ghats in Canara and Sunda, though not common there; abundant in the Dekhan, on the right bank of the Godavery, and in Ganjam and Gumsur; also in the Bombay ghats, at Khandalla and Parr; also in the Panjab, the Siwalik tract, Sylhet, and Assam. In the mountainous parts of the coast of Coromandel it grows to be a large tree; flowers during the hot and rainy seasons, and the seed ripens in December and January. The wood is high-coloured, hard, and durable, and much used amongst the inhabitants of the hills, where it is plentiful. It attains an extreme height of 20 feet, with a circumference of 1 foot, and the height from the ground to the intersection of the first branch is 8 feet. The tree is held sacred by the Hindus, in consequence of which it is difficult to obtain the timber; but it is a good fancy wood, and suitable for buildings. The bark and fruit are used medicinally, and the pleasant-tasted fragrant flowers are used to make a cooling drink in fevers.

Bignonia Indica, *Linn.*

Spathodea Indica.	Bignonia pentandra, *Lour.*
Calosanthes Indica, *Blume.*	

Mulin, Sori, . . HIND. | Tat Morang, . . HIND.
Tat Palanga, . . ,, | Tetoo, ... MAHR.

This is common near water streams on the Bombay side, chiefly below the ghats. On the Coromandel coast it grows tall, chiefly up amongst the mountains; flowering-time, the beginning of the wet season; seed ripens in January and February. The wood is so soft and spongy as to be unfit for use. It grows in Behar and in the Siwalik hills, and immense pods 18 in. long and 4 in. broad hang from its branches in its leafless state. In the Tenasserim Provinces it is often seen near the dwellings of the natives; it grows luxuriantly in the cold regions of the Himalaya. The bark and capsules are astringent, and used in tanning and dyeing. The leaves, called Sionak in the Panjab, are used in medicine.

Bignonia quadrilocularis, *Roxb.*

Spathodea Roxburghii, *Spr.* | Wurrus, . . . MAHR.

This large tree is found in the higher hilly places of the Konkan, the higher valleys of the ghats, Circar mountains, Malabar hill, Bombay, Elephanta; and it is very common in Padshapore jungles, in the Southern Mahratta country. It flowers during the beginning of the hot season, and its flower is very beautiful. The wood is strong, tough, durable, and is much used for beams, as planking for carts, and for many purposes, by the natives.

Bignonia stipulata, *Roxb.*

Spathodea stipulata, *Wall.*

Pha bhan, . . AKYAB. | Ma shoay, of MOULMEIN.
Ka-mhoung, . . ,,

The stipuled trumpet-flower tree has a long twisted pod. It is common throughout Tenasserim and at Moulmein. The flowers are often seen in bazars, where they are sold for food. In Akyab the natives make a spirituous liquor from the bark. Dr. M'Clelland describes it as affording a strong, very dense, and most valuable wood for purposes requiring strength, elasticity, and density.

Bignonia suaveolens, *Roxb.*

Stereospermum suav., *W.* | Tecoma suaveolens, *G. Don.*
Paml, Parool, . . BENG. | Bhita padari?. . . SANSK.
Padul, Padal, . . ,, | Krishna vrinta, . ,,
Sammi, Sammu, . HIND. | Patali, Kalagoru, ,,
Parul, ... MAHR. | Kuberakoshi, Padari, TEL.

This middle-sized tree grows in the Dandelle forest above the ghats, in Canara and Sunda. It occurs, though not very common, in Ganjam and Gumsur, where it attains an extreme height of 20 feet, with a circumference of 1½ feet, and the height from the ground to the nearest branch is 12 feet. It is a native of the southern parts of the Coromandel coast, and also occurs in the Dekhan, Sukanuggur, Gorakhpur, the Khiri jungle, Dehra Doon, and Kangra. It has large, dark, dull crimson flowers. Its wood is very similar to that of B. chelonoides, but of a redder hue, elastic, and long-grained, and is used for buggy shafts, plough yokes, etc. The bark is employed medicinally.—*Roxb.; Voigt; Gibson; Beddome.*

Bignonia suberosa, *R.* Indian cork tree.

Millingtonia hortensis, *Linn. fil.*

Neemi Chambeli, HIND. | Akas Nim, . . . HIND.

This is a very handsome tree, common in the gardens of S. India, in Tanjore, Madras, Segaon, and between Ava and Taong Dong. In January the tree is covered with beautiful and fragrant pure white blossoms. It grows with great rapidity, sending out numerous suckers, from which it may be easily raised. It is a good avenue tree. The rough bark peels off in small pieces about once a year, and is deeply cracked and spongy, like an inferior sort of cork. The wood is hard, close-grained, and of a pale yellow colour, not easily worked, flexible, but not fibrous. A cubic foot unseasoned weighs 50 to 52 lbs., and 42 lbs. when seasoned, and its specific gravity is ·672. It is well adapted for furniture and ornamental work.—*Roxb.; Riddell; Beddome; Cleghorn.*

Bignonia undulata, *Roxb.*

Tecoma undulata, *G. Don.*

Bohira Reora, . . HIND. | Khew, ... SIND.
Rukt Reora, . . MAHR. |

A tree with drooping branches like the weeping willow, leaves covered with micaceous scales; flowers in lateral racemes, very large, orange-coloured, and scentless. It is found in the N. parts of Baglan and in Kandesh; is more common in Sind, in some of the valleys of the Pubb hills, and at Shah Bilawul; it occurs in Gujerat, is very common in Marwar and other parts of Rajwara; and in the month of March, when covered with its blossoms, it is splendid. The wood is fine-grained and valuable, having a scent like the walnut leaf. It is reckoned very strong and durable, but from its size is applicable only to small purposes.—*Drs. Roxb., Irvine, Gibson.*

Bignonia xylocarpa, *Roxb.*

Tecoma xylocarpa, *G. Don.*

Ghan seng, . . . CAN. | Vadenkurni maram, TAM.
Khurseng, . . MAHR. |

This large tree grows in all the Madras forests. It is easily distinguished by its peculiar rough pods, two feet or more in length. The wood is never large, is of a brownish yellow colour; very hard, and good if ripe; rather close-grained; takes a good polish, and is used in turnery and in cabinet-making. It also affords an oil, obtained by a simple process of reverse distillation, and said to be of great efficacy in cutaneous affections.—*Drs. Roxb., Wight, M'Clelland, Hooker, Mason, Stewart, Cleg., Riddell, Gibson; Capts. Beddome, Macdonald.*

BIGOTI. GUJ. In Baroach, village lands, undivided.

BIHI. HIND. Seeds of Cydonia vulgaris; quince seed, from Bihi, the quince. There is a 'tursh' or bitter, and 'shirin' or sweet, quince; also a sweetmeat made with quince seeds.

BIHISHTI, HIND., or Saka, ARAB., a water-carrier who conveys it in a skin over his back. The word seems to be derived from Bihisht, the paradise or heaven of the Mahomedans.

BIH RECHNI. HIND. Euphorbia dracunculoides.

BIHU, a somewhat sensual dance by the Miri girls. It resembles the Naga movement. Once a year, the unmarried people of the village live together in a large building, and at the close the couples who suit each other pair off and marry.

BIHULL, the inner bark of Grewia oppositifolia, employed in the Himalaya for making ropes.

BIJ, also Binj, HIND. Seed, any seed, hence Bijwar, seed-corn. Bij band is the Sida cordifolia and Rumex acutus; Kamul bij, Nymphæa alba; Sukka-ki-bij, Cannabis sativa; Bij-gai, Lonicera quinquelocularis. Bij-gah, a scarecrow.

BIJA GANITA and the Lilawate are the best Hindu books on algebra and arithmetic, by Bhaskara Acharya.

BIJAI. HIND. A bull liberated by the Hindus as part of a religious ceremonial. See Brikhotsarg.

BIJALA, surnamed Silpagiri, king of Kalyan in the early part of the 11th century. He was a Jaina, and was assassinated by three of the Vri Saiva sect, at the instigation of his minister Basava.

BIJAPUR, formerly the capital of the Adal Shahi dynasty, which ruled there from A.D. 1501 to A.D. 1660. Yusuf Khan, a son of Murad II. of Anatolia, was purchased, in 1499, at Ahmadabad, for the Bijapur Body Guard. But in 1501 he assumed independence, under the title of Adal Shah. The territories over which this dynasty ruled varied considerably in extent, as the Nizam Shahi of Ahmadnaggur, the Bahmani kings of Beder, the Mahrattas, and Dehli family pressed on them. The successive sovereigns were—

Yusuf Khan, styled Yusuf Adal Shah, .	A.D. 1501
Ismail Adal Shah I., ...	,, 1510
Malloo Adal Shah, ...	,, 1534
Ibrahim Adal Shah I., ...	,, 1535
Ali Adal Shah I., ...	,, 1557
Ibrahim Adal Shah II. (in his reign Chand Sultan was regent), ...	,, 1579
Muhammad Adal Shah, ...	,, 1626
Ali Adal Shah II., ...	,, 1660
Sikandar Adal Shah, ...	,, 1672

The tombs of this family at Gogi and Bijapur are domes on basements. Bijapur was taken by Aurangzeb A.D. 1686, and is now in ruins, only occupied by 12,938 inhabitants. Its splendid mosques, mausoleums, and palaces, although falling into decay, are amongst the grandest architectural works in India. The more conspicuous structures are the tomb of Ibrahim, the Mehtar Mahal, the Jamma Masjid, the tomb of Muhammad Adal Shah. A great brass gun is still on the ramparts of this city, said to have been cast on the 13th December 1585 at Ahmadnaggur, by a European, whom tradition styles Rumi Khan. It weighs 41 tons. Bijapur fell to Aurangzeb after a siege. Although they had an inner fort much stronger than the outer works, the garrison were so much in want of provisions, that they were compelled to surrender about the 15th October 1686. Shirzi Khan concluded the terms through Ghazi-ud-Din, to whom the emperor, agreeably to custom, when he received such proposals through any of his officers, was pleased to assign the nominal honour of the conquest. Bijapur thenceforth ceased to be a capital, and was soon after deserted. The ruins occupy a space of about thirty miles in circumference, and are exceedingly grand. The great Mahomedan historian Ferishta is supposed to have died here, during a pestilence that swept away a multitude of the people, but this is uncertain. A Buddhist or Jaina temple, under ground, the several beautiful mosques and mausolea, and the huge gun on the ramparts, into which a full-grown man can creep, all merit attention.—*Briggs' Nizam.*

BIJAR. HIND. Stiff clay soil, lying low, chiefly sown with rice only; occasionally with grain also. Bija Sal, also Bija Sar, HIND., Pterocarpus marsupium.

BIJARA SALA. SANSK. Marking nut.

BIJAYANAGAR, also written Vijianagar, said to be properly Vidia-nagar, or the town of learning, was founded, according to one account, by two fugitives from Telingana; according to Prinsep, in 1338, by Bilal Deo of Karnata, who resisted Mahomed Toghalak, and founded Vijianagar. In 1347, Krishna Rai ruled there; in 1425, Deva Rai; in 1478, Siva Rai. The sovereigns claimed to be of the Yadu race. Towards the 15th century it was the capital of a great Hindu power, which ruled over the Hindu chiefs to the south and south-east of the territories of the Adal Shahi, Nizam Shahi, and Kutub Shahi, kings of their Dekhan; and what is now called the Ceded Districts of British India formed the chief part of their dominion. Their capital was successively at Bijanagar on the Tumbudra, at Pennaconda, and Chandragiri. The rajas long maintained their place among the powers of the Dekhan, but in A.D. 1565 four Mahomedan rulers formed a league against Ram Raj, and a great battle took place (A.D. 25th January 1565, A.H. 20 Jamadi us Sani 972) near Talli-cotta, on the Kistna, at which the venerable raja, then 70 years of age, was taken prisoner, and put to death in cold blood. His army numbered 70,000 horse, 90,000 foot, 2000 elephants, and 1000 heavy cannon. Writing towards the middle of the 19th century, Elphinstone says his head was kept till lately at Bijapur as a trophy. This battle destroyed the monarchy of Vijianagar, but added little to the territories of the victors, their mutual jealousies preventing them extending their frontiers, and the country fell into the hands of petty chiefs or insurgent officers of the old government, since known to the British as zamindars or poligars. The brother of the raja removed his residence further east, and finally settled at Chandragiri, 70 miles N.W. of Madras, at which last place his descendant first granted a settlement to the English in A.D. 1640. The ruins of Bijanagar are now known as those of Humpi, and those at Chandragiri are extensive and remarkable.—*Elphinstone*, p. 416.

BIJION. BURM. In Amherst, a timber used for house posts, rafters. It is a heavy, compact, grey, close-grained wood.—*Captain Dance.*

BIJNOUR or Bijnaur, a town which gives its name to a district in the N.W. Provinces of India. The town is in lat. 29° 22′ 36″ N., and long. 78° 10′ 32″ E., with a population of 12,865 souls. The district has an area of 1902 square miles, and a population of 737,153 souls. Of these, 243,455 were Mahomedans.

BIJOLI. The rao of Bijoli is one of the sixteen superior nobles of the rana of Mewar's court. He is a Pramara of the ancient stock of Dhar. There is an ancient inscription at Bijoli. See Lat.

BIJUCO, a fibre exhibited from Manilla in the Exhibition of 1851. Its source was not known.

BIJUK. BENG. Citrus medica, citron.

BIKANIR, long. 73° 22′ E., lat. 27° 56′ N., is the chief town of a sovereignty, chiefly in the great Indian desert, which has an area of 17,676 square miles. The population was estimated by Tod in the beginning of the 19th century at about 539,000, and the revenue at about six lakhs of rupees. In 1874, Major Powlett estimated the population at 300,000. The ruling family are of the Rahtor tribe of Rajputs, who have held sway there since 1439. Bikanir maintains a force of 2100 cavalry, and about 1000 infantry and 30 guns. Bikanir was originally inhabited by various small tribes of Jats and others, the quarrels among whom led to the conquest of the country in 1458 by Bika Singh, a son of raja Jodh Singh of Jodhpur. After consolidating his power, he conquered Bagore from the Bhattee of Jeysulmir, and founded the city

of Bikanir; he died in A.D. 1505. Rai Singh, the fourth in descent from Bika Singh, succeeded to power in 1573, and in his time the connection of Bikanir with the Dehli emperors began. Rai Singh became a leader of horse in Akbar's service, and received a grant of 52 parganas, including Hansi and Hissar. The earliest treaty with the British Government was in 1801. Sirdar Singh succeeded to power in 1852. He did good service during the mutinies, both by sheltering European fugitives, and by co-operating against the rebels in the districts of Hansi and Hissar. He received a salute of 17 guns and the right of adoption. The Oswal and the Mahesri Rajputs form the chief part of the population; the Sewak are servants of the temples. On the side of the tank where the dead are burned are the cenotaphs of twelve chiefs. The wells at the city are 300 feet deep. The territory was once populous and wealthy; but the plundering Beedawat bands, with the Sahrai, the Khasa, and Rajur robbers in the more western desert, so destroyed the kingdom, that while formerly there were 2700 towns and villages in Colonel Tod's time, not one-half of these remained. Three-fourths of the population are the aboriginal Jit, the rest are their conquerors, —the descendants of Bika, including Sarsote (Saraswati) Brahmans, Charans, Bards, and a few of the servile classes. A list is given of 37 fiefs, the chieftains, retainers of Bikanir, holding 43,572 foot and 5402 horse.—*Tod's Rajasthan*, i. p. 240, ii. p. 98; *Prinsep's Antiquities*, p. 259; *Aitcheson's Treaties*, iv. p. 147; *Elphinstone's Caubul*, p. 10.

BIKAS. HIND. A grass of N. India, growing in low ground, with stem and leaves larger than the Dub grass.

BIKH, Bikhma, Bikya, Bish, Vish, Visha, and Ati visha, HIND., are names of a powerful vegetable poison. Dr. Wallich refers the plant to the Aconitum ferox; it seems, however, to be the roots of several aconites, for Dr. Hooker, in one part of his journal, mentions that he met with A. palmatum, which yields one of the celebrated Bikh poisons. All the Sikkim kinds are called gniong by the Lepcha and Bhotia, who do not distinguish them. The A. napellus, he says, is abundant in the north-west Himalaya, and is perhaps as virulent a Bikh as any species. At another place he mentions that magnificent gentians grow in the Lachoong valley, also Senecio, Corydalis, and the Aconitum luridum, a new species, whose root is said to be as virulent as A. ferox and A. napellus. The result, however, of Drs. Thomson and Hooker's examination of the Himalayan aconites (of which there are seven species), is that the one generally known as A. ferox, and which supplies a great deal of the celebrated poison, is the common A. napellus of Europe. Bikhmaura is also a name for A. ferox.—*Wall.; Hooker's Jour.* i. p. 168, and ii. p. 108; *Engl. Cyc.* p. 455. See Aconitum.

BIKKI. TEL. Gardenia latifolia.

BIKRAMPUR, an ancient town in the Dacca district of Bengal, equal to Nadya as a seat of learning; for several hundred years, from the time of Vikramaditya until taken by the Mahomedans, it was a seat of government under the Hindu rulers of Bengal. There is a mound near; and near the site of the palace is a deep excavation called Agnikunda, in which it is said the last native prince with all his family burned themselves on the approach of the Mahomedans.—*Imp. Gaz.*

BIKWAN and Bhanguria are branches of the Gaur taga.

BILA, a Negro race occupying the southern part of the Malay Peninsula, along with the Simang, in the provinces of Quedah, Perak, Pahang, and Tringanu.

BILADURI, or Al Biladuri, author of the books Fatah ul Baldan, or the Conquest of Sind, Syria, Mesopotamia, Egypt, Persia, Spain; and the Kitab-ul-Baldan, a cosmographic work. His name was Ahmad bin Yahya bin Jahir, surnamed also Abu Jafar and Abu Hasan. He lived at Baghdad, and died A.D. 892–3, A.H. 279. He was called Biladuri, from being addicted to the use of an intoxicating electuary made with the Malacca bean of the Anacardium occidentale.

BILAI KAND. HIND. Pueraria tuberosa.

BILASPUR of the Central Provinces forms the northern section of that tract of country which is usually known as the Chhattisgarh plateau. It is situated between lat. 21° 45′ and 23° 10′ N., and long. 81° 30′ and 83° 15′ E. It was long held by the Hai-hya Bansi Rajputs, but was overrun by the Mahrattas early in the eighteenth century. The district contained a population of 715,398 in 1872, amongst whom the chief divisions are:—

IMMIGRANTS, 598,268.		Banya, ...	4,873
Chamar, ...	164,388	Other Hindus, . .	133,833
Panka, ...	72,972	Mahomedans, . .	9,041
Ahir or Raut, . .	66,574	PRIOR RACES, 173,194.	
Teli, ...	51,679	Gond, ...	120,159
Kurmi, ...	39,843	Kanwar, ...	30,436
Mali, ...	25,145	Bhumia, ...	2,264
Brahman, . . .	17,167	Binjwar, . . .	7,009
Bairagi, ...	11,092	Dhanwar, . . .	3,988
Rajput, ...	10,702	Other non-Hindus,	9,338

BILATEE or Bilati. BENG. An alteration of the Persian word Vālāyăti, meaning foreign, exotic.

Bilati Ananas, Fourcroya cantala.
,, Amra, Spondias dulcis.
,, Aloo, potato, Solanum tuberosum.
,, Amlee, Garcinia pictoria.
,, Pita-silli, common parsley.
,, Bagoon, tomato or love-apple.
,, Mehndee, myrtle, Myrtus communis.

BILAURI. HIND. Polygonum bistorta.

BILBA, a nomade tribe in Lahijan in Persian Azarbijan, who roam about the frontiers of Persia and Turkey. They are the most predatory, turbulent, and treacherous of all the border tribes of Kurdistan, and have been ruthlessly hunted down by other tribes. They number about 5000 families, in three divisions,—Piran, Mengur, and Marnish.

BILDI. HIND. Pharbitis nil.

BILIGIRI RANGAN, a range of hills in the east of the Yelandur Jaghir in Mysore. The only inhabitants are the wild Soligar.

BILIMBI. MALAY. Averrhoa bilimbi, and A. carambola.

BILIN. HIND. Feronia elephantum.

BILITSHI. HIND. Ribes nubicola, R. glacialis, and R. glossularia; currant and gooseberry.

BILKHARIA. HIND. A tribe of Rajputs of the Bachgoti Chaipan stock, so named from Bilkhar in Oudh.—*Wilson's Gloss.*

BILLA GANNERU. TEL. Vinca rosea.

BILLA ILEI. CAN. Gerbillus Indicus.

BILLAIN-LENA. HIND. A deprecatory custom in India amongst Mahomedan women. A woman

sweeps her open hands along the outline of the body of another person from the head downwards, then presses the backs of her fingers against her own temples. The ceremony is intended to represent that the performer takes on herself all the evils that may befall the other.

BILLA JUVVI, Erra Juvvi, and Nandireka. TEL. Ficus nitida, *Thunb.* Dr. Wight considers this to be the same as F. Benjamina, *L.*

BILLAPA. TEL. Trichilostylis globulosa. *Nees.*

BILLA SOORGUM, a town in the Ceded Districts of India, where there are caves containing osseous breccia and deposits, described by Lieut. Newbold.

BILLAWAR. CAN. A wood of Mysore. It has great toughness or elasticity, makes handsome furniture resembling walnut, and is much used for the framework of carriages, for felloes and spokes of wheels.

BILLAWAR, a race in Canara engaged in collecting palm toddy.

BILLICUL, a small natural lake near Segoor on the Neilgherries, 5700 feet above the sea.

BILLI LOTAN. SANS. Valerian; also a species of Melissa or Nepeta ruderalis. The words mean cat-rolling, from the circumstance that cats roll amongst these plants.

BILLU KARRA, also Billudu chettu. TEL. Satin wood, Chloroxylon Swietenia, *D.C.* Karra in Telugu means wood, Chettu, a tree.

BIL-LUTA. BENG. Pogostemon plectranthoides. Bil-nalita, Corchorus fascicularis.

BILODAR or Biddoja. HIND. Falconeria insignis.

BIL-PAT. BENG. Lochennia corchorifolia.

BIL-RAI. BENG. Sinapis patens.

BILU, Burmese Buddhist myths, the equivalents of the Hindu Rakshasa. They are generally, however, described as engaged in some humorous mischief.—*Yule's Embassy*, p. 27.

BILU. MAHR. Waste land, or uncultivated land, viz. the Gaothan or village site; Gaoran, free grazing ground; Turmandi, the cattle standing-place; Hulabamu, grass land.

BILVA or Bilvamu. SANSK. Ægle marmelos. It is sacred to Mahadeva; he alone wears a chaplet of its flowers, and they are not offered in sacrifice to any other deity. If a pious saiva Hindu should see any of its flowers fallen on the ground, he would remove them reverently to a temple.

BILVA-TITHA. CAN. Feronia elephantum.

BIMA, one of three races speaking distinct languages current in the island of Sumbawa. Their alphabet, once distinct, has been displaced by that of the Celebes. See India.

BIMAK KABULI. HIND. Myrsine Africana.

BIMB or Vimba. SANSK. Bryonia grandis.

BIMB of Abyssinia. Bruce thought that this might be the insect which is alluded to in Scripture as the plague of flies. See Tsal-tsal; Tse-Tse.

BIMBA, a race who occupy the rugged mountains of, and along with, the Kukha. They were under Sikh rule, but are shiah Mahomedans.

BIMBASARA, king of Magadha, B.C. 578, reigned 52 years. He was first of the house of Bhattya, and was murdered by his successor,—this dynasty, from B.C. 578 to B.C. 447, in succession being parricides. See Bhattya; Vindusara.

BIMLIPATAM, a seaport town, in long. 83° 29′ E., and lat. 17° 53′ N. It has an open roadstead with a small river. It is 15 miles N. of Vizagapatam, on the eastern side of the Peninsula of India. The Dutch had a factory there, which was plundered by the Mahrattas in 1754.

BIMRA of Chenab, Vitex negundo.

BIN. BURM. A tree; Cannabis sativa.

BINA or Vina. HIND. A lyre; also Andropogon muricatum. In Bengal, Avicennia tomentosa; in Borneo, Antiaris toxicaria.

BINAULA. Seed of the cotton plant. Binahar, HIND., cotton-gatherer.

BINAURIA. HIND. A plant of N. India, given as fodder to horned cattle.

BIN BHANTA. SANSK. Solanum melongena.

BIN-BHINSA. HIND. The jungle sheep or four-horned antelope, Tetraceros quadricornis.

BINDA. TEL. Abelmoschus esculentus.

BINDA, Chaing or Chain, fishermen, boatmen, and general labourers.

BINDAHARA, at a native Malay court, the treasurer.

BINDAK, also Findak. HIND. Corylus avellana, hazel nut.

BINDAL. HIND. Momordica echinata.

BINDH MADHU, a great temple at Benares, described by Tavernier 1680, but destroyed by the emperor Aurangzeb. It was in the form of a St. Andrew's cross.

BINDIYACHAL hills, in Bundelkhand, commencing near Seundah, long. 26° 14′ E., lat. 78° 50′ N.; proceeds S.W. to Narwar, 25° 39′, 77° 52′; S.E. to 24° 12′; N.E. to Ajegarh, 24° 53′, 80° 20′, and Kullinjar in the same vicinity; and E. to Barghar, 25° 10′, 81° 36′. None are more than 2000 feet; the average between the Tura and Kuttra passes, about 520 feet. The Tons falls over the brow by a cascade of 200 feet; Bilohi, 398 feet; and Bonti, 400 feet.

BINDLIGAR. HIND. Maker of tinsel ornaments.

BINDRABAN or Vrindawan, signifying a grove of Tulsi trees, is a holy Hindu town situated on the right bank of the river Jumna. The circumstance which imparts most to its sacred character, is its having been the site of the early revels of Krishna, the Apollo of the Hindus, Muttra having been his birthplace. Many a Hindu Anacreon courts the muses with lays dedicated to this youth, prominent in Hindu mythology, and minstrels and maids join in soft strains to his praise. Bindraban is now noted for the manufacture of pretty toys, made of a composition that may be mistaken for mineral. Indeed, the vendors pass them off as such, and, to enhance their value, declare that they are brought from Jeypore, where articles of this description, and marble toys especially, receive a fine finish. The Valabbacharya sect of the vaishnava Hindu have many hundreds of their temples at Mathura and Bindraban. At Benares and Bindraban, the annual dances, constituting the Ras Yatra, in commemoration of Krishna and the sixteen Gopi, are performed with much display.—*Tour of India by French*, 214. See Ras Yatra; Rudra Sampradayi.

BINDU, a perfect jogi, and teacher of yoga practices.

BINDUNI, a small tribe amongst the Bakhtiari, who are believed by the latter to be prior settlers.

BINDU-SAROVARA, a lake from which the

Ganges issues, also called Lake Mansaravara. It is fabled to be formed by drops of water falling from Mahadeva's hair.

BINEPATTA, in Coorg, a race of Malabar who personate demons at festivals.

BINGHAR BIJ. HIND. Asphodelus fistulosus.

BINGU. PANJ. Celtis Caucasica.

BINJAI. MALAY. Mangifera cæsia, *Jack.*

BINJI DOAR, a tract of country in the N.E. frontier of India, towards Bhutan, in long. 91° E. The language spoken thence to the Kuriapera Doar, in long. 92° E., is a dialect of the Buteah or Tibet. It is occupied by the Changlo race, a word which means black. See Bhutan.

BIN-JOGI, a pipe used by snake-charmers.

BINJWAR, a tribe who speak a dialect of Hindi, and generally observe Hindu customs, but the manes of their forefathers appear to be their chief worship; they live in a very wild state, subsisting principally by hunting. The Byga of the Mundla district are nearly connected with them.—*Dalton, Ethnol.* 148.

BIN-KUK. ARAB. Armeniaca vulgaris, *Lam.*

BINLANG are stones worshipped as emblems of Siva. They are formed at Muheswur, in the Nerbadda, where a whirlpool occurs, and rounds and polishes fallen stones into the form of a lingam. See Hindu; Siva.

BINNA. HIND. Vitex negundo.

BIN NELLI. SINGH. Phyllanthus urinaria.

BINNUGE, according to Thunberg, is the name given by the Singhalese to a species of Ipecacuanha. There are two kinds, one called Elle Binnuge; the other, which is red, is called Rat Binnuge. The red is reported to be the better. Both are species of Periploca, both creep or twine round the bushes which grow on the sandy downs.—*Thunberg's Trs.* iv. p. 186.

BINSIN. HIND. Myrsine Africana.

BINT. ARAB. A daughter, a girl. In Egypt, every woman expects to be addressed as 'O lady,' 'O female pilgrim,' 'O bride,' or 'Ya bint!' (O daughter). In Arabia you may say, 'Y'al mara!' (O woman); but if you attempt it near the Nile, the answer of the offended fair one will be, 'May Allah cut out thy heart!' or, 'The *woman*, please Allah, in thine eye!' And if you want a violent quarrel, 'Y'al aguz!' (O old man), pronounced drawlingly,—'Y'al ago-o-ooz,'—is sure to satisfy you. In India, 'Ho-ma' (O mother) is a usual and acceptable exclamation; and Amma, or the Ma-Sahiba or lady mother, are terms which the highest in the land would accept. On the plains of Torrento, it was always customary, when speaking to a peasant girl, to call her 'Bella fé' (Beautiful woman), whilst the worst of insults was 'Vecchiarella.' So the Spanish calesero, under the most trying circumstances, calls his mule 'Vieja, ravieja' (Old woman, very old woman).—*Burton's Mecca*, i. p. 121.

BINTANGOR, a wood of the Malay Peninsula, in great abundance around Singapore. It is used in ship-building, serving for planks, masts, spars, etc., and is exported in large quantities to the Mauritius, California, etc. For masts and yards, the wood preferred is the red bintangor of Sumatra. It is a species of Uvaria or Calophyllum, which, in all the maritime ports of India, has obtained the name of poona or puhn, from the Malayan word signifying tree in general; as puhn upas, the poison tree, puhn kayu, a timber tree, etc., the source of the commercial term for the poona or peon spars.—*Exh. of* 1851.

BINTENNE, a town in Ceylon where hot springs occur. See Hot Springs.

BINTULU, a river of Borneo, on the banks of which the Kyans dwell. See Kyans.

BINTUNGAN wood of Java is employed in the same manner as Wadang, but grows to a larger size; the colour of the wood and bark is red.

BINUA. The Jakun, Orang Bukit, Rayet Utan, Sakai, Halas, Belandas, Besisik, and Akkye are regarded by Newbold (ii. 382) merely as divisions of Orang Binua, people of the country. Malays term them Orang Utan, men of the forest; Orang Darat Liar, wild men of the interior; and Orang-ulu, people of the upper part of the river, etc.,—epithets which they consider offensive. The Binua people occupy the rivers Johore (the Lingiu and the Sayong), Binut Pontian, Batu, Pahator, Rio, Formosa (the Simpang, Kiri, Pau, and Simrong, with their numerous affluents), and Indau (the Anak Indau, Simrong, and Made), with the country watered by them, and by means of these rivers a constant communication is maintained between the families of the Binua on the two sides of the Peninsula. The boundary between Pahang and Johore intersects the country of the Binua, the whole of the Anak Indau, and the lower part of the Simrong being in Pahang, and all the other rivers, including the Made, on which they are found, appertaining to Johore. The authority of the Bindahara and the Tamunggong is little more than nominal. The Binua are divided into tribes, each under an elder, termed the Batin. The Jakun are extremely proud, and will not submit, for any length of time, to servile offices or to much control. The Binua or Sakai language of Pera appears to resemble, in its phonetic character, the ruder dialects of the Burman group. This character is intermediate between that of the Simang on the one side, and that of the ruder Sumatran, Javan, and Borneon, on the other. The Johor Binua is more guttural, aspirate, and harsh, remarkably broad and slow.

In the Binua, the cheek-bones are broad in all directions, and prominent, giving to the face, below the base of the forehead, a marked lateral development beyond it, or to the forehead an appearance of being compressed. The lower jaw is massive, spreads out and does not rise rapidly, thus producing an obtuse chin, and the anterior maxillary projection considerable.

The lofty Gunong Bermun, nearly 100 miles to the north of the Lulumut group, with the mountains which adjoin it, may be considered the central highlands of many tribes. In the ravines and valleys of Gunong Bermun, two of the largest rivers of the Peninsula, the Pahang and the Muar, with their numerous upper tributaries, have their source. The Simujong, which unites with the Lingi, also rises there.

The upper part of these rivers, and many of their feeders, are occupied by five tribes, differing somewhat in civilisation and language. The Udai (who appear to be the same people who are known to the Binua of Johore under the name of Orang Pago) are found on some of the tributaries of the Muar, as the Segamet, Palungan, and Kapi, and in the vicinity of Gunong Ledang. This tribe has less approximated to Malayan habits than the

others. The Jakun partially frequent the same territory, the lower part of Palungan, Gappam, etc., and extend northwards and north-westwards within the British boundaries.

Many of the Mintira around Gunong Bermun wear the bark of the tirap, the men using the chawat, and the women a piece of rude cloth, formed by simply beating the bark, which they wrap round their persons, and which, like the sarong of the Johore women, reaches only from the waist to the knees. The Udai women wear the chawat like the men. The Bermun tribes believe in Pirman as a being who made the world. He dwells above the sky. Each tree has a jin, and the Jin Bhumi haunts the rivers and mountains, causes sickness and death. There is no religious worship, but recourse is had in sickness to a Poyang, who combines the functions of priest, physician, and sorcerer. The Poyang and Pawang of the Bermun tribes, the Poyang of the Binua, the Batta, the Dyak, and Dato, and the Si Basso of the Batta, are all the shaman, priest, wazir, physician, in different shapes.—*Journal Indian Archipelago*, 1847; *Newbold, British Settlements*, ii. p. 392.

BIOPHYTUM SENSITIVUM. *D. C.* Syn. Oxalis sensitiva. A plant of the Moluccas and of both the Peninsulas of India.—*Roxb.; Voigt.*

BIR or Vir, a man, the Latin vir. Birbani is the term amongst the Jat for a man's own wife; a femme couverte. Birbhum, said to mean the land of heroes.

BIR, a town on the left bank of the Euphrates, in the pashalik of Orfa, with 1700 houses. Caravans and travellers from Aleppo to Orfa, Darkokr, Baghdad, and Persia, cross the river here.

BIR or Ber. ARAB. A cistern to hold rain-water. Jacob's well, Bir Yakub, or Bir-us-Samariah, is 9 feet broad, and more than 70 feet deep. In 1855 it still had a stone over its mouth, as in John iv.

BIR, a village in the Kangra district of the Panjab, with valuable magnetic iron ore, from which iron is manufactured.

BIRA or Beri. HIND. Small pieces of areca nut, spice, catechu, and sometimes a little quicklime, rolled up in a leaf of the piper betel. It is used as a masticatory, an aromatic, astringent, and alkalescent condiment. It is presented to visitors on their leaving.—*W.*

BIRA. TEL. Elæodendron Roxburghii, *W. and A.*

BIRA. HIND. Zizyphus nummularia.

BIRA KAYA. TEL. Luffa fœtida, *W.*

BIRAMDANDI. HIND. Microlonchus divaricata.

BIRBA. HIND. Terminalia bellerica.

BIRBAL. Raja Birbal, a general of the emperor Akbar, who placed confidence in him. He failed in an expedition against the Yuzufzai Afghan, and was killed in the destruction of the army in January 1586. His companionable qualities endeared him to the emperor, but he was a man of solid merit, and of very lively conversation, and many of his witty sayings are still current in India. A small but richly-ornamented house is pointed out to have been the residence of Birbal in Futtehpur Sicri.—*Tr. Hind.* ii. p. 9; *Elphinstone*, p. 455.

BIRBAT. SANSK. Coral.

BIRBAT. SANSK. Areca nut, with spices.

BIRBHAN, the founder of the Sad'h or Sad'hu, a Hindu unitarian sect, who are chiefly in the upper part of the doab from Farrakhabad to beyond Dehli. In 1868 there were 9923 in Oudh. According to Mr. Trant, the sect originated about A.D. 1658, with a person named Birbhan, an inhabitant of Brijhasir, near Narnal, in the province of Dehli. He is said to have been taught by Udaya Das, or Uda-ka-Das (the servant of the one God), who was also known as the Mālik-ka-Hukm, the command of the Creator, meaning the personified word of God. Birbhan has also been said to be a disciple of Jogi Das.

The essence of the Sad'h doctrines is embodied in the Adi-Upa-des, a tract with twelve commandments—(1) to acknowledge one God; (2) to be modest and humble; (3) not to lie; (4) nor malign; (5) nor steal; (6) nor kill; (7) nor beg; (8) nor covet; (9) to avoid narcotics; (10) be monogamic; (11) wear white clothes; and (12) make no marks on their bodies. Their doctrines are evidently derived from the unitarianism of Kabir, Nanak, and similar writers, with a slight graft from the principles of the Hebrew code. They have no temples. Birbhan preached a really pure and excellent ethical code, making truth, temperance, and mercy the cardinal virtues, but retaining many of the doctrines of Hinduism, such as that of Mukti, which is the tenet considering the ultimate object of all devotion to be liberation from life on earth.—*H. Wilson*, p. 353; *Oudh Census*, 1868.

BIRBHUM, a district in the Bengal Presidency, between lat. 23° 33′ and 24° 9′ N., and long. 87° 7½′ and 88° 4′ 15″ E., with an area of 1344 square miles, and in 1872 a population of 696,943. Its name is said to mean the land of heroes, but the Santal Parganas are on the north, and in their tongue Vir means jungle. The aboriginal races, Bagdi, Chamar, Muchi, Dom, Bauri, number 197,423. Its former chief town is Nagar or Rajnagar, now in decay. Near Deoghur or Byjnath is a small town in the zillah of Birbhum, famous for its temples, visited every year by thousands of pilgrims from the North-West Provinces of India. It is situated in the great table-land which extends from near Bardwan to Dunwa Ghat in Behar. Granite, syenite, and gneiss, traversed by greenstone veins, are the prevailing rocks; copper, lead, and iron ores. The vein of copper at the surface runs east and west; is partly in the form of green carbonate. Veins of lead ore, in the state of galena or sulphuret, traverse the principal vein at right angles. The nearest coal is forty miles off.

BIRCH TREE. Betula, *sp.*

Tag-pa, ... BHOT. | B'hurjia, . GR., SANSK.

Birch trees are found in the N.W. Himalaya, and in Japan. The birch, tagpa, of the Chenab river is usually a crooked and stunted tree, but sometimes exceeds one foot in diameter. The annual bridges over the mountain torrents are made of birch twigs. The thin white bark of the Betula bhojputra occurs in sheets or pieces, which can be peeled off. It is used to make umbrellas, and for writing on in lieu of paper. A species of birch of China, the Hwa-muh (bark, Hwa-muh-pi), is used in the saddler, shoemaker, cutler, and candle-maker's trades. See Betula.

BIRD CHERRY. Cerasus, *species.*

BIRD-EYE PEPPER, Capsicum baccatum.

BIRD FEATHERS, from the cranes and king-

fishers, form a considerable article of trade in Southern Asia. The feathers of a large green kingfisher are exported from Madras to Singapore, to be used by the Malays, Javanese, and Chinese. They sell there at 200 per cent. profit.

BIRD FISH, Hemiramphus argenteus.

BIRD ISLAND, called by the Malays Pulo Manok, lies midway between Ceram and the Serwatty group, in the Eastern Archipelago. It is a high solitary mountain with a truncated cone, inhabited by myriads of birds, and natives resort to the island to collect the eggs. Sulphur also occurs on the island.—*Horsburgh.* See Keffing.

BIRD, JAMES, of the Bombay Medical Service, in which he rose to be a Member of the Medical Board. He wrote an Analysis of the Murat-i-Ahmadi, a history of Gujerat, in Lond. As. Trans. 1833, i. p. 117; Biographical Sketch of Capt. M'Murdo, ibid. 123; Memoir on the Country from Poona to Kittoor, ibid. ii. p. 65; Account of the Ruined City of Bijapur, Bom. As. Trans. i. p. 367; Translation of Cufic Inscriptions from Southern Arabia, ibid. 239; Translation of Inscriptions at Burra and Bajah, ibid. 438; Introductory Notice to the History of Sind, ibid. 402; Biographical Notice of Arabic and Persian Library at Cutch Bhooj, ibid.; On Bactrian, Hindu, and Roman Coins in the Bombay Collection, ibid. 293; Account of Temple of Somnath, from the Persian, ibid. ii. p. 13; On the Christian Faith in Arabia, and Himyaritic Inscriptions from Aden and Saba, ibid. 30; Hindu Gold Coins, and Zodiac Coins of Jahangir, ibid. 55; On the Æthiopic Family of Languages in Eastern Africa, ibid. 294; Memoir of General Kennedy, ibid. 417; Historical Geography of Hindustan, and on the Origin of the Social State among the Hindus, Bl. As. Trans. 1840, ix. p. 848; Account of the City of Balkh and its Neighbourhood, extracted from Persian Authorities, Bom. Geo. Trans. ii. p. 60; Illustrations of the Arab and Persian Geographers, or the Geography of the Middle Ages, ibid. 58; Historical Researches on the Origin and Principles of the Buddha and Jaina Religions, with Accounts of the Caves of Western India, Bombay 1847, folio.—*Dr. Buist's Catalogue.*

BIRD-LIME.

Kilut; gatap, .	MALAY.	Pissini, ...	TAM.
Ptits-chei-Klei, .	,,	Banka, ...	TEL.

The substances known in Europe under this name are the viscid juices of several trees. One is prepared in Europe from the middle bark of the holly, by boiling it seven or eight hours in water, then laid in heaps on the moist ground to ferment, with stones over it, to press it down till it passes into a mucilaginous state, then pounded, washed and kneaded till free from extraneous matter, and kept for four days in pots to ferment and purify itself, when it is fit for use. In Southern India it is obtained from the Palay, the Isonandra acuminata. The best is prepared from the outer covering of the fruit and tender twigs and bark of the jack tree, but several of the Artocarpi yield it. —*Rohde; Tom.*

BIRD NESTS.

G'ne-ta-thay, . .	BURM.	Ababil-ka-ghoslah, ...	HIND.
Yen-wo, . . .	CHIN.	Nidi-di-Tunchino, .	IT.

Nids de Tunquin, .	FR.	Sarang-burong, .	MAL.
Indianische-vogelnester, ...	GER.	Nidos de la China, .	SP.

The edible birds' nests of Southern and Eastern Asia are perhaps obtained from more than one species of swallow, but one of them seems to be the Collocalia nidifica, C. brevirostris, *M'Clelland*, of Java, and other islands of the Eastern Archipelago, the Assam hills, the Sikkim Himalaya, Neilgherries, Wynad, Ceylon, the western coast of India, at Pigeon Island S. of Honore, the Vingorla rocks, and at Sacrifice Rock, 20 miles S. of Tellicherry. Dr. Jerdon says that the best nests are from the Collocalia linchi (C. fuciphaga), which builds in the Nicobar Islands, and along the east coast of the Bay of Bengal from Arakan southwards to Java; but several other species of Collocalia occur in the islands of the Eastern Archipelago, as far as New Guinea, one in the Mauritius, and one in the islands of the Pacific. The nests are collected all over the Malay and Philippine Archipelagos, on the Malabar coast and the Tenasserim provinces, wherever there are caves to afford the birds shelter and protection. The caves are most frequent in the limestone formation, but Java and Borneo seem to be the birds' chief resort. The celebrated caves of Karang-bolong (hollow-rocks) are situated in the province of Baglen in Java, and on the shore of the southern sea. The entrance is at the sea level, and at the foot of limestone rocks several hundred feet in height. One place has 200 feet of perpendicular descent before coming to the first ledge. The mouths of the caves are about 18 feet broad and 30 high, while, within, they expand to breadths of from 60 to 114 feet, and to heights of from 420 to 480, the sea penetrating them to the extent of one-fourth of their length, and in rough weather rendering them inaccessible. The descent of the collectors to the caves is effected by narrow rattan ladders, usually about 74 feet in length, attached at top to a stout tree. Within the caves are bamboo scaffoldings erected in order to reach the nests, which are detached from the sides by the hand, and from the roof by hooks attached to long poles. There are three periods for making the collection, April, August, and December. The nest-gatherers are bred to their dangerous calling, and before the commencement of the first gathering, plays are acted in masks, and there is feasting on the flesh of buffaloes and goats, to invoke the aid of the 'lady queen of the south' (Nai ratu kidul), an imaginary being, without whose tutelary aid the work of robbing the nests would not, as they think, prosper. After the crop has been taken, the caves are closed against human ingress. The whole annual gathering, which is effected at little cost, amounts to from 50 to 60 pikuls yearly, or, on an average, to 7370 lbs., worth at Batavia about £18,000. On the N.W. side of Borneo, and not far from the banks of the river Baram, birds' nest caves are found 140 miles from the sea, by the course of the river. They consist of three chambers, one of which is reckoned to be no less than 200 fathoms in length. These are the property of the powerful Kayan tribe, and, like those of Karang-bolong, are carefully guarded.

The nests used by the Chinese are brought principally from Java and Sumatra. Nests are composed of a mucilaginous substance, and it has been supposed by some that the Gelidium corneum enters into their composition, but it is more probable that they are formed by mucus

eliminated from the stomach of the swallow. Externally they resemble ill-concocted fibrous isinglass, and are of a white colour, inclining to red; their thickness is little more than that of a silver spoon, and their weight from a quarter to half an ounce. When dry, they are brittle and wrinkled, little larger than a goose egg. Those that are dry, white and clean, are the most valuable. They are packed in bundles, with split rattans run through them to preserve their shape. If procured before the eggs are laid, the nests are of the best kind; if they contain eggs only, they are still valuable; but if the young are in the nests or have left them, they are nearly worthless, being dark-coloured, streaked with blood, and intermixed with feathers and dirt. The best are found in deep, damp caves, which, if not injured, will continue to produce indefinitely. Some of the most profitable caves are 50 miles in the interior. Everywhere the method of procuring these nests somewhat resembles that of catching birds in the Orkney Isles. After they are obtained, they are separated from feathers and dirt, are carefully dried and packed, and are then ready for the consumer. The Chinese are the only purchasers, and carry them in junks to the Chinese market, where they command extravagant prices; the best, or white kind, often being worth 1800 dols. per pikul of 133⅓ lbs. avoir., which is nearly twice their weight in silver. The middling kind is worth from 1200 to 1800 dollars, and the worst, or those procured after fledging, 150 or 200 dollars per pikul; according to these three qualities, the duty is levied. 8½ millions of nests are annually imported into Canton. Latterly nests of first quality fetch £5 to £6 the pound; those of the second quality, 9s. 4½d.; and the third sort, only 3s. 1d. The most part of the best kind is sent to Pekin for the use of the court. The Japanese do not use them. The Chinese consider the birds' nests as a great stimulant and tonic, but other gelatinous food would be equally serviceable. To render it fit for the table, every feather, stick, or impurity of any kind is carefully removed; and then, after undergoing many washings and preparations, it is stewed into a soft, mucilaginous jelly. The sale of birds' nests is a monopoly with all the governments in whose dominions they are found. Crawfurd estimated that about 243,000 pounds, at value of 1,263,570 dollars, are annually sent away from the Archipelago, mostly to China. Java alone sent about 27,000 pounds, mostly of the first quality, estimated at 60,000 dollars.

A few birds' nests of the esculent swallow are to be got from a rocky island about 20 miles south of Tellicherry, named Sacrifice Rock. The only preparation the birds' nests undergo is that of simple drying, without direct exposure to the sun, after which they are packed in small boxes. The edible-nest swallows are numerous in the limestone caves on the islets and islands on the Tavoy coast; and the government revenue from the bird nest farm in 1847 was nearly Rs. 11,000; but in 1849 it fell to less than Rs. 7000. At Mergui they are not so numerous. The Japanese powder the agar-agar seaweed, boil it to a jelly, and make artificial nests, called Dschin-schan, which they export to China.—*Crawfurd's Dic.* pp. 54, 55; *Morrison; Jerdon.*

BIRD of PARADISE. Papua birds.

Burong Mati, . . . ARU.	Ave de Pardiso, . PORT.
Manuk devata, . . JAV.	Burong Papua, . TERN.
Burong devata, . MALAY.	Soffu, Sioffu, . . . „

Birds of paradise, the most beautiful of winged creatures, were fabled, in the fancy of an Arabian poet, as visitants from heaven to earth; and the islanders of the Archipelago are said to believe that, when old, and feeling the approach of death, the paradise birds fly upward towards the sun, but, having spent their strength in the inferior world, fail to reach again their celestial home, fall and die as they descend (see Camoens' Lusiad, Book x.). No representation can exaggerate their beauty, or excel the lustre of their plumage. They were supposed footless, and incapable of alighting, until it was discovered that the Indians cut off their feet before preserving them. They are obtained in New Guinea, the Aru Islands, Misol, Salwatti, Wagiou (Crawfurd, Jour. Ind. Arch. iv. 182). In the nutmeg season, they come from their breeding grounds in the interior of N. Guinea, and sail in flocks of thirty or forty over the eastern borders of the Archipelago (Valentyn qu. Forrest, Voyage to New Guinea, 142). In Linnæus' genus Paradisea, many birds were included which have since been transferred to other genera. But three species still included in that genus are, P. apoda, *Linn.*, with back of deep maronne brown, contrasting with the golden fulvous neck; it is the P. major of Shaw, and has peculiar dense feathering on the breast. P. Papuana, *Bechstein* (P. minor, *Forster*); back of a pale golden brown, shading with the golden fulvous of the neck, which is continued all round the neck only in this species. P. Rubra, *Cuvier* (P. sanguinea, *Shaw*), is bright golden fulvous on the crown, neck, and back; its axillary plumes are gorgeous red. All have short velvety feathers of a golden fulvous hue on the crown and nape, with the throat and forehead deep, dark, satiny green. Their Malay name, Manuk devata, means Birds of God. The living bird is a model of symmetry. The adult male birds of some species have ornamental tufts of long hairy plumes growing from under the wing, like the purple honeysucker of India, and in two species the middle pair of tail feathers are long wiry barbless stems; and the red kind have a broad flat riband of whalebone substance. The beautiful little king-bird of paradise, Cicinnurus regius, has a deep emerald green disc on the middle tail feathers; the Samalia magnifica has huge neck tufts. In the Parotia sex-setacea, the feathers of the flanks are a large floccose mass. The splendid Lophorina superba has its scapulary feathers enormously developed, like an erectile mantle, and is peculiarly adorned on the breast. The entire group is peculiar to Papua or New Guinea and the Aru Islands. They are shot with sharp or blunt arrows. They are as omnivorous as the crow; and Rupicola coyana, like the turkeys, Argus pheasants, and the dancing bird of America, are fond of displaying their plumage in their sacaleli dances. Mr. A. Russel Wallace applies the term birds of paradise to the following:—

Paradisea apoda, Great Paradise Bird, Aru Islands.
P. Papuana, the Lesser Paradise Bird, in New Guinea, Mysol, and Jobie.
P. rubra, the Red Paradise Bird, in Waigiou.
Cicinnurus regius, the King Paradise Bird, in New Guinea, Aru Islands, Mysol, Salwatti.

Diphyllodes speciosa, the Magnificent, in New Guinea, Mysol, and Salwatti.
D. Wilsoni, the Red Magnificent, in Waigiou.
Lophorina atra, the Superb, in New Guinea.
Parotia sexpennis, Golden Paradise Bird, New Guinea.
Semioptera Wallacei, Standard Wing, Batchian, Gillolo.
Seleucides alba, the Twelve-wired Paradise Bird, in New Guinea and Salwatti.
Ptiloris magnifica, the Scale-breasted Paradise Bird, New Guinea.
Pt. Alberti, Prince Albert's Paradise Bird, in North Australia.
Pt. Paradisea, the Rifle Bird, in East Australia.
Pt. Victoriæ, the Victoria Rifle Bird, in N.E. Australia.
Astrapia nigra, the Paradise Pie, in New Guinea.
Sericulus aureus, the Paradise Oriole, in New Guinea and Salwatti.

Epimachus magnus (Upupa magna, *Gm.*, U. superba, *Lath.*). Body generally black or brownish-black; tail graduated, thrice as long as the body (Lesson says three feet in length, French); feathers of the sides elongated, raised, curled, glittering on their edges with steel-blue, azure, and emerald green, like precious stones; the head and the belly lustrous, also with steel-blue, etc. In truth, language fails to convey any just idea of the magnificence of the species. It inhabits the coasts of New Guinea.—*Indian Field; A. Russel Wallace; Bikmore; J. I. Arch.* iv. 182; *Crawf.; Forrest, Voyage*, 142; *Valentyn, Ind. Arch.* iii. 366.

BIRD PEPPER. Capsicum frutescens.

BIRD, ROBERT MERTENS, a Bengal civil servant; during the years 1834–1844, along with others, he completed the rent settlement for twenty to thirty years of the lands of the N.W. Provinces of India. It comprehended a survey of 72,000 square miles in extent, containing a population of 23,000,000, and cost £500,000.

The birds of Eastern and Southern Asia have been described by many naturalists. In 1831 a catalogue of 156 species, collected by Major Franklin on the banks of the Ganges and the Vindhian range of mountains, was published in the Proceedings of the Zoological Society of London.

In 1832 a catalogue of 226 species, collected by Colonel Sykes in the Bombay Presidency, was also published in the Proceedings of that society. This was undoubtedly the most valuable enumeration of the birds of India published, and contained descriptions, with many highly interesting observations, on the habits, food, and structure of many of the species.

In 1859 Dr. Jerdon published a catalogue of 390 birds of the Peninsula of India, with brief notes on their habits and geographical distribution. Subsequent to this, he issued a series of supplements, followed by a paper from the pen of Lord Arthur Hay, Marquess of Tweeddale, who, till his death in 1878, continued to enrich the literature of this branch of science. In 1881, his nephew, Captain Ramsay, edited a complete reprint of all the Marquess of Tweeddale's ornithological works. Mr. B. Hodgson of Nepal furnished a large amount of valuable information on the ornithology of the Himalaya; General Hardwicke's labours were of great value, his collection being described in 1832 by J. E. Gray. Captain Tickell, Bengal army, also contributed largely to the stock of knowledge regarding the ornithology of Central India; and the other names which may be added to this list of naturalists are Captain J. D. Herbert, who collected in the Himalaya; Dr. N. Wallich, who collected in Nepal; Dr. M'Clelland, who added birds from Assam and Burma; Dr. W. Griffith, whose collections of birds were made in Afghanistan; Dr. Hugh Falconer, in N. India; and Captain (now General) Richard Strachey, in Kamaon and Ladakh. Dr. Stoliczka collected in Tibet and the Himalayas at elevations from 2000 to 16,000 feet, and notices of the birds appeared in the Ibis, 1866-7-8. The birds of the Tenasserim Provinces have been largely described by the Rev. Dr. Mason, and those of Ceylon by Dr. E. Kelaart, Edgar L. Layard, and Captain Legge. These were accompanied by a continued series of valuable articles from Mr. E. Blyth, who was constant in his pursuit of science. Dr. Horsfield and Mr. Moore's catalogue of birds in the India House Museum, appeared in 1856 and 1858; and Jerdon's Birds of India, printed in 1862 and 1864, and the reprint of 1877, have done much to complete our knowledge of this class of the animal kingdom. The comprehensive work of Allan Hume, C.B. and Major C. H. T. Marshall, on 148 of the Game Birds of India, and Allan Hume's list of above a thousand of the birds of India, have added many forms to those which previous writers had described. Eastwards from the Malay Peninsula into the Eastern Archipelago, the labours of Dr. T. Horsfield in Sumatra, Sir T. Stamford Raffles in Java, Mr. G. Finlayson, Dr. Helfers, Dr. Theodore Cantor, Professor Bikmore, and Mr. Alfred Russel Wallace, have given to Europe a very full knowledge of the birds of that extensive region.

The birds of the East Indies are scarcely less beautiful than numerous. Perhaps the choicest of them are the Himalayan pheasants, distinguished for their very graceful and rich plumage, and the beautiful paradise birds of the Eastern Archipelago. The Himalayan bustard is remarkable for its form and varied colour. The paradise birds of Aru at their pairing season have sacaleli or dancing parties amongst the larger forest trees with immense heads, spreading branches, and large but scattered leaves, giving a clear space for the birds to play and exhibit their plumes. One of the birds is nearly as large as a crow, and is of rich coffee-brown colour. The head and neck is of a pure straw yellow above, and rich metallic green beneath; and long plumy tufts of golden orange feathers spring from the sides beneath each wing, and when the bird is in repose, are partly concealed by them. At the time of its excitement, however, the wings are bent over its back, the head is bent down and stretched out, and the long plumes are raised up and expanded till they form two magnificent gold fans, striped with deep red at the base. When seen in this attitude, it really deserves its name. A dozen or twenty full-plumaged male birds assemble together, raise up their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from branch to branch in great excitement, so

that the whole tree is filled with waving plumes in every variety of attitude and motion.

The colouring of birds is often imitative, in the tropics. Among forests which never lose their foliage, are groups whose chief colour is green, and the parrots are a most striking example. The stonechats, the larks, the quails, the goat-suckers, and the grouse which abound in the North African and Asiatic deserts, are all tinted and mottled so as to resemble with wonderful accuracy the average colour and aspect of the soil in the district they inhabit. The small quail-like birds forming the genus Turnix have generally large and bright-coloured pugnacious females; and Jerdon, in his Birds of India, mentions the native report that during the breeding season the females desert their eggs and associate in flocks, while the males are employed in hatching the eggs.

Most birds moult or change their plumage once a year only, after the season of pairing or incubation; but certain families or tribes of birds have two moults, one of them immediately before pairing, and the plumage then becomes showy and gay, with tufts or plumes. Some birds in spring actually change their colour, or portions of their feathers are changed, as in the ear-tufts of the lesser florikin, the Sypheotides auritus. The male of birds is the more highly coloured, except in birds of prey, the painted snipe (Rhynchæa), and some species of Ortygis, the little bustard quail. A few of the gallinaceous birds are polygamous, and their males are very pugnacious.

Nests greatly vary. Those of the weaver-bird, tailor-bird, honeysucker, and oriole are made with much art. The edible nest of the colocasia swallow is formed in caverns, of inspissated saliva; swallows, swifts, bee-eaters, and weaver-birds build in companies; certain ducks breed on cliffs or trees, and they must carry their young to the water, though this has not been observed. The Megapodidæ, gallinaceous birds (says Mr. Wallace, i. 156) found in Australia, its surrounding islands, and as far west as the Philippines and the N.W. of Borneo, have large feet and long curved claws, and most of them rake together rubbish, dead leaves, sticks, and stones, earth and rotten wood, until they form a mound often 6 feet high and 12 feet across, in the middle of which they bury their eggs, and leave them to be hatched by the sun or by fermentation. The eggs are as large as those of a swan, and of a brick-red colour, and are considered a great delicacy. The natives are able to say whether eggs be in the mound, and they rob them eagerly. It is said that a number of these birds unite to make a mound and lay their eggs in it, and 40 or 50 eggs are found in one heap. The mounds are found in dense thickets. The species of the Megapodidæ in Lombok is as large as a hen, and entirely of a dark hue, with brown tints. It eats fallen fruits, earth-worms, snails, and centipedes, but the flesh is white and well flavoured when properly cooked.

In Bengal, the newly-arrived European will particularly be struck with the number of birds of large size which he sees everywhere, even in the most densely-populated neighbourhoods: Flocks of vultures, huge adjutants in their season, swarms of kites in their season too, for they disappear during the rains, all three are seen soaring and circling high in air as commonly as at rest; Brahmany kites, various other birds of prey, among which four kinds of fishing eagle, including the British osprey, are not uncommon; waterfowl in profusion in all suitable localities; herons especially, of various kinds, very abundant; several sorts of kingfisher, mostly of bright hues; the common Indian roller, also a bird of great beauty, and the little bright green bee-eater (Merops viridis) conspicuous everywhere; the common crow of India, of unwonted familiarity, impudence, and matchless audacity; the different mainas, remarkable for their tameness; the drongo or king crow, the satbhai or seven brothers, with their discordant chattering; two sorts of melodiously chirruping bulbuls; the bright yellow mango bird or black-headed oriole; the pretty pied dhyali, the only tolerably common sylvan songster worthy of notice; the brilliant tiny honeysuckers, also with musical voices; the lively and loud golden-backed woodpecker, and two monotonously-toned species of barbet; the pleasingly-coloured rufous tree-magpie (Dendrocitta rufa); the noisy koel, remarkable for the dissimilarity of the sexes, and for parasitically laying in the nest of the crow; the crested cuckoo (Oxylophus) during the rainy season (parasitical upon the satbhai), with other cuculine birds, especially the coucol or crow-pheasant, another noisy and conspicuous bird wherever there is a little jungle; and last, but not least, characteristic in many districts, is the harmonious cooing of several kinds of dove, soothing to repose and quiet, and the loud screaming of flocks of swift-flying green parrakeets, with sundry other types all strange to the new-comer; as the bright little jora, the tiny tailor-bird, and the baya or weaver-birds, with their curious pensile nests, and the diminutive thick-billed munia. Of the swallows, occasionally and somewhat locally, a few of the Hirundo rustica may be seen, chiefly over water; and along the river banks the small Indian bank martin (H. Sinensis) will be seen abundantly. But the swallows are replaced by two non-migratory swifts, the common house swift (Cypselus affinis) and the little palm swift (C. Batassiensis). The roller and the king crow habitually perch on the telegraph wire to watch for their insect prey, the former displaying his gaily-painted wings to advantage as he whisks and flutters about, regardless of the fiercest sun. The small white vulturine bird, Neophron percnopterus, the rachamah or Pharaoh's chicken, is abundant, and a single pair has been known to stray to Britain. Of the smaller British land birds, the wryneck is not uncommon; and the European cuckoo will now and then turn up, more frequently in the barred plumage of immaturity; the hoopoe, too, is common, but rare. Among the hawks, the kestrel will occasionally be observed in extraordinary abundance; and harriers (Circus) are often seen beating over the open ground. But the small waders are particularly common in all suitable places, including most of those found in Britain in greater or less abundance; wonderful is the number of fishers, and vast indeed must be the consumption of their finny prey. Sundry fishing eagles, and a great bare-legged fishing owl, with various kingfishers in abundance, numerous kinds of heron in surprising numbers, pelicans, darters (plotus), pigmy cormorants, and grebes or dabchicks, besides gulls, terns,

BIRDS.

and rarely skimmers (rhynchops), gulls, three species, the common British Xema ridibunda, and a nearly affined species, with the fine kroikocephalus ichthyætus, are seen chiefly towards the mouths of the Gangetic rivers. Over the salt water lake near Calcutta has been seen the great white egret, so prized in Europe. The gull-billed tern is there one of the common birds; and the whiskered tern (Hydrochelidon Indica), and the peregrine falcon, may not unfrequently be seen, well meriting the name of duck-hawk bestowed on it in North America; also great flocks of longshanks (Himantopus), wading and seeking their subsistence in the expanse of shallow water along the reed-fringed nullahs or watercourses; various rallidæ are swarming around.

In winter, many Indian birds assemble in large flocks. Amongst these are crows, starlings, finches, larks, parrots, a few thrushes, pigeons, rock pigeons, cranes, ducks, flamingoes, and pelicans.

The *migratory* birds of India are mostly residents of the colder northern countries; they come to India in September and October, and leave it again in March, April, and May. Among the grallatores or waders, some cranes and storks, four-fifths of the ducks, and the great majority of the scolopacidæ, breed in the north, and come to India in the cold season. The peregrine falcon, the true hobby, the kestrel, the British sparrow-hawk, all the Indian harriers, and the short-eared owl, are true migratory birds. Amongst the insessores, the wagtails, some of the pipits, and larks, stonechats, several warblers and thrushes, buntings, and the shrike, hoopoe, and two starlings, are the chief groups amongst which migratory birds occur. In Lower Bengal, kites quit Calcutta and neighbourhood during the rains, and return in the cold weather; it is supposed that they go to the north-east. The kestrel, baza, and Indian hobby are most frequent in Bengal during the rains; and in the rains the adjutant visits Calcutta, and leaves in the cold weather. The European quail is the only real migratory bird of the gallinaceæ; but some other quails, bustard-quails, and rock partridges (Pteroclidæ), wander about to different localities; and the Sypheotides auritus, Buphus coromandus, some rails, terns, and gulls, also wander. These birds travel with wonderful instinct direct to their homes, returning year after year to the same spot, often to the same nest.

The great migration of birds to and from Southern India, Asia, says Mr. Hodgson, 'seems to take place across the mountains of Nepal. The wading and natatorial birds generally make a mere stage of the valley on their way to and from the vast plains of India and Tibet, the valley being too small, dry, open, and populous for their habits, especially that of the larger ones. Some, however, stay for a longer or shorter time in their vernal and autumnal migrations; and some, again, remain throughout that large portion of the year in which the climate is congenial to their habits. Of all of them, the seasons of arrival, both from the north and from the south, are marked with precision.

The grallatorial and natatorial birds begin to arrive in Nepal from the north towards the close of August, and continue arriving till the middle of September. The first to appear are the common snipe and jack snipe and rhynchæa; next the scolopaceous waders (except the woodcock), next the great birds of the heron and stork and crane families, then the natatores, and lastly the woodcocks, which do not reach Nepal till November. The time of the reappearance of these birds from the south is the beginning of March, and they go on arriving till the middle of May. None of the natatores stay in Nepal beyond a week or two in autumn (when the rice fields tempt them), or beyond a few days in spring, except the teal, the widgeon, and the coot, which remain for the whole season upon some few tanks, whose sanctity precludes all molestation of them. There are cormorants throughout the season upon the larger rivers within the mountains, but none ever halt in the valley beyond a day or two; for so long, however, both they and pelicans may be seen occasionally on the banks just mentioned. The larus and sterna are birds which usually affect the high seas, but Mr. Hodgson had killed both the red-legged gull and a genuine pelagic tern in the valley of Nepal. But so had he fishing eagles; and in truth, he adds, who shall limit the wanderings of these long-winged birds in the ethereal expanse? Mr. Blyth tells us that many of the feathered inhabitants of the British Islands are found in Southern Asia. The community of species is most remarkable among the diurnal birds of prey, and, as might be expected, among the wading and swimming tribes. The pretty little water-wagtail, usually the first and most welcome harbinger of the coming cold weather, comes and remains whilst the cold season lasts. This bird, and the harsh chattering of a very common kind of shrike (Lanius cristatus) in Indian gardens, are the earliest intimations of the coming change of season. A snipe (Gallinago stenura), and the water-wagtail in their season, and the common sparrow at all seasons, are probably all that the European, unversed in the study of ornithology, will be able to recall to mind as yielding associations of home, unless perchance he may also recollect the common small kingfisher of India, which differs from the British bird only in its more diminutive size. In the sub-Himalayas, the forms of Europe and of W. and N. Asia prevail more and more towards the N.W.; Malayan forms eastward, and Chinese types, and particular sub-Himalayan genera and species, the range of which extends eastward to China. Again, on the highlands of the Peninsula of India, and still again in those of Ceylon, distinct species of the northern types occur, but no different genera. Thus the jungle-fowl of N. India is replaced by a different species (Gallus Sonneratii) in the Peninsula, and by a third (G. Stanleyi) in Ceylon, and not a few similar instances might be adduced. The grey wagtail of Britain (Calobates sulphurea) is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain. The most abundant lark on the plains of Upper India and table-land of the Peninsula is the charandol (Galerida cristata), which is also a European species, though of rare occurrence in Britain: and the song, also its mode of delivery of it in the air, are not very unlike that of the

skylark, although it does not soar to so lofty an altitude.

In Bombay, on the approach of the monsoon, nearly all the kites, hawks, vultures, and other carrion birds disappear from the sea-coast, while the crows begin to build their nests and hatch their young just at the season that seems most unsuitable for incubation, for the eggs are often shaken out, or the nests themselves are destroyed. The carnivorous birds, as the rains approach, withdraw themselves from a climate unsuitable to the habits of their young, betaking themselves to the comparatively dry air of the Dekhan, where they nestle and bring forth in comfort, and find food and shelter for their little ones.

In Bengal, the kites and Brahmany kite breed chiefly in January and February, and disappear during the rains. The adult adjutants make their appearance as soon as the rains set in, and, becoming in fine plumage towards the close of the rains, depart at that time to breed in the eastern portion of the Sunderbuns upon lofty trees, and along the eastern coast of the Bay of Bengal upon trees and rocks. Vultures are permanently resident; and the crows propagate chiefly in March and April, their nests being not infrequently destroyed by the fury of the nor'-westers.

Not a few migratory species are common to the polar circle and to Lower Bengal, and even further towards the equator, according to season; but the individual birds may not migrate so far north and south. The Calliope Kamschatkensis, a delicate little bird much like a nightingale, but with a brilliant ruby throat, which is not rare in the vicinity of Calcutta during the cold season, returns early in April, with the snowfleck, in the lower Kolyma district, in northern Siberia, as we are told by Von Wrangell,—that is to say, before the last of them have left Bengal. Another and non-migratory species of the same genus (C. pectoralis), peculiar, so far as known, to the Himalaya, is enumerated in Mr. Hodgson's List of the Birds of Nepal. The hoopoe (Upupa epops), common in Southern Asia during the cold season, and on the table-lands at all seasons, is to all appearance a bird of fluttering and feeble flight, but has repeatedly been observed, during the seasons of migration, at altitudes considerably above the limits of vegetation. 'On the western side of the Lanak pass, about 16,500 feet, I saw a hoopoe,' writes Major Cunningham; and at Momay (14,000 to 15,000 feet elevation), under the lofty Donkia pass in northern Sikkim, Dr. Joseph D. Hooker observed, in the month of September, 'birds flock to the grass about Momay; larks, finches, warblers, abundance of sparrows (feeding on the yak droppings), with occasionally the hoopoe; waders, cormorants, and wild ducks, were sometimes seen in the streams, but most of these were migrating south.' 'An enormous quantity of waterfowl,' remarks Dr. Hooker, 'breed in Thibet, including many Indian species that migrate no further north. The natives collect their eggs for the markets of Jigatzi, Giantchi, and Lhassa, along the banks of the Yaru river, Ramchoo, and Yarbru and Dacchen lakes.' Amongst other birds, the Sarus, or giant crane of India (Grus antigone) (see Turner's Tibet, p. 212), repairs to these enormous elevations to breed. The Sarus also breeds south of the Himalaya; and specimens too young to fly are occasionally brought for sale even to Calcutta. Turner also says the Lake Ramchoo is frequented by great abundance of waterfowl, wild geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of the Sarus, the largest species of the crane kind, are seen there at certain seasons of the year, and any quantity of eggs may then be collected, found deposited near the banks. The European crane (Grus cinerea), also a common Indian bird, says Major Lloyd, as observed by himself in Scandinavia, usually breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. The female lays two eggs. Major Cunningham, also, in his Ladakh, etc., remarks 'that he shot the wild goose on the Thogji, Chanmo, and Chomoriri lake at 15,000 feet; and he and Col. Bates shot three teal on the Suraj Dal, a small lake at the head of the Bhaga river, at an elevation of upwards of 16,000 feet.

Many highly approximate races (considered, therefore, as species) maintain their distinctness, even in the same region and vicinity, as Falco peregrinus and F. peregrinator, Hypotriorchis subbuteo and H. severus, Circus cyaneus and C. Swainsonii in India. Coracias Indica of all India meets, in the Panjab, etc., the European C. garrula; but in Assam, Sylhet, Tiperah, and, more rarely, Lower Bengal, it coexists with the C. affinis, specimens of which from the Burmese countries are ever true to their proper coloration, as those of C. Indica are from Upper and S. India; but there is seen every conceivable gradation or transition, from one type of colouring to the other, in examples from the territories where the two races meet; so also with the Crocopus phœnicopterus of Upper India and the Cr. chlorigaster of S. India and Ceylon, which blend in Lower Bengal; and Gallophasis albocristatus of the W. Himalaya and G. melanotus of Sikkim, which produce an intermediate race in Nepal; and G. Cuvieri of Assam and Sylhet, and G. lineatus of Burma, which interbreed in Arakan, etc., so that every possible transition from one to the other can be traced. If inhabiting widely-separated regions, the (assumed) distinctness of such races would be at once granted, as with Phasianus colchicus and the Chinese Ph. torquatus, which readily intermix and blend, wherever the latter has been introduced in Europe. Such races as the crossbills, the Bauri and Shahin falcons of India, the British Phylloscopus trochilus and Ph. rufus, and the different European sparrows, maintain themselves persistently distinct; and this while the common sparrow of India would probably blend with the British sparrow (though considered distinct by some), if an opportunity should occur of its doing so.

The following *British birds* are given in the Calcutta Review (March 1857) as common to Great Britain and Southern Asia:—

Gyps fulvus (Vultur fulvus), griffin vulture.
Neopthron percnopterus, Pharaoh's chickens.
Gypaetos, the lämmergeyer.
Aquila chrysaetos, golden eagle.
A. mogilnik, or imperial eagle, *Temm.*
A. nævia, spotted eagle.
Eutolmætos fasciatus.
Hieraetus pennatus.
Pandion haliætus, osprey.

Falco candicans (Falco gyrfalco), gyr falcon.
F. sacer, *Schl.* (F. lanarius, *Temm.*).
F. lanarius, *Schlegel.*
F. peregrinus, Peregrine falcon.
Hypotriorchis subbuteo, the hobby.
Erythropus vespertinus, red-footed falcon.
E. cenchris (Falco tinnunculoides), *Vieillot.*
Tinnunculus alaudarius, the kestrel.
Astur palumbarius, goshawk.
Accipiter nisus, sparrow-hawk.
Buteo vulgaris, common buzzard.
Pernis apivora, honey buzzard.
Circus æruginosus, marsh harrier.
C. cyaneus, hen harrier.
C. cineraceus (C. Montagui).
Circaetus Gallicus.
Bubo maximus, eagle owl.
Scops Aldrovandi, Scops-eared owl.
Asio otus (Otus vulgaris), long-eared owl.
A. brachyotus (Otus brachyotus), short-eared owl.
Syrnium aluco (S. stridulum), tawny owl.
Athene psilodactyla (Noctua passerina), little owl.
Turdus viscivorus, missel thrush.
Oreocincla Whitei (Turdus Whitei).
Turdus pilaris, fieldfare.
T. iliacus, redwing.
T. merula, blackbird.
T. (or merula) simillima.
Cyanecula Wolfi (Phœnicura suecica), blue-throated warbler.
Ruticilla phœnicurus (Phœnicura ruticilla), redstart.
Pratincola rubicola (Saxicola rubicola), stone-chat.
P. rubetra (Saxicola rubetra), whin-chat.
Saxicola œnanthe, wheatear.
Locustella rayi (Salicaria locustella), grasshopper warbler.
Acrocephalus arundinaceus (Salicaria turdoides), thrush-like warbler.
Sylvia atricapilla (Curruca atricapilla), blackcap warbler.
S. cinerea (Curruca cinerea), common white-throat.
S. curruca (Curruca sylviella), lesser white-throat.
S. orphea (Curruca orphea), Orpheus warbler.
Phylloscopus trochilus, willow warbler.
Regulus cristatus, golden-crested regulus.
Reguloides proregulus (Regulus modestus).
Parus major, great tit.
P. cœruleus, blue tit.
P. ater, cole tit.
Orites caudatus (Parus caudatus), long-tailed tit.
Calobates sulphurea (Motacilla boarula), grey wagtail.
Pipastes trivialis (Anthus arboreus), tree pipit.
Anthus pratensis, meadow pipit.
A. obscurus (A. petrosus), rock pipit.
Corydalla Richardi, Richard's pipit.
Corydalla campestris.
Galerida cristata (Alauda cristata), crested lark.
Calendrella brachydactyla (Alauda brachydactyla).
Certhilauda desertorum.
Ammomanes Lusitanica.
Emberiza miliaria, common bunting.
E. citrinella, yellow bunting.
E. cia.
E. fuscata of N. Asia.
E. melanocephala of S. Europe.
Fringilla montifringilla, mountain finch.
Passer montanus, tree sparrow.
P. domesticus, house sparrow.
P. salicarius (vel Hispaniolensis).
Coccothraustes vulgaris, hawfinch, qu. C. Japonicus, *Schlegel*?
Chrysomitris spinus (Cardueli spinus).
Linota cannabina, common linnet.
L. canescens, mealy redpole.
L. montium, mountain linnet.
Carpodacus erythrinus.
Loxia curvirostra, common crossbill.
L. bifasciata, European white-winged crossbill.
Sturnus vulgaris, common starling.
Pastor roseus, rose-coloured pastor.
Fregilus graculus, chough.
Corvus corax, raven.
C. corone, carrion crow.
C. cornix, hooded crow.

C. frugilegus, rook.
C. monedula, jackdaw.
Pica caudata, magpie.
Yunx torquilla, wryneck.
Upupa epops, hoopoe.
Sitta Syriaca, rock nuthatch.
Trichodromus muraria, wall creeper.
Cuculus canorus, common cuckoo.
Coracias garrula, roller.
Merops apiaster, bee-eater.
Hirundo rustica, swallow.
H. urbica, martin.
H. riparia, sand martin.
H. rupestris.
Cypselus apus, common swift.
C. melba (C. Alpinus), Alpine swift.
Acanthylis caudacuta, large spiny-tailed swift.
Caprimulgus Europæus, night jar.
Columba livia, rock dove.
Starna cinerea (Perdix cinerea), common partridge.
Coturnix vulgaris, common quail.
Tetrax campestris (Otis tetrax), little bustard.
Otis Macqueenii, Macqueen's bustard.
Œdicnemus crepitans, great plover.
Charadrius hiaticula, ringed plover.
Ch. Cantianus, Kentish plover.
Ch. Philippinus (Ch. minor), little ringed plover.
Ch. pyrrhothorax.
Calidris arenaria, sanderling.
Squatarola Helvetica (Sq. cinerea), grey plover.
Vanellus cristatus, lapwing.
Strepsilus interpres, turnstone.
Hæmatopus ostralegus, oyster-catcher.
Grus cinerea, common crane.
Ardea cinerea, common heron.
A. purpurea, common heron.
Herodias alba (Ardea alba), great white heron.
H. garzetta (Ardea garzetta), little egret.
H. bubulcus (Ardea russata), buff-backed heron.
Ardetta minuta (Botaurus minutus), little bittern.
Botaurus stellaris, common bittern.
Nycticorax Gardeni, night heron.
Ciconia alba, white stork.
C. nigra, black stork.
Platalea leucorodia, white spoonbill.
Falcinellus igneus (Ibis falcinellus), glossy ibis.
Numenius arquata, common curlew.
N. phæopus, whimbrel.
Totanus fuscus, spotted redshank.
T. calidris, common redshank.
Actitis ochropus (Totanus ochropus), green sandpiper.
A. glareola (Totanus glareola), wood sandpiper.
A. hypoleucos (Totanus hypoleucos), common sandpiper.
Totanus glottis, greenshank.
Recurvirostra avocetta, avocet.
Himantopus candidus (H. melanopterus), black-winged stilt.
Limosa œgocephala (L. melanura), black-tailed godwit.
L. rufa, bar-tailed godwit.
Philomachus pugnax (Machetes pugnax), ruff.
Scolopax rusticola, woodcock.
Gallinago scolopacinus (Scolopax gallinago), common snipe.
G. gallinula (Scolopax gallinula), jack snipe.
Tringa subarquata, curlew sandpiper.
T. canutus, knot.
T. platyrhyncha, broad-billed sandpiper.
T. minuta, little stint.
T. Temminckii, Temminck's stint.
T. Alpina (Tringa variabilis), dunlin.
Phalaropus fulicarius, grey phalarope.
Lobipes hyperboreus (Phalaropus hyperboreus), red-necked phalarope.
Crex pratensis, landrail.
Porzana Maruetta (Crex porzana), spotted craik.
P. pusilla (Crex pusilla), little craik.
P. Baillonii (Crex Baillonii).
Gallinula chloropus, moor-hen.
Fulica atra, common coot.
Anser cinereus (Anser ferus), grey-leg goose.
A. brachyrhynchus, pink-footed goose.

Bernicla ruficollis (Anser ruficollis), red-breasted goose.
Cygnus musicus (Cygnus ferus), Hooper swan.
Casarca rutila (Tadorna rutila), ruddy shieldrake.
Tadorna vulpanser, common shieldrake.
Spatula clypeata (Anas clypeata), shoveller.
Anas stepera, gadwall.
A. acuta, pintail duck.
A. boschas, wild duck.
A. querquerdula, gargany.
A. crecca, teal.
A. penelope.
Fuligula ferina, pochard.
F. nyroca, ferruginous duck.
F. marila, scaup duck.
F. cristata, tufted duck.
Clangula glaucion (Fuligula clangula), golden eye.
Mergellus albellus (Mergus albellus), seamew.
Mergus merganser, goosander.
Podiceps cristatus, great-crested grebe.
P. Philippensis (P. minor), little grebe.
Phalacrocorax carbo, common cormorant.
Sylochelidon Caspia (Sterna Caspia), Caspian tern.
Sterna paradisea (Sterna Dougalli), roseate tern.
S. hirundo, common tern.
Hydrochelidon Indica (Sterna leucoparica), whiskered tern.
Gelochelidon angelica (Sterna angelica), gull-billed tern.
Sternula minuta (Sterna minuta), lesser tern.
Anous stolida (Sterna stolida), noddy tern.
Onychoprion fuliginosus (Sterna fuliginosa), sooty tern.
Xema ridibunda (Larus ridibundus), black-headed gull.
Larus fuscus, lesser black-backed gull.
Procellaria hœsitata, capped petrel.
Puffinus obscurus, dusky petrel.

Those birds which are common to India and the *polar circle*, appertain for the most part to the wading and webfooted orders; and a few of them are of very general distribution over the world, as especially the common turnstone (Strepsilas interpres), which seems to be found on every sea-coast. The Lobipes hyperboreus is a little arctic bird, of rare occurrence even in the north of Scotland, Orkney, and Shetland, but a specimen was procured near Madras; and the nearly related Phalaropus fulicarius was obtained in the Calcutta provision bazar so late in the year as May 11, 1846.

Mr. Blyth remarks that various instances occur of *closely-affined* Indian and European birds, which every ornithologist would at once pronounce to be distinct, *e.g.* Oriolus galbula and O. kundoo; Troglodytes Europæus and Tr. sub-Himalayanus; Certhia familiaris and C. Himalayana, etc. And not infrequently the exact European species inhabits India in addition to another, which would otherwise be regarded as its counterpart or representative, or, according to the views of some naturalists, a mere local or climatal variety of the same species. Falco peregrinus is common in India, together with F. peregrinator, which would otherwise be regarded as its Indian counterpart; Hypotriorchis subbuteo found together with H. severus; Hirundo Sinensis (the ordinary Indian sand martin), together with H. riparia; Cuculus canorus (the European cuckoo), as also several affined species, and so on. In some cases, a European species may have two or more 'representatives' in India, or *vice versâ*. Thus Nucifraga caryocatactes of the pine forests of Europe and Siberia is replaced by N. hemispila in those of the Himalaya generally, and by H. multimaculata about Kashmir; Parus major by P. monticolus and P. cinereus, if not also P. nuchalis (in addition to cinereus), in S. India; Picus major by P. Himalayanus; Accentor alpinus by A. Nipalensis. While, on the other hand, Lanius lahtora in India is represented both by L. excubitor and L. meridionalis in Europe; Sitta cinnamoventris by S. Europæa and S. cæsia, etc. Some ornithologists regard the Passer domesticus, P. Italiæ (vel Cisalpinus), and P. salicarius (vel Hispaniolensis), of Europe, as being local varieties merely of the same, yet they hold true to distinctive differences of colouring wheresoever found; and examples of the last-named race from Afghanistan and the extreme N.W. of India differ in no appreciable respect from Algerian specimens with which they have been compared; moreover, this race is of far more gregarious habits even than Passer domesticus,—a fact noticed of it alike in N. Africa and in Kohat. The Tibetan raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline. It may be presumed to inhabit the lofty mountains of Bhutan to the north; but the smaller crow of Southern Asia is the C. splendens, while the common black crow of all India, C. culminatus, would seem to stand here alike for the raven, the carrion crow, and the rook. The true rook (Corvus frugilegus), however, is known to inhabit or visit the Peshawur valley, Afghanistan, and Kashmir. The rook of China and Japan is considered a distinct species, C. pastinator of Gould, and the jackdaw (C. monedula) accompanies it in those countries; while the true northern raven, Corvus corax, is met with not only there, but also over a great portion of the Panjab. In other parts of India, the comparatively small C. culminatus is popularly known to Europeans as the raven, but the northern raven would make a meal of one and not feel much the worse for it.

Dr. Francis Buchanan Hamilton, remarking upon a falconry observed by him in the Shahabad district, mentions that he saw, in several days' hawking, a large bird of prey, named jimach, attack a very strong falcon as it was hovering over a bush into which it had driven a partridge. The moment the falcon spied the jimach it gave a scream, and flew off with the utmost velocity, while the jimach equally pursued. They were instantly followed by the whole party, foot, horse, and elephants, perhaps 200 persons, shouting and firing with all their might; and the falcon was saved, but not without severe wounds, the jimach having struck her to the ground, but a horseman came up in time to prevent her from being devoured.' The wokhab, Aquila fulvescens, is a small eagle, very abundant in the plains of Upper India, the Dekhan, etc. The Honourable (now Sir) Walter Elliot remarks that 'the wokhab is very troublesome in hawking after the sun becomes hot, mistaking the jesses for some kind of prey, and pouncing on the falcon to seize it. He had once or twice nearly lost shahins (Falco peregrinator) in consequence, they flying to great distances for fear of the wokhab, *i.e.* the jimach. The principal species employed in Indian falconry are identical with those of Europe, namely the bauri of India, which is the Peregrine falcon of the west, and the baz of India, which is the goshawk or gentil falcon of Britain. In a curious Persian treatise on the subject, by the head falconer of the Moghul emperor

Akbar, the various species used are enumerated, and may be recognised with precision; among them is the shangar, which is clearly the gyr falcon of the north, represented as extremely rare and valuable, taken perhaps once or twice only in a century, and then generally in the Panjab. The shahin (Falco peregrinator) does not inhabit Europe. With five or six exceptions only, the whole of the European diurnal birds of prey are met with in India, many of them being much commoner in India; and they are associated with numerous other species unknown in Europe. The sport of falconry is widely diffused over Asia, even to the Malayas. The bustard 'quarry' hawked by Dr. Layard's Bedouin companions on the great plain of Mesopotamia, is the houbara (Houbara Macqueenii) of Sind and Afghanistan, being a different species from that of Spain and North Africa (H. undulata); the former has unexpectedly been found, of late years, in England and Belgium, if not also in Denmark.

The great spiny-tailed swift of the Himalaya (Acanthylis nudipes of Hodgson) was obtained, a few seasons back, in England. Mr. Gould identifies this British-killed bird with his Ac. caudacuta of Australia, but it appears identical with the Himalayan species; upon comparing Himalayan specimens with Mr. Gould's plate, no difference can be detected. The great alpine swift (Cypselus melba) is common to the Himalaya, the Neilgherries, and high mountains of Ceylon, but the great Acanthylis of the Himalaya has never been observed in S. India, and is replaced in the Neilgherries, Ceylon, and also across the Bay of Bengal (in Penang, etc.), by Ac. gigantea.

Gold and silver pheasants are inhabitants of China; but the golden pheasant, according to M. Temminck, inhabits not only China and Japan, but the northern parts of Greece, as also Georgia and the Caucasus; and it has been met with even in the province of Orenbourg. M. Degland informs us that M. Gamba, French consul at Tiflis, met with this gorgeous bird in numerous flocks on the spurs of the Caucasus, which extend towards the Caspian Sea, and that now it has gone wild and multiplied in some of the forests of Germany.

In Southern Asia, the birds familiarly known as *bulbuls* must not be confounded with the Persian bulbul, which is a species of true nightingale (Luscinia), a genus very closely related to some of the small thrushes of America. There is no true nightingale wild in India; but the shama, Cercotrichas (Kittacincla) macroura, undoubtedly the finest song-bird of this part of the world, is not infrequently designated the Indian nightingale. It is common to India and the Malay countries; and there is a second species (C. Luzoniensis) in the Philippines, and a third (C. erythropterus) in Africa. Orocetes cinclorhynchus is also termed shama in the Madras Presidency. The esteemed Indian songster is le merle tricolor de longue queue of Levaillant (Oiseaux d'Afrique, pl. 114). The bhimraj (Edolius paradisæus) is popularly denominated the mocking-bird by Europeans.

The *song* of birds is chiefly observed amongst the merulidæ, saxicolinæ, sylviadæ, larks, and some finches. In India there are few songsters in the groves, but some of the larks are kept in cages. Amongst Mahomedans in British India, the lark is usually their cage-bird, but partridges and quails are also domesticated. Quails, bulbuls, and cocks are trained to fight, falcons and hawks to hunt on the wing.

The Chinese are passionately fond of singing birds; the wealthy will pay exceedingly high prices for those whose notes are fine, and are as great connoisseurs in the notes of the lark, as Europeans are in those of the bullfinch. A bird is as generally the companion of a mandarin, as a dog is of an Englishman. These birds have a silken cord attached to their legs, which is entwined around the finger of their owner. In China it is the Acridotheres cristellatus, the Shantung lark. It has great facility in learning sounds, and will bark, mew, crow, cough, and sneeze, sometimes talk; and a single bird will fetch £6. The acridotheres will imitate the human voice accurately. In China, a starling is often domesticated; it is lively, good-natured, and easily tamed. They also tame the fork-tailed parus (Leiothrix luteus of Scopoli). It is in form and habit like the robin of Britain; is pretty olive-green, black forked tail, with wing primaries bright yellow and red. It turns summersaults on its perch. They have a short, loud song. Canaries are sold in many shops of Japan. The grackle, Eulabes religiosa, called the myna, is largely domesticated. The partridge, the bulbul shrike, are also largely domesticated. The hoopoe is to be seen occasionally. In China the cormorant and the pelican are trained to fish.

Many races have had *mythical birds*. The Zend has the eorosh; the Persians, the roc and si-murgh; the anka of the Arabs; the Turks, the kerkes; the phœnix of the Egyptians and Greeks; the yggdrasil of the Edda; the griffin bird of the age of chivalry; the kirni of the Japanese; and the garuda of the modern Hindus. A Hindu legend relates that two lovers were transformed into Brahmany ducks, the Casarca rutila, *Pallas*, and condemned to live at night apart on opposite banks of a river, and all night long each in its turn asks its mate if it shall come across; but the question is always met with a negative. 'Chakwi, shall I come?'—'No, Chakwa.' 'Chakwa, shall I come?'—'No, Chakwi.'

Sailors have familiar names for *sea birds;* amongst others, the Booby, the Nelly, the Noddy, the Reef Bird, the Frigate Bird, the Tropic Bird, the Cape Pigeon, the Mother Cary's Chicken, the Mutton Bird (Œstrelata Lessoni), the Whale Bird (Prion desolatus). Cape Hen is the petrel, also called Black Night-Hawk; and the Mackerel Bird, King Bird, or Kinger of sealers, is the tern, Sterna virgata.

Of *land birds* with peculiar names may be mentioned the Mocking-bird, the Laughing Jackass, the Satin-bower bird (Ptilonorhynchus holosericeus); in India, the Coppersmith, the satbhai.

ORDER, RAPTORES, Birds of Prey.

Fam. Vulturidæ, Vultures. *Sub-Fam.* Vulturinæ, True Vultures.

Vultur monachus, *Linn.*, great brown vulture.
V. calvus, *Scop.*, *Hume*, black vulture.
Gyps fulvus, *Gmel.*, large tawny vulture.
G. Indicus, *Scop.*, long-billed brown vulture.
G. Bengalensis, *Gmel.*, common brown vulture.

Sub-Fam. Neophroninæ, Scavengers.

Neophron percnopterus, *Linn.*

Sub-Fam. Gypaetinæ, *Bon.*
Gypaetus barbatus, *Linn.*
G. occidentalis, *Bon.*, Arabia.

Fam. Falconidæ, Falcons. *Sub-Fam.* Falconinæ, True Falcons.
Falco peregrinus, *Gmel.*, peregrine falcon.
F. peregrinator, *Sundev*, the shahin.
F. sacer, *Schl.*, the saker or cherrug.
F. jugger, *Gray*, the laggar.
F. Babylonicus, *Gurney*, red-headed lanner.
Hypotriorchis subbuteo, *L.*, the hobby.
H. severus, *Horsf.*, Indian hobby.
H. œsalon, *Gm.*, the merlin.
H. chicquera, *Daud*, the Turumti merlin.
Tinnunculus alaudarius, *Bress.*, kestrel.
Erythropus cenchris, *Naum.*, lesser kestrel.
E. vespertinus, *Linn.*, red-legged falcon.
Hierax cutolmos, *Hodgs.*, pigmy falcon.
H. melanoleucos, *Bly.*, Assam.
H. coerulescens, Java, Malayana.
H. sericeus, China.

Sub-Fam. Accipitrinæ, Hawks.
Astur palumbarius, *Linn.*, goshawk.

Sub-genus, Lophospiza.
Lophospiza trivirgatus, *Hume*, crested goshawk.
Micronisus badius, *Gm.*, shikra.
Accipiter nisus, *Linn.*, sparrow-hawk.
A. virgatus, *Temm.*, besra sparrow-hawk.

Sub-Fam. Aquilinæ, Eagles.
a. True Eagles.
Aquila chrysaetos, *Linn.*, golden eagle.
A. imperialis, *Bechst.*, imperial eagle.
A. nævia, *Gm.*, spotted eagle.
A. fulvescens, *Gray*, tawny eagle, the wokhab.
A. hastata, *Less.*, long-legged eagle.
A. pennata, *Gm.*, dwarf eagle.

b. Kite Eagles.
Neopus Malaiensis, *Rems.*, black eagle.

c. Hawk Eagles.
Eutolmaetus Bonellii, *Hume*, crestless hawk eagle.
Limnaetus niveus, *Temm.*, changeable hawk eagle.
L. cristatellus, *Temm.*, crested hawk eagle.
L. Nipalensis, *Hodgs.*, spotted hawk eagle.
L. Kienierii, *De Sp.*, rufous-bellied hawk eagle.

d. Serpent Eagles.
Circaetus Gallicus, *Gmel.*, serpent eagle.
Spilornis cheela, *Daud*, crested serpent eagle.
S. bacha, *Daud.*, Java.
S. spilogaster, *Bl.*, Ceylon.
S. holospilus, Philippines.

e. Fishing Eagles.
Pandion haliætus, *Linn.*, osprey.
Poliœtus ichthyœtus, *Horsf.*, white-tailed sea eagle.
Haliætus fulviventer, *Vieill.*, ring-tailed sea eagle.
H. leucogaster, *Gm.*, grey-backed sea eagle.

Sub-Fam. Buteoninæ, Buzzards.
Buteo vulgaris, *Bechst.*, the buzzard.
B. desertorum, *Hume.*
B. canescens, *Hodgs.*, long-legged buzzard.
B. aquilinus, *Hodgs.*, upland buzzard.
B. plumipes, *Hodgs.*, harrier buzzard.
B. pygmæus, *Bly.*, Tenasserim.
Poliornis teesa, *Frankl.*, white-eyed buzzard.
Archibuteo hemiptilopus, *Blyth*, brown eagle buzzard.

Harriers.
Circus cyaneus, *Linn.*, hen harrier.
C. Swainsonii, *A. Smith*, pale harrier.
C. cineraceus, *Montague*, Montague's harrier.
C. melanoleucos, *Gm.*, pied harrier.
C. æruginosus, *Linn.*, marsh harrier.

Sub-Fam. Milvinæ, Kites.
Haliastur Indus, *Bodd.*, maroon-backed, Brahmany kite.
Milvus govinda, *Sykes*, Pariah kite.
M. ater of Europe.
M. melanotis of China.
Pernis cristata, *Cuv.*, crested honey buzzard.
Baza lophotes, *Cuv.*, crested black kite.
Elanus melanopterus, *Daud*, black-winged kite.

Fam. Strigidæ, Owls. *Sub-Fam.* Striginæ, Screech Owls.
Strix Javanica, *De Wurmb.*, screech owl.
S. candida, *Tickell*, grass owl.
S. Indica, *Hume.*
Phodilus badius, *Horsf.*, bay screech owl.

Sub-Fam. Syrniinæ, Hooting Owls. *Sub-genus*, Bulaca.
Syrnium Indranee, *Sykes*, wood owl.
S. Newarense, *Hodgs.*, Nepal wood owl.
S. Sinense, *Lath.*, mottled wood owl.
S. niviculum, *Hodgs.*, Himalayan wood owl.
Bulaca ocellata, *Hume.*

Sub-Fam. Asioninæ, Eared Owls.
Otus vulgaris, *Flem.*, long-eared owl.
O. brachyotus, *Gm.*, short-eared owl.

Sub-Fam. Buboninæ, Horned, Eagle, and Scops Owls.
Urrua Bengalensis, *Frankl.*, rock horned owl.
U. coromanda, *Lath.*, dusky horned owl.
Huhua Nipalensis, *Hodgs.*, forest eagle owl.
Ketupa Ceylonensis, *Gm.*, brown fish owl.
K. flavipes, *Hodgs.*, tawny fish owl.
Ephialtes pennatus, *Hodgs.*, Indian Scops owl.
E. lettia, *Hume.*
E. lempigi, *Horsf.*, large Indian Scops owl.
E. bakkamæna, *Hume.*
E. griseus, *Hume.*
Scops rufescens, *Horsf.*, Malayana.

Sub-Fam. Surniinæ, *Kaup.*
Athene brama, *Temm.*, spotted owlet.
A. radiata, *Tickell*, jungle owlet.
A. Malabarica, *Blyth*, Malabar owlet.
A. cuculoides, *Vigns.*, large-barred owlet.
A. Persica, *Hume.*
Glaucidium Brodiæi, *Burton*, pigmy owlet.
Ninox scutellatus, *Raffl.*, brown hawk owl.

Order, Insessores, *Vigors*, Perching Birds.

Tribe, Fissirostres.

Fam. Hirundinidæ. *Sub-Fam.* Hirundininæ, Swallows.
a. Hirundo, True Swallows.
Hirundo rustica, *Linn.*, common swallow.
H. Tytleri, *Hume.*
H. domicola, *Jerdon*, Neilgherry house swallow.
H. ruficeps, *Hume.*
H. filifera, *Stephens*, wire-tailed swallow.
H. daurica, *Linn.*, red-rumped swallow.
H. fluvicola, *Jerdon*, Indian cliff swallow.

b. Sand Martins.
Cotyle riparia, *Linn.*, European sand martin.
C. subsoccata, *Hodgs.*, dusky martin.
C. Sinensis, *Gray*, Indian bank martin.

c. Crag Martins.
C. concolor, *Sykes*, dusky crag martin.
C. rupestris, *Scop.*, mountain crag martin.

d. House Martins.
Chelidon urbica, *Linn.*, English house martin.
C. Cashmiriensis, *Gould*, Kashmir house martin.
C. Nipalensis, *Hodgs.*, Himalayan martin.

Sub-Fam. Cypselinæ, Swifts.
Acanthylis sylvatica, *Tickell*, white-rumped spine tail.
A. gigantea, *Temm.*, brown-necked spine tail.
A. caudacuta, *Lath.*, white-necked spine tail.
Cypselus melba, *Linn.*, Alpine swift.
C. apus, *Linn.*, European swift.
C. affinis, *Gray*, Indian swift.
C. leuconyx, *Blyth*, white-clawed swift.
C. Batassiensis, *Gray*, palm-clawed swift.
Collocalia nidifica, *Latham*, edible nest swiftlet.
C. linchi (C. fuciphaga), Nicobars to Java.
Dendrochelidon coronatus, *Tickell*, crested swift.
D. klecho, Malayana.
D. comatus, Sumatra.
D. mystaceus, N. Guinea; and
D. Wallacei, Celebes.

Fam. Caprimulgidæ, Goat-suckers. *Sub-Fam.* Steatorninæ, *Gray.*
Batrachostomus moniliger, *Blyth*, frog-mouth.
Otothrix Hodgsonii, *Gray*, frog-mouth.

Sub-Fam. Caprimulginæ, Night Jars.
Caprimulgus Indicus, *Lath.*, jungle night jar.
C. Kelaartii, *Blyth*, Neilgherry jungle night jar.
C. albonotatus, *Tickell*, Bengal jungle night jar.
C. macrourus, *Horsf.*, Malay jungle night jar.
C. atripennis, *Jerdon*, Ghat jungle night jar.
C. Asiaticus, *Latham*, Indian jungle night jar.
C. Mahrattensis, *Sykes*, Sykes' jungle night jar.
C. monticolus, *Franklin*, Franklin's jungle night jar.
C. stictomus, *Swinhoe*, of China.

Fam. Trogonidæ, Trogons.
Harpactes fasciatus, *Gm.*, Malabar trogon.
H. Hodgsoni, *Gould*, red-headed trogon.

Fam. Meropidæ, Bee-eaters.
Merops viridis, *Linn.*, Indian bee-eater.
M. Philippensis, *Linn.*, blue-tailed bee-eater.
M. quinticolor, *Vieill.*, chestnut-headed bee-eater.
M. apiaster, *Linn.*, European bee-eater.
M. Ægyptius, *Forsk.*
M. badius of Malacca.
Nyctiornis Athertoni, *Jard.*, blue-necked bee-eater.
N. amictus of Malayana.

Fam. Coraciadæ, Rollers.
Coracias Indica, *Linn.*, Indian roller.
C. affinis, *M'Clel.*, Burmese roller.
C. garrula, *Linn.*, European roller.
Eurystomus orientalis, *Linn.*, broad-billed roller.
E. gularis, *V.*, N. Guinea.

Fam. Halcyonidæ, Kingfishers.
Sub-Fam. Halcyoninæ.
a. Entomothera.
Halcyon leucocephalus, *Gm.*, brown-headed kingfisher.
H. amauropterus, *Pearson*, brown-winged kingfisher.
b. Cancrophaga.
H. fuscus, *Bodd.*, white-breasted kingfisher.
H. atricapillus, *Gm.*, black-capped kingfisher.
c. Calialcyon.
H. Coromandelianus, *Sc.*, ruddy kingfisher.
H. Smyrnensis, *Hume.*
Todiramphus collaris, *Sc.*, white-collared kingfisher.
Ceyx tridactyla, *Pallas*, three-toed kingfisher.
C. rufidorsa, *Strickland*, Malayana.
C. luzoniensis, the most beautiful kingfisher.
Sub-Fam. Alcedininæ.
Alcedo Bengalensis, *Gm.*, Indian kingfisher.
A. euryzona, *Temm.*, great Indian kingfisher.
A. Meningting, Tenasserim to Java.
A. Beryllina, Java.
A. Moluccensis, Moluccas.
Ceryle rudis, *Linn.*, pied kingfisher.
C. guttata, *Vigors*, mottled kingfisher.
C. lugubris, *Schl.*, of Japan.

Fam. Eurylaimidæ, *Sw.*, Broadbills.
Psarisomus Dalhousiæ, *Jameson*, yellow-throated broadbill.
Serilophus rubropygia, *Hodgson*, red-backed broadbill.
Eurylaimus Javanicus, Malayana.
E. ochromelas, Malayana.
Corydon Sumatranus, Burma.
Cymbirhynchus macrorhynchus, Burma.
C. affinis, Arakan.
Peltops Blainvillii, N. Guinea.
Calyptomena viridis, Malacca, Archipelago.

Fam. Bucerotidæ, Hornbills.
Homraius bicornis, *Linn.*, great hornbill.
Hydrocissa coronata, *Bodd.*, Malabar hornbill.
H. albirostris, *Shaw*, Bengal hornbill.
H. affinis, *Hutton*, Dehra Doon hornbill.
H. convexa, *Temm.*, Malacca, Java.
H. Malayana, Malacca, Java.
H. nigrirostris, Malacca, Java.
Meniceros bicornis, *Sc.*, common grey hornbill.
Tockus Singhalensis, *Shaw*, jungle grey hornbill.
Aceros Nipalensis, *Hodgs.*, rufous-necked hornbill.
Rhinoplax scutatus, Malay Peninsula.
Rhyticeros ruficollis, *Tem.*, Burma, Malacca.
Rh. subruficollis, *Blyth*, Burma, Malacca.
R. plicatus, *Lath.*, Burma, Malacca.
Berenicornus Tickelli, *Blyth.*

TRIBE, SCANSORES, Climbers.
Fam. Psittacidæ, Parrots. *Sub-Fam.* Palæorninæ, Parrakeets.
Palæornis Alexandri, *Linn.*, Alexandrine parrakeet.
P. torquatus, *Bodd.*, rose-ringed parrakeet.
P. rosa, *Bodd.*, rose-headed parrakeet.
P. schisticeps, *Hodgs.*, slaty-headed parrakeet.
P. columboides, *Vigors*, blue-winged parrakeet.
P. Javanicus, *Osbeck*, red-breasted parrakeet.
P. calthrapæ, *Layard*, Ceylon parrakeet.
P. caniceps, *Blyth*, Nicobars, Penang.
P. erythrogenys, *Blyth*, Andamans.
P. longicauda, Sumatra, Malay Peninsula.

BIRDS.

Sub-Fam. Loriinæ, Lories.
Loriculus vernalis, *Sparrm.*, Indian lorikeet.
L. galgulus, Malay Peninsula.
L. Asiaticus, Ceylon.
Psittinus Malaccensis, Malay Peninsula.

The true lories inhabit the Moluccas and N. Guinea.

Sub-Fam. Cacatuinæ.
The cockatoos consist of—
(1) White cockatoos, with large crest, from Moluccas.
(2) Black cockatoos of Australia, forming the crested genera Microglossum and Calyptorhynchus.

The Nestorinæ have a greatly prolonged upper mandible. The Psittacinæ are found in both continents, and in the E. Archipelago. The maccaws have one large-sized group, viz. true Maccaws, the other Conurus, smaller.

Fam. Picidæ, Woodpeckers. *Sub-Fam.* Picinæ.
Picus Himalayanus, *J. and S.*, Him. pied woodpecker.
P. majoroides, *Hodgs.*, Darjiling black woodpecker.
P. cathpharius, *Hodgs.*, lesser black woodpecker.
P. macei, *Vieill.*, Indian spotted woodpecker.
P. Scindianus, *Gould*, Sind pied woodpecker.
P. brunneifrons, *Vig.*, brown-fronted woodpecker.
P. Mahrattensis, *Lath.*, yellow-fronted woodpecker.
P. Blanfordi, *Blyth*, Burma woodpecker.
P. atratus, *Blyth*, Burma.
P. Andamanensis, *Blyth.*
P. analis, *Temm.*, Java.
P. cabanisi, *Malh.*, China.
P. pectoralis, *Blyth.*
Hypopicus hyperythrus, *Vigors*, rufous-bellied woodpecker.
Yungipicus rubricatus, *Blyth*, Darjiling pigmy woodpecker.
Y. pygmæus, *Vigors*, Himalayan pigmy woodpecker.
Y. Hardwickii, *Jerd.*, southern pigmy woodpecker.
Y. Moluccensis, Java, Molucca.
Y. canicapillus, *Bl.*, Burma.
Y. gymnophthalmos, *Bl.*, Ceylon.
Y. scintilla, *Natt.*, Himalayas.
Y. maculatus, Philippines.
Y. zizuki, Japan.

Sub-Fam. Campephilinæ.
Hemicircus canente, *Less.*, heart-spotted woodpecker.
H. concretus, Malay Peninsula.
Chrysocolaptes sultaneus, *Hodgs.*, golden-backed woodpecker.
C. Goensis, *Gm.*, black-backed woodpecker.
Mulleripicus pulverulentus, *Temm.*, large slaty woodpecker.
M. Hodgsoni, *Jerd.*, great black woodpecker.
M. Javensis, *Horsf.*, Malacca.
M. Hodgei, *Bl.*, Andamans.

Sub-Fam. Gecininæ.
Gecinus squamatus, *Vig.*, scaly-bellied green woodpecker.
G. striolatus, *Blyth*, small green woodpecker.
G. occipitalis, *Vig.*, black-naped woodpecker.
G. viridanus, *Blyth*, Burma.
G. awokera, *T.*, Japan.
G. guerini, *Malh.*, China.
G. affinis, *Raffles*, Sumatra.
G. dimidiatus, *T.*, Java.
Chrysophlegma flavinucha, *Gould*, large yellow-naped woodpecker.
C. chlorolophus, *Vieill.*, lesser yellow-naped do.
C. chlorophanes *Vieill.*, southern yellow-naped do.
C. mentalis, *T.*, Burma, Malayana.
C. miniata, *Forster*, Malacca.
C. puniceus, *Horsf.*, S. Burma, Malayana.
Venilia pyrrhotis, *Hodgs.*, red-eared bay woodpecker.
V. rubiginosa, *Eyton*, Malacca.
Meiglyptes pectoralis, Malayana.
M. tristis, S. Burma, Malayana.
M. jugularis, *Bl.*, Burma.
M. Raffiesii.
Gecinulus grantia, *M'Clel.*, pale-headed woodpecker.
Micropternus phaioceps, *Blyth*, Bengal rufous woodpecker.
M. gularis, *Jerdon*, Madras rufous woodpecker.
M. badius, Malacca.
Brachypternus aurantius, *Linn.*, golden-backed do.
B. chrysonotus, *Less.*, golden-backed woodpecker.
B. dilutus, *Blyth*, pale-backed woodpecker.

BIRDS.

B. Ceylonus, Ceylon.
Chrysonotus shorei, *Vig.*, large 3-toed woodpecker.
C. intermedius, *Blyth*, common 3-toed woodpecker.
C. rubro-pygialis, *Malh.*, southern 3-toed woodpecker.

Sub-Fam. Picumninæ, Piculets.

Vivia innominata, *Burton*, speckled piculet.
Sasia ochracea, *Hodgs.*, rufous piculet.
Picumnus abnormis, *T.*, Malayana.

Sub-Fam. Yunginæ, Wrynecks.

Yunx torquilla, *Linn.*, common wryneck.
Y. Indica, *Gould*, chestnut-throated wryneck.

Sub-Fam. Indicatorinæ, Honey Guides.

Indicator xanthonotus, *Blyth*, yellow-backed honey guide.
I. Archipelagicus, *T.*, Malayana.

Fam. Megalaimidæ, Barbets.

Megalaima virens, *Bodd.*, great barbet.
M. lineata, *Vieill.*, Himalayan green barbet.
M. caniceps, *Franklin*, common green barbet.
M. viridis, *Gm.*, small green barbet.
M. Zeylanica, *Layard*.
M. corvinus, *T.*, Java.
M. phaiostictus, *T.*, Cochin-China.
Cynops Asiatica, *Lath.*, blue-throated barbet.
C. Franklinii, *Blyth*, golden-throated barbet.
Xantholæma Indica, *Lath.*, crimson-breasted barbet.
X. Malabarica, *Blyth*, crimson-throated barbet.
X. rubricapilla, *Gm.*, of Ceylon.
Chotorhœa, *sp.*, of Malay Peninsula and Arch.
Megalorhynchus Hayi, of Malacca.

Fam. Cuculidæ. *Sub-Fam.* Cuculinæ, Cuckoos.

Cuculus canorus, *Linn.*, European cuckoo.
C. Himalayanus, *Vigors*, Himalayan cuckoo.
C. poliocephalus, *Latham*, small cuckoo.
C. Sonneratii, *Latham*, banded bay cuckoo.
C. micropterus, *Gould*, Indian cuckoo.
C. striatus, *Drapiez*, hill cuckoo.
Hierococcyx varius, *Vahl.*, hawk cuckoo.
H. nisicolor, *Hodgs.*, hawk cuckoo.
H. sparverioides, *Vigors*, hawk cuckoo.
Polyphasia nigra, *Blyth*, plaintive cuckoo.
P. tenuirostris, *Gray*, Assam, Burma.
P. merulina, of Malayana.
Surniculus dicruroides, *Hodgs.*, drongo cuckoo.
S. lugubris, *Horsf.*
Chrysococcyx Hodgsoni, *Moore*, emerald cuckoo.
C. xanthorhynchus, *Horsf.*, Malayana.
C. Malayanus, *Horsf.*, Malayana.
C. basalis, *Horsf.*, Malayana.
Coccystes melanoleucos, *Gmel.*, pied-crested cuckoo.
C. coromandus, *Linn.*, red-winged cuckoo.
C. glandarius.
Eudynamys orientalis, *Linn.*, Indian koel cuckoo.

Sub-Fam. Phænicophainæ.

Zanclostomus tristis, *Less.*, green-billed malkoha.
Z. viridirostris, *Jerd.*, small green-billed malkoha.
Z. Javanicus, Burma, Malayana.
Z. Sumatranus, Burma, Malayana.
Z. diardi, Burma, Malayana.
Phænicophaus pyrrhocephalus, Ceylon.
P. curvirostris, Burma, Malayana.
Rhinortha, *sp.*, Malayana.

Sub-Fam. Centropodinæ, Coucals.

Centropus rufipennis, *Illiger*, common coucal; crow-pheasant.
C. viridis, *Scop.*, Indian crow-pheasant.
Taccocua Leschenaultii, *Less.*, sirkeer.
T. sirkee, *Gray*, Bengal sirkeer.
T. infuscata, *Blyth*, northern sirkeer.
T. affinis, *Blyth*, Central Indian sirkeer.

TRIBE, TENUIROSTRES.

Fam. Nectarinidæ. *Sub-Fam.* Nectarininæ, Sun-birds.

Arachnothera magna, *Hodg.*, spider-hunter.
A. pusilla, *Blyth*, *Hodg.*, spider-hunter.
A. Phayrei, *Bl.*, Pegu.
A. flavigastra, *Eyton*, Malacca.
A. chrysogenys, *Eyton*, Malacca.
A. modesta, *Eyton*, Malacca.
A. inornata, *Eyton*, Malacca.
Æthopyga miles, *Hodgs.*, red honey-sucker.
Æ. Vigorsii, *Sykes*, violet-eared honey-sucker.
Æ. Gouldiæ, *Vigors*, purple-tailed honey-sucker.
Æ. ignicauda, *Hodgs.*, fire-tailed honey-sucker.
Æ. Nipalensis, *Hodgs.*, maroon-backed honey-sucker.
Æ. Horsfieldii, *Bl.*, green-backed honey-sucker.
Æ. saturata, *Hodgs.*, black-breasted honey-sucker.
Leptocoma Zeylanica, *L.*, amethyst honey-sucker.
L. minima, *Sykes*, tiny honey-sucker.
Arachnechthra Asiatica, *Lath.*, purple honey-sucker.
A. lotenia, *L.*

Sub-Fam. Dicæinæ, Flower-peckers.

Dicæum coccineum, *Scop.*
D. chrysorhæum, *Temm.*
D. minimum, *Tickell.*
D. concolor, *Jerdon.*
Piprisoma agile, *Tickell.*
Myzanthe ignipectus, *Hod.*
Pachyglossa melanoxantha, *Hodgs.*

Fam. Certhiadæ. *Sub-Fam.* Certhinæ, Creepers.

Certhia Himalayana, *Vig.*
C. Nipalensis, *Hodgs.*
C. discolor, *Blyth.*
Salpornis, spilonata, *Frankl.*
Tichodroma muraria, *L.*

Sub-Fam. Sittinæ, Nuthaches.

Sitta Himalayensis, *Jard.* and *Selb.*
S. leucopsis, *Gould.*
S. castaneoventris, *Frank.*
S. cinnamomeoventris, *Bl.*
S. formosa, *Blyth.*
Dendrophila frontalis, *Horsf.*

Fam. Upupidæ. *Sub-Fam.* Upupinæ, Hoopoes.

Upupa epops, *Linn.*
U. nigripennis, *Gould.*

Fam. Melliphagidæ, Honey-eaters of Australia and Islands.

Fam. Paradiseidæ, Birds of Paradise.

Astrapia nigra, paradise pie, N. Guinea.
Cicinnurus regius, king paradise bird, N. Guinea.
Diphyllodes speciosa, the magnificent, N. Guinea.
D. Wilsoni, red paradise bird, Waigion.
Epimachus magnus, long-tailed paradise bird, N. Guinea.
Lophorina atra, the superb, New Guinea.
Paradisea apoda, great paradise bird, Aru.
P. Papuana, lesser paradise bird, N. Guinea.
P. rubra, red paradise bird, Waigion.
Parotia sexpennis, golden paradise bird, N. Guinea.
Ptiloris magnifica, scale-breasted paradise bird, N. Guinea.
Seleucides alba, 12-wired paradise bird, N. Guinea.
Semioptera Wallacei, standard wing, Batchian.
Sericulus aureus, paradise oriole, N. Guinea.

TRIBE, DENTIROSTRES.

Fam. Laniadæ. *Sub-Fam.* Lanianæ, Shrikes.

Lanius lahtora, *Sykes.*
L. erythronotus, *Vigors.*
L. tephronotus, *Jerdon.*
L. nigriceps, *Franklin.*
L. Hardwickii, *Vigors.*
L. cristatus, *Linn.*
L. arenarius, *Blyth.*
L. tigrinus, Malayana.
L. hypoleucos, *Blyth.*

Sub-Fam. Malaconotinæ, Wood Shrikes.

Tephrodornis pelvica, *Hod.*
T. sylvicola, *Jerdon.*
T. Pondiceriana, *Gmel.*
T. grisola, *Blyth.*
Hemipus picatus, *Sykes.*
H. obscurus, *Horsf.*, Java.

Sub-Fam. Campephaginæ, Cuckoo Shrikes.

Volvocivora Sykesii, *Strickland.*
V. melaschistos, *Hodgs.*
Graucalus macei, *Lesson.*
G. Papuensis, N. Guinea.
G. Javensis, Java.
G. fasciatus, Sumatra.
G. pusillus, *Blyth*, Ceylon.
Pericrocotus speciosus, *Latham.*
P. flammeus, *Forster.*
P. brevirostris, *Vigors.*
P. solaris, *Blyth.*
P. roseus, *Vieill.*
P. peregrinus, *Linn.*
P. erythropygeus, *Jerdon.*
P. albifrons, *Burm.*

Sub-Fam. Dicrurinæ, Drongo Shrikes.

Dicrurus macrocercus, *Vie.*
D. balicassius, *Linn.*
D. longicaudatus, *A. Hay.*
D. cœrulescens, *Linn.*
D. leucophœus, Malacca.
Chaptia ænea, *Vieillot.*
Bhringa remifer, *Temm.*
Edolius paradiseus, *Linn.*
E. Malabaricus, *Scop.*
E. Rangoonensis, *Gould.*
E. brachyphorus, *Temm.*; Borneo.
E. Formosus, *Cabanis.*
Chibia Hottentota, *Linn.*

Sub-Fam. Artaminæ, Swallow Shrikes.

Artamus fuscus, *Vieillot.*
A. leucorhynchos, Philippines.
A. leucogaster, *Val.*, Java.

Fam. Muscicapidæ, Fly-catchers. *Sub-Fam.* Myiagrinæ.

Tchitrea paradisi, *Linn.*

Tickellia Hodgsoni, *Moore.*
Regulus Himalayensis, *Bly.*

Sub-Fam. Sylviinæ, Grey Warblers.

Sylvia orphea, *Temm.*
S. affinis, *Blyth.*
S. curruca, *Gmelin.*

Sub-Fam. Motacillinæ, Wagtails and Pipits.

a. Hill Wagtails.

Enicurus maculatus, *Vig.*
E. immaculatus, *Hodgs.*
E. schistaceus, ,,
E. Scouleri, *Vigors.*
E. nigrifrons, *Hodgs.*

b. Water Wagtails.

Motacilla Maderaspatana, *Br.*
M. Luzoniensis, *Scopoli.*
M. Dukhunensis, *Sykes.*
Calobates sulphurea, *Bech.*

c. Field Wagtails.

Budytes viridis, *Gmelin.*
B. citreola, *Pallas.*

d. Garden Wagtails.

Nemoricola Indica, *Gmelin.*

a. Tree Pipits.

Pipastes agilis, *Sykes.*
P. arboreus, *Bechst.*
P. montanus, *Jerdon.*

b. Titlarks.

Corydalla Richardi, *Vieill.*
C. rufula, *Vieill.*
C. striolata, *Blyth.*
C. Hasselti, *Brehm.*
C. infuscata, *Blyth.*

c. Stone or Lark Pipits.

Agrodroma campestris, *Linn.*
A. cinnamomea, *Rupp.*
A. sordida, ,,

d. True Pipits.

Anthus cervinus, *Pallas.*
Heterura sylvana, *Hodgs.*

Fam. Ampelidæ. *Sub-Fam.* Leiotrichinæ.

a. Blue Thrush Tits.

Cochoa purpurea, *Hodgs.*
C. viridis, *Hodgs.*

b. Hill Tits.

Pteruthius erythropterus, *Vig.*
P. rufiventer, *Blyth.*
Allotrius œnobarbus, *Tem.*
A. flaviceps, *Temm.*
Cutia Nipalensis, *Hodgs.*
Leioptila annectans, *Blyth.*
Leiothrix luteus, *Scop.*
L. argentauris, *Hodgs.*
Siva strigula, ,,
S. cyanouroptera, ,,
Minla ignotincta, ,,
M. castaniceps, ,,
M. cinerea, *Blyth.*

c. Flower-pecker.

Proparus chrysœus, *Hodgs.*
P. vinipectus, ,,
Ixulus flavicollis, ,,
I. occipitalis, *Blyth.*
I. striatus, ,,
Yuhina gularis, *Hodgs.*
Y. occipitalis, ,,
Y. nigrimentum, *Hodgs.*
Myzornis pyrrhoura, ,,
Erpornis xantholeuca, ,,
Zosterops palpebrosus, *Tem.*
Sylviparus modestus, *Burt.*
Cephalopyrus flammiceps, *Burton.*

Sub-Fam. Parinæ, Tits.

Ægithaliscus erythrocephalus, *Vigors.*
Æ. iouschistos, *Hodgs.*
Æ. niveogularis, *Gould.*
Lophophanes dichrous, *Hod.*
L. melanolophos, *Vigors.*
L. rubidiventris, *Blyth.*
L. rufonuchalis, ,,
L. Beavani, ,,
Parus cœmodius, *Hodgs.*
P. Atkinsoni, *Jerdon.*
P. monticolus, *Vigors.*
P. cinereus, *Vieill.*
P. nuchalis, *Jerdon.*
Machlolophus xanthogenys, *Vigors.*
M. Jerdoni, *Blyth.*
M. spilinotus, ,,
Melanochlora sultanea, *Hodgs.*

Sub-Fam. Accentorinæ, Accentors.

Accentor immaculatus, *Hodgs.*
A. Nipalensis, *Hodgs.*
A. altaicus, *Brandt.*
A. strophiatus, *Hodgs.*
A. Huttoni, *Moore.*
A. rubeculoides, *Hodgs.*

TRIBE, CONIROSTRES.

Fam. Corvidæ. *Sub-Fam.* Corvinæ, Crows, Rooks, Nut-crackers, Magpies.

Corvus corax, *Linn.*
C. Tibetanus, *Hodgs.*
C. corone, *Linn.*
C. culminatus, *Sykes.*
C. intermedius, *Adams.*
C. tenuirostris, *Moore.*
C. splendens, *Vieill.*
C. frugilegus, *Linn.*
Colæus monedula, *Kaup.*
C. dauricus, *Pallas.*
Nucifraga hemispila, *Vig.*
N. multimaculata, *Gould.*
Pica Bottanensis, *Deles.*
P. Bactriana, *Bonap.*

Sub-Fam. Garrulinæ, Jays.

Garrulus bispecularis, *Vig.*
G. lanceolatus, *Vigors.*
Urocissa Sinensis, *Linn.*
U. flavirostris, *Blyth.*
Cissa Sinensis, *Briss.*

Sub-Fam. Dendrocittinæ, Magpies.

Dendrocitta rufa, *Scop.*
D. pallida, *Blyth.*
D. Sinensis, *Latham.*
D. frontalis, *M'Clel.*
D. leucogastra, *Gould.*

Sub-Fam. Fregilinæ, Choughs.

Fregilus Himalayanus, *Gould.*
Pyrrhocorax alpinus, *Vieill.*

Fam. Sturnidæ. *Sub-Fam.* Sturninæ, Starlings.

Sturnus vulgaris, *Linn.*	A. fuscus, *Wagler.*
S. unicolor, *Marm.*	A. cristatellus, China.
S. cineraceus, *Temm.*	A. Javanicus, Java.
Sturnopastor contra, *Linn.*	Temenuchus pagodarum, *Gm.*
S. tricolor, *Horsf.*	T. Malabaricus, *Gm.*
S. temporalis, *Wagler.*	T. Blythii, *Jerdon.*
Acridotheres tristis, *Linn.*, *Myna.*	Pastor roseus, *Linn.*
A. Ginginianus, *Lath.*	

Sub-Fam. Lamprotorninæ, Hill Mynas.

Saraglossa spiloptera, *Vig.*	Enodes erythrophrys, Java.
Eulabes religiosa, *Linn.*	Scissirostrum pagei, Celeb.
E. intermedia, *A. Hay.*	Basilornis, *sp.*
E. ptilogenys, *Blyth.*	Calornis dauricus.
Graculus venerata, *Temm.*	Lamprotornis cantor.
Ampeliceps coronatus, *Bly.*	

Fam. Fringillidæ. *Sub-Fam.* Ploceinæ, Weaver Birds.

Ploceus Baya, *Blyth.*	P. Bengalensis, *Linn.*
P. manyar, *Horsf.*	P. Philippinus.

Sub-Fam. Estreldinæ, Amadavads, Munias.

Munia Malacca, *Linn.*	M. acuticauda, *Hodgs.*
M. rubronigra, *Hodgs.*	M. Malabarica, *Linn.*
M. undulata, *Lath.*	Estrelda amandava, *Linn.*
M. pectoralis, *Jerdon.*	E. Formosa, *Lath.*
M. striata, *Linn.*	

Sub-Fam. Passerinæ, Sparrows.

Passer Indicus, *J. and S.*	P. pyrrhopterus, *Jerd.*
P. salicicolus, *Vieill.*	P. flaveolus, *Blyth.*
P. cinnamomeus, *Gould.*	P. jugiferus, *Temm.*
P. pyrrhonotus, *Blyth.*	P. flavicollis, *Frank.*
P. montanus, *Linn.*	

Sub-Fam. Emberizinæ, Buntings.

a. True Buntings.

Emberiza pithyornis, *Palla.*	E. spodocephala, *Pallas.*
E. cia, *Linn.*	E. Stewarti, *Blyth.*
E. Stracheyi, *Moore.*	E. fucata, *Pallas.*
E. hortulana, *Linn.*	E. pusilla, ,,
E. Huttoni, *Blyth.*	

b. Yellow Corn Buntings.

Euspiza melanocephala, *Gm.*	E. aureola, *Pallas* and many others.
E. lutcola, *Sparr.*	

c. Crested Buntings.

Melophus melanicterus, *Gmel.*

Sub-Fam. Fringillinæ.

a. Grosbeaks.

Hesperiphona icterioides, *Vig.*	Mycerobas melanoxanthos, *Hodgs.*
H. affinis, *Blyth.*	M. carnipes, *Hodgs.*

b. Bullfinches.

Pyrrhula erythrocephala, *Vig.*	P. aurantiaca, *Gould.*
P. erythaca, *Blyth.*	Pyrrhoplectes epauletta, *Hodgs.*
P. Nipalensis, *Hodgs.*	

c. Crossbills.

Loxia Himalayana, *Hodgs.*	Propyrrhula subhemachala, *Hodgs.*
Hæmatospiza sipahi, ,,	
Chaunoproctus papa, *Bon.*	

d. Rose Finches.

Carpodacus rubicilla, *Kaup*	P. pulcherrimus, *Hodgs.*
C. erythrinus, *Pallas.*	P. frontalis, *Blyth.*
Propasser rodopeplus, *Vig.*	P. Murrayi, ,,
P. thura, *Bon.*	Procarduelis Nipalensis, *Hodgs.*
P. rhodochlamys, *Brandt.*	Pyrrhospiza punicea, *Hod.*
P. rhodochrous, *Vig.*	

e. True Finches.

Callacanthis Burtoni, *Gould.*	Serinus canaria, Canary birds.
Carduelis caniceps, *Vigors.*	Fringilla montifringilla, *Linn.* and others.
Chrysomitris spinoides, *Vigors.*	Fringillauda nemoricola, *Hodgs.*
Metoponia pusilla, *Pallas.*	

Sub-Fam. Alaudinæ, Larks.

a. Bush Larks.

Mirafra Assamica, *M'Clel.*	M. erythroptera, *Jerdon.*
M. affinis, *Jerdon.*	M. cantillans, ,,

b. True Larks and Sky Larks.

Ammomanes phœnicura, *Frank.*	O. longirostris, *Gould.*
A. Lusitanica, *Gm.*	Spizalauda deva, *Sykes.*
Pyrrhulauda grisea, *Scop.*	Alauda triborhyncha, *Hodgs.*
Calandrella brachydactyla, *Temm.*	A. gulgula, *Franklin.*
Alaudala raytal, *B. H.*	A. Malabarica, *Scop.*
Otocoris penicillata, *Gould.*	Galerida cristata, *Linn.*

c. Desert Larks.

Certhilauda desertorum.

Order, Gemitores, Pigeons.

Fam. Treronidæ. *Sub-Fam.* Trerorinæ, Green Pigeons.

Treron Nipalensis, *Hodgs.*	A. Malabarica, *Jerdon.*
T. psittacea, *Gmel.*	A. Phayrei, *Blyth.*
T. curvirostra, ,,	A. flavo-gularis, ,,
T. aromatica, ,,	A. pompadoura, *Gm.*
T. axillaris, *Gray.*	A. olax, *Temm.*
T. capellii, *Temm.*	A. fulvicollis, *Wagl.*
Crocopus phœnicopterus, *Latham.*	Sphenocercus sphenurus, *Vigors.*
C. chlorigaster, *Blyth.*	S. apicaudus, *Hodgs.*
Osmotreron bicincta, *Jerd.*	

Sub-Fam. Carpophaginæ, Fruit Pigeons.

Carpophaga sylvatica, *Tick.*	C. insignis, *Hodgs.*

Fam. Columbidæ. *Sub-Fam.* Palumbinæ, Wood Pigeons.

Alsocomus puniceus, *Tick.*	P. pulchricollis, *Hodgs.*
A. Hodgsonii, *Vigors.*	P. Elphinstonei, *Sykes.*
Palumbus casiotis, *Bonap.*	

Sub-Fam. Columbinæ, Rock Pigeons.

Palumbœna Eversmanni, *Bon.*	C. rupestris, *Pallas.*
Columba intermedia, *Stric.*	C. leuconota, *Vigors.*

Sub-Fam. Macropyginæ, Cuckoo Doves.

Macropygia tusalia, *Hodg.*	M. phasianella, *Temm.*
M. rufipennis, *Blyth.*	M. macrura, *Gmel.*
M. ruficeps, *Temm.*	

Sub-Fam. Turturinæ, Turtle Doves.

a. Auriti.

Turtur rupicolus, *Pallas.*	T. meena, *Sykes.*

b. Maculicolles.

T. Cambayensis, *Gmel.*

c. Tigrini.

T. Suratensis, *Gmel.*

d. Streptopelieæ, Ring Doves.

T. risoria, *Linn.*	T. humilis, *Temm.*

Fam. Gouridæ. *Sub-Fam.* Phapinæ, Ground Doves.

Chalcophaps Indicus, *Linn.*	G. striata of Java.
C. Stephani of N. Guinea.	Calœnas Nicobaricus.
C. Javanicus, *Gm.*, Java.	Goura coronata.
Geopilia, *sp.*, of Malayana.	G. Victoriæ.

Order, Rasores, Game Birds.

Fam. Megapodidæ. *Sub-Fam.* Megapodinæ, Mound Birds.

Megapodius Nicobariensis, *Blyth.*	Leipoa ocillata of Australia.
	Mesitus variegata.

Sub-Fam. Talegallinæ, Mound Birds, Brush Turkey.

Talegalla Lathami.	Megacephalon maleo, Celebes.
T. Cuvierii; N. Guinea.	

Fam. Pteroclidæ, Sand Grouse or Rock Pigeon.

Pterocles arenarius, *Pallas.*	P. exustus, *Temm.*
P. fasciatus, *Scopoli.*	P. Senegallus, *Linn.*
P. alchata, *Linn.*	

Fam. Phasianidæ. *Sub-Fam.* Pavoninæ, Pea-fowl.

Pavo cristatus, *Linn.*	P. bicalcaratum, *Linn.*
P. muticus, ,,	P. Napoleonis, *Masseng.*
Polyplectron Tibetanum, *Temm.*	P. chalcurus, *Temm.*
P. lineatum, *Hardw.*	Argusanus giganteus, *Tem.*

Sub-Fam. Phasianinæ, Pheasants.

Lophophorus Impeyanus, *Latham.*	P. Torquatus.
Crossoptilon auretum, *Pal.*	P. Mongolicus, *Gould.*
C. Tibetanum, *Hodgs.*	P. versicolor, *Vieill.*
Ceriornis satyra, *Linn.*	P. Reevesii, *Gray.*
C. melanocephala, *Gray.*	P. Soemmeringii, *Temm.*
C. Temminckii, ,,	Thaumalea picta.
Ithaginis cruentus, *Hardw.*	T. Amherstiæ.
Pucrasia macrolophia, *Less.*	Gennæus nycthemerus, *Gould.*
P. castanea, *Gould.*	Gallophasis albocristatus, *Vigors.*
Phasianus Wallichii, *Hard.*	G. melanotus, *Blyth.*
P. Colchicus.	G. Horsfieldii, *Gray.*
P. lineatus, *Lath.*	

Sub-Fam. Gallinæ, Jungle Fowls, Firebacks, Black Pheasants.

Gallus ferrugineus, *Gmel.*	Galloperdix spadiceus, *Gm.*
G. Sonneratii, *Temm.*	G. lunulosus, *Val.*
G. Stanleyi, *Gray.*	G. Zeylonensis.
G. furcatus, *Temm.*	Diardigallus prelatus.

Fam. Tetraonidæ, Grouse and Partridges.

Sub-Fam. Perdicinæ.

a. Snow Fowl.

Tetraogallus Himalayensis, *Gray*, snow cock.	Francolinus vulgaris, *Steph.*
T. Tibetanus, *Gould.*	F. pictus, *Jard. and Selb.*
T. Caucasicus, *Pallas.*	F. Phayrei, *Blyth.*
Lerwa nivicola, *Hodgs.*	Tetrao pintadeus, *Scopoli.*

b. Rock or Sand Partridges.

Caccabis chukor, *Gray.*	Ammoperdix bonhami, *Gr.*

c. Grey or Bush Partridges.

Ortygornis Ponticerianus, *Gmel.*	Rhizothera longirostris, *Temm. ?*
O. gularis, *Temm.*	

d. Wood Partridges.

Arboricola torqueola, *Val.*	P. personata, *Horsf.*

BIRDWOOD, Sir GEORGE CHRISTOPHER MOLESWORTH, M.D. of Edinburgh University, K.C.S.I., a medical officer of the Bombay army. In 1856 he was present at the capture of Mohammarah, for which he received the medal and clasp given for the Persian war of 1856–57. In 1857 he was appointed Professor of Anatomy and Physiology in Grant Medical College, and until his leaving India he continued in the chairs of Anatomy, Physiology, Botany, and Materia Medica. He was appointed Curator of the Government Central Museum at Bombay, and, with the assistance of Dr. Bhau Dhajee, he established the Victoria and Albert Museum and the Victoria Gardens in Bombay. He was honorary secretary to the Asiatic Society of Bombay and the Agri-Horti-

cultural Society of Western India. In 1867 he was sent as Special Commissioner for the Government to the Universal Exhibition held in Paris. Addresses were presented to him on his finally leaving India in 1869, by the Asiatic Society, the Agri-Horticultural Society, the University of Bombay, of which he was then Registrar, and the students of Grant Medical College. On the proclamation of the Queen as Empress of India, January 1, 1877, he was appointed to the Companionship of the Star of India. He has devoted himself to writing on Indian subjects and on Indian art. In 1870 he contributed a paper to the Linnean Society on the Genus Boswellia. It is the record of the discovery of the frankincense trees of the Somali country, made by him in conjunction with Colonel Playfair, then Resident at Aden. In 1878 he wrote the Handbook to the Indian Court at the Paris Exhibition of 1878; and his Handbook on the Industrial Arts of India has attracted abiding attention to the traditional handicrafts of India, and created a widespread demand for them all over Europe and in America. He is the author of the Vegetable Products of Bombay, a very valuable book on the economic products, which has gone through two editions.

BIRGO. HIND. Nima quassioides.

BIR-GUJAR, one of the thirty-six royal races amongst the Rajputs, descendants of Rama through Lawa, his second son. Their opponents, the Cuchwaha, also descend from Rama. The family state that they came from Rajore, the capital of Deoti, in the Macherri country. They settled in Dor country, then slaughtered the Mewatti and Bheehar, and are now dwelling from Rohilkhand to Muttra (Mathura), also in Shamsabad, Farrakhabad Eyta of Mynpuri, and Gorakhpur; and a clan, now Mahomedans, have settled in Muzaffarnagar. All the doab clans long since became Mahomedans, some in the time of Ala-ud-Din, Khilji, but retain the Hindu title of Thakur, with many Hindu customs, as Thakur Akbar Ali Khan.—*W.; Elliot.*

BIRGUS LATRO, the Tatos of Philippines, the cocoanut crab, hermit crab, or robber crab of the Keeling islands, is a link between the short and long tailed crabs, and bears great resemblance to the paguri. In the Keeling islands they live on the cocoanuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is merely a story. Its front pair of legs are terminated by very strong and heavy pincers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk fibre by fibre, from that end in which the three eyes are situated, and then hammers upon one of them with its heavy claws, until an opening is effected. It then, by its posterior pincers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates surprising quantities of picked fibre of cocoanut husks, on which it rests as on a bed. Its habits are diurnal; but every night it is said to pay a visit to the sea, perhaps to moisten its branchiæ. It is very good to eat; and the great mass of fat accumulated under the tail of the larger ones, sometimes yields, when melted, as much as a quart of limpid oil. They are esteemed great delicacies, and are fattened for the table. The Birgus latro, by means of blood-vessels in its walls, breathes air directly.—*Bikmore*, p. 149; *Darwin*, p. 552.

BIRHASPATI or Brihaspati, the planet Jupiter.

BIRHERIA, one of the Chamar tribes.—*Elliott.*

BIRHOR, a forest race-dwelling in the south of Chutia Nagpur and in the Hazaribagh district. They live in the jungles on the sides of hills, in small water-tight huts constructed only of branches of trees and leaves. The men snare hares and monkeys, and collect the bark of the Bauhinia scandens for cordage, and the women bring the forest products to the weekly markets. The race claim relation with the Kharria, as offspring of the sun. Their number is estimated at not more than 700 for the whole Hazaribagh district. They are quite migratory, wandering about from jungle to jungle, as the sources of their subsistence become exhausted. Amongst themselves they speak the Kol language, but can also converse freely in such Hindi as is spoken in this province.

The Birhor in Chutia Nagpur proper and Jashpur live in an equally wild state, but communicate with each other in a dialect of Hindi. They are a small, dirty, miserable-looking race, who have the credit of devouring their aged parents; and when taxed with it by Colonel Dalton, they admitted that their fathers were in the habit of disposing of the dead by feasting on the bodies; but they declared they never shortened life to provide such feasts, and shrank with horror at the idea of any bodies but those of their own blood-relations being served up to them. The raja of Jashpur said he had heard that when a Birhor thought his end was approaching, he himself invited his kindred to come and eat him. The Birhor brought to Colonel Dalton did not acknowledge this.—*Dalton, Ethnol. of Bengal*, 220.

BIRI. HIND. Ærua Javanica.

BIRIJA. HIND. Turpentine of Pinus longifolia; Galbanum. See Biroza.

BIRJEE PASS, one of the passes from Kunawar to the Outer Himalaya.

BIRJIA. HIND. One of the Ahir tribes.

BIRK, also Virk, a distinguished Jat tribe.

BIR KAIA. TEL. Cucumis acutangula.

BIRKAT-el-HAJI, the Pilgrim's Pool, four leagues eastward from Cairo. It is a considerable lake, which receives its water from the Nile.

BIRM. DUK., Trichosanthes incisa. Cratæva nurvala; also C. tapia and Taxus baccata.

BIRM-BHAT, a branch of the Bhat tribe, whose office is the recitation of ancestral exploits at family festivals. They are hired for the occasion. They reside permanently in villages and towns, and do not lead a migratory life like some of the other Bhats.

BIROTA. HIND. Zizyphus nummularia.

BIROZA, HIND., also Ganda biroza and Sat biroza. Pinus longifolia.

BIRRA, HIND., also Bejar in E. Oudh. Gram and barley sown together as a mixed crop.

BIRRI. HIND. Picea Webbiana, P. Pindrow, the silver fir; also Clematis Nepalensis.

BIRS NIMRUD, ruins six miles from Hillah, in the province of Baghdad, the site of the ancient Borsippa. According to Bunsen, the bilingual inscription found on the original spot by Rawlinson, on the walls of the temple, among the ruins of Birs Nimrud, teaches us that this building, which forms the nucleus of that mound, was the sanctuary of Maradach, erected by Nabopolassar

and Nabukodnossor. The term is Turkish, and means the tower or Akron of Nimrud. The Jews style it Nebuchadnezzar's prison. It was considered by Niebuhr, Rich, and others, to be the ruins of the temple of Belus. The Qamus gives Birs as the name of a town or district between Hillah and Kufah, which is still known, and is conjoined with Babel in the Chaldaic Sidra Rabba of the Sabæans, under the name of Barsif; whence the Borosippo of Strabo, and other ancient authors, directly proceeds. — *Mignan's Travels*, 259, 202; *Bunsen*, iv. 414; *Rich's Babylon*, 34.

BIRSOON. ARAB. Gossypium Indicum.

BIRT, also Brita and Burt. HIND. A grant of land under stipulations. It also means proprietary right, endowment, maintenance, custom, or privilege derived from the performance of offices, religious or secular. It conveys an unreserved proprietary right of inheritance, share, transfer, and alienation in perpetuity. The Birtia is the owner of the soil.—*Elliot.*

BIRTH, second birth or 'twice born' are terms frequently met with in writings on the Hindu people, and indicate that the person to whom it is applied has received the zonar or sacrificial cord. In this respect it resembles the confirmation of the Episcopal Church of England. The term is also often used by Sudra Hindus to imply conversion of heart. Hindus and Mahomedans have many child-birth ceremonies. The Mahomedans of N.W. India, on the birth of a child, show it a sword or knife, to ward off evil from it. There, also, on the birth of a child among the Sudra Hindus, a Brahman is at once sent for, who announces the nakshatra or planet under which it has been born. A Chamarni, or wife of a Chamar, is also summoned, for the purpose of taking charge of both mother and infant. She remains for six days, and then leaves, after receiving clothes and other perquisites. Her place is supplied by a Navin, or barber's wife, who continues her service for a month or upwards. On the sixth day the mother is allowed to bathe, according to the time fixed by the Brahman, and her friends visit her, bringing with them spices, clarified butter, and articles of clothing for the child. She also bathes on the twelfth day, and is considered to be ceremonially clean. Her friends now approach her person, which they are permitted to touch, offering their congratulations. During the whole of the first twelve days the women of the neighbourhood gather themselves daily at the house, and sing songs, called Sohar, in honour of the occasion. If the infant is born in the Mûl-nakshatra, the woman remains impure for twenty-seven days, as amongst the Brahmans. On the occasion of a birth in a Chinese house, large bunches of evergreens are suspended above the house door. In Japan, annually, in front of every house where a child has been born, a huge paper fish, from 3 to 25 feet long, is hoisted on a bamboo pole. Theatrical representations last throughout the day.

BIRTHWORT, Aristolochia bracteata, *Retz*; A. longa.

BIRUNI, the takhallus or nom-de-plume of Abu Rihan, author of the Tarikh-i-Hind, or history of India, A.D. 1331. See Al Biruni.

BIRUN-JASIF. PERS.? Artemisia vulgaris.

BIRZUD. PERS. Galbanum.

BIS. HIND. Myricaria Germanica, also Salix alba, and S. tetrasperma. Kala bisa, Hippophae rhamnoides.

BIS. HIND. Twenty. See Biswa.

BISADÆ or Besadæ, in mediæval Greek called Vesadæ, are alluded to in the tract of Palladius de Moribus Brachmanorum, written about A.D. 400. The same name is applied by Ptolemy to a similar race inhabiting Northern India.

BISAHAR MOUNTAINS, an offshoot of the Western Himalaya, extends for almost 60 miles from the lofty cluster of Jumnotri peaks to the Sutlej, below Shatul. The Bisahar peaks range in heights from 16,982 to 20,916 feet, the highest being the peaks of Jumnotri. Its passes are from 14,891 to 16,035 feet in height. The great mass of this range is granite. The people speak a Hindi dialect. See Ladakh; Thoji-chanmo.

BISATI. HIND. A pedlar, from Bisat, stock; one who hawks his goods about from place to place, and keeps no shop for the exhibition of his wares. He is commonly found seated on the ground, with his goods spread out for sale on a mat before him.

BISAYA, a group of islands in the Eastern Archipelago. Ambergris is frequently gathered in considerable lumps in the vicinity of Samar and the other islands of the Bisaya group, as well as mother-of-pearl, tortoiseshell, and red and black coral; of the latter kind shafts occur as thick as the finger and 6 or 8 feet long.—*Walton's State*, pp. 38, 39.

BISCHOFFIA JAVANICA. *Bl.* Red cedar.

B. trifoliata, *Hook.*	Stylodiscus trifoliatus, *B.*
Andrachne trifoliatus, *R.*	Microelus Ræperianus, *W.*
Boke, ... MAHR.	Mogagerri vembu, TAM.

This very large and valuable timber tree has a wide range; in the Peninsula of India it ascends the mountains to 5000 feet elevation, and it is found in Northern India, Borneo, the Archipelago, S. China, and the Philippines, but appears to be absent from Ceylon; it is the only known species of the genus. It flowers in February, and ripens its seed in May and June. It has an immense trunk; the timber is reddish, very hard and durable, and much in use in some parts with planters and others for building, planking, etc., but it is very little known or utilized.—*Beddome, Fl. Sylv.*

BISCUIT.

Biscoot, . ANGLO-HIND.	Biscotto, galetta, . IT.
Skibstvebak, . . DAN.	Biscoito, ... PORT.
Scheepsbeschuit, . DUT.	Bort Ssucher, . . . RUS.
Biscuit, ... FR.	Bizcocho, galletta, SP.
Zweibach, . . . GER.	

Biscuit, from the two Latin words, bis coctus, twice baked, is an unfermented bread, which, if properly prepared, can be kept a great length of time, and hence its use as a common form of bread at sea.—*Toml.; Faulk.* See Bread.

BISEN. HIND. A powerful tribe of Rajputs in Cawnpur and the eastern parts of the N.W. Provinces. Their chief is the raja of Salempur Majjhauli.—*Elliot; Wilson.*

BISESWARA, a Hindu deity. Near this idol is the temple of Anna Purna, the Indian Cybele, or the Anna Perenna of the Romans. To heighten the devotional feelings; her image is placed in a dark recess, and is veiled from the public gaze. It is of marble, and has its face covered by masks, of which there are two, one of gold, the other of silver.

BISFAIJ. HIND. Species of Polipodium and Adiantum.

BISH. HIND. Any vegetable poison; Aconitum ferox, and other species.—*Wall.*

BISH-BANS. Beesha Rheedii, *Kunth.;* Bambusa baccifera. See Bamboo.

BISHEN GANGA. On its bank is built Badarinath, in lat. 30° 46′ N., long. 79° 32′ E.

BISHKHAPRA. HIND. Primula speciosa; also Trianthema decandra and Tr. pentandra; the latter is used in N. India medicinally. It spreads over the ground, and forms a circle nearly a yard in diameter.

BISH-KOPRA. HIND. Iguana. (Qu. Bish Kobra, or poison cobra.) A lizard found in Gujerat. It has been described as venomous. Ghoor, the Hindu patriot calls them; Tuckhub and Tuckoo in Bengal, the word Tuckoo being in consonance with the call or song of the reptile. In Baraitch in Oudh it is called Bis-kopra. It is described as flat, about 1½ inches in breadth, and 15 inches in length, with a head very like a snake's in point of shape. It possesses fangs; and a small dark-greenish bag under the tongue, and in close proximity to the teeth, indicates the poison bag. It is a venomous-looking creature, and possesses to a remarkable degree the pugnacity of the venomous snake when assailed. All this seems a popular delusion, a venomous lizard being an anomaly unknown in creation.—*Z.*

BISH-KUCHOO. BENG. Arum fornicatum, poisonous Calla.

BISHMAN. BENG. Colocasia cucullata.

BISHNAVI, a Hindu sect in Rohilkhand and the Doab. The author of the volume Tanbih-ul-Jahilin remarks that most of the teachers of the reforming Hindu sects, the Kabir panthi, Parnami, Daud panthi, Sadh, Sat nami, Kalal panthi, and Bishnavi, have been Mahomedans. The Bishnavi are, however, said to have been founded by Bishno, a Tuga Brahman, a pupil of a Mahomedan fakir. Professor Wilson says the sect is of growing importance in some parts of the N.W. Provinces, combining Hindu and Mahomedan practices and belief, generally terming themselves shaikhs, but adding this title to a Hindu name. The Bishnavi is the most common sect in the desert and in Sind. In the desert, where 'they are a law unto themselves,' they wear the junnoo or zonar; they cultivate, tend cattle, and barter their superfluous ghi for other necessaries.—*Elliot; Rajasthan*, ii. 319.

BISHOP, the episcopos of the Greeks, is a title given by Christians to the overseers of their churches. Bishop of Babylon is the title of the Romish prelate for the pashalik of Baghdad. The Protestant bishops of distinction in India, since the early part of the 19th century, have been Heber, Corrie, Middleton, Milman, Caldwell. Bishop's College, Calcutta, on the bank of the Hoogly, was established for the education of clergy for the Episcopal Protestant Church. Bigandet was an eminent Catholic bishop.

BISHOP'S-WEED SEED.

These carminative seeds yield by distillation a very useful oil, which is given medicinally as a stomachic. The distilled water is used as a carminative in every nursery of Madras, under the name of 'omum water.'—*Ainslie*, p. 269.

BISH TARAK. BENG. Argyreia speciosa; also Lettsomia nervosa.

BISH-ul-YUKURUNI. ARAB. Menispermum cordifolium.

BISH-UMBA. BENG. Cucumis colocynthis.

BISHWA TULSI. BENG. Ocimum sanctum.

BISI. URIA. A fiscal division of a district paying revenue under the Hindu government of Orissa.

BISI. HIND. A measure of weight, commonly a vis; in Garhwal and Kamaon, a dry measure; in Rangpur, a land measure.

BISI. HIND. Unclean.

BISINDIDI. CHENAB. Gardenia retrosperma.

BISIR. HIND. Pyrus Kamaonensis.

BISLOOMBAH, HIND., also Bisloombhee. Colocynth; Cucumis pseudo-colocynthis.

BISMILLAH means literally, in the name of God; and Mahomedans never commence, or leave off, eating without saying it. It is often used by them, also, in commencing a book, or on rising up or sitting down, and by the pious on every occasion, however unimportant. It answers to the Christian grace before meat. It is also used as a sacrificial prayer; directing the victim's face towards the Kaba, the person cuts its throat, ejaculating, 'Bismillah! Allahu Akbar!' The camel is sacrificed by thrusting a pointed instrument into the interval between the sternum and the neck. This anomaly may be accounted for by the thickness and hardness of the muscles of the throat. Burckhardt makes the Mahomedan say, when slaughtering or sacrificing, 'In the name of the most merciful God!' But Mr. Lane justly observes that the attribute of mercy is omitted on these occasions.

Bismillah-ur-Rahman-ur-Rahim, in the name of the merciful and clement God, is a frequent prayer of Mahomedans. Zamakshari, in his Commentary on the Koran, observes, Rahman denotes a more extensive idea than Rahim; for this reason people say, in speaking of God, 'The merciful (Ar Rahman) in this world and the next,' and 'the clement or compassionate (Ar Rahim) in this world.' The correct pronunciation to a European are, Bismillah irruhman nirruheem. The words are first taught to Mahomedan children at the age of four years four months and four days, with certain ceremonies. It is their christening or initiation into the church.—*Herk.; Burton's Pilgrimage*, iii. p. 303.

BISMUTH. Mr. Piddington found bismuth in one of the ores sent him from the antimony mines near Moulmein; it is found in connection with silver in Burma, and has been obtained in small quantities in Kashmir, from the Jammu territory. —*Mason; Powell, Handbook.*

BISON. Gavæus gaurus.

Gavæus gaurus, is the bison of sportsmen in India. It inhabits all the large forests. In its range in the Western Ghats, or Syhadri mountains, some of the bulls attain a height of 19 hands at the shoulder. It is not, however, a true bison. It is the Bos gour of Traill, the B. asseel of Horsfield. Bibos cavifrons, *Hodgson*, and Bibos asseel, *Hors.*, are, however, separated by some authors, and the term bison is very indiscriminately given to bovine animals to whom it does not pertain. The genus bison proper comprehends two living species, one of them European, now become very scarce, and

varieties of this small tree, α. se-coloured flowers, cultivated in , and β. Indica, with white flowers, India. In the native of India the ite, and the immature capsule green; plant from West Indian seed the se-coloured, and the immature seed- and the eastern plants do not furnish of so good a colour. The plant is Singapore, in Mysore, largely all and is a favourite dye with the is grown in Dacca, the Malay he Eastern Archipelago, the Hawaiian gatabu, Rio Janeiro, Peru, and e shrub rises to the height of seven or producing oblong heavy pods, some- bling those of a chestnut. Within this generally thirty or forty irregularly- ls, which are enveloped in a pulp of a colour, and a fragrant smell; the pulp arnotto of commerce. The dye is pared by macerating the pods in boil- When they begin to ferment, the rongly stirred and bruised with wooden promote the separation of the red skins. ss is repeated several times, till the left white. The residuum is dried in and made up, while soft, into balls or 2 or 3 lbs. weight. The dry hard paste est of all ingredients for imparting a nt to cheese and butter. The Spanish s mix it with their chocolate, to which beautiful rich hue. It imparts a pale r to silk and cotton. BLACK RACE, the Kara-chi.

BLACK SEA, on the N.W. side of Asia, forms in part the boundary between Asia and Europe.

BLACKSMITH. The Lohar, or blacksmith of India, is one of the five artisans who wear the zonar, or poitu, or sacred string, the other four being the goldsmith, stone-cutter, carpenter, and coppersmith. The blacksmiths of India who make iron, obtain a great heat by throwing a quantity of (bhusa) rice-chaff on the top of their fire. The chaff being composed of silica and vegetable matter, the latter burns, and so forms potash, which alkali combines with the silica and forms a glass or vitreous cake. The coal-worker throws drops of water on the fire to make the mass cake.

BLACK SOIL, or black cotton soil, or cotton soil of Southern India, is met with in great tracts of country. It is remarkable for permanence of fertility, yielding crops without manure for a thousand years. It is supposed by some to be decomposed trap, but others regard it as a true alluvium, deposited from still water. It is called regur in Hindi. During the dry season, it rends into great gaping cracks, but it is highly absorbent of moisture, and very retentive; and during the rainy season it presents a uniform glazed surface of black tenacious clay. It can absorb more than one-third of its entire weight of water, and it has in a very remarkable degree the power of absorbing moisture from the air. Thoroughly dried cotton soil in one night absorbed 7·99 per cent. of water. It is the soil in which cottons, sorghum, wheats, and maize are largely grown. In many parts it is 15 and 20 feet deep, and is to be seen everywhere in the Peninsula of India in patches of greater or less extent, but it covers the whole surface of the greatest outburst of volcanic rocks in the world, in the western part of the Dekhan, Central Provinces, and Berar.

BLACK STONE, the Hajar-ul-aswad of the Mahomedans, now built into the wall of the Kaba at Mecca, is fabled to have fallen from paradise with Adam. It is kissed by each pilgrim.

BLACKWELLIA CEYLANICA. *Gardner.*

B. tetandra, *W. I.* | Leeyang-gass, . . SINGH.

This tree grows in the moister parts of Ceylon up to 3000 feet. It attains a height of 30 to 40 feet.—*Thw. Zeyl.* i. p. 79.

BLACKWELLIA TOMENTOSA. *Vent.* The Myouk kyau of the Burmese, a tree of British Burma; wood tough, of a light yellow colour, used for the teeth of harrows. A cubic foot weighs 56 lbs. The average length of the trunk to the first branch is 70 feet, and average girth at 6 feet from the ground is 6 feet. B. spiralis, fœtida, propinqua, Cochin-Chinensis, paniculata, Nepalensis, and padiflora also occur in India.—*Voigt; Dr. Brandis.*

BLACKWOOD, Rosewood.

Biti, ... CAN.	Eru pottu, . . . TAM.
Sisam, ... GUJ.	Biti-maram, . . ,,
Sisam, Sit Sal, . . HIND.	Irugudu chettu, . TEL.

This is a commercial term for several dark-coloured timbers, and every locality has a wood which is known by this name. The timber known in Britain as East Indian blackwood is from the Dalbergia latifolia of the Malabar coast, where it grows to an immense size. The wood of the trunk and large branches is extensively used for making furniture; it is heavy, sinking in water, close-grained, of a greenish-black colour, with lighter coloured veins running in various directions, and takes a fine polish. Bombay seesum-wood, however, is probably the timbers both of Dalbergia latifolia and D. sissoides, brought from Cochin and other places lower down on the Malabar coast. It sells for about the same price as teak. It is a brittle, open-grained wood, not at all a favourite with cabinetmakers of England, where the highest prices ever realized for it in the state of log were about £10 per ton. The principal furniture-dealers in Bombay are Parsees, mostly from Gujerat. The pattern meant to be carved is first carefully drawn on paper; then on the wood. The tools used are the native adze, chisel, and drill; the centre-bit and other tools of English pattern, from which so much assistance might be obtained, are never resorted to. The general design of the various pieces of furniture is mostly excellent, the patterns elegant and tasteful; the finish for the most part is poor, the joinery always execrable. Concealed joints never seem to be thought of; pins which might be kept out of view are made as conspicuous as possible; and great clumsy screw-nails, which might, without trouble, be hid, are fully exposed to view. Considerable quantities of blackwood furniture are sent to Britain annually by residents in Bombay for their own after use, or for the service of friends. It is packed up without being jointed or polished, and is put together by English workmen, who, it is believed, think but lightly of its merits. The principal furniture shops in Bombay keep from five to ten workmen each, and probably turn out Rs. 25,000 to Rs. 30,000 worth of furniture amongst them annually.

BLACKWOOD'S HARBOUR is a sheet of water between Armagon shoal N. of Madras, and the mainland.

BLADDER WORM, Measle. See Cysticercus.

BLAIR. Lieutenant Archibald Blair, R.N., in 1777 and 1795 made a circuit of the entire Andaman Archipelago, and embodied the result of his researches in general charts, plans, and a report containing useful information for mariners. He surveyed also the Kattyawar coast, Salsette, and other patches here and there.—*Marine Survey.*

BLANAH. MALAY. In Burma, a well-known palatable fish.

BLANKET.

Bett decke, Windel, GER.	Coperta di lana, . . IT.
Kamal or Kamli, HIND.	Manta, ... SP.

A soft, loosely-woven woollen stuff, used as a bed covering by night and cloak by day. Most of the blankets or Kamli manufactured in India, are of a coarse description, and only used by the poorer natives. Blankets are manufactured in Mysore from half-bred merino wool, half-bred but wool; warp woof Mundium wool, common

country wool and Mundium wool. Those of Kachar sell well. The white blankets made at Rampur in the Western Himalaya, and known as the Rampur chadr, are sold in London at £3 and upwards. They have a sale in Great Britain. The Kamli or cumblies made in the Ceded Districts are of a superior texture. A woollen manufactory is working at Bangalore.

BLATTA ORIENTALIS, the cockroach; a very troublesome insect in houses and in ships; lodging in cupboards, presses, and amongst books, and soiling by their exuvia whatever they approach.

BLATTI. MALEAL. Sonneratia acida.

BLEACHING.

Nikharna, . . .	HIND.	Salavy pannukiradu,	TAM.
Khumbi karna, .	,,	Nana padam, . .	TEL.

In India, the substances present in goods which oppose the bleaching process are first removed by scouring in an alkaline lye; afterwards natives usually dung the cloths which are to be bleached, and then steam them over the mouth of an earthen pot set in a clay fireplace. But little science enters into the process, and generally the goods suffer much from the water in which they are scoured being overcharged with lime. Bleached cloth, particularly of tents, is far less durable than that which has merely had the dressing and filth thoroughly removed by washing. This is easily explained, as cotton goods have a certain resinous substance in them that obstructs the absorption of moisture. Besides the removal of this, cloth sustains much damage from the abuse of the caustic lye bath. Cloths should be scoured more than once at intervals during the process of bleaching, because many of the substances cannot be removed but after exposure to the light and air.

Wool, also, is protected by a peculiar varnish, exceeding three per cent. of its weight, which must be removed by scouring. *Warm* water must be employed. Wool is further bleached by sulphuring, either in close chambers in which sulphur is burnt, or by the sulphuric bath. In either case it acquires a brittleness which must be removed by washing in soap and water.

Several seats of the cotton manufacture, such as Dacca and Baroach, are famous for their bleaching. This has been ascribed to the excellence of the water in the neighbourhood of these places. At Dacca fine muslins are merely steeped in water; other cloths are first washed. But all, of whatever texture they may be, are next immersed for some hours in an alkaline lye, composed of soap and of sajji mattee, that is, impure carbonate of soda. They are then spread over the grass, and occasionally sprinkled with water, and when half dried are removed to the boiling-house in order to be steamed. This is effected by twisting the cloths into the form of loose bundles, and placing them upon a broad clay platform, which is on a level with, and surrounds, the neck of a boiler sunk into the ground. They are then arranged in circular layers, one above the other, around a bamboo tube, which is kept upright by means of transverse supporters projecting from it, the whole forming a conical pile that rises to a height of five or six feet above the boiler. The fire is kindled in the excavation below, and as the ebullition of the water proceeds, the steam diffuses itself through the mass of the cloths above, swelling by its high temperature the threads of the latter. The operation of steaming is commenced in the evening, and continued all night till the following morning. The cloths are then removed from the boiler, steeped in alkaline lye, and spread on the grass as on the preceding day, and again steamed at night. These alternate processes of bucking and crofting, as they are technically called, during the day, and of steaming at night, are repeated for ten or twelve days, until the cloths are perfectly bleached. After the last steaming, they are steeped in clear filtered water acidulated with lime-juice, in the proportion generally of one large lime to each piece of cloth. Lime-juice has long been used in bleaching in all parts of India; and Tavernier describes Broach as famous as a bleaching station on account of its extensive meadows, and the large quantity of lemons reared there. Mixed fabrics of cotton and Muga silk are steeped in water mixed with lime-juice and coarse sugar, which latter article is said to have the effect of brightening the natural colour of the silk.—*Royle, Arts, etc. of India*, p. 481; *Rohde, MSS.*

BLEEKER, DR. P., a Dutch naturalist, who from 1845 to 1860, in numerous contributions on the fishes of the Eastern Archipelago, added greatly to the stock of knowledge of the fauna of the region from Penang to Japan. He gave a catalogue of 780 species of fish found at Amboyna.

BLENDJU, in Java, a substance prepared as a paste, fried with oil, and eaten with coffee.

BLENNIIDÆ, the Blenny family of fishes, comprising many East Indian genera. Blennies, with protruding eyes, are to be seen hopping about the muddy banks of rivers, and perching on stray logs like frogs.—*Adams*, p. 67. See Fish.

BLERONG or Balerang. MALAY. Sulphur.

BLETIA HYACINTHIANA. *R. Br.* One of the Orchiaceæ, a plant of China and Japan, with bright purple flowers.—*Voigt*, 625.

BLIGHIA SAPIDA, *Kön.*, or Cupania sapida, *Camb.*, the Akee tree, one of the Sapindaceæ, has been introduced from Guinea into India. It rises 30 to 40 feet. The fruit has the size and shape of a pear, and is of a red colour. It is much esteemed in Guinea and the West Indies. The genus was named after Captain William Bligh, R.N., master of the 'Bounty,' whose crew mutinied, and he and the officers took to the boats.

BLIGHT. The grains or ears of nearly all the cereal grasses are subject to several well-marked diseases, resulting from attacks of parasatic fungi, animalculæ, and insects, causing great losses to the agriculturist. The liability of the seeds of grasses to parasitic infection is explained by the large amount of nitrogenized matter contained in them, and to their softness of texture. The diseases generally alter the perisperm, sometimes destroying it altogether; and three minute cryptogamic plants are the most frequent, viz.:

Caries. Uredo caries attacks wheat, usually spares the pericarp, but changes the perisperm into a black fetid powder. The component globules are devoid of pellicles. The disease is highly contagious.

Carbon or smut, Uredo segetum, occurs under the epidermis, is composed of spherical globules, attacks all the cereal grains indiscriminately, and resembles black dust.

Ergot or spur, Sclerotium clavus, is elongated

in form, black externally, white and horny within, exceedingly deleterious in its properties if long taken; in large doses, acts specifically on the womb. This fungus is particularly liable to attack the seeds of rye, and is then called spur or ergot, when the grains assume a black colour, and increase to several times their original size. See Bane; Crops; Dry Rot; Insects.

BLIMBI. MALAY. Averrhoa bilimbi. The fruit of the plant known as the tree cucumber; has various terminations, Blimbing basi, Blimbing bulu, Blimbing teres, perhaps varieties. Blimbing manis, Averrhoa carambola, *Linn.* Blimbing saga, Cicca disticha.

BLISTERING BEETLES of India, Pan-mau, CHIN., consist of several species of Mylabris. About 180 lbs. forwarded by Dr. Birdwood to test the market value in England, were sold there at 5s. 8d. per lb. Several kinds of beetles, when applied to the skin, cause great irritation, inflammation, and blistering. These consequences are occasioned by an acrid principle called Cantharidin contained in these insects. The ancients chiefly employed two species of Mylabris, one of which, the Mylabris cichorei (vern. Telini, HIND.), has been used for ages, and is so at present by the European and Native physicians of India and China. The Cantharis vesicatoria, or Spanish blistering fly, is the species officinal in the British Pharmacopœia. Its colour is bright shining green or bluish, length about $\frac{3}{4}$ths of an inch, breadth $\frac{1}{4}$th to $\frac{1}{3}$d of an inch. It occurs in the south of Europe generally, especially in Italy and Spain, and is found occasionally in England. The blistering flies of India are chiefly the Mylabris or Meloe cichorei, the Cantharis gigas, and the Cantharis violacea. The Mylabris cichorei is common in the neighbourhood of Dacca, in the Hyderabad country, in Kurnool, and numerous other localities. The insect is about an inch long and $\frac{1}{3}$d broad; the elytra or wing coverts are marked with six cross stripes of deep blue and russet brown. The Buprestis of ancient writers is met with in the bazars under the name of the golden fly (sona-mukhi). The Cantharis violacea is often mixed with specimens of Meloe in the bazars. The Telini fly, if procured before the mites have commenced its destruction, yields on an average one-third more of cantharidin than the Spanish fly of the European shops. The blue fly is of uncertain strength; the Buprestis, in all the specimens obtained, was quite inert. A species, called Meloe trianthema, from its being usually found on the Trianthema decandra (Biscopra, HIND.), was described by Dr. Fleming. A tincture, acetous plaster, and ointment of the Meloe chichorii are given in the Bengal Pharmacopœia. Some prejudice exists against the article, on account of its alleged excessive severity of action, owing to the presence of a greater quantity of cantharidin than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. At the Madras Exhibition of 1855, specimens of Mylabris pustulata and M. punctum were exhibited by M. Collas of Pondicherry. Both insects are found in large quantities at certain seasons all over Southern India.—*O'Sh.; Dr. Hunter in Tr. As. Soc.* v. p. 216; *Madras Exhibition.* See Cantharides; Insects.

BLOOD.

Dam, ...	ARAB.	Thyak, ...	LHOPA.

Vi, ...	LEPCHA.	Rattamu; Rattam,	TEL.

Blood for blood, the vendetta of the Italians, is the law of most rude populations, but most of the settled races occupying the south and east of Asia are dwelling under civil laws administered by officers of justice. The Vedas, which all Hindus acknowledge, enjoin the offering of bloody sacrifices to the gods, and amongst many Saiva sectarians this rite is continued. The non-Hindu aboriginal races also offer bloody sacrifices to demons, and to the Gramma devata, or village tutelary deities. The investing tika mark of chiefship, placed on the forehead of their Rajput ruler by the Bhil, is blood drawn from the arm of a Bhil. The Karen of Burma and the Kyan of Borneo, in swearing brotherhood, drink water in which the blood of the parties has been mixed. The old Mongolians mingled gold and blood in their cup of peace. The custom of the old Hungarians in their A'ldomas (alliance), was to open reciprocally a vein in each other's arms and drink the blood out of one cup. The Turks practised the same observance in their alliances with the Hungarian Christians, as is noticed by Petchevi's History.

Blood-coloured water is noticed in Exodus vii. 19; and Homer alludes to blood rain. In the Red Sea, periodically, a blood-red colour is observable in the water; and a similar occurrence was noticed at Picenium, B.C. 323; in Italy, A.D. 787; in the Valsinian lake, B.C. 208, mentioned by Livy; in a Venetian lake, B.C. 586; in Lake Wan, A.D. 1110. Pliny mentions a lake near Babylon which had a red colour during eleven days of summer, possibly from a red conferva.

Blood-money, Duja, ARAB., is payable in Lahej by a criminal to the relatives of the murdered person; for wilful murder, 100 female camels, or 1000 Venetian sequins; manslaughter, 700 dollars; death by misadventure, the culprit is not imprisoned, but is allowed to appeal to the pity of the charitable for the means of escaping from a cruel death, which the nearest relative inflicts; should the nearest of kin be a child, the punishment is postponed until he reach manhood.

Blood-showers is a term given to substances of a red colour which occasionally appear; also what have been called showers of pearls, of manna, of spiders, of toads, of fish. In India, in 1825, a shower of red fluid at Jeysulmir is mentioned in the Asiatic Journal. In 1828, very heavy rain fell at Augur in Kandesh, accompanied by hail, single pieces of which weighed as much as half a seer. This was followed by drops of red rain, descending from the sky. In 1855, a shower of red rain, or of flesh, as the natives called it, fell near Shikarpur in Sind. Another shower fell in the Jellasore district over an expanse of above fifty bighas. The carmine colour of snow has been ascertained to be due to a kind of algæ, called Protococcus nivalis or Protococcus hematacoccus. Until lately, much perplexity was occasioned by the same form of organism sometimes appearing red, sometimes green. It is still, indeed, matter of question whether the protococcus or the hematacoccus are most nearly allied to the vegetable

or to the animal kingdom. It is a simple cell, which lives for itself and by itself; and is dependent upon nothing but a due supply of matter and the appropriate stimuli for their continuance and growth, and for the due performance of all its functions, until its term of life is expired. Klaproth in 1815 ascertained that the red appearance in the sea was produced by an albuminous vegetable matter.—*Jam. Ed. Journ.* ii. 830–31; *Captain Prideaux, the Arab Tribes; Forbes; Vambery, Bokhara*, p. 151; *Moor; Buist, Cat.*

BLOODSTONE, Heliotrope.

Blutstein, . . . GER.	Sanguigna, ... IT.
Radawar, . GUJ., HIND.	Piedra sanguinaria, . SP.

This quartzose mineral is of a deep leek-green colour, and has red spots scattered through it, caused by iron. Masses of it are obtained in the trap formation of the Dekhan, but it is chiefly brought to Bombay from different parts of Gujerat, etc., and is re-exported largely to Europe. It is used for seals, rings, and brooches.—*Madras Museum.*

BLOOD-SUCKER, a name applied to the Calotes viridis, *Gray*, C. opiomachus, and C. versicolor, etc.; also to Sitana Ponticheriana, *Cuv.* They are all unsightly reptiles, with large heads and powerful jaws, so that even the bravest crow attacks them cautiously. There are 11 species of Calotes and two of Sitana in India. Mahomedans dislike the blood-sucker, as the creature often raises and lowers its head in the manner of these religionists when at prayer. See Calotes; Reptiles; Sitana.

BLOOD-WOOD of Port Jackson is a species of Eucalyptus, *sp.* The blood-wood tree of Norfolk Island, Baloghia lucida, *Endlicher*, grows to 40 feet in height. It yields a blood-red sap, which has been utilized as a paint. It is obtained by an incision 8 to 10 feet long, tapering to a point; a gill to a pint from each tree.—*Von Mueller; G. Bennett*, p. 346.

BLOW-PIPE is in constant use in India, in the arts, amongst goldsmiths, tinsmiths, banglemakers, and others; the cook-room of every house also has one of bamboo. The Malay races also use the blow-pipe, sumpitan, for projecting peas, small pellets, and wooden and iron arrows. The accuracy of fire with these is great; little birds can easily be destroyed, but even large birds like the crow can be brought down by the earthen pellet from a blow-pipe. It is used as a weapon by the Malays of Borneo, by the Lao-Ti on the Mekong river, by the Orang-kubit and the Semang on the Peninsula of Malacca. The paradise birds are killed and stunned by wooden arrows from the blow-pipe. The Indians on the Amazon use it, and, it is said, can throw the arrow to 250 feet.—*Peschel.*

Mortuth, Nila-tutiah, H.	Turishu; Turishi, TAM. TEL.

This salt is not known to occur in nature, but it is largely made in several parts of India, by boiling sheet copper or copper filings in sulphuric acid, and evaporating the remainder, on which crystals form. It is also obtained from copper ore by pulverising the ore, which is then thrown into earthen vessels filled with water, and, after filtration, the crystals form. The colour is a beautiful blue. It is largely used in surgery and in the arts.—*M'Culloch.*

It grows in the Konkans, Assam, Malay Peninsula, Moluccas, and Java. It is used as medicine and as a seasoning for food, and has a stimulo-diaphoretic action.—*Roxb.*

BLUMEA GRANDIS. *De Cand.*
Conyza grandis, *Wall.*
Pung-ma-theing, ... BURM.

Abundant throughout the Tenasserim Provinces, growing six or eight feet high, with leaves like mullen, which, when bruised, emit a strong odour of camphor. The Tavoyers informed Dr. Mason that they made an impure camphor from the weed by a very simple process; and Mr. O'Riley of Amherst made more than 100 pounds, which he sent to Calcutta, and it was reported 'in its refined form to be identical in all its properties with Chinese camphor.' The plant is so abundant, that these provinces might supply half the world with camphor. Wherever trees are cut down this weed springs up, and often to the exclusion of almost everything else, so that an old clearing looks like a field under cultivation. B. lacera, *D. C.*, of all the East Indies, is used in dyspepsia.—*Roxb.; Mason.* See Camphor.

BLUME, CAR. L., an eminent Dutch botanist. He was educated as a medical man. In Java, in 1823–24, he conducted a botanical exploration, and in 1825 he commenced the Bijdragen tot de Flora van Nederlandsch, Indie, and, on his return to Holland, the Flora Javæ was begun in 1828, and the Rumphia in 1835, each of which consists of several folio volumes, illustrated with a profusion of admirably-coloured plates. These are amongst the most splendid and learned botanical works of the age. The Museum Botanicum Lugduno-Batavum, a periodical with outline plates, commenced in 1852, contains careful descriptions of genera and species of Java, Borneo, Molucca, and Japan plants.—*H. et T.*

BLUNJI PAT. BENG. Corchorus olitorius.

BLYTH, EDWARD, for many years Curator of the Museum of the Bengal Asiatic Society, the

ablest zoologist who has ever resided in India; author of numerous learned articles on the mammals, birds, fishes, and reptiles of Eastern and Southern Asia, mostly in the Bl. As. Trans., vols. xiv., xv., i. 280:—Fauna Indiæ, Drafts for, ibid. 345; On three Indian Species of Bat, ibid. 1841, vol. x. 971; New Species of Pica from the Himalayas, ibid. 186; Description of Caprolagus, a new Genus of Leporine Mammalia, ibid. 247; Supplement to the Monograph of the Indian and Malayan Species of Cuculidæ, or Birds of the Cuckoo Family, ibid. vol. xi. 898, 1095, et seq.; 1843, vol. xii. 240; Notes on Various Indian and Malayan Birds, ibid. 1842, vol. xi. 160; On the Predatory and Sanguivorous Habits of the Bat of the Genus Megaderma, with some Remarks on the Blood-sucking Propensities of other Vespertilionidæ, ibid.; Monograph of a species of Lynx, ibid., but described as Tapozous longimanus by General Hardwicke, Descriptive Notices of, ibid. 784; On the Leitrichane Bird of the Sub-Himalayas, by H. B. Hodgson, with additions and annotations; A Synopsis of the Indian Pari and of the Indian Fringillidæ, ibid. 1844, vol. xiii. 923; Catalogue of Birds.

BO or Bodhi, also Bodhi-druma, a tree sacred to a Buddha or Tirthankara. See Bo Tree.

BOA or Boe, sometimes called Poam by the people of Malabar, has wood much like the timber called in Ceylon Palari or Palis and Irambu, or, as known by the English term, iron-wood. It is a strong, heavy wood, and is considered durable. It grows from 20 to 30 feet high, and from 12 to 30 inches in diameter.—*Edye, M. and C.*

BOA. *Linn.* A genus of innocuous serpents, of the family Pythonidæ, order Ophidia, sub-order Innocuus. The genus, as defined by Linnæus, belongs to the New World; but in India the term Boa and Boa-constrictor is applied to species of Python in the tropical parts of South-Eastern Asia, some of which are of considerable size, and able to kill large four-footed animals. A female python 20 feet long, captured in Ceylon when in a torpid state, was taken to the London Zoological Gardens, and before the end of six years it had grown to 29 feet in length, and was as thick round as a man's thigh. It was very vicious at all times, but at length destroyed itself by swallowing a blanket. The pythons on the western coast of India and in Ceylon are amongst the largest met with. The organisation of the boas and pythons is directed to the slaughter of their prey by compression, and to this end are given to them enormous dimensions and power of muscle. When a boa dashes at the prey, it generally preserves its hold of the tree by a coil or two towards the tail; it seizes with widespread jaws, and throws with rapidity the folds of its body round and round its victim. Tightening, and crushing rib and limb within their embrace, these folds relax not until life is pressed out. The serpent then pauses for a few moments. Soon, however, it begins to touch the carcase gently with its muzzle; the jaws again and again dilate, until the skin is strained so tight that every scale is isolated. Then grasp following upon grasp gradually and irresistibly engulfs the body, which, in its passage through the folds, has been compressed and attenuated into the most convenient possible form for this final operation. Death inflicted by such overwhelming action is almost instantaneous, in small animals especially.

BOAD or Bod, a tributary state in Orissa, with an area, including the Kandh-Mals, of 2064 square miles, and a population in 1872 of 108,868. The aboriginal tribes are the Pan, Kandh, Dimal, Goala, Sud, and Keut. Bod, the chief town, is in lat. 29° 50′ 20″ N., and long. 84° 21′ 41″ E. The reigning family are Kshatriya Hindus.

BOALEE. BENG. The jawbone of this fish is used in carding cotton for the Dacca muslins, as a substitute for the heckle and hand cards.—*Royle.*

BOAR.

Jangli Sur, Sur, .	HIND.	Verraco, ...	SP.
Verro, ...	IT.	Adavi Koku, . . .	TEL.

The boar is the male of the hog or swine. Of these, in Asia, are seven wild species, viz. Sus scrofa, *Linn.*, var. S. Indicus, Bengalensis, Andamensis, Malayensis, Zeylanensis, Babyrussa, and Papuensis. When the wild boar of India, the Sus Indicus, has the run of cultivated lands, it eats daintily; but when stinted for food it will revel on a dead camel, and when pressed by want it prowls around the villages in search of refuse. The wild boar of India is shot and hunted with dogs by natives, but British sportsmen there hunt it with the horse and spear; and of all the wild creatures in India, the boar exacts from its pursuers the greatest care.

The Sus Indica of Pallas, Sus scrofa of other naturalists, the common wild boar, is supposed to be the parent of one of the two groups into which domestic pigs are arranged. The Sus scrofa group or breed is known as the Chinese breed, and extends into Europe, North Africa, and Hindustan; but in the latter country the boar of the N.W. Provinces is not higher than 36 inches, though that of Bengal attains 44 inches. The parents of the other group are unknown.

Sus scrofa is not known in a wild state, but its domesticated forms come near to S. vittatus of Java. The Roman or Neapolitan pig, the domesticated breeds of China, Cochin-China, Siam, the Andalusians, Hungarian, the swine of S.E. Europe and Turkey, and the Swiss, are all of the Sus scrofa group, which, a Chinese author says, can be traced back for 4900 years. The Japan masked pig is the Sus pliciceps of Gray, and has a deeply plicated or furrowed skin.

Porcula sylvania, the pigmy hog of the sal forest of North India, is called by the natives Sano Banel, also Chota Sur.

With the great Chalukya dynasty of the Peninsula of India and Gujerat, their boar standard was one of their chief prerogatives, and they coined a gold piece with the emblem of a boar. One of the great protecting incarnations of the Hindu god Vishnu was in the figure of a Varaha or boar.

In the mythology of the ancients, the wild boar was sacred to Typhon. In India, the Rajputs, on the first day of spring, worship Vasanthi, or spring, Basanth, personified; prince and vassal then chase, slay, and eat the wild boar. Personal danger is disregarded on this occasion, as want of success is deemed an omen that Oomia, the great mother, may refuse petitions during the year.

The boar hunt in spring-time is a Scythic custom. Amongst the Scandinavian Asi, the grand festival to Friya was in spring; then boars were offered to her by the Scandinavians, and boars made of paste were eaten by the people. Bakings in the shape of a boar were widely spread, as shown by the baking of 'cochelins' for New Year's Day in France. The Egyptian custom of baking swine-shaped pieces of dough is mentioned by Herodotus.

The Rajput festival is called Ahairea, and has a religious origin. The boar is the enemy of Gouri of the Rajputs. It was so held of Isis by the Egyptians, of Ceres by the Greeks, and of Friya by the Northman, whose favourite food was the hog; and of such importance was it deemed by the Franks, that the second chapter of the Salic law is entirely penal with regard to the stealers of swine. The heroes of the Edda, even in Valhalla, feed on the fat of the wild boar Serimner, while 'the illustrious father of armies fattens his wolves Geri and Freki, and takes no other nourishment himself than the uninterrupted quaffing of wine;' quite the picture of Har, the Rajput god of war, and of his sons the Bhyru, Gora, and Kala, metaphorically called the 'sons of slaughter.' The cup of the Scandinavian god of war, like that of the Rajputs, is the human skull (cupra).—*Tod's Rajasthan*, i. p. 566; *Darwin*.

BOARD. Under the East India Company, the military and civil administration of British India was conducted by officials assembled in Boards. In the year 1784 the Government of India was placed under a Board of Control, composed of the king of Great Britain's ministers, who in that capacity bore the title of Commissioners for the Affairs of India. This system continued until the year 1858, when British India was taken under the direct control of the Crown. In that interval, however, the Home Government of India consisted of a board of 18 members, called the Directors of the East India Company and the President of the Board of Control. The Directors had mostly all the patronage as to appointments, except the higher offices and commands which were made in communication with the British Ministry, who likewise originated all questions of peace and war, possessed the power of reversing the Acts of the East India Company and of the Government of India, and also of sending out instructions on special matters to the Governor-General without consulting the Directors. The Presidencies were under a Council of four, and the subordinate administrations were under the Justice Court of Sadr and Faujdari Adawat, the Revenue, Military, Medical, and Marine Boards. Since India came under direct British control, the Court of Directors has been replaced by a Council, and the Military, Medical, and Marine Boards abolished.

BOARDA-GOOMOODOO. TEL. Benincasa cerifera.

* BOASOO. MALEAL. Mimusops kauki, *L.*

BOATS and SHIPS, the Filuka and Karib of the Arabs; the Markal, Kayik, Sandal, Nao, Jahaz, and Kishti of India.

The difference as to size between the boat and the ship, so marked in Europe, is less observable amongst the communities of Eastern and Southern Asia; and the Kishti of the people of India, the Prahu and the Kora-kora of the Malay, the various kinds of Manche of Pambam, Mangalore, and Panyani, and the Patamar, range from a few tons to a few hundred tons. In India the Nao and the Kishti, in Burma the Thu or The and Serpa, are boats that might be described separately. In Britain, even, a boat may be a large or small vessel, used for traffic and passage, rowing or sailing on seas or rivers, and receiving names according to the construction, form, or purpose to which it is applied, as the wherry, punt, gig, pinnace, yawl, skiff, lugger, ferry boat, steamboat, packet boat, jolly boat, long boat, lifeboat, and canal boat; and in size they may range up to 15 tons burden. The sea-going vessels are known as sloop, smack, cutter, clipper, schooner, brig, brigantine, barque, and ship, and range from 15 to 3000 tons.

The boats in use along the coasts of the Peninsula of India well illustrate the readiness with which seafaring people adapt their materials to the requirements of their respective localities, and the rapid sailing boats of Bombay and the vicinity of Cannanore, and the Catamaran and Masula boat of the Coromandel coast are illustrations of this adaptation.

Ganja is a boat used for travellers on the Nile.

Mtepe, of Zanzibar, called Muntafiyah by the Arabs, is a sailing ship with a beam one-third of its length. Its planks are pegged together, not nailed, and it carries from 12 to 20 tons.

Badan, a sailing ship of Sur, Sohan, and Muscat, has a standing plank covering; makes 11 knots an hour.

Kelek is a leathern raft in use on the Euphrates and Tigris, and was known to the ancients as the 'Navigia Coriacia.'

Kufa, the circular bowl-shaped basket-boat (from the Arabic word, which means basket), is also used as the common wherry boat. Its fabric is of close willow-work, well coated, and made waterproof with the bituminous product of the country. It holds about three or four persons, with room enough, though not in the most agreeable positions. It is moved across by paddles. Herodotus notices the different kinds of boats plying on the rivers of Babylon, mentioning them as composed of willows and the skins of animals; and adds, that on their arrival at the great city, the owners sold all the material of the boats excepting the skins, and those they packed on the backs of asses, and carried whence they came. A raft is made of full-grown sheep and goats' skins, which are taken off with as few incisions as possible, and then blown up like a bladder and dried. A square framework, formed of poplar beams, branches of trees and reeds, is constructed of the size of the intended raft; the inflated skins are tied to it by osier and other twigs, the whole being firmly bound together. The raft is then moved to the water and launched. Care is taken to place the skins with their mouths upward, that, in case any should burst or require refilling, they can be easily opened by the raftmen. Upon the framework of wood are piled bales of goods and property, belonging to merchants and travellers. When any person of rank or wealth descends the river in this fashion, small huts are constructed on the raft, by covering a common wooden takht or bedstead of the country with a hood, formed of reeds and lined with felt. In these huts the travellers live and sleep during the journey. The poorer passengers bury themselves,

to seek shade or warmth, amongst the bales of goods and other merchandise, and sit patiently, almost in one position, until they reach their destination. They carry with them a small earthen mangal or chafing dish, containing a charcoal fire, which serves to light their pipes and to cook their coffee and food. The only real danger to be apprehended on the river is from the Arabs, who, when the country is in a disturbed state, invariably attack and pillage the rafts. The raftmen guide their rude vessels by long oars (straight poles), at the end of which a few split canes are fastened by a piece of twine.

A curiously-formed vessel, of a crescent shape, carrying one mast and a large lateen sail, trades between Baghdad and Bussora; under a fair wind, it can reach the latter place in six or seven days.

The *Kashmir* boats are the *Bagla*, a large vessel; the *Parinda*, a light, fast-sailing boat; the *Bahta*, a large-sized barge for loading grain; the *Dunga*, for ordinary merchandise; the *Shikari*, and the small Banduqi Shikari.

On the *Indus*, five kinds of boats are used between Attock and the sea. On the Kābul river and on the Upper Indus it is still the custom to stuff skins with reeds or straw, as floats. General Ferrier descended the Kābul river from Jalalabad to Attock on a raft so constructed. The best known are the *Zoruk* of the Upper Indus, the *Dunda* or *Dundi*, which plies from Mithancote to the sea, and the *Dugga*, which, from its strong build, is specially suited to the navigation of the rapids between Attock and Kalabagh. The better kinds of wood used in their construction (sissu and large babul) are procured with difficulty; and various timbers are generally seen in one boat, such as sissu, babul, deodar, chir, bahn, and karil. Malabar teak is much prized in the Lower Indus, and fetches a large price. The ordinary ferry boats are constructed by the sides and bottom being prepared separately, and brought together to be secured by knees or crooked pieces nailed to the bottom and sides. The bottom is made of sissu, the knees of mulberry or olive, and the side planks of deodar. The wedges and trenails are usually made of tut and kahu. Ropes for rafts and boats are prepared either from hemp (Cannabis Indica), sirki (Saccharum spontaneum), Typha latifolia, dib, or other reeds, common on the river bank. Munj (Saccharum munja) is also largely employed by the native boatmen. The great boat-building localities of the Panjab are Pind Dadun Khan, Wazirabad, Jhelum, Attock, Nowshera, Hashtnagar, Mokhud, and Kalabagh.

The *Panjab* boats, ships, oars, etc., are made of Acacia speciosa, Capparis aphylla, Cedrus deodara, Dalbergia sissu, Fraxinus floribunda, Olea Europæa, Pinus longifolia, Populus Euphratica, and Salvadora oleoides.

The boat in common use for transport in Sind and the lower part of the river is the *Dunda* or *Dundi;* it is flat-bottomed, with a slight convex inclination, for the additional facility of getting off sandbanks. The Dundi consists of three distinct parts, the two sides and bottom, the latter being adjusted to the others by warping the end up to the slope required, and then strengthened with joints or ribs (as they are termed); the boat thus admits of being dismembered and transported, a fact corroborative of the accuracy of Alexander's historians.

On the *Sutlej*, in the Indus and lower stream, the *Zoruk* is frequently seen. It differs from the Dundi in having no elevation at the stern, is square built, fore and aft, is of 40 to 50 tons burden, and carries no sail. The Zoruk is the common cargo boat at the Upper, as the Dundi belongs to the Lower Indus; it sails pretty fast, and sinks with prodigious facility.

The *Dundi* is well adapted for the transport of goods, but from insufficient construction many are annually lost. From the scarcity of large trees and the high price of teak plank, the carpenters are obliged to use the small wood, and most of them are formed of innumerable pieces fastened by bamboo pegs, nails being employed only to secure the knees and ribs. It has one mast, is square-rigged, and can only sail before the wind. Those on the Khori and P'harran branches of the Indus are from 20 to 30 candies burden.

Kotal is broad-beamed, and used as a ferry boat.

The *Jumpti*, or state barges used by the late Amirs, were strong, teak-built, double-masted, decked vessels, propelled by enormous sweeps, and having pavilions at either extremity. The Zoruk, the Nawuk, and the Dunda are nearly all flat-bottomed, and, though clumsily formed, are strong and safe. The Nawuk and Dunda are found principally upon the Chenab and the Sutlej; they have pointed bows and sterns.

Mashak.—Natives cross the Panjab rivers upon inflated buffalo and sheep skins, the mouth of which is sewn up, and the legs made air-tight below the knee and hock joints, so that the figure of the animal is somewhat preserved, and they are thus easily carried. Burnes says he has seen upon the Indus 'a man with his wife and children in the middle of the stream, the father on a skin dragging his family, seated upon reeds, their clothes and chattels forming a bundle for the head.' Much art is required to manage these air-bags. Lieutenant Wood nearly lost his life in attempting to bestride a Mussak.

The *Tirho* of the Indus is a rude boat made of the leaves of the Typha elephantina, used during the inundations for crossing the river.

Canoe of the Malabar Coast.—From Cape Comorin to Calicut, on the western side of the Peninsula, the coast abounds with fish, which is generally taken with the hook and line by the natives of the fishing villages, in a small canoe, the best description of which is formed from the angely wood tree, Artocarpus hirsuta; but the inferior sort is of cherne maram. They are cut out from the solid tree, and are from eight to twenty feet in length, and from one and a half to two feet in breadth, the depth being about one, or one foot and a half. They are managed with much dexterity by the natives, with a scull-paddle. On the backwater of Cochin, and on the river's mouth, they are employed in great numbers in taking the seer fish, or country salmon, etc. The largest sort of boats are used for the conveyance of rice and merchandise on the numerous rivers which disembogue into the backwater, to the extent of 150 miles, parallel to the sea-coast. At times these boats are converted into the

Jangar, used on the rivers of the Malabar Coast, and made into a double platform canoe by placing a floor of boards across two boats, with a bamboo railing which extends from ten to twelve feet fore and aft, and sixteen feet long; and when

BOATS AND SHIPS OF MALABAR.

these boats are thus formed into rafts, cattle and burdensome articles are conveyed across the rivers, as also the native regiments, with all their followers, horses, bullocks, baggage, carts, etc.

Pamban Manche, the Snake Boat of Cochin, is a canoe of great length; they are used by opulent natives and Europeans as boats for the conveyance and despatch of persons on the numerous rivers and backwaters, particularly on that between Cochin, Allepey, and Quilon, which is about 80 miles southward, and on that which runs to Ralipact and Trichoir; the former place being about 20, the latter about 60 miles to the northward. These boats are from 30 to 60 feet in length, without any regard to breadth or depth, as they are worked from the solid tree. The broadest do not exceed 3 feet. Those of the raja and officers of state are very handsomely fitted up, and carved in a most fantastical manner; they are made very neat, and even splendid, with painting, gilding, etc. The largest boats are sculled by about twenty men, double-banked; and when pressed, their velocity is surprising, as much as a mile in five minutes. Mr. Edye had himself been sculled in one of them a distance of forty-eight miles in six hours. These boats are peculiarly adapted to the rivers; for it frequently occurs that in the dry season there are sand-banks, perfectly dry, nearly a hundred yards in breadth, over which they must be drawn by the strength of the few men who are in them, the smaller size having only six rowers and a cockswain. Those natives who can afford the expense, have the cabin neatly fitted up with venetian blinds on the sides, but generally the cuscus or grass-mat is substituted. This boat is formed from the angely-wood, which is very durable if kept oiled.

Cochin Bandar Manche, or Canoe of Burthen,—are canoes which are cut and formed from the largest and softest timber of the forest. They are from 20 to 50 feet in length, their breadth and depth being proportioned to the full size of the tree, so as to reduce its dimensions as little as possible. They will carry about 18 tons burden, and are made from 3 to 5 inches thick at the bottom; but at the top of the side, or gunwale, about 1½ to 2 inches, with a proportionate increase of thickness at the extreme ends to protect the end-grain of the wood, and withstand any shock that they may meet with. At the distance of about 5 feet on the inside there are ribs about 6 inches broad, projecting about 2 inches from the side of the boat, for the purpose of giving support and strength to the body of the canoe. These boats may be considered valuable for the service of the port at which they are used, and, notwithstanding their heavy appearance, they are very buoyant, and go very fast through the water. In one of about 35 feet long, with six men and a tindal (cockswain), Edye passed the Minden's (the admiral's ship) barge, which had twelve men on board, and in a distance of four miles to that ship's anchorage he gained on them by time about twenty minutes, although there was a strong sea-breeze and swell against him. At Cochin, these boats are used for the purpose of conveying various articles of burden and water to the ships in the roads.

Mangalore Manche of the Western Coast of the Peninsula is a flat-bottomed boat of burden, about 25 to 35 feet long, 6 to 7 feet broad, and 4 to 5 feet deep. It is formed to meet the river, which is very shallow and flat; and to land the cargoes of the Patamars, which are discharged and loaded at the mouth of the rivers. These boats are sewed together similar to the masúla boat and other native vessels; they are forced along by bamboo poles, as the water is not more than from 6 to 10 feet deep, except in the south-west monsoon, when the rapids swell, and the whole of the river is considered impassable; and at this period all the vessels are taken to the shore and laid up.

Calicut Manche is a boat very similar to that of Mangalore, with the exception only of a raking stem, for the purpose of taking the beach, as the port of Calicut is open to the coast and there is no river. These boats are propelled by the paddle and sail, and generally carry eight men; they are much employed in watering and completing the sea-stock of ships homeward-bound; also in loading ships with pepper, timber, etc., for Bombay; and in shipping the produce of the forests of Canara and Malabar, all of which is rafted off to vessels called Dow, Boatile, Patamar, etc.

Panyani Manche is a coasting boat, of about 50 feet long, 10 to 12 feet broad, and 5 to 7 feet deep. It is framed with timbers and planks, which are sewed together. The timbers are about 4 feet asunder, and on them, inside, some few planks are placed as bands and clamps, which are nailed to the frame. These are very rudely put together, and not of much importance either in form or construction. During the south-west monsoon, or from June to November, they are laid up at Baipur river for safety, and are only used in the fine-weather season. They carry the productions of the cocoanut tree, viz. coir, copra, cajan, the leaf of the Corypha umbraculifera, which is used for coverings of houses, also for books, and various other purposes; jagari, oil, and arrack, to Cochin and Mangalore; and bring from these ports rice, cloth, salt, etc. These vessels keep along shore, and take advantage of the sail in rowing. They have generally from eight to ten men, who are fishermen of the Mopila caste of Musalmans, descendants of the first Arabian settlers on the shores of the Peninsula, and who, marrying the daughters of the country, obtained the name of Mapillai.

The *Boatila Manche* of the island of Ceylon navigates the Gulf of Manar, and the southern part of the Peninsula of India. This boat, which is about 50 to 60 feet in length, 16 to 18 feet in breadth, and 8 to 10 feet in depth, has more of the European form than any of the Indian-built vessels that are met with. The after part shows the origin to be of Portuguese construction, as it is very similar to that of many of the boats still in use by the people of that country, which are said to be of the same shape as the vessels in which Vasco De Gama sailed to India. They have a deck fore and aft, and are built with all sorts of jungle wood in a very rough manner, and fastened with nails and bolts. They are equipped with one mast, which inclines forward, and a square lug-sail; also a small bowsprit, at about the angle of 45°, with a sort of jib foresail, one pair of shrouds, and a backstay, which completes the rigging. These vessels carry on the trade of the island across the gulf. The exports are rice, tobacco, etc.; and the imports, cloth.

The *Bombay Fishing Boat* is one of the swiftest

BOATS AND SHIPS OF MALABAR.

and most elegant sea-going vessels of that coast. A complete set of models of the native vessels plying on the coast, at an estimated price of Rs.15 each, or about Rs.1000 in all, was sent to the Exhibition of 1851. The mode of building is precisely the reverse of that pursued by Europeans, who begin with drawing the lines, then lay down the keel, ribs, and frame, and finally applying the planking. In India, drawn lines are dispensed with altogether. Having laid down the keel, the Indian shipbuilders fasten on the planking, leaving the ribs and frame to the last. The keel having been laid, and the stem and sternposts put in their places, they are fashioned in both sides with a groove. The lower edge of the plank next laid is made to conform in shape to this. The under groove is smeared over with red ochre and water, and the edge of the plank that follows is tried on from time to time till it takes a tinge everywhere, showing with what exactness it coincides. It is then steeped in water, and bent over a fire of wood into the proper shape, and applied to its place. When all is ready, the channel in the lower plank is filled up with cotton and tar. The two planks are now sewed together in the following manner, —a pair of holes are bored in the upper and a corresponding pair in the lower plank, all along at intervals of a foot or two, according to the nature of the lines; a strong coir string is laced through this in the form of the letter X, the knot being inside. A stout wedge of wood is next driven through the strings outside, so as to bring the planks perfectly in contact. The planks being put sufficiently in their places, when gunwale high is attained, the timbers are put in; when the planks have been nailed to them, the sewing holes are filled up either with nails when opposite a timber, or with wooden pins. The masts rake forward instead of back; the keel is hollow in the middle, and not so long as the sternpost; the fore-part of the boat sharp, with hollow lines, the stern plump and round. The Bombay fishing boats can beat the best of the English yachts. There are three great fishing villages in Bombay island, at Worlee, Sewree, and Mahim. A Patamar employs from 15 to 20 men, a fishing boat from 10 to 15, a canoe from 3 to 4. *Canoes* are chiefly employed in the coast fishing, and attending the men on the mud banks, and in landing cargo when there is no depth of water sufficient for larger vessels. They are hollowed out of a single log, and are very serviceable, handsome-looking, well-finished craft. They are impelled either by paddles or sails; when the latter are employed, an outrigger is resorted to; they will bear a surprising stretch of canvas, and make their way rapidly through the water.

The *Patamar* vessels sail remarkably well, and stow a good cargo. They belong principally to Bombay merchants, and partly carry on the coasting trade to that port. They are grab-built, that is, with a prow stem, which is the same length as the keel; and the dimensions of the large class are 76 feet 6 inches in length, 21 feet 6 inches in breadth, 11 feet 9 inches in depth, and about 200 tons burden. They are planked with teak, upon jungle wood frames, and are really very handsome vessels, being put together in the European manner, with nails, bolts, etc.; and their bottoms are sheathed with inch-board, and a layer of chunam mixed with cocoanut oil and a portion of damar (country rosin); this is a very durable substance, and a great preservative to the plank against worms. Some of the smaller of these vessels, of about sixty tons burden, are sewed together with coir, as other native boats are. The small class has one, and the large class two, masts, with the lateen sail; the foremast raking forward, for the purpose of keeping the ponderous yard clear when it is raised or lowered. The yard is slung at one-third of its length; the tack of the sail is brought to the stern-head, through a fixed block, and the sheet hauled aft at the side, as usual. The halyard is a pendent and treble block from the masthead aft to midships; thus acting as a backstay for the mast's security, together with about two pairs of shrouds. These vessels generally export salt from Bombay to the coast, and take back coir, rice, cocoanut, copra, oil, timber, sandal-wood, pepper, and various articles, the production of the coast. They are navigated with much skill by men of the Mopila caste, and other Musalmans, and have a crew of ten or twelve men and a tindal, who are good pilots and navigators off the coast from Bombay to Cape Comorin,—generally speaking, honest and trustworthy.

The Arab *Dow* is employed in the trade between the Red Sea, the Arabian coast, the Gulf of Persia, and the coasts of India, in Cutch, Gujerat, and Malabar. They were also used in the Persian Gulf for war and piracy. They are always manned by Arabs. The Arab Dow is 50 to 500 tons, but usually of about 150 to 250 tons burden by measurement; grab-built, with 10 or 12 ports; about 85 feet long from stem to stern; 20 feet 9 inches broad, and 11 feet 6 inches deep. Of late years this description of vessel has been built at Cochin, on the coast of Malabar, most perfectly in the European style. These vessels have a great rise of floor, are calculated for sailing with small cargoes, and are fully prepared, by internal equipment, for defence, with decks, hatchways, ports, poop-deck, etc., like a vessel of war; many of them are sheathed on two-and-a-half-inch plank bottoms with one-inch board, and the preparation of chunam and oil, as before described, which is called galgal, put between the planks and sheathing-board, causing the vessel to be very dry and durable, and preventing the worm from attacking the bottom. The worm is one of the greatest enemies in India to timber in the water, while the white ant is as much so out of it. On the outside of the sheathing-board there is a coat of whitewash, made from the same articles as that between the sheathing and planks, which coat is renewed every season they put to sea. These vessels have generally one mast and a lateen sail; the yard is the length of the vessel aloft, and the mast raking forward for the purpose of keeping this ponderous weight clear in raising and lowering. The tack of the sail is brought to the stern-head, and sheets aft in the usual way; the halyards lead to the taffrail, having a pendent and treble purchase-block, which becomes the backstay, to support the mast when the sail is set; this, with three pairs of shrouds, completes the rigging, which is very simple, the whole being of coir rope. (The Ki-Dow is a small Dow.) Several of these vessels were fitted as brigs after their arrival in Arabia, and armed by the Arabs for cruising in the Red Sea and Arabian Gulf, as piratical vessels; they

were also the class of vessels of which Tipu Sultan's fleet at Onore (Hunawar) consisted. When armed, they were too powerful for the Bombay marine brigs, but this never happened but when in great numbers and the brigs weak and unsupported. Sir John Malcolm says the large Dow ships make generally one voyage in the season to the southward of Arabia, taking advantage of the north-east monsoon to come down, and the south-west to return with an exchange cargo. They generally bring dates, fruit, preserves, Shiraz wine, and horses, and take back rice, coir, canvas, cocoanuts, oil, timber, damar, etc., various articles of cloth of the country manufacture; and from Bombay, European articles of every description. The trade in those vessels, extending from Allipey, the southernmost port on the coast of Malabar, up to Bombay,—all the trade to Bengal,—is carried on by ships which are called 'country traders,' from the Gulf of Persia and Arabia.

The *Bagla* or *Budgerow* takes its name from an Arabic word, the feminine of baghl, a mule. The Bagla is engaged in the trade of Cutch, Gujerat, and the Malabar coast, to the Gulf of Persia, the coast of Arabia, and the Red Sea. They are Indian vessels, and manned with Indian seamen called lascars. It is one of the most ancient vessels to be met with in the Indian seas. Their extreme length from stern to taffrail is about 74 feet, the breadth about 25 feet, and the depth in hold 11 feet 6 inches, with about 150 tons burden. The peculiarity of form and extraordinary equipment of these vessels is said to have been the same from the period of Alexander the Great. They are armed with two guns on the afterpart or right-aft of the stern, for defence against pirates, and have their poop-decks with a round stern, their extreme sections about the centre or middle of the vessel; they are very broad in proportion to their length, with a sharp rising floor; the stern is straight, and rakes very little more than the stern-post. These vessels are constructed with timbers and planks, which are nail and trenail fastened in the most rude and unsafe manner possible. The topside above the deck is barricaded with mats on the outside of the timbers, which run up to about eight feet from the deck; and when they have no cargo on board this barricade is removed. They have only one mast, with a huge yard made from two spars, the small ends lashed together, and a lateen sail, the tack of which goes to the stern-head; they generally trade like the Dow, and are navigated by Arabs and the people of Cutch. This singular and rude vessel, as well as the Arab Dow, is peculiarly adapted to the coasts of Arabia and the Red Sea, which are subject to periodical winds, during which these vessels are navigated with much ease.

The *Sambuk* is a small coasting vessel from 15 to 50 tons burden, trading in the Red Sea.

The *Doni* of the Coromandel coast is a huge vessel of the ark-like form, about 70 feet long, 20 feet broad, and 12 feet deep, with a flat bottom or keel part, which at the broadest place is 7 feet, and at the fore and after parts of the vessel it breaks into 10 inches, which is the siding of the stem and stern post. The fore and after bodies are similar in form from midships. Their light draught of water is about 4 feet, and when loaded about 9 feet. These rude, unshapely vessels trade from Madras and the east coast to the island of Ceylon and Gulf of Manar. They have only one mast, with a long sail, and are navigated from land to land and coastwise in the fine season only. The rate of current in the Bay of Bengal is very great at the change of the season or monsoon, as much as sixty miles in twenty-four hours. When they are off a port in a calm, their sailors throw a handful of sand or shells and feathers in the calm sea, and by the drifting of the feathers on the surface, and sinking of the sand or shells, a calculation of the rate of current is formed, and they anchor off the coast accordingly. The anchor is made by lashing together three crooked branches of a tree, which are then loaded with heavy stones, and their cable is formed from coir yarns. In fact, the whole equipment of these rude vessels, as well as their construction, is most coarse and unseaworthy, and far behind those of any other part of India.

Mr. Edye remarks that among all the numerous vessels of every class and description which traverse the ocean, there is a peculiarity of form and construction intended to meet the various localities of the ports or seas in which they are navigated; and perhaps in no part of the globe is this principle more fully displayed than in the Indian seas, and on the coasts of the southern Peninsula of India, including the island of Ceylon, where the nature and change of the season, the monsoons, and the navigation of the seas and rivers, are singularly well provided for by the truly ingenious and efficient means adopted by the natives in the formation of their rude but most useful vessels.

Catamarans of Ceylon, and of the Eastern and Western Coasts of the Peninsula, are formed of three logs of timber, and are used by the natives for similar purposes; the timber preferred for their construction is of the dup wood, or cherne maram (piney tree). Their length is from twenty to twenty-five feet, and breadth two and a half to three and a half feet, secured together by means of three spreaders and cross-lashings, through small holes; the centre log being much the largest, with a curved surface at the fore-end, which trends and finishes upwards to a point. The side logs are similar in form, but smaller, having their sides straight, and fitted to the centre log. The Catamaran is generally navigated by two men, sometimes by one only, but with great skill and dexterity; they think nothing of passing through the surf on the beach at Madras, and at other parts of the coast, where the boats of the country could not live in the breakers; and they are propelled through the water to ships on the coast, when boats of the best construction and form would swamp. In Ceylon, in the monsoons, when a sail can be got on them, a small outrigger is placed at the end of two poles as a balance, with a bamboo mat and yard, and a mat or cotton cloth sail, all three parts of which are connected; and when the tack and sheet of the sail are let go, it all falls fore and aft alongside, and, being light, it is easily managed. In carrying a press of sail, they are trimmed by the balance lever by going out on the poles, so as to keep the log on the surface of the water, and not impede its velocity, which in a strong wind is very great. They are frequently met in with ten or fifteen miles off the southern part of the island of Ceylon, and will convey any letter or despatch to the shore with

safety; but as to its dryness, the man who takes it has nothing but a pocket made from the leaf of the areca tree (A. catechu, *Linn.*), which is tied round his waist, and is the only article about him. These are the persons who are employed in the pearl fishery.

Canoes are largely used in India as ferry boats, and have shapes and forms to suit the rivers and waters. Small canoes are formed of hollow palmyra tree, two of which lashed to a couple of spars form the usual mode of crossing lakes and rivers in the Circars; the root forms the head of the canoe, the smaller end is either elevated out of the water by the form, or some six inches of the pith is left at that end. As this decays, a lump of clay supplies its place. Formerly, seagoing vessels were planked with this wood, but the iron fastenings are soon destroyed. Boats planked with it were till lately common on the Godavery, being built probably where sawyers were not procurable. Canoes of Calicut are hewn out of the trunk of the jack-fruit tree, Artocarpus integrifolia. Canoes of Point de Galle and the Malabar coast have weather-boards on an outrigger in the form of a smaller canoe; they are sharp at both ends, and beat to windward without tacking. The Jangar of the Malabar coast, for rivers, is a kind of canoe.

The *Point de Galle Canoe*, or *Market Boat*, is formed from a single stem of dup wood, or piney varnish-tree. They are from eighteen to thirty feet in length, from eighteen inches to two and a half feet in breadth, and from two or three feet deep, exclusive of the wash-board, which is about ten inches broad, and sewed to the gunwale by coir yarns, with loose coir padding on the joints, in the same manner as the other boats used in India are sewed together, which will be more fully described below. These boats are fitted with a balance log at the end of the bamboo outrigger, having the mast, yard, and sail secured together, and, when sailing, are managed in a similar way to the Catamarans. Vessels passing the southern part of the island of Ceylon are generally boarded by these boats, even at the distance of twenty to twenty-five miles from shore. They will sail at the rate of ten miles an hour in strong winds, which are generally prevalent there, and with a crew of five men. As the outrigger must always be kept to windward, and shifting it from side to side would be impossible, the canoe is so constructed as to proceed with either end foremost. This form of canoe is common wherever the Malays have extended themselves, throughout Polynesia and the coral islands of the Pacific, and to Madagascar and the Comoros, where a Malay colony settled. The great canoes of Ceylon called Ballam or Vallam are usually made of the Artocarpus hirsuta, the angely or angelica tree.

Madras Masula Manche is used all along the eastern coast of the Peninsula. It is formed with a flat bottom, for the purpose of taking the beach in the surf, when European boats cannot approach it. These boats are beached in the third surf, and taken most completely out of the water, on the immediate receding of the swell, by natives. They are 30 to 35 feet long, 10 to 11 feet broad, and 7 to 8 feet in depth. Their planks are sewed together with coir yarns, crossing the seams over a wadding of coir, which presses on the joints, and prevents leakage. By this peculiar means of security, the boat remains pliable, and yields to the shock which it receives on taking the ground; whilst boats with framed timbers and planks, nail or trenail fastened, would be broken to pieces from the heavy surf, that at times runs as high as from six to ten feet. The Catamaran can be kept in attendance as a life-preserver in the event of any accident to the Masula boat by upsetting, or in case of any of the Europeans being washed out by the surf. The crews of the Masula boats are brave, self-reliant men. The Masula boats receive their cargoes and passengers from the ships outside the surf, and land them in perfect safety. They are rowed by twelve men, in double banks, with paddles, that is, a board about ten inches broad and fourteen inches long, fixed at the end of a pole. They are steered by a tindal (cockswain), and one or two men constantly bale out the water. The steersman gives time by a song, which is sung by all the boatmen, and, according as its modulations are slow or quick, the oars are plied. These modulations are regulated by the waves, as they may be slow or rapid in succession.

The *Ganges* boats are the Budgerow, Boleah, Panswah, Palwar, Puteli, Bhur, Oolak, and Dengi. The bulky Oolāk, or baggage boat of Bengal, is sometimes as large as the Puteli, and used for the same purposes. The Palwar and Bhur are seagoing ships.

The *Puteli* is a large boat used for goods traffic.

The *Palwar*, also a cargo boat, from 15 to 20 tons burden, was originally built at Dacca.

All the common arts and manufactures of Bengal are carried on at Dacca, but in none of them do the Dacca workmen show more superior skill than in that of boat-building. For their work in this art they have been celebrated since the reign of Jahangir, when the Nowarrah was established here for the protection of the lower districts of Bengal against the incursions of the Mughs of Arakan.

The *Tista* river in the Terai at Leelpigoree is navigated by canoes, 30 to 40 feet long, some being rudely cut out of a solid log of sal, while others are built, the planks, of which there are but few, being sewed together, or clamped with iron, and the seams caulked with the fibres of the root of the dhak (Butea frondosa), and afterwards smeared with the gluten of Diospyros embryopteris. The bed of the river is here three-quarters of a mile across, of which the stream does not occupy one-third; its banks are sand-cliffs, fourteen feet in height.

On the *Irawadi* rivers, two kinds of vessels, of entirely different structure, are used, the larger of which may reach to 120 or 130 tons burden.

The larger boats are termed *Hnau*, and are of the form of construction more commonly met with. The keel-piece is a single tree hollowed out, and stretched by the aid of fire when green,—a complete canoe, in fact. From this, ribs and planking are carried up. The bow is long, with beautiful hollow lines, strongly resembling those of the modern steamers. The stern rises high above the water, and below the run is drawn out fine to an edge. A high bench or platform for the steersman, elaborately carved, is an indispensable appendage. The rudder is a large paddle lashed to the larboard quarter, and having a short pillar passing athwart the steersman's bench. The most peculiar part of the arrangement of these vessels is in the spars and rigging. The mast consists of two spars; it

BOATS AND SHIPS OF BURMA.

is in fact a pair of shears, bolted and lashed to two posts rising out of the keel-piece, so that it can be let down, or unshipped altogether, without any difficulty. Nearly the same kind of mast is used by the Illanun pirates of the Eastern Archipelago. When chased, they are thus enabled to run into a creek and drop the mast instantaneously, so that it gives no guidance to their whereabouts. Above the mainyard the two pieces run into one, forming the topmast; wooden rounds run as ratlines from one spar of the mast to the other, forming a ladder for going aloft. The yard is a bamboo or a line of spliced bamboos of enormous length, and, being perfectly flexible, is suspended from the masthead by numerous guys or halyards, so as to curve upwards in an inverted bow. A rope runs along this, from which the huge mainsail is suspended, running on rings, like a curtain, both ways from the mast. There is a small topsail of similar arrangement. The sailcloth used is the common light cotton stuff for clothing. If of any heavier material, it would be impossible to carry the enormous spread of sail which distinguishes these boats. The mainyard of one vessel was found to be 130 feet long, and the area of its mainsail would not be very much less than 4000 square feet, or one-eleventh of an acre. From their rig, these boats can, of course, scarcely sail but before the wind. But in ascending the Irawadi, as on the Ganges during the rainy season, the wind is almost always favourable. A fleet of them speeding before the wind with the sunlight on their bellying sails, has a splendid though fantastic appearance. With their vast spreading wings and almost invisible hulls, they look like a flight of colossal butterflies skimming the water.

Pein-go or *Pein-go-ma* is another description of Burmese boat, and it is said to be the peculiar craft of the Ning-the or Kyendwen river. Though it traffics to all parts of the Irawadi, it is extensively used at Ye-nan-gyoung for the transport of petroleum. It is flat-bottomed or nearly so, having no canoe or keel-piece like the Hnau, but being entirely composed of planks, which extend throughout the length of the vessel, wide in the middle and tapering to stem and stern like the staves of a cask. A wide gallery or sponson of bamboo, doubling the apparent beam of the boat, runs the whole circuit of the gunwale. These boats are generally propelled by oars or a pole, though occasionally carrying sails, but not of the same spread of cloth as the Hnau. The prow of a Burmese boat appears to be regarded by the Burmese boatmen with almost as much superstitious veneration as the quarter-deck of a frigate is by an English post-captain.

The buoyancy of the Pein-go boat is increased by one or two large hollow bamboos being lashed with rattans along the water-line. When laden with cargo made up into bales, a ledge, about 3 or 4 feet broad, made of bamboos, with a rail, is thrown out the whole length of the sides, for increase of stowage. The cargo is protected by a thatch roof. The steersman sits at the stem on a high chair, elaborately carved, and having a little thatch roof. When not favoured by a breeze the boat is propelled by 6 or 8 rowers.

Loung-zayet, is a round-bottomed boat, with stem and stern high but rounded in or curved in; in other respects like the Pein-go-ma.

Loung-go.—Bottom made up by scooping out a very large log. The depth of the boat is increased from two to three feet, by having nailed on planks running from stem to stern. Six to eight feet of the stern end is covered in by a hood of bamboo matting, made water-proof with earth oil or earth air and dammer; here the crew and family live. The large boats of this description have a mast and sail; the smaller ones, when favoured with a breeze, put up two bamboos ten or fourteen feet in length, joined at the top and spread out at the bottom, and for a sail both men and women's clothes are spread out. The crew are three or four and a steersman, generally the owner.

Ka-do-lay, a ferry boat, bottom made from a single log, sides planked, the whole length from 1 to 2 feet in breadth; about 5 or 6 feet of the stern end is covered with a rounded hood of thatch and bamboo. The steersman sits at the extreme stern end and steers with a paddle, while the boat is propelled by two rowers.

Sa-dho, a canoe made up from one log, varying in length from 6 to 15 feet and 2 to 2½ feet in breadth.

Canoes of two different forms are in use on the Irawadi, some of which are ridiculously small in proportion to the number of persons they carry.

Loung, a racing boat, bottom made up of one large long log, from 30 to 40 feet or more in length, with a side planking like the Ka-do-lay, paddled by 25 or 40 men according to size.

Gandoo.—This is the largest kind of native trading boat; it is built on a canoe of a single tree of the largest size, chiefly of peengado, but teak and thengan canoes are also used for this purpose. These canoes are from 25 to 30 cubits long and 3 to 4 cubits wide; ribs are fastened inside the canoe, and planks are then built on them up to the size required; the largest are 35 to 40 cubits long and 8 cubits deep, with a breadth of 15 cubits. Burden from 40,000 to 60,000 viss, and have a crew of from 40 to 50 men. They are built principally in the Henzadah district; they have two masts, and are rigged with square sails on the foremast, generally two of very large size. They trade to Arakan and Dacca chiefly, the cargo consisting principally of cutch and cotton, which they exchange for betel-nut and tobacco, and generally realize large profits.

Katoo.—This form of trading boat is an improvement on the foregoing. It is built with a thick plank from a keel, in the same way as ordinary vessels, and usually with the fore part in imitation of the Chinese junk. The largest kind carry about 20,000 viss, and the rig is similar to the junk, two or three fore-and-aft sail, which enable them to beat when the wind is adverse.

Sampan, a Chinese ferry boat shaped much like a spoon with just the handle cut out, leaving its shoulders projecting. The boat is flat-bottomed, built of teak planks nailed to ribs set about 18 inches apart; over the ribs are planks loosely fitted on and forming a deck. The boat is propelled by a single Chinaman, who stands in the bowl of the spoon with his face to the head of the boat. Sometimes a large square sail is used, when a large square rudder is shipped to guide the boat. A very unsafe boat under sail. It is painted like the junk in the forepart and stern. About two feet of the head of the boat is planked up, and serves as a box. Cost of Sampan, Rs. 50 to Rs. 60.

The *Sampan* boat at Singapore is remarkable

Sampan means three boards, and is the ordinary name for small boats or punts propelled by short oars or paddles. They are very narrow, without keels, and draw very little water.

The *Chu-Teng*, or hot congee boat, has a small galley for the purpose of enabling its owner to heat rice water, calling out, Mi chuk! Congee for sale.

Other boats of China are the—

Chay-Teng, or sugar-cane boats.
Choy-Teng, or vegetable boats.
Chu-Yuk-Teng, or pork boats.
Fa-Teng, or flower boats.
Kow-Teng, or cake boats.
Kong-Nga-Teng, or chinaware boats.
Mi-Teng, or rice boats.
Ngou-Yuk-Teng, or meat boats.
Na-Choy-Teng, or green-pea boats.
San-Kwo-Teng, or fruit boats.
Tchi-Teng, or firewood boats.
Tai-Tow-Teng, or barbers' boats, which are the smallest of the lot.
Yu-Teng, or fish boats.
You-Teng, or oil boats.—*Layard, Nineveh*, ii. 97; *Drew, The Northern Barriers; Ferrier's Journ.* 429; *Yule, Embassy; Marryat, Ind. BO-AY-GY-IN. BURM. Bauhinia Malabarica.

BOBAN ESWARA. See Karli.

BOBBARLU. TEL. Dolichos Sinensis, *L.*

BOBBERY. ANGLO-HIND. for Bap-re. Oh! thou Father! a very disrespectful address; to create a bobbery is to cause a disturbance.

BOBBILI, a zamindari estate in the Vizagapatam district of the Madras Presidency. It has been in the possession of a Hindu family since A.D. 1652. Its fort was the scene of a tragic occurrence in 1757, when it was besieged by M. Bussy, on the instigation of the raja of Vizagapatam. M. Bussy offered terms, which being refused, M. Bussy then in one day thrice stormed the fort; and on at last gaining admittance, he found that the garrison had destroyed their women and children, and only dead and desperately wounded men remained, with the infant son of the raja, Ranga Rao, and an old man. Four others of the defenders had not perished, and two nights later they crept into the tent of the raja of Vizianagram, and killed him with thirty-two wounds. Other troubles followed; but in 1794, the son, Ranga Rao, was restored to his father's zamindari. Bobbili town is in lat. 18° 34′ N., and long. 83° 25′ E. The estate has 154,443 inhabitants.—*Orme*, ii. p. 258; *Imp. Gaz.*

BOD, in lat. 29° 50′ 20″ N., and long. 24° 21′ 41″ E., is the chief town of the tributary estate of Bod in Orissa, which has a population of 108,868 souls,—Hindus, with 23 per cent. of the population aboriginal tribes, mostly Kandh, with Pan, Damal, Goala, Sud, and Keut. The Mahanadi bounds it on the north. The ruling family are Kshatriya The tribute is Rs. 800 annually.—*Imp. Gaz.*

BODANTA. TEL. Bauhinia purpurea, *L.*

BODARA. HIND. Marlea begonifolia.

BODASARAM BODATARAPU. TEL. Sphœranthus hirtus.

BODDA. TEL. Ficus glomerata, *R.*; F. racemosa, *Willd.* Bodda, Atti and Medi are applied indiscriminately to various kinds of Ficus, but most frequently to F. glomerata. Bodda-nar, fibre of F. racemosa.

BODDAMA KAIA. TEL. Bryonia callosa. Its bitter seeds are given in worm cases, and yield also a fixed oil, used in lamps.—*O'Sh.*

BODDA MAMIDI. TEL. Cupania canescens.

BODDI CHETTU. TEL. Macaranga Roxburghii, *R.*

BODDU KURA. TEL. Rivea hypocrateriformis, *Ch.* The leaves are used as a vegetable in the south, as are those of R. Bona-nox in Bengal. The buds of Calonyction and some sp. of Ipomœa, especially I. reptans, are also eaten as vegetables (kura).—*Voigt; Elliot.*

Boddu Pavili Kura or Ganga Pavili Kura, Portulaca oleracea, *L.*

Boddu Malle, Jasminum sambac.

Boddu Tunga, Hymenochæte grossa, *Nees.*

BODHI. BURM. The pipal tree, Ficus religiosa, under which Gautama attained Buddhahood. See Bo Tree; Buddha.

BODHI-SATWA, a Buddhist saint, who in the next birth becomes a Buddha; a candidate for the superior Buddhaship in Buddhism; an actual experimental religionist. A mortal who has arrived at supreme wisdom (Bodhi), and yet consents to remain as a creature (satwa) for the good of mankind. The Bodhi-satwa, Avalokit Eswara, was the Chinese Kwan Yin.—*Hardy's Eastern Monachism*, p. 434; *Growse*, p. 96.

BODICE, or Choli, is worn everywhere in the south of India. It is cut in square pieces, which meet in front, and are tied by the ends in a strong knot under the breasts; and the sleeve, which in some instances reaches below the elbow, and in others above it, is put into the opening left unsewn in the upper part of the square body piece. The construction of this article of dress is very simple, and most women make their own. In the south of India, bodices are not worn by the women of some races. It is only, they say, courtesans who are ashamed of them who hide their bosoms. A form of bodice, named angia, is entirely closed in front, and is shaped out to fit the bosom. This garment is worn alike by Mahomedan and by many Hindu women. The dress of Mahomedan women further consists of petticoats, generally very wide indeed, and falling in heavy folds. Some wear an under-petticoat of fine calico as a protection to the costly stuff of which the outer garment is composed, or to escape friction. The stuff—satin, silk, or cotton cloth—is gathered into a strong band of tape, which is tied over one hip, and the plaits or gathers are carefully made, so as to allow the cloth to fall in graceful folds. Over the choli or angia bodice is a light muslin shirt, which continues below the waist, called a koortni; and over all a scarf of white or coloured muslin of fine texture, do-patta, passed once round the waist, and thence across the bosom and over the left shoulder and head, like the sari, completes the costume. Where the langa or petticoat is not

worn, paijama or trousers take their place. These are sometimes worn loose, as in Oudh and Bengal, and elsewhere as tight as they can be made. The cutting out of these tight trousers is no easy matter, for they have several gores on the inside of the thigh, and are contrived so that they are flexible, however tight, and do not hinder the wearer from sitting cross-legged. With the trousers, which are tied at the waist, are worn the angia or choli bodice, the koortni or shirt, and the do-patta or scarf. In full dress, a Mahomedan lady wears the peshwaz or Persian robe, in which dancing-women usually perform. It has long tight sleeves, a tight body crossed in front, and a very voluminous muslin skirt, the most fashionable amplitude being about forty or even sixty yards in circumference. This garment is often trimmed in a costly manner with gold or silver lace, and is only worn as a bridal dress or at domestic festivals. Any additions to the above consist only in variations of the component parts; cloth for bodices is made like saris, with coloured borders. In the cutting out of the bodice, it is contrived that each sleeve ends with the border, and that it runs round the bottom of the garment, if not entirely, at least to some extent. Bodices are also made of English white muslin, jaconet, or fine calico, and of chintz, provided the colour is fast. Many are of silk and cotton mixed, others of silk or cotton only.

The silk sari, and also the pitambar, or men's silk waist-cloths, are worn by Hindus at entertainments and festivals, as also in religious worship. Saris are nearly universal for Hindu wear; and soussi, made into petticoats and trousers, is as universal for Mahomedan women and men also, and it has this advantage over saris, that the colours and patterns differ very little anywhere within the confines of India; whereas the saris, dhotis, and loongis must be made to suit particular localities, and the patterns of one locality would inevitably be rejected in another. A kind of soussi is produced in France, blue striped, closer in texture than the Indian, perhaps, but belonging to the same class or category; and another, called grivas, in particular, near Vichy, both excellent and fast-coloured fabrics, and both used for trousers and blouses. The Indian soussi are always striped or checked, woven in narrow patterns, with coloured yarns, blue and white, black and blue, red and blue, yellow, white, and blue, green and chocolate, as detailed in Dr. Watson's list; and they are worn, fine and coarse, literally by millions of the people of the middle and lower classes. In Sind, under the shift, but of cloth called kanjari, the choli or gaj conceals the bosom. When it passes round the side like a bodice and is fastened behind, its name is puth. This article of dress is very often omitted in Sind, a fact which may in some measure account for the pendent shape which the bosom assumes even in young women after a first or second child.—*Watson; Burton's Scinde*, p. 301.

BODOANDA, a Jakun tribe inhabiting Quedah.

BODO JAMO. URIA. Eugenia jambolana.

BODOKA. URIA.? In Ganjam and Gumsur, a common timber tree, extreme height 35 feet. It has a light, white wood, used for scabbards, bazar measures, boxes, bullock yokes, the poles of palanquins, tonjons, and toys.—*Captain Macdonald.*

BODON. HIND.? A tree of Chutia Nagpur, with a hard, reddish-grey timber.—*Cat. Ex.*

BOD-PA, a name of Tibet.

BOECHEE. HIND.? A red-coloured wood, very hard and close-grained. The tree grows in the Santal jungles, but scarce. Seemingly fit for any building purposes. *Engineers' Journal*, 1860.

BOEHMERIA, a genus of plants belonging to the nat. ord. Urticaceæ. The species in the East Indies are—macrostachya; macrophylla, *D. Don;* platyphylla, *D. Don;* frutescens, *Thunb.;* frondosa, *D. Don;* ternifolia, *D. Don;* salicifolia, *D. Don;* interrupta, *Willd.;* goglado. Many of these are stinging nettles; B. nivea, the Urtica tenacissima of Roxb., yields the Rhea fibre of Assam. B. salicifolia has an edible berry.—*Roxb.* iii. 590; *Royle*, 372.

BOEHMERIA FRUTESCENS. *Thunb.*

Pooah of the PARBUTTIAH. | Yenki, ... LIMBOO.
Kienki, . . . LEPCHA. | Poee of GARHWAL, KUMAON.

This plant grows wild, to a height of 6 or 8 feet, in the mountain valleys of Eastern Nepal and Sikkim, and in the hills near the Terai, to elevations of 1000 to 3000 feet. Its fibre is used for twine, rope, fishing-nets, and game-bags, and could be woven into sailcloth. When to be used as a fibrous material, it is cut down when the seed is formed, as with the common flax in Europe. At this time the bark is most easily removed, and the produce is best. After the seed is ripe it is at least deteriorated. As soon as the plant is cut, the bark or skin is removed, and is then dried in the sun for a few days; when quite dry, it is boiled with wood ashes for four or five hours; when cold, it is beaten with a mallet on a flat stone until it becomes rather pulpy, and all the woody portion of the bark has disappeared; then it is well washed in pure spring water, and spread out to dry. After exposure for a day or two to a bright sun, it is ready for use. When the finest description of fibre is wanted, the stuff, after being boiled and beaten, is daubed over with wet clay, and spread out to dry. When thoroughly dry, the clay is rubbed and beaten out; the fibre is then ready for spinning into thread, which is done with the common distaff. The Pooah is principally used for fishing-nets, for which it is admirably adapted on account of its great strength of fibre, and its extraordinary power of long resisting the effects of water. It is also used for making game-bags, twine, and ropes. It is considered well adapted for making cloth, but is not much used in this way. Pooah fibre, when properly dressed, is quite equal to the best Europe flax, and will produce better sailcloth than any other substance seen in India. If potash were used in the preparation (which is invariably done with Russian hemp and flax) instead of clay or mud, the colour would be improved, the substance rendered easy to dress, and not liable to so much waste in manufacturing. Captain Thompson thought that it would be worth twelve rupees a maund in Calcutta.—*Royle*, p. 368.

BOEHMERIA INTERRUPTA. *Willd.*

Urtica interrupta, *Linn.*

Lal bichhutee, . . BENG. | Kyet-bet-ya, . . BURM.

Grows in the Bombay and Bengal Presidencies, and in Burma. Its hairs sting like those of the nettle.—*Voigt*, 281.

BOEHMERIA NIVEA. *Hooker and Arn.*

Urtica nivea, *Linn.* | Urtica tenacissima, *Roxb.*
,, candicans, *Burm.* | Boehmeria candicans.
China grass, . . . ENG. | Rhea, Dom Rhea, HIND.

This plant is cultivated in the eastern parts of India and in China for its fibres, which are second to none for strength and beauty, and are used for textile fabrics. It grows rapidly and luxuriantly, and can be cut three or four times in the course of the year; the young shoots are those which are used, and on the stem being cut down, numerous straight simple shoots spring up from one to eight feet high.—*Drury's Useful Plants.* See Rhea.

BOEHMERIA PUYA, *Royle*, is botanically a different species from the B. nivea, though its fibre is almost identical with that furnished by B. nivea. It flourishes at Darjiling, Dehra Doon, and other places in the north of India. Its commercial value is the same as that of Rhea, affording the Puya fibre of Northern India.

BOEHMERIA RUGULOSA, *Wedd.*, grows in Garhwal and Darjiling Terai.

BOEHMERIA SALICIFOLIA. *D. Don.*

Urtica salicifolia, *Roxb.* | Siharu, ... PANJ.

A plant of the Moluccas and of the Himalayas, as far as Dehra Doon, found in Simla and in Garhwal, and in the Sutlej valley between Rampur and Sungnam, at an elevation of 6000 feet. Used for making ropes. Its berries are edible.—*Royle; Voigt*, 280; *Cleghorn, Panjab Report*, p. 68.

BOEHMERIA UTILIS. *Royle.* Rhea.

Bon or Bun Rhea. | Leepeah of . . . NEPAL.

Jungle Rhea is common in Nepal and the Assam forests, and thrives best in the vicinity of water or of running streams. When unmolested it grows to a tree, but, by proper management, the divided roots afford numerous shoots, and the plant can be propagated by slips as well as by the seed. Its cultivation for its fibre might be carried on, as with the willow in Europe. It is said to be exported into Southern, from Northern, China. It is cultivated largely by the hill tribes north-west of Yunnan, and by the Singphos and Dhoanneas of the north-eastern frontier of India to a small extent only, for a coarse cloth, but chiefly for nets. The Nepalese recognise it as the Leepeah of Nepal (Journ. Agri-Hortic. Soc. vii. p. 222). This fibre is well adapted for rope-making. It is about five feet in length, brown in colour, strong, and flexible. It is all that can be desired either for canvas or lines, and only requires to be known to be generally used for such purposes. It was made into a five-inch rope by Messrs. Huddart, along with the Dom Rhea or China-grass, and broke with a weight of about nine tons, or precisely 21,025 lbs. Since then, it has been made up into ropes of various sizes, which greatly exceed in tenacity those made of Russian hemp of the same size. It has also been made up into lines and cords, some of them almost fine enough for fishing lines; in all which it displays its fitness for all such purposes, from the union of strength and flexibility. It was valued at £35 a ton.—*Royle, Fib. Pl.* p. 363.

BOERHAAVIA ERECTA. *Linn.* Hog-weed.

B. procumbens, *Roxb.*, *W. Ic.*

Tikri, ... HIND. | Mukaratay kiray, . TAM.
Tamirama, . . MALEAL. | Ataka mamidi, . . TEL.
S'inadika, . . SANSK. | Adavi mamena, . ,,

Var. α. Rosea, Gada-poorna, deep-rose.
Var. β. Alba, Shwet-poorna, white.

A very common, troublesome weed. The long fusiform perennial roots strike so deep as to render it no easy task to dig them up. It produces blossoms and ripe seed during the whole year. Horsfield says that in Java this is deemed emetic. The native practitioners of India reckon the root amongst laxative medicines, and prescribe it in powder. The small round leaves which grow at the joints of the stalks of the plant are eaten. —*Roxb.* ii. 146; *Ains.; O'Sh.; Voigt*, 328.

BO-GAHA. SINGH. Ficus religiosa.

BOGLE, GEORGE, in 1744 was deputed to Tibet by Warren Hastings as ambassador.

BOGNIO or Bounigo. JAPAN. A governor.

BOGRA, a revenue district in the Rajashye, Koch-Bahar, division, between lat. 24° 32′ 15″ and 25° 18′ 30″ N., and long. 88° 54′ 15″ and 89° 48′ E., with an area of 1491 square miles, and a population of 689,476 souls, chiefly semi-Hinduized aborigines of the Koch'h, Pali, and Rajbansi races, and the Ghatwal. There are also a large number of Kaibartta cultivators, with boating and fishing castes. The mound of the ruined city of Mahasthana is, as the shrine of Shah Sultan, largely visited by Mahomedans.—*Beng. Dir.; Imp. Gaz.*

BOGSHA, a tribe occupying the low Terai adjoining Rohilkhand.

BOGUE FORTS were captured by the British navy on the 25th February 1841.

BOGUM-WANLU. TEL. From Sanskrit Bhogam. Common women. See Basava; Murli.

BOHIRA. HIND. Bignonia undulata.

BOHNI. HIND. With shopkeepers and hucksters, the first money received of the day; it is the handsel of the British. Throughout India, credit for such transaction is not allowed; it must be a ready-money transaction.—*Elliot.*

BOHRA. Many of the Mahomedan shopkeepers on all the western side of India, and as far east as Secunderabad and Bellary, are Bohra, and they are in many parts of Central India and the N.W. Provinces; in the Rajput states, on the north-western coast of peninsular India, and are gradually extending to the south. They call themselves Ismaili, acknowledge an Archimandrite or religious chief, and are an active, intelligent, mercantile race. They are scattered all over the country, but are found principally in Gujerat and the adjoining provinces of Cutch, Sind, and other parts of the Bombay Presidency. They are a peaceable, inoffensive body of men. They are fair, robust, somewhat taller than the average Englishman. Wilson says that these appear to have originated in Gujerat, where they became converts to Mahomedanism; but they seem to have come from Sind. They are engaged in every branch of commerce as wholesale merchants of the first class, as well as pedlars; and sometimes both characters are to be found in the same person. They are a chief medium through which the retail trade in European articles is carried on. The good understanding in which they live with each other strengthens their association; and though they have in former times suffered from the violence of power, few of the industrious classes have escaped so well, during the worst of times, as the Bohra. They are united under the spiritual rule of their elected mullah, or priests, to whose orders, in conformity with the ancient precepts of the remarkable sect of Mahomedans to which they belong, they render

implicit obedience, corresponding in many respects with the Ismailiyah, the Ansariah, the Mutawilah, and the Druses of Syria, and holding the doctrine of the divine character of Ali. They are of the sect of the Hasani, the Assassins once so dreaded in Egypt and Persia, for the murders perpetrated in blind obedience to the mandate of their spiritual chief, so famous in the crusade history under the name of the Old Man of the Mountain, or Shaikh-ul-Jabal. At Oojein, in Sir J. Malcolm's time, 1200 families lived in four mahal or wards connected with each other, but separated by strong gates from the other parts of the city. No one except a Bohra could enter their precincts without leave. The chief mullah, who resided at Oojein, was appointed by the high priest of this class at Surat, and his authority extended over all his sect. His orders regulated their most minute actions; and he promulgated annually a table of rules for their guidance. He estimated the Bohra in his diocese or charge at nearly 10,000 families, or about 45,000 souls. They seem to abstain wholly from political intrigue, are liberal-minded and open-handed, and as good citizens far excel the Mahomedans either of Arab or Persian descent. The name is said to be derived from Beohar, trade. Wilson says the word is derived from the Gujerati words, Vohora, Wohoro, and Ohoro. The Bohra in the N.W. Provinces of India and the Upper Doab have a humbler branch, called Koyan or Rebte, who are money-lenders. Sir J. Malcolm says that besides the Mahomedan Bohra, there is a tribe of Brahmans from Nat'hdwara in Mewar, who have likewise this appellation.—*Elliot; Malcolm's Central India*, ii. p. 111; *Census.*

BOI, TEL., also pronounced Bhui. On the Madras side of the Peninsula, a palanquin-bearer; fisherman employed also as a house-servant.

BOIDU. TEL. A man of the cowherd or shepherd caste.

BOIL. The Dehli boil, Sind boil, and Aleppo boil are very intractable diseases. The Aleppo boil, about the size of a shilling, occurs in Teheran. It is of a livid colour, not painful; its progress is slow. It is called the Hebt-us-Sinne, or the Blotch of a year, also the Haleb-chiban. It is seldom cured in 8 months.

BOILA. NEPAL. Bauhinia Vahlii.

BOIS. FR. Wood; hence Bois à batir, Bois de charpente, timber.

BOJ. HIND. Acorus calamus, also Typha angustifolia.

BOJA. TEL. Inga xylocarpa.

BOJAH. HIND. Eleusine coracana; beer made from this grain.

BOJAJA. JAV. Crocodile.

BOJH, also Bojha. HIND. A weight, a load.

BOJIDAN, the root of a small plant brought from Dehli to Ajmir; used as an aphrodisiac.—*Gen. Med. Top.*

BOKA. HIND. A basket, pail, or leather bag, for throwing water to a higher level. It is the source of the English word bucket.—*Ell.*

BOKAARA GAS. SINGH. Gomphia angustifolia, *Vahl.*

BOKADA. TEL. Clerodendron viscosum.

BOKARO, a coalfield of the Hazaribagh district of Bengal, covering an area of 220 square miles on either side of the Bokaro river. The quantity available is estimated at 1500 millions of tons. It is regularly worked.—*Imp. Gaz.*

BOKAT. HIND. Asphodelus fistulosus.

BOKENAKOO. HIND. Zapania nodiflora.

BOKHARA, a khanate in Turkestan, of small extent, surrounded by a desert. It lies between the parallels of lat. 37–43° N., and long. 60–68° E. It is an open champagne country of unequal fertility, and intersected by the Amu or Oxus on the southern border. Its rivers are the Amu or Oxus and Syr or Jaxartes, the Kohik or Zar-afshan and the river of Karshi and Balkh. It is ruled over by an Amir. The population was estimated by Irving (1809) at 3,600,000, by Burnes at 1,000,000, by Fraser at 2,500,000, and by Balbi (1826) at 1,200,000. A considerable portion of the khanate consists of a clayey, saline soil, and sandy steppes, with a visible slope to the south-west, while it is barricaded to the north-east by huge ranges of mountains. The prior occupants are the Tajak, whose time of immigration into Bokhara is unknown. Previous to the conclusion of the first century of the Hijira, the followers of Mahomed penetrated there, and forced them at the point of the sword to embrace the new creed. At that period Bokhara was governed by the Samanides. In the 10th century the weak rule of these princes was totally overthrown by the Uzbaks, whose power was not of long duration; for in the 12th century the khanate of Bokhara was deluged by the overwhelming flood of the Moghul hordes of Chengiz Khan, and the Uzbaks were driven by the Moghuls into the desert to the west of the Syr-i-Darya. Bokhara has often changed its rulers and modified its inhabitants. At each successive influx new tribes were added to the bulk of the population. This intermixture was more particularly felt whenever the Uzbaks re-entered the khanate. Of the Tajak there is but a remnant left in the city of Bokhara. Owing to their peaceful disposition, not to use the word cowardliness, they abstain from taking any part in warlike achievements. The most salient traits of their character are avarice, falsehood, and faithlessness. They are usually tall; have a white skin, with black eyes and hair. In their dress they strictly adhere to the rules of the Koran, and there is much greater affectation than is observable among the Uzbak. Their politeness in conversation often becomes disgusting, especially if they require the assistance of the person to whom they address their words. The number of the Arabs is somewhat greater than that of the Tajaks. They are chiefly dispersed over the northern parts of the khanate, having their headquarters in the vicinity of Vardanzi and Samarcand. They have not relinquished the habits of their ancestors, and continue to lead a wandering life, with this difference, that the severity of the climate has induced them to exchange their tents for the kibitki. Such only as are compelled by the nature of their occupation, live in fixed habitations. Their features betray their origin. Their large eyes are black as well as their hair; and their skin, which is very susceptible of the effects of the sun's rays, often becomes nearly black from exposure. They speak Arabic amongst themselves.

Bokhara has grain, fruit, silk, cotton, dyes, and cattle, all unrivalled of their kind. Their horses are celebrated throughout Asia; their camels surpass all the other sorts of this most useful domestic animal in the south and west of Asia; and their mutton is equal to any in the world. The hilly

country east and south of Samarcand is rich in minerals.

The Uzbak are undoubtedly the preponderating race in Bokhara, not so much from their number, as by the ties which bind them together. They are divided into stems and sections, like the Kirghiz, and have their elders or beys, who enjoy a certain consideration among them. The Uzbak branches, with some of their subdivisions, are enumerated in the work called Nassad-Mameti-Uzbakia. Many of their tribes are in this khanate.

Manghit encamp at different places, partly in the neighbourhood of Karshi, and partly near Bokhara, and it is out of one of its branches, called Tuk, that the reigning dynasty proceeds. Uzbak are generally middle-sized men; the colour of their beards varies between a shade of red and dark auburn, whilst few are found with black hair. Their dress is very plain, consisting chiefly of khalatu, or flowing dresses of alaja. The wandering Uzbak live, like the Kirghiz, in kibitki. The external felt is usually of a black or dark grey colour, but the interior is more tastefully ornamented than the tents of the latter; for the Uzbaks hang small carpets of home manufacture along the sides, and, though the work be coarse, and the colours generally of a sombre hue, dark red or brick colour in particular, their presence sets off the tent to advantage, and gives it an appearance of cleanliness. Their meals are very monotonous, the staple article being constantly mutton. Kumis (fermented mare's milk) is only drunk by those who keep large herds of horses. Their chief occupation consists in breeding flocks. Children all but naked are seen driving the sheep round the aul, while the chief sits listlessly in his kibitka, leaving all the household affairs to the care and management of the women, who do not differ in dress from the Kirghiz women. In the interior of the aul, half-naked children may be seen romping about and fighting with dogs.

Bokhara has a considerable number of Persians, especially Persian captives, who are brought thither in small parties. The greater majority, however, of this people were transplanted from Merv, in the reign of Amir Seyid, when that city fell under his sway. With a view of weakening it, and thereby ensuring his own safety, he ordered 40,000 families to be transported from Merv to the neighbourhood of Samarcand. It is from them the Persians of Bokhara chiefly descend.

The Persian population are easily distinguished by the regularity of their features and their bushy black hair. They profess outwardly the Sunni faith, though in their hearts they remain Shiah. The Jughi, Mezeng, and Luli are classed among Musalmans in Bokhara; their women go unveiled, and the men are careless in their religious duties. Numbers of them are established at Bokhara and other towns as medical men, fortune-tellers, and horse-dealers. Such as lead a wandering life encamp in tents of a coarse cotton stuff called bez. They have permission to halt near all the lakes and rivers of the khanate whenever those places are not previously occupied by Uzbaks; in consequence of which a great number of them are dispersed along the banks of the Zar-afshan, near Samarcand, while others encamp in the neighbourhood of Karakul. Bokhara and Samarcand are the centres of Mahomedan theology. There are no Mahomedans so strict as the inhabitants of Bokhara, but it was the most shameless sink of iniquity in the east. They have a monastery at Bokhara, dedicated to the famous darvesh Mulana Jalal-ud-Din, who centuries ago went from Bokhara to Iconium. Its houses are built of mud and wood. The rooms have no furniture; and glass for windows is unknown, oiled paper being used in lieu. Bokhara and Turkestan send out raw silk of various kinds, caled chilla jaidar, vardanzwi, lab-i-abi, churkhi, from Khokan, Balkh, Kunduz, Akcha, Shibarghan, etc. Bokhara gold coins are budki and tila. Broadcloth is little used, only cotton cloths (alaja), and stiff, loose silken garments. Women's clothes are of a dark colour, often blue, and fit tightly, with a horsehair veil.

Bokhara city, in lat. 39° 46′ 45″ N., long. 64° 26′ E., is about 7 miles from the left bank of the river Zar-afshan. It is about 7½ miles in circumference, and is surrounded by a clay curtain, with bastions at intervals. It has about 15,000 houses, and a population of 75,000 souls. The ark or palace was built by Alp Arslan. The foreign traders have their respective caravansaries. It has numerous mosques, and about 140 schools and colleges. The inhabitants consist of the Tajak, Nogay, Uzbak, Arab, Jews, Persians, and a few Russians. The Jews are dyers and silk traders, and must wear a small cap and girdle around their waist, to be distinguished from the Mahomedans. There are merchants from Sind, and many darvesh. Whole streets contain nothing but shops and magazines for merchants from all parts of Turkestan, Kashgar, Hindustan, and Russia. There are, all around, numbers of country houses, with gardens.

The brothers Polo stayed three years in Bokhara in the time of Barak Khan (A.D. 1264-1274); and Anthony Jenkinson, who together with the brothers Johnson travelled in Central Asia as agent for Russian cloth manufactures, was in Bokhara A.D. 1558–59. It was visited in the early part of the 19th century by Sir Alexander Burnes, Dr. Joseph Wolff, Colonel Stoddart, and Captain Conolly. The two last fell victims to the fanaticism of the people. It was taken by Russia in 1868.—*Wolff's Bokhara*, ii. pp. 3, 4; *De Bode, Bokhara; Vigne, Personal Narrative; Ferrier's Journey; Max Müller; Powell's Handbook; Trotter, Central Asia.*

BOKHARA CLOVER, Melilotus, a genus of plants of the nat. order Fabaceæ, several species of which, native and foreign, are grown in India, Melilotus arvensis, Italica, leucantha, officinalis, parviflora, and sulcata. M. arborea is the Bokhara clover, and affords two or three cuttings in a season; most of them are grown as clover.

BOKHARA, LITTLE, a name of Chinese Tartary or Eastern Turkestan.

BOKHARI, one of the six principal collectors of the hadis or traditions of Mahomed. The other five collectors were, Muslim, Abu Daoud, Tirmidzi, Nasar, Ibn Maja or Ibn Khozeima. Bokhari was a takhallus or literary appellation. His real name and cognomen are Abu Abdullah Muhammad Ismail. He was born A.H. 194, and died A.H. 256.

BOLA of Bengal, the fish Corvinus chaptis.

BOLAN, a pass in Saharawan in Baluchistan, 61¾ miles long, leading through the Hala Mts. from Kutchi to Dasht-i-be-Daulat. It is a succession of valleys, bounded by mountains. The road is good over the bed of the torrent, from which large stones can be removed. It is better adapted for camels than horses or wheeled conveyances. It is the principal route for the traffic from Sind to Afghanistan. In 1838, the British Indian army, 13,030 strong, and Shah Shuja's army, 6070 strong, with 40,000 followers, marched through this pass. The water of the Bolan or Kahi river disappears in the shingle at Ab-i-gum, to reappear lower down. The British Indian army again, in the war of 1878-79, marched through the Bolan to Kandahar. The entrance is 800 feet; Ab-i-gum, 2540; crest, 5793 feet. Dr. Hunter says 8500 feet. Average ascent, 90 feet per mile.

The Bolan, with the Moolla pass far to the south, are the only practicable routes intersecting the great chain of mountains, defining, on the east, the low countries of Kutch Gandava and the valley of the Indus; while westward it supports the elevated regions of Kalat and Saharawan. There are many other passes over the chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-lands. Such are the passes of Takari and Nagow between the Bolan and Moolla routes, and there are others to the N. of the Bolan. This pass is particularly important, as occurring in the direct line of communication between Sind and the neighbouring countries, with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard Sair and Garm Sair. The natives say that all below the pass is Hind, and that all above it is Khorasan. This distinction is in great measure warranted, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.—*Masson's Journeys*, i. p. 338.

BOLARUM, a military cantonment of the Hyderabad contingent, ten miles north of the city of Hyderabad in the Dekhan, continuing to the north of the Secunderabad cantonment. The force comprises a regiment of native cavalry, one of infantry, and a battery of artillery.

BOLBOPHYLLUM, a genus of plants belonging to the natural order Orchiaceæ. B. auricomum, Careyanum, flexuosum, fuscescens, Jenkensonii, serpens, and sunipia, occur in Nepal, the Khassya hills, Burma, and Tenasserim. The most highly valued of the orchid order among the Burmese and Karens is a sweet-scented bolbophyllum, which Karen youths wear in the lobes of the ear, and maidens in their hair. It abounds in almost every part of the jungles, throwing down delicate straw-coloured racemes over the rough grey bark of old Lagerstroemia trees. B. Careyanum is common in the vicinity of Moulmein, and easily recognised by a long leaf at the apex of a false bulb, and by its small purplish flower.—*Mason.*

An earthy mineral of a fine red colour, one of the hydrous silicates of alumina. That found in the island of Lemnos is white, and called Lemnian earth. Armenian bole is in use in India amongst native practitioners as an astringent; it is largely employed by fraudulent dealers to colour articles of food, etc. It is employed in native painting and gilding. In many countries, Bengal and South America especially, this and other unctuous earths are eaten occasionally by pregnant women, to allay the craving for food so common in that state; and in times of scarcity it has been used by both sexes as a mechanical substitute for proper food. It consists of alumina, silica, magnesia, and oxide of iron. It is brought to India from the Persian Gulf; but it also occurs of fine quality in the Rajmahal hills, also in Mysore, Bellary, and other localities. Reduced to very fine powder, it is used as an absorbent application, sprinkled over ulcers or other raw surfaces. The boles of Blois, Silesia, Lemnos, Armenia, and other places are celebrated. They do not effervesce with acids; are astringent, contain silicate of alumina, and a varying proportion of iron and magnesia. The red varieties are called Armenian bole, and the white varieties are Lemnian earth. —*O'Sh.; Smith.*

BOLEDI, a tribe of Arab descent in the Kaj district of Baluch Makran. They were in brief authority in the early part of the 17th century.

BOLEOPHTHALMUS BODDÆRTII, the leaping fish of the seas of the E. Archipelago. They are salamandrine-looking creatures, scarcely distinguishable from the mud on which they lie, but make a series of leaps on being alarmed. They are 3 or 4 inches long, wedge-shaped, with flat pointed tails, head, and prominent eyes. They are called by sailors Jumping Johnnies. They leap by means of their ventral fins.—*Collingwood.*

BOLETUS DESTRUCTOR, dry-rot fungus.

BOLETUS IGNIARIUS, Agaricus albus.

Buti ka Mochka,	CHENAB.	Gharikun, . . .	PERS.
Jangli Bulgar, .	KASHM.	Kiain, ...	PANJAB.

B. igniarius, dried and sliced, is the amadou or German tinder.—*Eng. Cyc.* See Fungi.

BOLINTRABOLUM. TEL. Bol ka gond, and Bija bol, HIND. A dark, reddish-yellow opaque gum-resin, appears to be true myrrh. It is considered a warm medicine; is given to children in enlarged abdomen, mixed with aloes, as a deobstruent, and is also used in making native ink; one seer costs eleven annas.—*Gen. Med. Top.*

BOLKUKRI. BENG. Adolia castinacarpa.

BOLO CHAPTIS. *Buch.* Corvinus bola, *M'Clell.* Corvinus chaptis. A whiting that furnishes isinglass; the jawbone of the fish is described as Boalee.—*Mason.* See Bola.

BOLOR MOUNTAINS, the mountains of Balti, extend for 300 miles, from the sources of the Gilgit and Yasan rivers in 73°, to the 77th degree E. long., the source of the Nubra river. The Bolor mountains form the western boundary of Chinese Turkestan and Dzungaria. Bolor pro-

duces much gold. The higher mountain range abounds in rock-crystal, called Bilor-stone. The people of the neighbouring Dardu districts on the Indus know Balti only by the name of Palolo. Balti is still famous for its gold washings. Ptolemy calls the people Βύλται, or Byltæ.—*Yule.*

BOLSARI. DUKH. Mimusops elengi.

BOLUNGEE and BANSO. TEL.? URIA.? Two rare bamboos of Ganjam and Gumsur; extreme height 25 feet, circumference ⅛ foot.—*Captain Macdonald.*

BOLWAN, amongst the Mahrattas, the ceremony of conducting a bride to her husband's house; also dismissal of the bridegroom's friends and attendants. Also, the ceremony of propitiating the Bhuta or spirits of deceased persons (pestilence) who have entered a village, inducing them to leave the village, and conducting them across the borders with music and a procession. The exercise of the Bolwan is a cause of great anger to the villagers to whom the pestilence is led. Perhaps from būlāna, to call.—*Wilson.*

BOM or Bun-zu or Bom-du are closely allied tribes, termed collectively Lungkta, Kungye, or Kuki, who occupy the highlands of Tiperah, and extend S.E. towards the head of the Koladyn. Both the Bun-zu and Kuki appear, like the Ku-mi, to belong to the Burman family. The Kuki represent its most archaic and barbarous condition. The tribes that have been exposed, on the seaboard of Arakan or in the basin of the Irawadi, to the influence of the Chinese, Shan, Mon, Bengali, and more distant commercial nations, have attained a comparatively high civilisation. The Singpho, although much behind the Burmans, are greatly in advance of the Kuki; and the Burmese seem, at a very ancient period, when their condition was similar to that of the Kuki, and perhaps in many respects more barbarous, to have spread themselves from the upper Irawadi to the south and west as far as the highlands of Tiperah on the one side, and Pegu on the other. Wherever the stock from which they have been derived was originally located, they probably first appeared on the ultra-Indian ethnic stage as a barbarous Himalayan tribe, immediately to the eastward of the Mishmi, if indeed they were not identical with the Mishmi of that era. The upper Irawadi was probably then occupied by the ruder and inland tribes of the Mon-Anam alliance.

BOMA-PAPATA. TEL. Stylocoryne Webera.

BOMBACEÆ. Several genera of this group of plants, as the adansonia, bombax, durio, ochroma, gossampinus, and salmalia, grow in the East Indies. Salmalia Malabarica and Gossampinus have a soft down attached to their seeds, and yield a powerful bast. Some authors regard this group as a section of the Sterculiaceæ.

BOMBARECK, a rock which British sailors so call. It is the Koh-i-mubarak, also Ras-mubarak, the fortunate or auspicious mountain, or headland, of the Arabs.

BOMBARIMASA. TEL. Citrus decumana.

BOMBAX CEIBA. *Linn.*

Muh-mien, . . . CHIN. | Pan-chi-hwa, . . . CHIN.

A tree of Jamaica introduced into the E. Indies. In South America and the West Indies it is used for canoes. It is common at Canton; and the fleshy petals of the flowers are sometimes prepared as food. It is said to be a large tree of the Burmese country, and its beautiful and soft floss is used for pillows and thin mattresses by the natives. The juice of the root is aperient, and its bark emetic.—*Voigt; Malcom's Travels*, i. p. 187; *Riddell; Williams' Middle Kingdom*, p. 284.

BOMBAX MALABARICUM. *D. C.*

Bombax heptaphyllum, *Cav.*
Salmalia Malabarica, *Sch. and Endl.*
Gossampinus rubra, *Ham.*

This large and stately tree grows in most parts of British India, and is often from 80 to 100 feet to the first bough. It occurs wild in the Siwalik tract up to 3500 feet, and beyond the Indus, and up to 6000 near the Ravi; and its wood is used there for planks, boxes, water conduits, well curbs, troughs, bridges, and scabbards, and light work, its wood being whitish, coarse-grained, weak, brittle, and very subject to the attacks of white ants, but it stands water well. In the Bombay Presidency, both on the coast and inland, it is one of the most common trees, and the planks are extensively used in making the light packing-boxes used in the export of bulky goods from Bombay and other places; also for fishermen's floats when the Adansonia is not at hand, and for canoes. It is abundant in the plains of British Burma, where its light and loose-grained wood is used for coffins. A cubic foot weighs 28 lbs. When the trees grow large, the stem spreads out towards the base, at intervals, into buttress-like projections. In spring, huge Magnolia-shaped scarlet blossoms cover the trees, and in some places the young flower-buds are cooked and eaten. Its cotton is used for stuffing cushions and pillows. In a full-grown tree on good soil, the average length of the trunk to the first branch is 60 feet, and average girth measured at 6 feet from the ground is 15 feet. It yields the Moochee-ras resin, and its roots constitute the Safed Moosli of the bazars, which, powdered, forms a thick mucilage with cold water, and answers admirably as a nutritious demulcent for convalescent persons.—*Drs. Wight, Brandis, Gibson, O'Shaughnessy, Stewart; Mr. Thompson; Captain Beddome.*

BOMBAY city, in lat. 18° 55′ 5″ N., and long. 75° 53′ 55″ E., is situated on an island of that name, with an area of 18·22 square miles, and gives its name to a presidency under the rule of a Governor and Council; also to the army which holds the Bombay territories and the peninsula of Aden; also to the small naval force of the Bombay Marine; and likewise to a group of islands off the Bombay shore. The English name is a changed form of Mumbadevi, a local Hindu goddess. The countries under the Bombay government present markedly differing features, alike in their physical aspect, in the races occupying them, and in the languages that they speak. In the times preceding and following the Christian era, portions of the territories under notice were distinct nationalities,—Kat'hiawar, Maharashtra, Gujarashtra, Saurashtra, and Sindhu; and a powerful ancient dynasty seems to have had their capital at Wallabhi, in the modern Gohilwad, another being the great Chalukya empire of the Dekhan, in the Dekhan part of the Bombay territories, on a

portion of the plateau between the rivers Nerbadda and Kistna, elevated about 1700 feet above the sea. What is known of the history of these regions while under their early rulers is chiefly derived from legends handed down by traditions relating to the various sectarian religions that were acknowledged, and by the architectural and sculptured remains and rock-inscriptions, which Colonel James Tod, Mr. James Fergusson, Colonel Sykes, Mr. James Prinsep, General Cunningham, and Mr. James Burgess have investigated. But since the time of the Arab, Turk, Moghul, and Pathan conquerors, all of them Mahomedans, and all of them creditably recording races, followed by the Portuguese, the Dutch, and the British, the eventful changes in these countries have been well known. The first of these, after the Scythic and Rajput occupancy, was Mahmud of Ghazni, who in 1024-6 captured and sacked the Saiva temple of Somnath in Gujerat, carrying back with him immense booty. From that time, the Rajput rulers of Gujerat, whose capital was at Anhalwara Patan, had to meet waves of invasion, until their dynasty was at last subverted in 1297 by Alaf Khan, the general of the Turki emperor of Dehli, Ala-ud-Din Khilji. In 1403, Jafar Khan, a Rajput convert, assumed independence, and the dynasty advanced to high power and splendour. The annual revenue rose to 11 millions sterling; and the ruins still at Ahmadabad and Champanier bear a mournful testimony to its former greatness, and to the revolutions to which it has since been subjected; for, in 1573, Gujerat was conquered by the emperor Akbar, and has repeatedly since then changed masters. The Bahmani kings, 1347-1526, the Nizam Shahi dynasty in 1490-1595, at Ahmadnaggur, the Adal Shahi, 1489-1579, at Bijapur, the great Sivaji, 1627-1674, carved out kingdoms for themselves; and on the death, in 1707, of Aurangzeb (Alamgir I.), the disorders led, in 1757, to the cession of the Gujerat Province to the Mahrattas, under the joint rule of the Peshwa and Damaji Gaekwar. While such changes were occurring in these northern tracts, natives of western Europe had appeared on the southern seaboard,—Vasco da Gama, a Portuguese leader, in 1498; the great Albuquerque, 1503, and that nation was in possession of Bombay island in 1532. A ship from England visited Surat in 1608; and the English in 1613 obtained permission from the emperor Jahangir to erect a factory there, which in 1618 was also granted to the Dutch. In 1661 the Portuguese gave Bombay island to Charles II. of England, as part of the dower given with his bride; and Charles sent the Earl of Marlborough, a most experienced sailor, with a strong fleet, to receive it from the Portuguese. In 1668 Charles transferred it to the English East India Company, for an annual rent of £10. In 1686 it was declared the chief seat of the English on that side of India; and in 1708 the territories attached were created the Bombay Presidency. All that remains of the Portuguese power on that coast is the territory of Goa, Daman, and Diu, an area of 1146 square miles, and 428,955 inhabitants.

Since the middle of the 18th century, the Bombay Presidency has been sometimes aggressive, sometimes on its defence. In 1756, in alliance with the Peshwa, the stronghold of Savandrug was captured, and the same year Admiral Watson and Clive stormed Gheria or Viziadrug.

The first war with the Mahrattas, 1774–1782, ended ingloriously, some districts being retained and some delivered up. In the second war, 1802, the British regained some tracts in Gujerat; and in the third war, 1817, the Peshwa Baji Rao was defeated in the Dekhan, and the greater part of what is now the present Bombay territories, Ahmadabad, Nasik, Ahmadnaggur, Poona, Belgaum, Dharwar, Kaladgi, Sholapur, and the Konkan, fell to the British. At the same time Kandesh was obtained from Holkar. In 1843 Sind was conquered. In 1848 Sattara lapsed from want of heirs. In 1860 Sindia ceded the Panch Mahals; and in 1861 North Canara was transferred from the Madras Presidency. The territory thus noticed lies between lat. 13° 53′ to 28° 47′ N., and long. 66° 43′ to 76° 30′ E. Its seaboard, and the rivers Indus and the Gulfs of Cutch and Cambay, 8000 square miles, and the harbours of Bombay and Karwar afford every facility for commercial operations. Its fertilizing rivers being the Mahi, Sabarmati, and Tapti; and its mountains, the Suliman in Sind, the Sahyadri, the Satpura, and the Satwala or Ajunta, are marked features in the landscape. The Manchur lake is on the right bank of the Indus, near Sehwan, and the Ran or Runn, is a level tract partially flooded during the rainy season of the S.W. monsoon. Thurr and Parkur, in Sind, is a sandy desert. The desert talukas of Omerkot consist of a narrow strip of sandhills and waste lying north of the Runn of Cutch, and stretching about 130 miles from District Mahomed Khan's Tanda on the west, to the Jodhpur frontier on the east. The principal town is Omerkot, situated between the desert and the plains. It has long been the acknowledged capital of that part of the country, and with its mud fort was considered the key to the desert commanding the high road between Marwar and Sind.

Aden is under the jurisdiction of Bombay. Almost the most southerly point on the Arabian coast. It is situated in lat. 12° 47′ N., and long. 45° 10′ E. It is a peninsula of about 15 miles in circumference, of an irregular oval form, 5 miles in its greater, and 3 in its lesser diameter, connected with the continent by a low narrow neck of land, 1350 yards in breadth, but which is in one place nearly covered by the sea at spring tides.

Bombay city in 1872 had 644,405 inhabitants. In 1881 the number was 773,196. The island has two hills of very moderate height, which rise from low lands formerly liable to be flooded. A stone embankment called the Vellaurd was built in 1833–34, to connect the Colaba and the Bombay islands. Malabar Hill is on the south-western side of Bombay island. At the north is Mahalakshmi, a ridge 200 feet high, with a handsome Hindu temple. About its centre are the Parsee dokhmas, or exposure towers. At the south end is Walkeshwur, a Brahman village, with interesting temples. Malabar Point, or Shirgundi, its south extreme, forms the north-west limit of the Back Bay. Back Bay lies between Malabar Hill and Colaba, is $2\frac{3}{4}$ miles wide, and unsuccessful efforts to reclaim it have been made.

The Bombay group, indeed, consists of fifteen or twenty islands in all,—the island of Bassein, about thirty miles to the northward of that which gives the cluster its name; Dravee and Versova, just off the shore of Salsette; Salsette, by much the largest of them all; Trombay, conspicuous for

the mountain called Neat's Tongue, which attains the altitude of 1000 feet; Bombay itself, united on the northward to Trombay and Salsette, as these are united to each other by bridges and embankments, and to the southward are Old Woman Island and Colaba. Henery and Kenery are far south. In the spacious harbour formed by the islands of Caranja, Colaba, Bombay, Salsette, Elephanta, Trombay, and the continent, several smaller rocky islands are scattered, bearing different names. Of these are Elephanta, and Butcher Island, called Dipa-devi, or the island of the gods, or holy island; it is low, less than a mile from Elephanta, in the direction of Salsette. Bombay harbour is very capacious, being from N. to S. 8 or 10 miles, with a general width of from 4 to 6 miles; its shores are irregularly indented by bays and inlets. Bombay Island has five or six bands of trap rock, chiefly greenstone and amygdaloid, separated by beds that have an appearance of being of sedimentary origin. The sea-breeze is felt through the island: the anchorage extends along the eastern face; and it is along this face of the island that the most densely crowded parts are. Owing to the value of property in that quarter, much new land has been reclaimed from the sea. The chief public buildings are the fort, the town hall, the government house, museum, and docks.

For administrative and revenue purposes, the Bombay Presidency is arranged into twenty-four districts, which enclose nineteen Native States under British protection. In 1881 the population of Bombay was 14,025,593, and that of Sind 2,404,934; the Native States, 6,831,505.

The total area is 191,835 square miles, and the population 23,180,721?

The various castes and sects in the British districts professing Hinduism, number— 12,606,004
and Mahomedans, ... 2,504,338
others, ... 185,409

But of these, 163,972 are descendants of races from beyond the British frontier,—Arab, Baluch, Makran, Persia, and Egypt. The aboriginal races of this part of India, Koli, Bhil, Kolamb, Ahir, and others, are given as 709,025. The number of castes was about 200; and the Sudra were returned, in 1872, as 10,801,393; these being chiefly the cultivators of the Kunbi and Mali sections.

In 1716 the population of Bombay Island was estimated at 16,000
on 1st May 1849, it was 556,119
and in 1872, ... 644,405
as under:—

Hindu Sudras, .	340,868	Bhattia, ...	9,466
Mahomedans, .	137,644	Europeans, . . .	7,253
Parsees, . . .	44,091	Jews, ...	2,669
Hindu out-castes,	31,347	Eurasians, . . .	2,352
Brahmans, . .	25,757	Lingaet, ...	1,242
Native Christians and Portuguese, .	25,119	Negro Africans, . .	1,171
Buddhists or Jains,	15,121	Chinese, ...	305

The vernacular languages spoken are English, Canarese, Kokani, Gujerati, Mahratti, Sindi, and Urdu.

Several of the races are keenly engaged in trade and in banking. Amongst the Hindus, the Bhattia race and the Marwari, Rajput tribes from Central India, and the Banya of Gujerat; amongst the Mahomedans are the Khoja, Borah, and Memon sects; the Lohani of Sind and the N.W. Frontier; with commercial men from Europe and America, Egypt, Arabia, Africa, and Persia, the Parsee (66,498), and a small number of Jews. The Khoja are converts from Hinduism to the Ismaili sect of Mahomedanism, and acknowledge the Imam of the Ismaili as their spiritual head. They have large trading colonies along the east coast of Africa. Cotton, opium, salt, cereals, are the chief articles of the foreign trade; for domestic use, the principal arts and manufactures are, cotton-weaving by hand and steam, cotton thread, woollen fabrics, rugs, carpets, working in leather, gold and silver, and silk lace, kimkhabs or brocades, silk fabrics, embroidery, edgings, paper, pottery, carving from sandal-wood, blackwood, ebony, etc., Bombay or Multan work, and blackwood furniture.

The land-revenue system is the Rayotwari, not, as in Madras, with annual fresh assessments, and the cultivator is part owner of the land. The Government rates levied are Rs. 0·12·7 per acre on dry crops, Rs. 3·9·3 on rice lands, and Rs. 3·11·4 on garden lands. Each village has its potail, who is the head of the village for both revenue and police purposes; the tullati or kulkurni, who is the clerk and accountant; the mhar, who is a kind of beadle; and the watchman. The potail and kulkurni either hold a certain quantity of rent-free land, or are remunerated by a cash payment equivalent to a certain percentage on the collections. The mhar and watchman, in common with the other village servants, also hold land on more or less favourable terms as regards assessment, and receive, besides, grain and other payments in kind from the villagers.—*Imp. Gaz.; Horsburgh; Finlay; Census Report.*

BOMBAY DUCK.

Bummalo of . . BENGAL. | Bamia of . . BOMBAY.

This little fish, Saurus nehereus, *B. Ham.*, in-

habits the seas of the S.E. of Asia. Its total length is 11 inches. The upper part of its head, back, and sides, light grey or dust-coloured, semi-transparent like gelatine, with minute starlike black and brownish dots; anterior part of abdomen pale silvery bluish; rest whitish; cheeks and opercles, pale silvery bluish, dotted like the body; fins transparent, coloured like the body, but more closely dotted, so as to appear blackish. The fish is of most voracious habits, gorging itself with other fishes of nearly its own size, also with its own species and with prawns. It is frequently taken with the stomach and the jaws expanded with prey. It is very short-lived. The whole body becomes at certain seasons brilliantly phosphorescent. In the Straits of Malacca it is at all times very numerous, although less so than it is at the Sandheads or in the mouths of the Ganges. Although very rich, it is a great delicacy immediately after it is taken. Salted and dried, it is also highly valued; and in this state large quantities are annually exported from Bombay and the Malabar coast to all parts of India.

BOMBAY MARINE. See Indian Navy.

BOMBAY WORK. The inlaid work of ivory, white and dyed, of ebony or other coloured woods, for which Bombay has long been famous, is said to have been introduced from the Panjab, and is also familiarly known as Multan work. The art dates from a remote period, and paper-cutters, work-boxes, writing-desks, and similar articles are its chief products. The effect of a large mass of it is very poor; the pattern is too fine for being distinguishable, and it fills the eye with a general greyish tint. In articles which do not present more than a foot or two of surface, it is very pleasing. The ground of the inlaid pattern is generally scented cedar or sandal-wood, the joinery exhibited in which is very indifferent. The inlaying material is prepared as follows: The wood or ivory is cut into slips of a lozenge or triangular section, as may be required, by a long, thin-bladed, fine-toothed saw. The tin is drawn through betwixt a pair of grooved rollers, like those used for laminating or extending iron; they work together by teeth at the extremity. One or two draws through extends the metal into the length desired. The wires and splints are nearly all either lozenge-shaped or triangular, the triangles being equilateral, the lozenges composed of two equilateral triangles. A pattern being fixed on, the splints are built up into pieces about eighteen inches long, and from a quarter to two inches in thickness, firmly glued together. In the case of borders, or continuous pieces of work, the rods are glued together betwixt pieces of ivory, or wood and ivory alternately, so as to form straight lines on each side of the pattern. When about to be used, they are sawn across the thickness of a sixpence, and arranged in a box divided into compartments, something like a printer's case. They are then picked up in succession, and applied with glue to the box or other article to be inlaid.

BOMBAZINE, a fabric of worsted and silk, the warp being of silk, and the weft or shoot of worsted.—*Tom.*

BOMBYA, at Gaya, a guide-conductor who precedes Hindu pilgrims, making a noise by beating his mouth.

BOMBYCINA, a group of lepidopterous insects, which, in their metamorphosis, construct a covering or case, generally called a cocoon. Each tribe of the Bombyces produces a cocoon of a peculiar form. They are said to spin or weave their cocoon, and are usually styled silk-moths. The valuable product of the silk-moth is the cocoon; and races have been produced differing much in their cocoons, but hardly at all in their adult states. Several distinct species exist in China and India, some of which can be crossed with the ordinary silk-moth, Bombyx mori. This is believed to have been domesticated in China B.C. 2700. It was brought to Constantinople in the 6th century, whence it was carried into Italy, and in 1494 to France, and has since been transported to many countries, where food and selection have produced many varieties. It is only in some districts of each country that eggs come to perfection. Captain Hutton was of opinion that at least six species have been domesticated. B. Cynthia feeds on the castor-oil plant, and spins very soft threads. Eastward of the city of Canton, on a range of hills called Lo-fau-shan, there are butterflies of large size, and night-moths of immense size and brilliant colouring, which are captured for transmission to the Chinese court and for sale. One of these, the Bombyx Atlas, measures about 9 inches across; the ground colour is a rich and varied orange-brown, and in the centre of each wing there is a triangular transparent spot, resembling a piece of mica. In their scientific classification, the Bombyces are arranged into eight stirpes or types, according to the forms of their larvæ, and those known to occur in India have been classed into 105 genera and 272 species. The most important of these, in a social point of view, are the silk-producing moths, belonging to the genera Bombyx, Cricula, Salassa, Antheræa, Actias, Saturnia, Attacus, Caligula, Neoris, Ocinara, Rhodia, Rinaca, Theophila, and Trilocha. At Simla, nine species of Bombyx, Saturnia, and Actias occur, nearly the whole of which might be turned to account in producing silk.

1. Bombyx mori, *Linn.*, the common domesticated or Chinese silk-worm moth, the Sericaria mori of Blanchard, and the 'pat' of Bengal. It is a native of China, but has been domesticated there and in Siam, India, Persia, France, America, and Italy. The tradition in China is that this was discovered B.C. 2640, in the reign of the emperor Hwang-Te, by his queen. The culture now flourishes principally about Nankin, in lat. 32° N.; but in India, into which it was early introduced, none of the silk filatures extend beyond 26° N. They have been found in a wild state in Kent in England, on shrubs, but the mulberry tree leaves are its favourite food.

2. Bombyx religiosa, *Helfer*, Deo-mooga, HIND., Joree, HIND., is found in Assam and Cachar, but is supposed by Mr. Moore to be identical with B. Huttoni. This feeds on the Ficus Indica and Ficus religiosa. Its cocoon shows the finest filament, has very much lustre, is exceedingly smooth to the touch, and yields a silk, if not superior, yet

certainly equal to that of B. mori. It has not been domesticated.

3. Bombyx Huttoni, *Westwood*, is found in the Himalaya, about Mussoori, where it occurs abundantly from the Doon up to at least 7000 feet. It feeds on the leaves of the wild mulberry, and breeds twice a year. It has not been domesticated, but feeds on the trees. It spins its cocoon on the leaf, which is enclosed; the silk is very fine, and of a very pale yellow tint. It is found in the Western Himalaya in great profusion, at elevations of 3000 to 8000 feet above the sea-level. It occurs in the height of the rainy reason, when the hills are enveloped in dense mists. Its eggs are deposited on the trees, and subjected to the influence of the frosts and snows of those mountain winters. The Agri-Horticultural Society of India declared that silk of the very best description can be obtained from its cocoons by careful reeling. The silk is fine and tough, though perhaps somewhat less soft and silky to the touch than that of the Chinese worm, and was valued by the Dehli shawl merchants at 25s. the pound.

4. Bombyx Horsfieldi, *Moore*, Java.

5. Bombyx sub-notata, *Walker*, Singapore.

6. Bombyx lugubris, *Drury*, Madras.

7. Bombyx yama mai, the oak silk-worm of Japan, has been naturalized in England. In Japan it is the most precious for the produce, and is a monopoly of the royal family. The cocoons are of a beautiful yellowish-green colour. The silk is as fine, thin, and light brown as that of the mulberry worm.

8. Bombyx Pernyi, of the north of China. It produces the gridelin cocoon and silk.

9. Bombyx Mylitta, of India, produces a large cocoon. It feeds on the leaves of the Rhamnus jujuba, and furnishes a dark-coloured or grey silk, coarse but durable, inferior to that of the B. yama mai. Other species are B. Arracanensis, fortunatus, sinensis, and textor.

10. Cricula trifenestratra, *Helfer*, has been arranged under the genera Saturnia, Euphranor, Antheræa, and Phalæna. It occurs in N.E. and S. India, in Sylhet, Assam, Burma, and Java; and feeds on the Protium Javanum, Canarium commune, Mangifera Indica, and Anacardium occidentale. Its cocoon is constructed like network, through which the enclosed chrysalis is visible. It is of a beautiful yellow colour, and of a rich silky lustre. C. drepanoides also occurs.

11. Salassa lola, *Westwood*, formerly in the genera Saturnia and Antheræa, occurs in Sylhet.

12. Antheræa paphia, *Linn.*

Kontkuri Muga, . ASSAM.	Koli-surrah, . . MAHR.
Bughi, . . . BIRBHUM.	Munga, ... MICHI.
Tasseh, ... HIND.	

This has been classed in the genera Phalæna, Saturnia, Bombyx, and Attacus. It is known to occur in Ceylon, S. India, N.W. and N.E. India, Bengal, Behar, Assam, Sylhet, and Java. It feeds on the Shorea robusta, Zizyphus jujuba, Terminalia alata, T. catappa, T. glabra, Bombax heptaphyllum, Tectona grandis or teak, and the mulberry or Morus Indica. The insect has not been domesticated, but is watched on the trees, and, in parts of India, is found in such abundance that the people from time immemorial have been supplied with a very durable, coarse, dark-coloured silk, which is woven into the well-known tasseh silk cloth. In the Bhagulpur district the cocoons are collected in cartloads, and are much used, cut into thongs, as ligatures for binding the matchlock barrel to the stock. In the rainy season the perfect insect appears from the cocoon in about twenty days. But tasseh moths are hatched twice in the year, in May and August. The caterpillar first draws a few leaves together, as if to screen itself from observation, and then spins a strong cord, composed of many threads, till about the thickness of a crow quill, at the end of which it weaves the cocoon. For the first 36 hours the cocoon is so transparent that the larva can be seen working within; but it soon acquires consistence, and is then rendered quite opaque by being covered with a glutinous substance. The moth generally deposits its eggs within a few yards of the cocoon. These the villagers collect and keep in their houses for about ten days, until the young caterpillars come forth, when they are placed on the Asan trees in the jungles, and in eight or ten days more they prepare for change to the chrysalis state. The owners tend them carefully, to protect them from the birds by day and from bats at night, and practise many superstitious ceremonies to aid them in their care.

13. Antheræa Pernyi, *Guerin*, syns. A. Mylitta, Saturnia Pernyi, is a native of China.

14. Antheræa Frithii, *Moore*, Darjiling.

15. Antheræa Roylii, *Moore*, Darjiling.

16. Antheræa Java, *Cramer*, syn. Bombyx Java, found in Java.

17. Antheræa Perottetti, *Guerin*, syn. Bombyx Perottetti, found at Pondicherry.

18. Antheræa Simla, *Westwood*, occurs at Simla and Darjiling. Its expanse of wings is nearly six inches.

19. Antheræa Helferi, *Moore*, Darjiling.

20. Antheræa Assama, *Helfer*, the Saturnia of Westwood, the Mooga or Moonga of the Assamese, is found in Ceylon, Assam, and Sylhet. It can be reared in houses, but thrives best when fed on trees; and its favourite trees are the Addakoory tree, Champa (Michelia) Soom, Kontoolva, Digluttee, and Souhalloo, Tetranthera diglottica and T. macrophylla, and the Pattee shoonda or Laurus obtusifolia. There are generally five broods of Moonga worms in the year.

21. Antheræa larissa, *Westwood*, syn. Saturnia, a beautiful species, found in Java.

22. Antheræa ——? *sp.* This is a native of Manchuria, in a climate as rigorous as that of Britain. It feeds on a species of the oak. Its silk is strong, with little lustre, and resembles strong yellow linen. Introduced into France. A. Andamana and A. mezankooria are also named.

23. Loepa katinka, *Westwood*, syns. Saturnia, Antheræa, native of Assam, Sylhet, Tibet, Java. Others are L. miranda, Sikkima, and Sivalika.

24. Actias selene, syns. Tropæa, Plectropteron, Phalæna, a native of India, at Mussoori and Darjiling, from 5000 to 7000 feet. It feeds on the Coriaria Nepalensis, or Munsuri, HIND., the walnut, Andromeda ovalifolia, and Carpinus. The eggs are laid for a few days after the visit of the male; they hatch in about 18 days, and the larva begins to form its cocoon when 7 weeks old.

25. Actias Mænas, *Doubleday*, syn. Tropæa, a native of Sylhet.

26. Actias Sinensis, *Walker*, syn. Tropæa, a native of N. China. Others are A. ignescens and A. leto.

27. Saturnia pyretorum, *Boisduval*, China.
28. Saturnia Grotei, *Moore*, Darjiling.
29. Attacus Atlas, *Linn.*, syns. Phalæna, Bombyx, Saturnia. This is the largest of all known lepidopterous insects. It is found in Ceylon, all over India, Burma, China, and Java, and the tasseh silk of the Chinese is said to be obtained from its cocoon.
30. Attacus Edwardsi, *White*, a native of Darjiling, of an intensely dark colour.
31. Attacus cynthia, *Drury*, syns. Phalæna, Bombyx, Samia, Saturnia. This is the Eri, Eria, or Arindi silk-worm of Bengal and Assam, which occurs also in N.E. India, Tibet, China, and Java. It feeds on the foliage of the Ricinus communis, the castor-oil plant, hence its name, the Arindi. It spins remarkably soft threads.
32. Attacus ricini, *Boisduval*, syns. Saturnia and Phalæna. This is found in Assam, Ceylon, and is the Arindi or castor-oil silk-worm of Bengal, so called because it feeds solely on the common castor-oil plant, with which, also, they are fed when domesticated. This is reared over a great part of India, but particularly at Dinajpur and Rangpur. The cocoons are remarkably soft and white, but the filament is very delicate; the silk cannot be wound off, and it is therefore spun like cotton. The yarn thus manufactured is woven into a coarse kind of white cloth, of a seemingly loose texture, but of incredible durability; a person rarely can wear out a garment made of it in his lifetime.
33. Attacus Guerini, *Moore*, is smaller than A. Cynthia and A. Ricini. It is found in Bengal. Others are A. Canningii, lunula, obscurus, and silhetica. Caligula Cachara, *Moore;* C. Simla, *Westw.;* C. Thibeta, *Westw.* Neoris Huttoni; N. shadulla; and N. Stolickzkana of Mussoorie, Yarkund, and Ladak. Ocinara lactea; O. Moorei and O. diaphana of the Himalayas. Rhodia newara, *Moore*, Nepal. Rinaca zuleika, *Hope*, Sikkim. Theophila bengalensis; Huttoni; mandarina; religiosa and Sherwilli of N. India and China. Trilocha varians, *Walker*, India.

The species of Bombyx called Bhooa, Buro bhoo, HIND., and Kala Jhanga, attack the maturing poppy plant in February and March in Lower Bengal.—*Major Hutton in* No. 8 *of Universal Review; Horsfield and Moore's Lepidopterous Insects*, 1858-9; *Silk-producing Moths; Pro. Zool. Soc.* 1859. See Lepidoptera.

BOMERANG, a projectile used by the Marawar of the Tondamans country, also in Gujerat, and in Australia; it is made of wood, ivory, iron, and wood and iron. The Indian bomerang, the katureea, is used by the Koli of Gujerat in the same manner as that of Australia. The distribution of the bomerang corresponds nearly to that of the Australian race as defined by Professor Huxley.

BOMKAR. MAHR. Weavers in Kandesh.

BOMLE-MARA, a tree of Canara and Sunda. Wood very serviceable for planks.—*Gibson.*

BOMMA JEMUDU. TEL. Euphorbia antiquorum.

Bomma Kachchika, Costus speciosus, *Sm.*
Bomma Medi, Ficus oppositifolia.
Bomma Papata, Stylocoryne Webera, *Rich.*
Bomma Sari, Polycarpæa corymbosa.
Bommidapu, Indigofera glandulosa, *Willd.*

BOMMIGAL. TAM. Toys.

BOMNI AMLI. DUKH. Adansonia digitata.

BOMORI, a town in Orchastati, Bundelkhand, in the N.W. Provinces, in lat. 25° 26′ 20″ N., and long. 79° 54′ 40″ E., has an artificial lake four miles long and two miles broad.—*Imp. Gaz.*

BOMRAJ, an estate in the Nellore district, Madras. In the 18th century, Bomraj, Venkatagiri, Kalastri (Kalahasti), and Sayyidpur constituted the district of the Western Palayams.—*Imp. Gaz.*

BOM-ZU or Bun-zu, Bom-du of the Rakhoing, dwell north of the Koladyn, inhabiting chiefly the upper basin of the Kurnfuli, or eastern branch of the Chittagong river. To the north of the Bomzu are closely allied tribes, termed collectively Lungkta, Kungye, or Kuki, who occupy the highlands of Tiperah, and extend S.E. towards the head of the Koladyn. Both the Bun-zu and Kuki appear, like the Kumi, to belong to the Burman family. The Kuki represent its most archaic and barbarous condition. The tribes that have been exposed on the seaboard of Arakan or in the basin of the Irawadi, to the influence of the Chinese, Shan, Mon, Bengali, and more distant commercial nations, have attained a comparatively high civilisation. The Singpho, although much behind the Burmans, are greatly in advance of the Kuki; and the Burmese seem at a very ancient period, when their condition was similar to that of the Kuki, and perhaps in many respects more barbarous, to have spread themselves from the Upper Irawadi to the south and west as far as the highlands of Tiperah on the one side, and Pegu on the other.

BONAI, a small tributary state in Chutia Nagpur; area, 1297 square miles. It was ceded to the E. I. Company in 1826. Its Dravidian and Kolarian races are the Bhuiya, Gond, and Kolita. Tigers, leopards, wolves, elephants, and bison are numerous. Population, 24,832.

BONANG. MALAY. A musical instrument of Java.

BONDARA. MAHR. Lagerstrœmia reginæ.

BONDUC NUT. Seeds of Guilandina bonduc, *L.*

The bones of cattle and other animals are extensively used in the arts, in forming handles for knives, walking-sticks, inlaying small boxes; lanterns, paper knives, buttons, and many small articles of dress, are made in China from horn and bones. Subjected to destructive distillation in large retorts, amongst the other products which pass over, is a peculiar oil, which is collected, and afterwards employed to feed lamps burning in small, close chambers, the sides of which thus become covered with lamp-black. The mass remaining in the retorts is called ivory black, bone black, and animal charcoal. This substance has a remarkable attraction for organic colouring matter, and is largely used for removing the colouring matter from syrup, in the refining of sugar, and in the purification of many other organic liquors. By exposing ivory black to an open fire, the carbon is driven off, and the bones are nearly blanched. These are reduced to powder, which is used for making the cupels of the assayer, also as a polish-

ing powder for plate and other articles, and also by the manufacturers of phosphorus for making lucifer matches.—*Morrison*, p. 197; *Toml.*

BONG. BENG. Solanum melongena.

BONGKO. JAV. Hernandia sonora.

BONG LONG THA. BURM. A timber tree of Amherst, Tavoy, and the Mergui Archipelago. It has a durable yet light wood with a very straight grain. Used for every purpose by the Burmese.

BONGS. TAGALA. Areca catechu.

BONGU VEDURU. TEL. Bambusa arundinacea. Bongu means hollow.

BONIN, of Kashmir, Platanus orientalis.

BONITO, the Scomber pelamys, *Linn.*, one of the mackerel tribe. It inhabits the southern seas, and is often caught by hook and line. Its flesh resembles raw beef, and when cooked is not inviting.—*Bennett*, p. 22.

BONO KONIARÉE. TEL.? URIA.? A scarce tree of Ganjam; extreme height 50 feet, circumference 3 feet. Used for planks, boxes, and walking-sticks.—*Captain Macdonald.*

BONOMI, JOSEPH, born 1796, died at Wimbledon Park 3d Dec. 1878. He was the son of Joseph Bonomi, architect to St. Peter's, Rome, and he came to England in 1796 with his father. In 1824 he went to Egypt with Mr. Robert Hay, a naval officer, and remained for eight years studying and drawing the hieroglyphics with Hay, Burton, Arundale, and others. In 1833 he went with Arundale and Catherwood to Jerusalem; they were the first to visit the Mosque of Omar and make detailed sketches of it. From these sketches Mr. Fergusson founded his opinion that this structure was built by order of Justinian over what was then believed to be the Holy Sepulchre. He also visited Sinai, Damascus, and Balbec. On his return to England he was busily employed in making drawings in connection with the works, on Egypt, of Sir Gardner Wilkinson, Dr. Birch, and others. In 1842 he was in the great expedition sent under Lepsius by the King of Prussia, and was another two years in that country. In 1853 he assisted Owen Jones in the works at the Egyptian Courts of the Crystal Palace, which convey a very perfect notion of Egyptian art. In 1861 he was appointed curator of Sir John Soane's Museum in Lincoln's-Inn-Fields. He produced Nineveh and its Palaces, besides numerous papers for learned societies, and contributions to scientific and other journals of the time. He was versed in the reading of hieroglyphics, but never pretended to be an authority.

BON RHEA. See Boehmeria.

BON SONE. BURM.? A tree of Moulmein. Wood used for house-building purposes.

BON SURAT, the commercial name given to the fibres of the Urtica crenulata, Orchor putta.—*Royle*, p. 366.

BONTA. TEL. Mullet fish.

Bonta Ariti, Musa paradisiaca.

Bonta chemudu, Euphorbia antiquorum, *L.*

Bonta Vempali, Tephrosia purpurea.

BONZE, a corruption of the Japanese Busso, a pious man. The term was given by the Portuguese to the priests of Japan, and has since been applied to the priests of China, Cochin-China, and the neighbouring countries. In China, the bonze are the priests of the sect of Fuh (Buddha), and they are distinguished from the laity by their dress. In Japan they are gentlemen of families. The term has been applied also to the Talapoin of Siam, and to the Phoungye and Raban of Burma.

The material of which European books are now made is paper. But the peoples of South-Eastern Asia still use largely the prepared leaf of the palmyra palm tree, on which they write with an iron style. Also a thick paper board, blackened, is largely used by many as a book, on which they write with a soapstone pencil.

Eastern races give the term book-religions to the creeds of the Buddhists, Brahmans, Zoroastrians, Confucius, Lâo-tze, Jesus Christ, and Mahomed. Mahomedans designate the Jews, the Christians, and their own sect, Ahl-i-Kitāb, people of the book. The book-religions form three groups, corresponding to the race of the early worshippers. The first is the Aryan. It includes the religion of the Brahmans, professed by the mass of the people of India; the religion of Zoroaster, a branch of the Vedic, preserved by the Parsees, a remnant of the ancient Persian race now settled at Bombay; and the religion of Buddha, a schism from the later Vedic. In the third century B.C., Buddhism became, under king Asoka, a state religion. Some centuries later it was rejected by the Hindus, and now there is scarcely a Buddhist in India; while it has become a religion in China, Tibet, Siam, Japan, Burma, and Ceylon, and its members cannot comprise less than one-third of the human race. The *second* group is formed by the three Semitic religions, Mosaism, with its two offshoots, Christianity and Islam. European Christianity is a resultant of Semitic and Indo-European religions. The three Semitic religions claim a spiritual descent from their forefather Abraham. The *third* group contains the two Chinese religions of Kung-Fu and Lâo-tze. All book-religions, with the exception of Brahmanism, had a founder with a distinct personality. Zoroaster, Buddha, Lâo-tze, Confucius, Jesus, and Mahomed lived noble lives, and left their words a rich legacy to mankind. None of them professed to found a new religion; they all claimed to restore an original faith. Zoroaster spoke of the prophets who were before him: 'Such sayings of ancient times hast thou revealed, O Ahura.' Buddha only claimed to be a link in the chain of wise men; Confucius said that he was 'a transmitter, not a maker, believing in and loving the ancients;' Lâo-tze desired to revive the faith of the earliest and purest age; Moses was 'educated in all the wisdom of the Egyptians;' Jesus assures us that he came 'not to destroy but to fulfil;' Mahomed said, 'Follow the religion of Abraham; he was neither Jew nor Christian, but righteous, pious, and no idolater.'

BOOK ATTENÉ. SINGH. Alstonia scholaris.

BOOKHOOR. HIND. Perfumes burnt in exorcising.

BOOK THA. BURM. A scarce tree on the sea-coast from Amherst to Mergui. When seasoned it floats in water. It is used by the Burmese for helves, but rots quickly.—*Captain Dance.*

BOPP, F., a Sanskrit scholar, who from the year 1816 printed works on Sanskrit grammar and comparative philology. He was the founder of comparative philology; in 1816 published his work Das Conjugations-system, and between 1833 and 1853 his Comparative Grammar of Sanskrit, Zend, Greek, Latin, Lithuanian, Slavonic, Gothic, and German. His Sanskrit grammars were published in 1827, 1832, and 1834, and his Vergleichendes Accentuations-system in 1854.—*Sayce.*

BOPPAYI. TEL. Carica papaya.

BORA. HIND. Dolichos catjang.

BOR-ABOR, a race dwelling on the north of the Abor, occupying the mountains on the north of the Brahmaputra river, in lat. 28° N. and long. 95° E., to the west of the Dihong river. Bor and Abor are Assamese names for the people who call themselves Padam. Bor means tribute; hence Abor, free from tribute; and the Padam race are so arranged into the payers and non-payers of tribute. Bor is also said to mean great, and we find the term of Bor Khamti employed. They carry bows and arrows, some of which are poisoned. Their dress is made of the bark of the Udhal tree. The Bor-Abor is the more distant, the more independent, and stronger portion. The Bor-Abor lie on the higher hills. Considerable numbers of these people are also found on the shores of the two great northern branches of the Brahmaputra river. The British Government make money payments to the Bor-Abor, Dola, Miri, and Aka, to abstain from levying black-mail in Assam. In the end of 1861, the Meyong Abor attacked and plundered a village in British territory, but the tribe expressed a desire to renew friendly relations, and begged that their offences might be overlooked. On the 5th November 1862, an agreement was made with them, binding them to respect British territory; and the same engagement was subscribed on 16th January 1863 by the Kelong Abor. On 8th November 1862, a similar engagement was concluded with the Abor of the Dihong Dibang Doars.

The Abor Miri language belongs to the old Assam alliance, but it has been greatly modified by Tibetan. It has a strong ideologic resemblance to the Dhimal, Bodo, Garo, and Naga.—*Jour. Ind. Arch.* 1853; *Treaties*, vii. p. 343; *Indian Annals; Latham's Ethnology.*

BORA-CHUNG, or ground-fish of Bhutan. It inhabits the jhils and slow-running streams near the hills, but lives principally in the banks, into which they penetrate from one to five or six feet, and are found generally two in each chamber, coiled concentrically like snakes. The entrance to these retreats leading from the river into the bank is generally a few inches below the surface, so that the fish can return to the water at pleasure. It is believed that they take possession of holes made by land-crabs. The bora-chung appear to be an Ophiocephalus, probably the O. barka described by Buchanan as inhabiting holes in the banks of rivers tributary to the Ganges.—*Tennent's Ceylon*, p. 367.

BORAGINACEÆ. *Lindley.* The borage tribe, comprising the genera anchusa, borago, coldenia, cynoglossum, echinospermum, echium, ehretia, heliotropium, lithospermum, messerschmidia, myosotis, onosma, tiaridium, tournefortia, and trichodesma. Borago officinalis, *Linn.*, Ch'ota Kulpa, HIND., a plant of Europe; is grown in India as a pot herb, and the young shoots and leaves for salad; requires treatment similar to Angelica. It is suitable for the flower garden. Country borage is the Coleus Amboinicus.

BORASSUS FLABELLIFORMIS. *Linn.*

Lontarus domestica, *Rumph.*

To eastern nations, the palmyra tree is only inferior in usefulness to the bamboo, the date tree, and the cocoanut palm. It grows straight to a height of 70 feet, with a girth of 5½ feet at bottom and 2½ at top. A Tamil poem of Ceylon, the Tala Vilásam, enumerates 801 purposes to which the palmyra may be applied. The trees have to attain a considerable age before they become fit for timber, as their wood becomes harder and blacker by age, and the harder and blacker it is the better. The wood near the circumference of old trees is very hard, black, heavy, and durable. A cubic foot weighs 65 lbs., and it is calculated to last 80 years. In some parts of the Ceylon and Madras coasts, this tree is very abundant, especially in sandy tracts near the sea, though it is to be seen in most parts of India, and occasionally so far north as 30°. It is used chiefly for rafters, joists, and reepers. When of good age, the timber is very valuable for this purpose. The trunk is split into 4 for rafters, into 8 for reepers; these are dressed with an adze. Those of the Jaffna palmyras are famous, and were, in former times, largely exported. From the structure of the wood, it splits easily in the direction of its length, yet supports a greater cross strain than any other wood. Old black palmyra wood was, next to the casuarina, the strongest wood that Dr. Wight tried. One specimen bore upwards of 700 lbs., and five of them gave an average of 648 lbs., though he found some very bad. Mr. Rohde also remarks that it is the strongest wood he tried, retaining for a length of time the position it assumed when loaded, without increase of deflexion. Iron nails soon rust in this wood. The thickness of rafters when trimmed up rarely exceeds two inches four feet from the ground, and one inch at twenty or twenty-four feet from it.

The fruit and the fusiform roots of the young trees are used as articles of food by the poorer classes, the fruit when young being jelly-like and palatable. Next to Caryota urens, it is the largest palm on the coast of the Peninsula. The dried leaves are used for writing upon with an iron style; also in thatching, making fans and light baskets for irrigation. The fibres of the petioles of the leaves (Palmyra nar) are employed for making twine and small rope; they are about two feet in length. The large carpenter beetle, Xylocopa, delights in boring this hard wood, though cumboo wood is still more attractive to it. Small canoes are formed of this tree. Two of the stems lashed to a couple of spars form the usual mode of crossing lakes and rivers in the Circars; the root forms the head of the canoe, the smaller end is either elevated out of water by the form, or some six inches of the pith is left at that end; as this decays, a lump of clay supplies its place. Formerly sea-going vessels were planked with this wood, but the iron fastenings were soon destroyed. Boats planked with it were, till the middle of the 19th century, common on the Godavery, being built probably where sawyers are not procurable. The peculiar structure of the wood of all the palms deserves attention; it appears formed of a series of hard, stiff longitudinal fibres, not interlaced or twisted, but crossed at considerable intervals at various angles by similar fibres, which proceed from the soft heart of the tree to the outer part, probably to the leaf-stem. A radial section of palmyra rafter shows this. The interstices are filled up with pith, the proportion of which increases with the distance from the outer part. The wood, known as porcupine wood, is used in England for veneers and inlaying. In Ceylon it is used for rafters, pillars, and posts of native houses. In the sandy parts of Jaffna, in Ceylon, a hollow palmyra is inserted to form a well. The dark outside wood of very old trees is used to some extent in Europe for umbrella handles, walking-canes, paper-rulers, fancy boxes, wafer stamps, and other articles. The timber of the female tree is the hardest and best; and that of the male tree is never used unless the tree be very old. At certain seasons of the year, thousands are employed in felling and dressing it. Each tree has from 25 to 40 fresh green leaves upon it at a time, of which the natives cut off twelve or fifteen annually, to be employed as thatch, fences, manure, mat, and mat baskets; bags, irrigation baskets, winnows, hats, caps, fans, umbrellas, etc.; books and olay, tatakoo or puttay, for writing on. In the Northern Konkan it is in some parts so abundant that it might be termed a forest. It is a rare tree in the southern jungles of the Bombay Presidency. The wood, when protected from moisture, is very durable, and may be used with advantage for terraces, etc., when the upper covering is complete. Its fruit, of the size of an ostrich egg, grows in clusters; but trees from which toddy or palm wine is drawn, cannot bear fruit. When the spathes of the fruit-bearing trees appear, the toddy drawer, climbing to the top of the tree, binds the spathes tightly with thongs to prevent their further expansion, and thoroughly bruises the embryo flowers within. For several succeeding mornings this operation of crushing is repeated, and each day a thin slice is taken off the end of the racemes, to facilitate the exit of the sap and prevent it bursting the spathe. About the morning of the eighth day, the sap begins to exude, when the toddy drawer again trims this truncated spathe, and inserts its extremity into an earthen pot to collect the juice. These vessels are emptied morning and evening, and the palmyra will continue for four or five months to pour forth its sap at the rate of three or four quarts a day; but once in every three years the operation is omitted, and the fruit is permitted to form, without which the natives assert that the tree would pine and die. The tree, during the first part of the season, yields a pretty large quantity of palm wine. This is either drunk fresh drawn from the tree, or boiled down into a coarse kind of syrup called jagari, or it is fermented for distillation. The date tree in South India also furnishes toddy, and the amount of daily drunkenness exceeds all that is ever witnessed in Europe. A farina, called Ila-Pananki jangu mavu, is obtained from the root by treating it as in manufacturing manioc. It is very nourishing. The germinating seeds (Ponatoo, SING.) are boiled and eaten in Ceylon as a vegetable.—*Seeman; Simmonds; Drs. Wight, Cleghorn, Gibson; Mr. Rohde; Hartwig*, p. 139; *Sir J. E. Tennent*, ii. p. 523.

The greater part of the crude borax or tincal met with in commerce, was formerly obtained from lakes in Tibet, the waters of which yield a yellowish-white mass, containing from 30 to 50 per cent. of real borax. That was refined chiefly at Venice and Amsterdam. Recently, a lake with waters similarly impregnated has been discovered at California. But, for a long time past, in Europe, the borax of commerce has been obtained by treating with carbonate of sodium, the boric acid obtained from the volcanic district of Tuscany, where jets of vapour issue from the ground. Natural borax is obtainable in large quantities in the valley of Puga, in Ladakh, from Lake Jigatzi in Tibet, 20 miles in circumference; also in the course of the Sanpu river, and from the Chaba lake beyond the Kylas hills. It is collected on the borders of the Tibetan lakes as the water dries up, then smeared with fat to prevent loss by evaporation, and transported across the Himalaya on the backs of sheep and goats, then refined at Umritsur and Lahore by washing with lime water. The salt and borax fields of Gnari, called Lha-lhaka or Lhali-lhaka, are to the north of Bongbwa Tal. Borax is procurable at Rudok in Changtan at ten annas per maund, of such quality that only about a quarter is lost in refining. That obtained at Puga, in the territory of the maharaja of Kashmir, loses one half. The Rudok borax is conveyed on sheep to Rampur on the Sutlej, at the rate of two miles a day, so that the price on the plains of raw borax rises to 7 rupees the maund, and of refined borax to 25 rupees.—*M. and M. Pr.* 1872–3. It is largely imported into Digarchi, whence it is distributed to other parts of Tibet and to India,

via Nepal, Sikkim, and Bhutan. It is used in the arts to clean metals before soldering, to form a glaze on earthenware, and in the preparation of varnishes. It is employed as a chemical flux, and in experiments with the blow-pipe, and in the moist way as a solvent for gum-lac. It is much used by the goldsmith, tinkers (Cannar, TAM.), and tinmen (Tagara-velecarer, TAM.), to facilitate the fusion of their metals. With it and lime-juice, the vaishnava Hindus prepare the irred Tiruchurnum, with which they mark their fore-heads perpendicularly. Borax is readily purified by simple solution and crystallization. It is sometimes adulterated with alum and common salt; but ammonia gives a white precipitate (alumina) if the former, and nitrate of silver a white precipitate if the latter, be present. Price of raw borax, 4d. per lb.; of refined borax, 6d. per lb.—*Beng. Phar.; Ains. Mat. Med.; Cal. Cat. Ex.* 1862; *Powell, Handbook.*

BORE or Tidal wave.

The dee lon, . . BURM.	Bana, ... MALAY.
Eagre, ... CHIN.	Bar, ... PERS.
Ban, Bora, . . . HIND.	

The bore occurs in Southern and Eastern Asia on several rivers, in the Gulf of Cambay, the Ganges, the Irawadi, and the Sitang, and on some rivers in China. Arrian (Exped. Alex. vi. 19) mentions how this phenomenon astonished the soldiers of Alexander, who had been accustomed to the tideless waters of the Mediterranean. The bore is a tidal wave which comes rolling in from the sea. In the Hoogly this is called Bora or Bore; in China it is known as Eagre; in the mouth of the united Tigris and Euphrates it is called Bar; in the Dordogne in France, it is called Mascaret; in the Maranon it bears the name of the Rollers; but by the American Indians it is called Pororca. This phenomenon is connected with the tides, as it always occurs at the springs.

The crest of the tidal wave in the Bay of Bengal, to the south of the bay, is almost a straight line running N.W. and S.E. between the south coast of Ceylon and the southern coast of Java. As it proceeds up the bay, it becomes convex towards the shore, and near the estuary of the Megna encounters at an obtuse angle vast quantities of fresh water coming down the three channels. When the tide is more than usually strong, as at full moon or under the influence of a strong S.W. wind, or when the river is heavily flooded, the opposing masses of water accumulate more rapidly, and the bore is produced. But when this occurs there are always two bores, one of salt water up the Sundip channel, known as the Chittagong bore; the other, called the Daula bore, up the middle and western channels. These two bores meet to the north of Siddhi. When the bore is violent, as during the equinoxes, and also when the S.W. wind is strong, it advances as a wall of water several feet high, stretching across the channels, and is so dangerous that native boatmen will for no consideration venture out into the river. Dr. Hooker mentions that, at the mouth of the Megna river, the great object in the navigation is to keep afloat and to make progress towards the top of the tide and during its flood, and to ground during the ebb in creeks where the bore (tidal wave) is not violent.

Similarly, the bore in the Hoogly is occasioned by the flood-tide, driven into the narrow river through the broad estuary, overcoming the freshes sent down by the heavy rains of the S.W. monsoon. It occurs between May and October, but is heaviest between July and September, between two days before and two days after the full moon. It also occurs at the change, but not with such violence. The wave usually rises on the Diamond Sand, where the river suddenly contracts and comes in 12 or 15 feet perpendicular with tremendous noise, carrying everything before it, though not with equal force, on both sides of the river, as it goes from point to point in the reaches, travelling at the rate of nearly 20 miles an hour to above Calcutta. There are generally three rollers following one another in quick succession, at 13 to 15 feet apart. When the S.W. monsoon has set in, the bore, for three or four days at the full and change of the moon, may be seen racing up the Hoogly river at the rate of twenty miles an hour, dashing from side to side of the river according as the bends or reaches deflect it in its course. Upon the approach of this wave a distant murmur is heard, which soon turns into the cry, Ban! ban! ban! from the mouths of thousands of people, boatmen, sailors, and others, who are on the look-out for this much-dreaded wave. This cry is the signal for all sorts of small craft to push out into the centre of the river, the only spot where the wave does not curl over and break. Should any boat or small craft be caught in that portion of the wave that breaks, instant destruction is inevitable. Numerous boats from the up-country provinces are lost every year, from the crew being ignorant either of the existence of the bore, or from not knowing the correct position to take up so as to meet it. Ships at anchor in Calcutta, though not exposed to the breaking portion of the wave, frequently part their cables when struck with the wave. Standing on the shore during the rapid rushing passage of the bore, it is a curious sight to see the lower portion of the river, or that nearest to the sea, six or eight feet higher than the upper portion of the river, the tide rising that number of feet in an instant. The height of the bore in the Hoogly, varies from five to twelve feet; it is exceedingly dangerous in some parts of the river, but more moderate in others; it never breaks on both sides of the river at the same time. Deep water engulfs its force, but shallow water, or a sandbank, brings out all its power and fury. The bore, in 1782, flowed as far as Nuddea in the Hoogly, but at the present day it falls short of that place by many miles, not ascending much beyond Sooksagor. It reaches Dacca on the Buree Gunga, and Castec on the Horinghatta branch.

In the Sitang river, of Burma, its fury is great, and occasions much loss of life. Burmans name 30 feet as the height to which it occasionally rises, and this may perhaps be the case in the bends of the river, where the rush has attained its full speed, before being reflected to the next bend. Even in the Hoogly at Calcutta, near the bend at Chandpal Ghat, the pointed curling wave may be seen several feet high.

The bore of the Tsien-tang river, in China, according to a Chinese proverb, is one of the three wonders of the world, the other two being the demons at Tang-chan and the thunder at Lung-chan. As in other countries, it appears generally on the 2d or 3d day after the full and

change of the moon, or at what are called spring tides, and particularly in spring and autumn, about the time the sun is crossing the line. Should it so happen that strong easterly gales blow at these times, the eagre rolls along in all its grandeur, and carries everything before it. Dr. Macgowan gave an account of it at Hang-chow-fu. Mr. Fortune, from a terrace in front of the Triwave temple, saw on a sudden all traffic in the thronged mart suspended; porters cleared the front street of every description of merchandise; boatmen ceased lading and unlading their vessels, and put out into the middle of the stream; so that a few minutes sufficed to give a deserted appearance to the busiest part of one of the busiest cities in Asia. The centre of the river teemed with craft, from small boats to large barges, including the gay flower boats; loud shouting from the fleet announced the appearance of the flood, which seemed like a glistening white cable stretched athwart the river at its mouth, as far down as the eye could reach. Its noise, compared by Chinese poets to that of thunder, speedily drowned that of the boatmen, and as it advanced, at the rate of 25 miles an hour, it assumed the appearance of an alabaster wall, or rather of a cataract, four or five miles across, and about thirty feet high, moving bodily onward. Soon it reached the advanced guard of the immense assemblage of vessels awaiting its approach, all intently occupied in keeping their prows towards the wave, which threatened to submerge everything afloat; but their boats all vaulted, as it were, to the summit with perfect safety, and when the eagre had passed about halfway among the craft, on one side they were quietly reposing on the surface of the unruffled stream, while those on the nether portion were pitching and heaving in tumultuous confusion on the flood, and others were scaling with the agility of salmon the formidable cascade. This grand and exciting scene was but of a moment's duration. The wave passed up the river in an instant, but from this point with gradually diminishing force, size, and velocity, until it ceased to be perceptible, which Chinese accounts represent to be eighty miles distant from the city. A slight flood continued after the passage of the wave, but it soon began to ebb. The Chinese say that the rise and fall of the tide is sometimes forty feet at Hang-chow. The maximum rise and fall at spring tides is probably at the mouth of the river, or upper part of the bay, where the eagre is hardly discoverable. In the Bay of Fundy, where the tides rush in with amazing velocity, there is at one place a rise of twenty feet, but there the magnificent phenomenon in question does not appear to be known at all. It is not, therefore, where tides attain their greatest rapidity, or maximum rise and fall, that the wave is met with, but where a river and its estuary both present a peculiar configuration.—*Fortune, A Res. among the Chi.* p. 316; *Calcutta Review; Arrian; Geog. Mag.* 1877; *Findlay.*

BORECOLE, Brassica oleracea, var. Scotch Kale; winter greens of England and Scotland.

BOREE and Boregaum are names for numerous towns of British India, many seemingly obtaining their designation from the Hindi word Burha, meaning old. Boregaum would be old town.

BOREE. SIND. Typha elephanta.

BOREGHAT, a pass in the Western Ghats leading from Bombay to Poona, in lat. 18° 46′ 45″ N., and long. 13° 23′ 30″ E. Its summit is 1798 feet above the sea.

BORENDA or Buang, a pass in the Himalaya, in 31° 22′ N. and 78° 6′ E., in Garhwal-Kanawar. The top of the pass is 15,296 feet according to Herb. and Hodgson, but 15,095 feet according to Gerrard. The source of the Pabar is 12,914 feet, Herb. and Hodgs., but 13,839 feet, Ger. It leads from the Baspa valley to the upper part of the Pabar or Tons river.—*Thomson, Tr.* 75; *Schl.*

BORER. ENG. A name given to the larva of coleopterous beetles which injure coffee trees, though the Casuarina and the Cinchona are also attacked by insects which have not been determined. There are two, the white and red borer, and the former and chief of these is the Xylotrechus quadripes of Chevrolat. The white borer has been likewise named the Sirex gigas, and popularly the worm or coffee fly. Whole estates in Coorg have been entirely destroyed by this scourge. In its complete stage the insect appears as a fly or winged beetle from 6 to 9 lines in length, with a hard slimy coat, in colour red and black, or yellow and black, in alternate transverse lines. It bores a passage into the stem of the coffee tree, generally a few inches above the ground. This passage, at first horizontal, soon takes an upward or spiral direction, and after a little a retreat is formed in which to deposit its larva. The tree soon begins to droop, and in a short time dies down to the point where the entry was effected, at which part it can be easily broken off by a sharp pull at the upper part. The large and rapid introduction of coffee-growing into Ceylon and India has shown that the plant is liable to be attacked by many enemies, and ignorance of that has been the cause of much loss. Coffee trees in Coorg have also been injured by the rot, a disease resulting from improper pruning. The rot attacks and decays the centre of the stem. In Coorg, when the tree is attacked by the borer, the leaves become yellow and droop. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the females near the root of the tree, and the pupa borers tunnel up the heart of the plant.—*Dr. Bidie on Coffee Planting.* See Bug.

BORI. MAL. Croton seed.

BORI, a sweetmeat of Dera Ghazi Khan, in yellow lumps, consisting of the pollen of the dib grass (Typha elephanta and T. angustifolia) collected and kneaded together, perhaps with the aid of a little treacle or sugar.

BORI, a small forest tract 30 square miles in extent, situated S. of the Pachmari range of hills in the Ch'hindwara district, and containing some fine teak and other timber.

BORNA COTI, in Hinduism, an imaginary city, supposed to lie under the equator at 90° from Lanca.

BORNELLA DIGITATA. *Adams.* A nudibranch or marine slug, which occurs in the tropical seas in the south of Asia, at Aden, in the Straits of Sunda, and on the Madras coast. It has brilliant colours, with vermilion streaks, is delicately marbled, and has waving elegant tufts. It swims by a lateral movement of the body.—*Collingwood, Rambles of a Naturalist*, London, 1868.

BORNEO, after New Holland, is the greatest island on the globe. If we comprise the numerous archipelagoes by which the island is environed, this group may be said to occupy more than eleven degrees of longitude and about ten of latitude, between lat. 7° N. and 4° 20′ S., and between long. 106° 40′ and 116° 45′ E. Its length from north to south will be about 300 leagues, and its breadth varying from 250 to 150 leagues. Its superficies, calculated by Melvill von Carnbee, and published in Le Moniteur des Indes, gives Borneo a surface of 12,741 square leagues, or 6992 myriametres, which makes it 2589 myriametres greater than Sumatra, and 5723 myriametres greater than Java. A native of Portugal, Lorenzo de Gomez, was the first of the European navigators who approached the northern part of this island, in 1518, in the ship St. Sebastien, on his route to China. He says that the natives termed it Braunai or Brauni, but the aborigines do not use any name appropriated to the whole extent of the country. The seaboard is even most often unknown to the savage and wandering tribes, who are separated by great distances from each other. The different tribes designate themselves by the names which they give to the rivers on the borders of which they have established their abode; it is thus that all the Dyaks of the great river Duson (the Banger of the maps) call themselves Orang Duson, and those of the river Sampit, Orang Sampit; Raja Brooke makes mention of Dyak tribes under the names of Sarebu, Sakarran, Lundu, Sibnuw, etc., established on the rivers which bear those names. Lofty ranges of mountains are in the centre and the north-west. Mr. St. John, in 1858, found each range looking more lofty as he approached the interior, but presenting one uniform aspect of forest, covering hill and valley. The great mountain Kinibaloa, in the N.E., is 13,000 feet high. The land on all sides gradually slopes towards the coast. The Sultan of Braunai claims an immense territory. The Dutch claim a territory exceeding 200,000 square miles on its western and south-eastern sides, with a population in 1881 of 1,014,547. The Spaniards till lately claimed territorial rights; and in 1881 Great Britain allowed a British company to obtain from the Sultan 30,000 square miles and 500 miles of seaboard, with the royal rights of life and death. Labuan has belonged to Great Britain since the middle of the 19th century, and Sarawak to the Brooke family.

Its inhabitants are generally recognised as of the Malay, the Kyan, and Dyak stocks. The Malay are settlers along the coast from Sumatra, Java, and Malacca; the Dyak is the name for the prior races, divided into land and sea Dyak, the latter being richer and more powerful, those of the interior being broken up into innumerable clans, some of them being tributary to the Sultan of Braunai, some of them under the Dutch in the south and west of the island, and some under the Sarawak Government. The *Millanowe* are on the north-east of the Sarawak territory. They are of a fair complexion, and are occupied with agriculture, trade, and peaceful pursuits. The *Kyan* are a powerful tribe of about 100,000 souls, who occupy the country from the south of the kingdom of Braunai right away into the interior; they strongly resemble the Dyak.

The *Dyak* are generally well made, with a muscular, well-knit frame, and are rather under than over the middle height. Their features are regular. Their colour is a deep brown, occasionally varying to a lighter shade. They dwell in very long houses, occasionally large enough to contain a community. From their supposition that the owner of every human head which they can procure will serve them in the next world, the system of human sacrifice surpassed that which was practised by the Batta of Sumatra, or, it is believed, by any people yet known. A man could not marry until he had procured a human head; and the possessor of several was distinguishable by his proud and lofty bearing. The chiefs sometimes made excursions of considerable duration for the sole purpose of acquiring heads, proceeding in their canoes to the more distant parts of the country, to which the numerous ramifications of the rivers afford them easy access. Upon their arrival near a village, if the party were small, they would take up their position in the bushes close to some pathway, and attack a passer-by unawares. A larger party would attempt perhaps to surprise a whole village; would remain concealed in the jungle on the banks of the river during the day, and at night surround the village so completely as to prevent the escape of the intended victims; an hour or two before daybreak, the attack commenced by setting fire to the houses, and their victims were destroyed as they endeavoured to escape. Apparently head-hunting was only general among those tribes inhabiting the banks of the large rivers, on which distant voyages can be made with facility, the Dyak race in the northern parts of the island being content with an occasional human sacrifice on the death of a chief. The sacrifice of a cock is sacred, as with the Karen and Chinese, and they believe that the Divine Being eats the spirit or essence of the offerings made to him. Head-hunting is now scarcely heard of. They are brave, hospitable, simple, and truthful, loyal, grateful, and willing to receive instruction. Chastity before marriage is not insisted on, and they marry when grown up. The men wear a narrow cloth passed between the thighs. The women have a still narrower strip, allowed to fall from the hips half way down the thighs, and affords little concealment. The clans have different languages, and they had no written character. With some Dyak tribes the couvade custom prevails. Among the Millanowe Dyaks the custom prevails of burying a slave at the foot of the excavation for a house post. The Millanowe, southward and westward, living on rivers near the sea, an industrious, intelligent people, who occasionally took heads, but have not the ferocity of the Kyan.

Orang Poonan, a forest race near the territory of the Mahomedan sultan of Koetei. Their tribes, like the Veddahs of Ceylon, pass day and night entirely in the open air, with no other shelter than a mat. They keep up fires all night. They wear a head-dress and a waistcloth of bark, and eat monkeys and game, which they kill with the sumpitan or blow-tube and poisoned arrows. The women are fairer than the Dyaks, but very dirty in their persons. They welcomed Mr. Bock by asking for beads and tobacco.

Mr. Carl Bock, writing in 1881, mentions his visit to a chief of the cannibal Dyaks, who had just slaughtered, and, with his followers, eaten up

seventy victims. He allowed himself to be sketched, and presented the author with two crania and a shield, in return for rice, beads, and twenty-four yards of calico. A high priestess of these savages stated that the palms of the hand were considered the best eating. A war-dance was executed by a Dyak, with much shouting, stamping, and flourishing of a sword. A Dyak is never without his sword, and his basket for betel and tobacco. Generally he wears a cloth or piece of bark round his loins, and a covering for the head of the same material. The lobes of their ears are hideously enlarged by artificial means; and when a warrior has secured a good many skulls, he is allowed to deck his ears with the canine teeth of a leopard. The Dyak, in their physical and social characteristics, resemble the Tarajah of Celebes.

The *Idaan*, occupying the northern parts of Borneo, suspended human skulls in their houses. The dominant Malay and the colonists of China are an active and industrious but turbulent and intractable part of the population (Revue de deux Mondes, ii.).

The *Orang Duson* villagers of the north are agricultural; the *Murut* in the inland parts of Braunai; the *Kadians* of the same country, are industrious, peaceful nations, valuable for those qualities.

The *Kyan* are more numerous, more powerful, and more warlike than any other in Borneo. They are an inland race, inhabiting a district extending from about sixty miles up the interior from Tanjong Barram to within a similar distance on the eastern shore. Fierce, reckless of life, and hot-blooded in their nature, they are nevertheless represented to be hospitable, kind, and faithful to their word, and honest in their dealings. The Kyan, on the Kapuas, are said to have been cannibals, eating the flesh of their enemies. They prize heads like the Dyaks. They carry spits in the scabbards of their swords. The Dyaks of Jangkang also are said to be cannibals. They live between Sangow and Sadong on the Sakiam, a branch of the Sadong river. The Jangkang people eat Malays or Dyaks or any one else whom they kill in war, and they kill their own sick if near death, and eat them. Whilst a party of this people were staying at Sangkang, one of them fell out of a mango tree and broke his arm, besides being otherwise much hurt, and his companions cut his throat and ate him up. The Jangkang Dyaks are said to eat only the tongue, brain, and muscles of the leg. The men of this tribe file down their front teeth to a point, like the teeth of a saw. They cut off their beards.

The *Tatau*, *Balinian*, and *Kanawit* have dialects of their own, and are wild and savage in their manners. Nine vocabularies have been collected, the most extensive by Mr. Robert Burns, and it is that of the most numerous, advanced, and powerful tribe in the island, the Kayan or Kyan, whose possessions extend from the northern to the southern coast. No native tribe of Borneo has ever invented letters. Mr. Crawfurd had seen the names of at least sixty of these small nations who have no common name by which to distinguish themselves from the people of other regions. The many languages of this island belong to the same class of languages as the Malay and Javanese; and the aboriginal inhabitants of Borneo are all of the same race with the Malays and Javanese. In 1824, out of the forty wild tribes in its interior, eight had adopted Mahomedanism and the Malay language. Amongst these were the Dyak race of Sugalam, who long since abandoned the cruel practice of head-hunting. There are eleven tribes located between the Malay of the coast and the Kyan, namely the Kanawit, Bakatan, Lugat, Tan-yong, Tatau, Balinian, Punan, Sokapan, Kajaman, Bintulu, and Tilian, the majority of whom are tributary to the Kyan. The six first mentioned are all more or less tattooed, both male and female, and certainly have all sprung from the one called Kanawit, who in habits closely assimilate to the Dyak of all Saribus, whose neighbours they are. The tribes Punan, Sakopan, and Kajaman are the chief collectors of camphor and birds' nests. The trees, which produce excellent timber, amount to upwards of sixty species.

At the mouths of most of the rivers on the east coast of Borneo, and also on the north and north-east coasts, the *Orang Baju* are found. They dwell in boats of eight or ten tons burden, which are covered, when in harbour, with a roof of matting. Each boat contains about fifteen inhabitants, men, women, and children, who employ themselves chiefly in catching and curing fish and trepang, and in making salt from seaweed. The latter they dispose of to the Dyaks. The women are equally skilful with the men, both in fishing and in the management of the boats. During the south-east monsoon, when the weather is fine in the southern parts of the island, they cruise about Passir and Pulo Laut; but when the monsoon changes, they sail on the northern parts of the island. In addition to these, living in prahus, and wandering about the shores of the island, are the *Lanun* from Magindano, and the *Orang Tidong*, country unknown. Brazen images, ruins of temples, and other remains of Hindu civilisation, are still to be seen on the southern coast. The coasts of the island are inhabited by several nations, totally unconnected with each other, governed by their own laws, and adopting their own peculiar manners and customs. The west coast is occupied by Malays and Chinese, the north-west coast by the half-caste descendants of the Moors of Western India, the north part by the Cochin-Chinese, the north-east coast by the Sulu, and the east and south coasts by the Bugis tribes of Celebes. The greater part of the coast of Borneo is rather dotted than peopled by Malay settlements, according to the Malays themselves, the result of migrations from Sumatra dating as far back as thirty generations. A small portion of the eastern coast is occupied by settlements of the Bugis of the Celebes of more recent date. The aboriginal inhabitants are thus in a great measure locked up in the interior, and precluded from access to that commerce with strangers which might civilise them. The Malays and natives of Celebes, by their superior civilisation and power, domineer over the rude aborigines, without, however, being able to penetrate into the interior, or to dispossess them of their land. The Malays build their houses 18 or 20 feet high, to avoid the Dyak spears. All the houses in a kampong are erected on posts 10 or 12 feet high, and are all under one roof, with only a slight partition separating the families.

Borneo, as a mineral country, is very rich, producing gold, coal, antimony, and iron, while caoutchouc and gutta-percha are amongst its

vegetable products. From the river Baram coal is traced to the upper parts of the Bintulu, and thence southward to the Rajang river, on the left bank of which, at Tujol Nang, there is a seam exposed, upwards of thirteen feet in thickness. At different other parts of the river, and also in several of its branches, coal is in abundance. From Tujol Nang the strike of the coal is southward across Dragon's plain. It is again found in the river Lang-Tha (a distance from the former place of about fifty miles), where it remained in a state of ignition for several years. Iron ore, yielding from 60 to 80 per cent. of iron, abounds in the Baluwi or Rajang district, over nearly one-half of the extreme breadth of the island. The iron is preferred to that of Europe.

The varieties of animal life are great. Some species of Actinia of enormous size occur in the China seas and on the coasts of Borneo, and fish live within them. Of 29 species of birds in Borneo and 21 in Sumatra, 20 are common to both islands. Of 29 in Borneo and 27 in Java, 20 are common to both islands. Of 21 of Sumatra and 27 of Java, 11 are common to both islands. The remarkable coleoptera beetles found in Borneo by Mr. Wallace, were the Neocerambyx æneas, Cladognathus tarandus, Diurus furcellatus, Ectatorrhinus Wallacei, Megacriodes Saundersii, Cyriopalus Wallacei. He collected about 2000 distinct kinds of beetles.

On every mountain-top is the pitcher plant, climbing over trees or running along the ground. The finest are on the summit of Kinibaloa; and the pitcher of the broad sort, Nepenthes raja, will hold two quarts of water. Another, the Nepenthes Edwardsiana, has a narrow pitcher twenty inches long, and grows to a length of 20 feet. Ferns are abundant. The Vanda Lowii, one of the Orchidaceæ, grows on the lower branches of trees. Its flower-spikes, 6 or 8 feet long, hang down to the ground, bearing large handsome flowers, 3 inches across, colours varying orange to red. The Polyalthea or tree-fern rises from a pyramid of roots, which descend for 70 or 80 feet to the ground below.—*Wallace*, i. 37, 161; *Journ. Ind. Arch.* 1845, 1849; *John's Ind. Arch.* ii. p. 265; *Quarterly Review*, No. 222; *Marryat's Ind. Arch.* p. 10; *Earl's Ind. Arch.* p. 270; *Voyage of the Menander in J. I. Arch.* 1853; *Carl Bock's Headhunters of Borneo; Regering's Almanac; Low's Sarawak*, p. 59; *Pritchard's Researches.*

BORO or Bodo, a race chiefly found in the forest tract, 15 to 20 miles broad, between the Himalaya mountains and the plains. They entered from northern Assam along the southern side of the Brahmaputra to the Surma, and along the skirts of the Himalaya as far west as the Konki, and are also spread in large numbers over the eastern portion of the space between these two diverging lands, that is, Middle and Lower Assam, outside the forest limits, between lat. 25° to 27° N., and long. 88° to 93° 30′ E. It is the northern Cachari who are said to have occupied the eastern part of Assam, and to have conquered Kamrup about 1000 years ago, spreading over Assam, Cachar, Tiperah, and Sylhet, and it is presumed as far as the present western boundary, on the north. The Rangtsa have for many centuries been intermixed with Nagas and Mikirs. The Hajong, who are found along the foot of the hills from Gauhatti to Sylhet, appear to preserve the same name. Mr. Hodgson considers that they and the Rabhas of the same tract are Bodo. The Rangtsa, according to their own traditions, come from the N.E. of Assam, where they conquered Kamrup, and extended their sway over all Assam, Cachar, the Barak valley, and Tiperah, nearly four centuries before the Ahom invasion. The period falls within the era when Tibetans spread into the Sub-Himalayas and Bengal; and as the conquest or resumption of Kamrup by the Koch'h took place some time before the beginning of the 12th century, the event was probably connected with the decay of the Tibetan or Tibeto-Himalayan predominance. They seem to have been the principal Tibetanized tribe of Lower Bhutan. The ruling families in Hirumbha (Cachar) and Tiperah appear to have remained Cachari; and it is probable that the Cachari retained a certain degree of independence along the skirts of the Himalaya. The Hirumbha tribe call themselves Rangtsa or Ramsa, and give the same name, Ramsa, to the languages of the Cacharis of the plain; Bodo, their own tongue being called Hoje or Hojai. The Hojai, according to Mr. Grange, is totally different from that of the Cacharis of the plain.

The western branch of this tribe belongs to Behar and Bengal, and to the Sikkim and Bhutan frontiers; the eastern branch occupies Assam and Koch-Bahar. They reside in villages of from ten to twenty huts; their clothing consists of cotton and silk materials. Fermented barley, rice, or millet is used by them as a slightly intoxicating beverage, which resembles the ajimana of the Newar of Nepal. They do not occupy a locality permanently, clearing and cropping and moving again to clear and crop another spot. A Bodo and Dhimal will only touch flesh which has been offered to the gods by a priest. The bridegroom purchases his bride either by money or labour. Polygamy is rare. There are professed exorcists among them.

The eastern Bodo in Cachar are called Borro, and are divided into the Cachari of the hill country and those of the plains. They are partly Hindu and partly pagan. Those in the plains in Assam are called Hazai, Hojai, or Hajong; are of the Hindu creed, and speak a Hindi dialect. The hill Cachari is stouter, hardier, and more turbulent, and lives in villages of from 20 to 100 houses. Like the Naga, their young men reside together in a large building. Chatgari, a frontier district between Desh During and the Bhutan hills, is the chief locality of the Borro of Cachar, the numbers there being about half the whole Boro population. Of the three separate people, the Koch'h, the Bodo, and the Dhimal, the faintly yet distinctly marked type of the Mongolian family is similar in all three, but best expressed in the Bodo features and form. When the Mahomedan power was established in Bengal, the Koch'h (Kocch or Kavach) kingdom extended from long. 88° to 93° E., and from lat. 26° to 27° N., from the south-eastern extremity of Nepal along the southern extremity of Sikkim and Bhutan into Assam, with Koch-Bahar as its capital; and the people consisted of the present Koch'h, Dhimal, and Bodo. They dwell in the sal forests with impunity.—*Latham's Descrip. Ethn.; Hodgson.* See Cachar; India; Kocch.

BORO-BODOR, a great Buddhist temple in Java, with figures similar to those in the Buddhist

temple at Gaya. It was designed by artists from the west of India, and is supposed to have been erected during the latter half of the 7th century A.D. It must have taken about 100 years to complete. Its figures show that the Buddhist Mahayana doctrines prevailed.—*Ferg.* p. 345.

BORODHA. URIA. Bauhinia variegata.

BOROJUAN. BENG. Ptychotis ajwain.

BOROKOLEE. TEL., URIA. This tree is supposed to be a species of Zizyphus. Planks, doors, boxes, matchlock stocks, and palanquins are made of its wood; the leaves, pounded and mixed with turmeric, are said to be efficacious in curing rheumatism; the seeds are also used medicinally in diseases of infants; the tree yields lac.—*Captain Macdonald.*

BORRERA ASHNEH, *Royle*, is the Chulchilhera lichen of the Himalaya. With ammonia it gives a reddish-brown colouring matter, and is used accordingly as a dye-stuff. Dr. J. D. Hooker found only this Borrera on the Donkia pass of the Himalaya, at an elevation of 22,000 feet; it migrates over the lofty slopes and ridges, blown about by the violent winds.—*Royle; Hook. Him. Journ.; O'Sh.* p. 672; *Z. in Indian Field.*

BORSIPPA. See Birs Nimrud.

BOS, a genus of bovine animals. See Bovinæ.

BOSCA TRINERVA. *Roxb.* A large tree of the Circar mountains.—*Rohde, MSS.; Roxb.*

BOSCAWEN, a British admiral, who in 1747 sailed for India with a great armament. On his arrival at Fort St. David, he took command of all the land and sea forces, and marched against Pondicherry, to which he laid siege on 23d June 1748, but raised it in November. In 1749 he took part in the war against Tanjore. In August he received Madras from the French, and in October returned to Britain.

BOSTAN AFROZ. HIND. Celosia cristata.

BOSTRICHUS. See Insects.

BOSWELLIA glabra and B. thurifera occur in India. They yield a fragrant gum-resin, called in Arabic Luban, also Kundur, supposed to be the Λιβανος of Theophrastus, and the Thurea virgo of the Romans. It seems to be olibanum, and identical with the frankincense that was used by the ancients in their religious ceremonies. Dr. Carter described and figured the frankincense tree of Arabia; and Captains Cruttenden, Vaughan, and Kempthorne have noted the presence of frankincense trees in the Somali country. Dr. Birdwood described three of these trees, with figures, and is of opinion that the frankincense or olibanum of commerce is obtained from the Somali country, and from Hadramaut in Arabia, being partly re-exported from India to Europe. He described five plants under this genus, and named the three new ones, Boswellia Carterii (Mohr Madow of the Somali), Boswellia Bhau Dajiana (Mohr Add of the Somali), and Boswellia Frereana (Yegar of the Somali). B. glabra yields a resin used as incense and as pitch. Resins analogous to olibanum are obtained from species of Croton, Bailleria, Amyris, Icica, and Lœtia of America. —*Birdwood.*

The Gum-resin, Olibanum.

Koondricum, MALE., TAM. | Salaee Gond, Gugal, HIND.

Captain Beddome says this fragrant resin-yielding tree is very common in many of the dry sub-alpine jungles of the Madras Presidency, particularly on the eastern side of the presidency, on the Vellore, Cuddapah, North Arcot, and Kurnool hills; Mysore, Guzzlehatty pass, etc. etc. It grows also in Kumaon, though rare west of the Jumna, but it does not occur in Ceylon. It flowers in January and February, generally when quite destitute of leaves, and the tree is of good size. The gum-resin is the olibanum of commerce, and is much used as a fragrant incense, and (when boiled with oil) as pitch. It is said to possess stimulant, astringent, and diaphoretic properties. It is largely used in some parts of India as an application to indolent sores, and is supposed to form the chief ingredient in 'Wroughton's ointment.' It is well deserving of careful attention, and can be procured in almost any quantity. The substance is bitter and pungent, and is soluble in ether and spirits of wine. In Kumaon nothing is known of its yielding the salaee, gum-resin. Its timber is said by the natives to be of little or no value.—*Roxb.; Powell, Handbook; Econ. Prod. Panjab; Rohde, MSS.; Beddome, Fl. Sylv.* p. 124; *Mr. Thompson.* See Olibanum.

Kunduru, ... TEL.

A large tree with pinnate leaves, which grows on the hills of the Dekhan, in the Konkan jungles, above Rajoor, in the hill of Shendur, in the Belgaum collectorate, in Bundelkhand, the mountainous tracts of C. India, Chutia Nagpur, Ajmir hills, and very common in the Shahabad country. Dr. Hooker, in ascending from Belcuppi in Behar to the height of 1360 feet, came upon a small forest of it, conspicuous from its pale bark and spreading curved branches, leafy at their tip; its general appearance being a good deal like that of the mountain ash. The gum, celebrated throughout the east, was flowing abundantly from the trunk, very fragrant and transparent. Ganda biroza is prepared from the gum-resin of this tree, and is similar in appearance and qualities to Venice turpentine. It is brought from Mewar, Haraoti, and the Shekhawatti hills, and is considered stimulating. An oil is distilled from it said to cure gonorrhœa. It is much used in painting, and by the lakheri, one maund costing twelve rupees from the Shahabad country. At Chandalgur it is termed, in the dry state, sukha biroza. B. glabra and B. thurifera both furnish the male frankincense of Dioscorides. The resin olibanum occurs in reddish or pale yellow tears, oval, oblong, and obtuse, sometimes in dense, opaque, brittle masses. The ganda biroza of the bazars is soft, ductile, opaque, greenish, and white. The odour is balsamic and resinous, especially while the resin is burning; the flavour balsamic, and rather bitter. The powder is citron yellow. It is frequently adulterated by dammer, sandarach, and other cheaper resins; when chewed, the hard variety softens, and dissolves partially in saliva, which it renders white and emulsive. Used for incense; also medicinally as a stimulant, astringent, and diaphoretic in affections of the

chest, also in chronic affections of mucous membranes, but chiefly in plasters, ointments, and for fumigation.—*Royle*, p. 338; *Hooker's Him. Jour.* p. 29; *Med. Top. of Ajmir; O'Sh. Beng. BOT, also written Bhot, the race occupying Tibet, Bhutan, Ladakh, and Balti. Their language is the oldest of the Turanian formations. See Bhot; Bhutan.

BOTA KADIMI, also Botta kadapa chettu. TEL. Nauclea parvifolia. The Telugu is from the resemblance of the capsule to the stamp used for impressing the bottu or sectarial marks of the Madhavacharya Brahmans.

BOTANY is the Ilm-i-Nabatat of the Persians. There has not been any branch of natural science, in its relation to the East Indies, so devotedly followed out as scientific and economic botany. Whether we regard the numbers working, the personal labour undertaken, the vast sums expended by its cultivators, or the important advantages which eastern countries have derived from them, their names ought ever to be kept in remembrance. During the past 300 years, amongst others who have worked in the East Indies, may be named, Governor Henry van Rheede, George Everhard Rumph, Leonard Plukenet, Koenig, Dr. John, Klein, Rottler, Sonnerat, Thunberg, the elder John Burmann, and the younger Nicholas Laur. Burmann, Hermann, Father Loureiro, Leschenault, Forskaol, Kæmpfer, Swartz, Jack, Carey, John Gerard, Jones, Fleming, Hunter, Anderson, Berry, Heyne, Buchanan, Russell, Noton, Shuter, Govan, Finlayson, Roxburgh, Wallich, Royle, Blume, Horsfield, Spry, Voigt, Griffiths, Wight, Sir Joseph Dalton Hooker, Thomas Thomson, J. L. Stewart, Baden Powell, Hugh Cleghorn, Heber Drury, A. Moon, W. Munro, Arnot, J. E. Stocks, Edward Waring, K. Aitchison, Maclelland, Sir Whitelaw Ainslie, Sir William Hardwicke, Sir William O'Shaughnessy, Sir Stamford Raffles; Colonel Beddome, Sir George Birdwood, Edgeworth, C. B. Clarke, Clement Markham; Drs. Mason, Thwaites, Jameson, Brandis, Forskal, Don, Bentham, Bidie, and Kurz; and notices of them will be found in this work under their respective headings.

In the 18th century Madras was the great home of research. In the 19th century the botany of the Bombay Presidency was greatly advanced by Mr. John Graham, Mr. Joseph Nimmo, Mr. Law of the Civil Service, Mr. Dalzell, and Drs. Lush, A. Gibson, Murray, and Heddle. And in the Bengal Presidency, William Roxburgh, Nathaniel Wallich, John Forbes Royle reigned supreme; and many younger men are treading in the footsteps of the above.

Agri-Horticultural Societies and their gardens have been formed at Calcutta, Saharunpur, Dapoolie, Bombay, Madras, Bangalore, and Ootacamund, to attend to the introduction of new plants into India, and to the useful application of the natural products of the country.

In March 1768 a Botanical Garden was established in Calcutta, under the care of Colonel R. Kydd. In 1793 Dr. Roxburgh was put in charge; and its superintendents have been successively, Dr. Roxburgh (obiit 1814), H. T. Colebrooke, Dr. Francis Hamilton, Dr. Nathaniel Wallich, Mr. Bentham, and Assistant-Surgeon W. Griffiths.

The Botanical Gardens at Peridenia are about five miles from Kandy, in Ceylon, and occupy a considerable extent of ground.

Baron Ferdinand von Mueller, of the Melbourne Gardens, has written a volume of great value (Select Extra-Tropical Plants, 1880), enumerating the plants which could be beneficially introduced and interchanged between Australia and the East Indies. In the middle of the 19th century, Clement Markham, C.B., devoted years of his life, risking life and health in a residence in South America and voyaging to the Neilgherry hills, in order to introduce there species of the Cinchona trees; and his efforts were so eminently successful, that the Cinchona alkaloids by 1882 were being sold at a rupee an ounce.

The total estimated number of Indian species are 12,000 to 15,000. The climate of India is generally tropical, and even on mountains of 4000 to 5000 feet the vegetation is temperate. The perennially humid forests are uniformly characterized by the prevalence of ferns; and at elevations below 5000 to 7000 feet, by the immense number of epiphytal orchidaceæ, orontiaceæ, and scitamineæ. They contain a far greater amount of species than the dry forest of North India, and are further characterized by zingiberaceæ, xylideæ, palms, pandaneæ, dracæna, piper, chloranthus, artocarpeæ, fici; urticaceæ, araliaceæ, apocyneæ, shrubby rubiaceæ, aurantiaceæ, garciniaceæ, anonaceæ, nutmegs, and dipterocarpeæ.

In the Himalaya, the truly temperate vegetation supersedes the subtropical above 4000 feet, and ascends to 12,000 feet, when it is succeeded by the alpine.

India contains representatives of almost every natural family on the globe, a very few American, Australian, and S. African orders of plants being the chief exceptions. In India the number of peculiar families largely represented in it is very limited. The Aurantiaceæ, Dipteraceæ, Balsamineæ, Ebenaceæ, Jasmineæ, and Cyrtandraceæ are the only orders which are largely developed in India, and sparingly elsewhere, and of these few contain a hundred Indian species. Sir Joseph Hooker is bringing out a descriptive work on the flora of India.

The species are much scattered. It is believed that nowhere in British India could more than 2000 flowering plants be found in a radius of 10 miles; and there is in India an almost complete absence of absolutely local plants. The plains of India are everywhere poor in species, and such as abound in individuals are usually of a weedy character. Indeed, there are few other countries in which the vegetation of the more accessible parts presents so little beauty or such short seasons of bloom. The great number of 222 British plants extend into India. Many North African and Arabian forms occur. Several Australian species are found in the Malayan Peninsula. Many of the Himalayan, Neilgherries, Khassya, and Ceylon species are found in the Malay Peninsula and in Java. Gualtheria nummularia extends from the N.W. Himalaya to the Java mountains; and plants common to India and Java are Sedgwickia cerasifolia, *Griff.*, Marlea, Cardiopteris lobata, several oaks and chestnuts, antidesmeæ, a willow, and Myrica. The Chinese type is abundant in

the temperate region of the Himalaya; and plants of N. America, west of the Rocky Mountains, also occur.

An immense proportion of annual plants, which vegetate on the last rainy seasons in the plains, and ascend the lofty mountains, are uniformly distributed throughout India. Of these the most conspicuous are gramineæ, cyperaceæ, a vast number of small leguminosæ and scrophularinæ, compositæ, some labiatæ, amaranthaceæ, convolvulaceæ, and acanthaceæ.

The winter months of the colder northern countries have a corresponding cold season in India, during which ex-tropical cereals, wheat, barley, and more rarely oats, with various kinds of pulse, are cultivated; and many wild plants appear, very many cyperaceæ, grasses, and such aquatics as myriophyllum, potamogeton, vallisneria, zannichellia, zemna, and others. The mountainous regions of Afghanistan are rich in Himalayan forms, and contain an immense number of European and Persian plants, which find their eastern limits within the British Himalaya; and many plants are found in those mountainous regions common to Europe and the Himalaya. Nepal, Bhutan, East Tibet, and the Khassya mountains present a flora which has much in common, and, in a geographico-botanical point of view, is one of the most important regions in India, if not in all Asia. In the Himalaya, the genera rhododendron, monotropa, pedicularis, corydalis, nepeta, carex, spiræa, primula, cerasus, lonicera, and viburnum attain their maximum of development.

In the Himalaya the truly temperate vegetation supersedes the sub-tropical above 4000 to 6000 feet, an elevation at which there generally is an annual fall of snow.

On the Himalaya, and on the isolated mountain ranges of the Peninsula of India, on the heights of Ceylon, and on the volcanic cones of Java, many plants occur, either identically the same or representing each other, and at the same time representing plants of Europe not found in the intervening hot lowlands. A list of the genera collected on the loftier peaks of Java raises a picture of a collection made on a hill in Europe. Still more striking is the fact that Southern Australian forms are clearly represented by plants growing on the summits of the mountains of Borneo. Some of these Australian forms extend along the heights of the Peninsula of Malacca, and are thinly scattered, on the one hand, over India, and, on the other, as far north as Japan. Along the Himalaya, at points 900 miles apart, glaciers have left the marks of their former low descent; and in Sikkim Dr. Hooker saw maize growing in gigantic ancient morasses. There are plants on the Himalaya and Neilgherries, Ceylon, and the Khassya mountains, and in the Malay Peninsula, and the moister and more equal parts of India, identical with those of Java. The genus calamus, orchids, araceæ, zingiberaceæ, and ferns are especially abundant; the genus grammatophyllum, the wonderful nepenthaceæ, or pitcher plants, of which solitary species occur in Madagascar, Ceylon, the Seychelles, Celebes, and the Moluccas.

Several species of Australian genera, myrtaceæ, the leptospermum, Bæckia, and metrosideros, are found in the Malay Peninsula. The *Eastern Archipelago* type forms the bulk of the flora of all the perennially humid regions of India, the Khassya mountains, the Upper Assam valley, the forests of the base of the Himalaya from the Brahmaputra to Nepal, the Malabar coast, Ceylon, and the whole of the Malayan Peninsula, many of the plants being identical with Javanese mountain species. Gualtheria nummularia ranges from the N.W. Himalaya to Java; and the more conspicuous of the trees common to Java and India are the Sedgwickia cerasifolia, *Griffith*, which is undoubtedly the Liquidamber altingia, *Blume*, Marlea, extending from China to Kashmir. The curious Cardiopteris lobata of Java is also a native of Assam; and several oaks and chestnuts, antidesmæ, a willow, and myrica, are common to Khassya and Java.

The *Chinese* type is abundant in the temperate regions of the Himalaya, extending westward to Garhwal and Kamaon, but is most fully developed in Sikkim, Bhutan, and the Khassya, and, as examples, are species of aucuba, Helwingia, stachyurus, enkianthus, Abelia, Skimmia, Adamia, Benthamia, and corylopsis, all of them genera that have been regarded almost exclusively Japanese and Chinese; also Microptelea parviflora, Hammamelis Chinensis, Nymphæa pygmæa, Vaccinium bracteatum, Quercus serrata, illicium, thea, magnolia, the schizandreæ, lardizabaleæ, camellia, deutzia, viburnum, Corneæ, Houttuynia, Bowringia, Wikstræmia, daphneæ, Henslovia, scepa, antidesma, Benthamia, Goughia. Euryale ferox, which is wild in the Gangetic delta, and is found as far westward as Kashmir, is abundant in China; and Nepenthes phyllamphora, a native of the Khassya mountains, is also found at Macao and eastward to the Louisiade Archipelago.

European forms abound in India. 222 British plants extend into India; and a multitude of mountain plants, and many of the most conspicuous ones of Europe, range from the coasts of the Levant and the Black Sea to the Himalaya, as Corylus colurna, Quercus ilex, Ulmus campestris, Celtis Australis, C. orientalis. Few European species, comparatively, extend into Nepal, and still fewer occur in Sikkim.

Egypt, southern Arabia, the warmer parts of Persia, Baluchistan, Sind, and the Panjab, have a remarkable similarity of climate. Many North African or Arabian forms extend throughout all the drier parts of India. Others are restricted to northern and western India; and though tropical Asia and Africa are separated by a vast expanse of ocean, there is a great similarity in the families of the trees and shrubs; and an affinity can be traced between the mountain vegetation of western tropical Africa and that of the peninsular chain.—*Royle on the Productive Resources of India; Wight's Prodromus Floræ Indicæ; Hooker et Thomson's Introductory Essay to the Flora Indica; Darwin, Origin of Species; Wallace; Ind. Ann. Med. Science.*

BOTERO. Giovanni Botero, an Italian, in A.D. 1550, was the first European author who treated of the tea-plant. His book was written to indicate the causes of the splendour and wealth of cities.

BOTLA BENDA. TEL. Abutilon Indicum.

BOT-PA, a race occupying Ladakh, or Little Tibet. They speak the Tibetan language, and are Buddhists, with a hierarchy of monks called Lama.

BO-TREE, ANGLO-SINGH, Ficus religiosa, grows

all over India. One of these is to be found within the precincts of every Buddhist temple in Ceylon, and it is frequently met with in deserted localities, or near the sites of ancient villages, and there the occurrence of a solitary Bo Tree, with its circular buttress of stonework round the stem, indicates the existence, at some former period, of a Buddhist temple in the vicinity. The planting of the Bo Tree in Ceylon, a ceremony coeval with and typical of the introduction there of Buddhism, is one of the most striking passages in the 18th chapter of the Mahawanso, entitled 'The obtaining of the Bo branch;' and the 19th chapter describes the arrival of the Bo Tree. A tree of unusual dimensions, which occupies the centre of a sacred enclosure at Anarajapoora, is still reverenced as the identical one which the sacred books record to have been planted by Mahendra 250 years before the Christian era, consequently in the year 1900 it will be 2150 years old. So sedulously is it preserved, that the removal of a single twig is prohibited; and even the fallen leaves, as they are scattered by the wind, are collected with reverence as relics of the holy place.

When Asoka, 250 B.C., sent his son Mahendra and his daughter Sangamitta to introduce Buddhism into Ceylon, one of the most precious things which they carried with them was a branch of that celebrated pipal tree beneath which Sakya became a Buddha, and which is still growing from the top of a small pyramid at Gaya. It was received with the utmost reverence by Devanampiyatisso, and planted in the most conspicuous spot in the centre of his capital. There it has been reverenced as the chief and most important numen of Ceylon. The city is in ruins, its great daghobas have fallen to decay, its monasteries have disappeared; but the great Bo Tree still flourishes; annually thousands repair to the sacred precincts within which it stands, to offer up prayers for health and prosperity. On the altars at the foot of the sacred Bo Tree, the Buddhists place offerings of flowers and perform their accustomed devotions.—*Tennent's Ceylon; Tennent, Christianity in Ceylon; Hardy's Eastern Monachism.*

BOTRYCHIUM VIRGINICUM. This large succulent fern grows plentifully in the Raklang pass in the Sikkim Himalaya. It is boiled and eaten, both there and in New Zealand. Other ferns are used for food. In Calcutta, the Hindus boil the young tops of a Polypodium with their shrimp curries; and both in Sikkim and Nepal the watery tubers of an aspidium are abundantly eaten. So also the pulp of one tree-fern affords food, but only in times of scarcity, as does that of another species in New Zealand, the Cyathea medullaris. The pith of all is composed of a coarse sago, that is to say, of cellular tissue with starch granules.—*Hooker, Him. Jour.*

BOTRYTIS BASSIANA. See Dry Rot.

BOTTA, French consul at Mosul, in 1842 began excavations on the sites of the buried cities of Assyria. He commenced his labours at Kouyunjik, a large mound opposite Mosul. Along with Mr. Layard, he made large researches, and during the entire period of his excavations, M. Botta sent to Mr. Layard not only his descriptions, but copies of the inscriptions.—*Layard's Nineveh.*

BOTTA-GENDA. GOND. Spilornis cheela.

BOTTA KADAPA CHETTU. TEL. Nauclea parviflora. The name is taken from the resemblance of the capsule to the stamp used for impressing the bottu or sectarial marks of the Madhavacharya Brahmans.

BOTTLE GOURD, Lagenaria vulgaris.

BOTTLES.

Butli, Budla, ANG.-HIND.	Buddigal, . . . TAM.
Bottiglie, Fiaschi, . IT.	Budlu, ... TEL.
Kacha, buli, balang, MAL.	

Skin or glass or stoneware vessels for holding liquids are of various shapes and sizes. The leather budla in which the people of India carry ghi and oil, is manufactured in many places by stretching skins over a clay model, which is afterwards broken and shaken out.

BOTTLE TREE, Delabechia rupestris of Australia. It is one of the order Sterculiaceæ. It attains a height of 35 to 55 feet, with huge branches at the summit, and the bark rugged. The foliage is small in comparison with the great size of the tree. The interior substance of the tree abounds in a mucilage resembling gum-tragacanth. The circumference of the trees, measured 7 feet from the base, is from 12 to 35 feet. The trees grow very luxuriantly in a soil of sand or sandy loam, and are often tapped by stockmen and others, who procure from them a glutinous and refreshing beverage. Large-sized trees scooped out form excellent canoes. It should be introduced into India. See Brachychiton.

BOTTU. TEL. The sectarial marks of the Madhavacharya Brahmans.

BOTTU KURA. TEL. Cordia polygama.

BOT YUL, the Tibetan name for Tibet.

BOUCEROSIA AUCHERI. *Dne.*

Chungi, Char-ungli, HIND.	Pawanne, Pauwauke,
Panj-angusht, . PERS.	PANJ.

This plant is found in the N.W. Himalaya, Trans-Indus, and Salt Range up to 3000 feet. Its stems, four or five inches long, resemble the fingers of the hand, are juicy, generally eaten raw, and deemed medicinal.—*Dr. J. L. Stewart.*

BOUCEROSIA EDULIS. *Edgeworth.*

Chung, Pippu, . PANJ.	Pippa, Sittu, Situ, PANJ.
Suhi Gandhal, . ,,	

Stem used as a relish for farinaceous food; not uncommon in the arid tract from the Salt Range southward to the boundary of the Panjab, and in Sind.—*Edgeworth; Dr. J. L. Stewart.*

BOUGHTON, GABRIEL, surgeon of the E.I. Company's ship Hopewell; about the year 1639 was summoned to the Dekhan from Surat to attend on a daughter of Shah Jahan, who had been severely burned. He asked as his reward liberty for the E.I. Company to trade in Bengal free of duties. Orme says he was sent for that purpose from Surat to Agra. The patient recovered; and the emperor, besides other favours, granted him a sunnud to trade free of customs throughout his dominions. Boughton proceeded to Bengal, on reaching which the nawab obtained his aid in order to attend on one of his favourite women, who recovered. Boughton remained in the nawab's service, who gave him and the English the right to trade; and Boughton induced the Company to send, in 1640, two ships.—*Broome, Hist. of the Bengal Army*, London, 1850; *Orme*, ii. p. 8.

BOULMALA, a stone procured from the hill state of Dhenkanal, in Orissa, used to make small mortars and the little tripods on which sandal-wood is ground by natives.—*Cal. Cat. Ex.* 1862.

BOURA CHANG, a fish of Bhutan, believed by

the natives to fall from heaven, from the circumstance of its being found after rain far from the water.

BOURBON, also called Reunion and Mascarhenas, is an island of a round form above 42 miles from N.W. to S.E. A volcano near its S.E. part, is in lat. 21° 9′ S. It is larger than the Mauritius; but it is only a great mountain cleft in three places, and clothed with wood, though portions below are cultivated. It was discovered by the Portuguese, who called it Mascarhenas. The French took possession of it in 1675. It was captured 10th July 1810 by the British, but restored at the general peace. Bourbon cotton is Gossypium Barbadense, *Roxb.*, and Bourbon Tacamahaca, Calophyllum inophyllum.—*Horsburgh.*

BOURDONNAIS, La, sailed for India when only 14 years of age. He became the governor of Mauritius and Bourbon in 1734. He returned to France; but in 1746 he revisited India, had an encounter with the British fleet, and on the 10th September he captured Madras, which capitulated, but was ransomed on the 10th October. He sailed for France, but was captured on his way. He was shortly after released, in consideration of his lenient treatment of Madras; but on arriving in France he was thrown into the prison of the Bastile, where he lingered for three years and died. Dupleix was jealous of him, and caused his imprisonment. He introduced cotton and indigo into the Mauritius.

BOURO ISLAND, one of the Moluccas. It is high, and has a semicircular mountain on its N.W. part. The island has two races; the larger number are Malays of the Celebes type, often exactly similar to the Tomore people of East Celebes, who are settled in Batchian; but the other, a taller, bearded race, resemble the Alfura of Ceram. Amongst its birds are two kingfishers, Tanysiptera acis and Ceyx cajeli; a beautiful sun bird, Nectarinea proserpina; and a black and white flycatcher, Monarcha loricata.—*Wall.*

BOVIDÆ, a family of mammals, comprising the sub-families Antilopinæ, Caprinæ, and Bovinæ.

The Antilopinæ have been enumerated under their own heading; the others are as under:—

Sub-Fam. Caprinæ, goats and sheep.

Nemorhœdus bubalina, *Jerdon.*

N. proclivus, *Hodgs.*	Antilope thar, *Hodgs.*
Sarao, saroowa, . HIM.	Thar, ... NEPAL.
Ramu, . . . KASHMIR.	Eimu, ... SUTLEJ.

The serow or forest goat occurs in the central ranges of the Himalaya, from Kashmir to Sikkim.

Nemorhœdus goral, *Jerdon.*

Antilope Duvaucelei, *H. Smith.*

Ra-giyu, ... BHUT.	Suh-ging, . . . LEPCH.
Gooral, ... HIM.	Sah; Sarr, . . SUTLEJ.
Pijur, . . . KASHMIR.	

The gooral or Himalayan chamois occurs in the whole range of the Himalaya from Bhutan and Sikkim to Kashmir.

True Goats.

Hemitragus jemlaicus, *Jerdon.*

H. quadrimammis, *Hodg.*	Capra jharal, *Hodg.*
Tare, tehr, tahir, . HIND.	Jharal, . . . NEPAL.
Kras, Jagla, . . KASH.	Jehr, ... SIMLA.
Kart, ... KULU.	Eshu, Eshi, . . SUTLEJ.
Jula (*m*), thar, tharni, KUN.	

The tehr or Himalayan wild goat inhabits the whole of the Himalaya.

Hemitragus hylocrius, *Jerdon.*

Kemas, *Ogilby.*	Capra warryato, *Gray.*
Ibex, . . NEILGHERRIES.	Warra-adu-watu, . TAM.

The Neilgherry wild goat occurs there and in the neighbouring hills in the W. Ghats, south to Cape Comorin.

Capra megaceros, *Hodgson.*

C. Falconeri, *Hugel.*

Ra-che; Ra-po-che, . LAD.	Mar-khor, . . . PUSHT.

The Mar-khor inhabits the Pir Panjal range of the Himalayas to the south of the valley of Kashmir, in the Hazara hills, and the hills on the north of the Jhelum, the Wurdwan hills, the Sulimani range, Ladakh, and Afghanistan.

Capra Sibirica, *Meyer.*

C. Sakeen, *Blyth.*	Ibex Himalayanus, *Blyth.*
C. Pallasii, ,,	
Skin, Sakyn, Iskin, Sakin, HIM.	Tangrol, ... KULU.
	Buz, ... SUTLEJ.
Kyl, ... KASH.	Dan mo (*f.*), . . TIB.

The Himalayan ibex occurs from Kashmir to Nepal in the Himalaya.

Ovis cycloceros, *Hutton.*

O. Vignei, *Blyth.*

Uria, urial, . . . HIND.	Koch, Kuch, SUL. HILLS.

The urial or Panjab wild sheep occurs in the Salt Range, Sulimani Range, Hazara hills, and hills near Peshawur, at from 800 to 2000 feet elevation.

Ovis Vignei, *Blyth.*

O. montana, *Cunningham.*

The Sha or Sha-poo of Tibet.

Ovis nahura, *Hodgson.*

O. Nahoor, *Hodgs.*	O. Burhel, *Blyth.*
Bharal; Bharur, . HIM.	Nervati, . . . NEPAL.
Menda (*m.*), . . . ,,	Wa, War, . . SUTLEJ.
Na, Sna, . . . LADAKH.	

The burhel or blue wild sheep is from Sikkim to near Simla.

Ovis Ammon., *Linn.*

O. argali, *Pallas.*	O. Ammonoides, *Hodgs.*
O. Hodgsoni, *Blyth.*	

Hyan, nuan, nyan, niar, nyund, gnow, of Tibet. It is found beyond the great central snowy range on the Tibet side, never under 15,000 feet in summer.

Ovis Polii, *Blyth*, the rass or rush of the plains of Pamir, east of Bokhara, at 16,000 feet.

Sub-Fam. Bovinæ, cattle.

Gavæus gaurus, *Jerd.*, gaur.

Bibos cavifrons, *Hodgs.*, *Ell.*	B. assel, *Horsf.*
Bos gour, *Traill.*	B. aculeatus, *Cuv.*
Vana-go, ... BENG.	Gauri-Gai, . . . HIND.
Ban-gau, ... ,,	Jangli-Khulga, . . ,,
Pyoung, ... BURM.	Gaoiya, ... MAHR.
Kar-Kona, . . . CAN.	Ban-parra of MUNDLAH.
The Gaur Bison, . ENG.	Bod of . . . . SEONI.
Peroo-maoo, . . . GOND.	Katu Yeni, . . . TAM.
Gour, ... HIND.	

Bison of Madras sportsmen. All the large forests of India.

Gavæus frontalis, gayal or mithun of the hilly tracts east of the Brahmaputra.

Gavæus sondaicus, the ban-teng, is the Burmese wild cow of Chittagong, Burma, and Malayana. It is the tsoing of the Burmese.

Bos Indicus, the zebu or humped cattle, known as the Brahmany bull, is wild in the Guntur district of the Madras Presidency, in parts of Oudh and Rohilkhand, and maintain themselves in dis-

tricts infested with the tiger. They have been domesticated in India and the Archipelago.

The Buffaloes.

Bubalus Arni, *Jerdon.*

Bos arni, *Kerr, Shaw.*	B. bubalus, *Anderson.*
B. buffelus, *Blyth.*	
Mung of . BHAGULPUR.	Jangli bhyus (*m.*), HIND.
Gera erumi, . . GOND.	,, mhyus (*f.*), . ,,
Arna (*m.*), Arni (*f.*), HIND.	

Occurs wild in Assam, in the Terai from Bhutan to Oudh, in Central India from Midnapur to Raipur, in the Purniah district, and a few in the N. and N.E. of Ceylon. The domesticated species is little changed from the wild buffalo.

BOVRA KORRO. PERS. A large desert partridge in northern Persia; Ptereocles exusta.

BOWRING, SIR JOHN, K.C.B., governor of Hong-Kong, but best known as an author by his political and literary writings. He was born at Exeter 17th October 1792, and became, in early life, a pupil of Jeremy Bentham, maintaining his master's principles for some years in the Westminster Review, of which he was the editor. He wrote Bowring's Siam, and a work on the Philippine Islands. Obiit 1872.

BOWSTRING HEMP, fibre of Sanseviera Zeylanica. Very tenacious fibre; the natives make their best bowstrings of it.

BOXWOOD, Buxus sempervirens, *Wall.* This is a valuable wood of a yellowish colour, close-grained, very hard, and heavy; it cuts better than any other wood, and is susceptible of a very fine polish. It was highly valued by the ancients as a material for musical instruments. It is of use for the turner, engraver, mathematical instrument maker, comb and pipe maker. The Himalayan box, Buxus sempervirens, *Wallich*, appears to be identical with the tree common all over south Europe, and extending into Persia, chiefly in valleys, at an elevation of from 3000 to 6000 feet. Dr. Stewart met with it from Mount Tira, near Jhelum, to Wangtu bridge on the Sutlej. It is variable in size, being generally 7 to 8 feet high and the stem only a few inches thick, but attaining sometimes a height of 15 to 17 feet, as at Manikarn in Kulu, and a girth of 22 inches as a maximum. It is found in the valleys of the Sutlej, Parbati, and near Dharmsala, and in the Salt Range. In the Nepal valley it is larger and more abundant than in other parts of the Himalaya. It is made by the villagers into little boxes for holding ghi, honey, snuff, and tinder. It is in demand for plugs for Minie rifle balls, and at Sealkote it is turned into pill boxes. The wood is liable to split in the hot weather, and should be seasoned and stored under cover. Thunberg says that B. sempervirens was not uncommon in Japan, in a wild and cultivated state. The annual consumption in Great Britain exceeds 2000 tons, half of which is of foreign growth. The wood of Sarcococca trinerva also gets this name. The Karens sometimes furnished Mr. Mason with specimens of a wood that can scarcely be distinguished from the boxwood of Europe. Nauclea cordifolia has wood coloured like that of the box tree, but much lighter, and at the same time very close-grained. Dr. Hunter highly praises the wood of the Euonymus dichotomus of the Pulney hills.—*Jour. A. H. Soc.* xi. 413, 1859; *Cleghorn, Panjab Rep.; Statistics of Commerce; Thunberg's Travels; J. L. Stewart; Powell's Handbook; Hunter; Royle.*

BOY, an Anglo-Indian term applied to a native domestic man-servant, supposed to have come from Bhui, the name of a Teling tribe.

BOYA, plural Boyadu or Boyidu, also Boyi. TEL. A mountaineer, a forester; was a title of some Teling chieftains, as Avare-Boyidu, Māra-Boyidu, Gondla-prote Boyidu.

BOYAR, a race widely diffused in the hilly parts of Palamau, Sirguja, Singrauli, Korea Bhakhar, Rewa, and other places. They cultivate millets and pulses on the virgin soil of newly-cleared forests. They live in small hamlets or detached houses. They bury their dead, depositing with each body of a male an axe, a knife, and a bow and arrow. The Boyar are generally of a dark-brown colour, fairly proportioned, and averaging upwards of five feet in height. The features have great breadth across the cheek-bones, very narrow forehead, nose broad, nostrils wide apart, the nasal bone more prominent, the mouth so wide as nearly to equal the space occupied by both eyes, lips protuberant, chin receding, but not so the brow, more hair on the face than is generally found amongst the tribes of this class.—*Dalton, Ethnol.* p. 134.

BOYILLA or Boiggiah, a race in the southern Mahratta country, whose sections take the name of Bhaka, Holga, and Berdur. The Bhaka again subdivide into the Ramusi, Yadu, Roray, and Gurgal. The four branches of the Bhaka constitute one people apart from the Holga or the Berdur. They are hardy, active, and enterprising, but predatory, covetous, rapacious, and treacherous.

BOZAH. HIND. A fermented liquor obtained from Eleusine coracana, and somewhat resembling country beer. It is chiefly used in the higher provinces of India, but the materials used in brewing or fermenting it vary in different places. The Sorghum vulgare is occasionally used, and it is occasionally made more intoxicating by the addition of drugs.—*Ainslie's Mat. Med.* p. 263.

BOZDAR, a border tribe on the N.W. frontier of India, with about 2500 fighting men. They dwell west of the Derajat, in the hills opposite Mungrota, about 50 miles north of Dehra-Ghazi Khan. After a series of troublesome inroads on the plains, a force was sent against them in March 1857, through the Mahvi and Mungrota passes, and, after seeing their green crops destroyed, and seeing the Osterani, a small but warlike tribe, join the British, one morning the Bozdar chiefs rode into the British camp and sued for peace. They were received in solemn durbar; and for every man they had slain in their forays 125 rupees were paid, and 50 rupees for every wounded man, this being the regular price of blood in the hills. A few months afterwards, they furnished a contingent to protect the frontier when the troops were sent to quell the mutiny of 1857. This Baluch tribe occupy the mountains and the low country, and have the following sections—Sehrani, Suwarni, Gulamanni, Jelalani, Chandiah, and Shahani. From the Kusranee limits the hills of the Bozdar tribe extend along the British frontier for about 15 or 20 miles. The range is intersected by some nine passes leading into the plains, the chief of which is the Sungurh pass, through which there is considerable traffic with Kandahar and the Panjab. Opposite these hills lies the Sungurh lowland (forming the upper portion of

the Dehra-Ghazi Khan district and cultivated by several peaceful tribes), and very much at the mercy of the Bozdars. There is only one Bozdar village in the plains, but there is much scattered cultivation belonging to the tribe. Almost the whole tribe and their chiefs live in the hills. They can muster 3000 or 4000 fighting men, some portion of whom are horsemen. They were probably the most formidable robbers in this part of the frontier. Under the Sikh regime they repeatedly carried fire and sword into the Dehra-Ghazi Khan district. The direct and main pass which leads into the Bozdar country is the Sungurh pass, opposite Munghrata, the one by which Sir N. Chamberlain's force entered. The Sukhi Surwar pass is below Dera-Ghazi Khan, in the Loggharri (Baluch) country, between which and the Bozdars there is also another Baluch tribe, the Khosahs. The Chachar pass, again, is still further lower down, near Hurrund, and more distant still from the Bozdars.—*Medley's Year's Campaigning.*

BOZGAND, also Bozghanj. HIND. Galls of Pistacia terebinthus, said to be flower-buds dried.

BOZIDAN, also Bozandan. HIND. Asparagus sarmentosus, A. racemosus.

BRAA. HIND. Colutea arborescens.

BRAB TREE, Borassus flabelliformis.

BRACELET.

Bracelet, Brassard, . FR.	Braccialetto, smaniglia, IT.
Armband, ... GER.	Brazalete, ... SP.
Khangni; Rakhi, HIND.	

Bracelets, anklets, and armlets of gold, silver, brass, copper, and deer horn, the metals being solidly massive or in the form of chains, are in use in all eastern countries, amongst Hindus and Mahomedans. Occasionally a grown man of the Hindus may be seen with a small gold or silver arm-ring or anklet, but in general they are restricted to women and children. The custom has doubtless obtained through all ages; and they are alluded to in Genesis xxxviii. 18; Isaiah iii. 19. Those of some of the Hindus are inconveniently massive, and heavy rings, usually of silver set with a fringe of small bells, are often worn by Hindu ladies. The brass ornaments of the Santal women weigh several pounds. Allusion is made in Scripture to a tinkling with the feet. Hindu women wear loose ornaments one above another on their ankles, which, at every motion of the feet, produce a tinkling noise. Armlets are worn alike by Hindus and Mahomedans, and by men and women; are of gold or silver; some are in the form of massive carved rings, some as lockets, the more expensive worn by royalty are their bazu-band, literally arm-binder. These are generally worn as ornaments, since the most ancient times, like earrings (Gen. xxxv. 4; Exod. xxxii. 3, 4; Hos. ii. 13; Judg. viii. 25). The *Ενοτια* in aures were often of gold, like those of the Ishmaelites; but ornaments were often caskets containing, as with the Mahomedans, charms, their taviz, or, like the Jangam sect of Hindus, the phallic lingam. These ornaments are often worn round the neck, like the golden bulla and leathern torum of the Roman youth, and as in Prov. vi. 21, and most women have frontlet ornaments, such as are alluded to in Deut. vi. 8.

The bracelets largely worn in India by all Hindu and Mahomedan women are of coloured glass, ornamented with lac and brass or tinfoil; some of the colours are beautiful; the manufacture of shell bracelets is one of the indigenous arts of Bengal, in which the caste of Sankhari at Dacca excel. The chanks of which they are made are large univalve shells (Turbinella pyrum) from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Ramnad in Southern India, and from the Maldive Islands. At Dacca these shells are used for beetling fine muslins, but principally for making the large massive bracelets which are worn by Hindu women. They are sawn into semicircular pieces, and these are riveted and cemented to form the bracelets, some of which are elaborately carved, and inlaid with a composition of lac and a red pigment. A pair of bracelets of this description frequently costs as high as 80 rupees. Of the thick pieces of the shells, beads are made to form the necklaces, which the Bengal sepoys wear.

Some Marwari women and the Binjara women have the entire forearm from the wrist to the elbow covered with heavy massive bracelets, and the lower part of the legs equally covered with anklets. The armlets of the Binjara women are of deer-horn. Amongst the Rajputs, the women adopt a brother by the gift of a bracelet. The intrinsic value of such pledge is never looked to, nor is it requisite it should be costly, though it varies with the means and rank of the donor, and may be of flock silk and spangles, or gold chains and gems. The acceptance of the pledge and its return is by the Katchli, or corset, of simple silk or satin, or gold brocade, and pearls. Colonel Tod was the Rakhi band Bhai of the three queens of Udaipur, Boondi, and Kotah, besides Chund-Bai, the maiden sister of the Rana, as well as of many ladies of the chieftains of rank. Though the bracelet may be sent by maidens, it is only on occasions of urgent necessity or danger. The festival of the bracelet (Rakhi) is in spring. The adopted brother may hazard his life in his adopted sister's cause, and yet never receive a mite in reward, for he cannot even see the fair object who, as brother of her adoption, has constituted him her defender.—*Tod's Travels in Rajasthan.* See Phylactery; Talsam; Taviz.

BRACHIOPODA, a class of molluscs, comprising the families Terebratulidæ, Spiriferidæ, Rhynchonelidæ, Orthidæ, Productidæ, Craniadæ, Discinidæ, and Lingulidæ. See Mollusca.

BRACHYCHITON DELABECHEI, Australian bottle tree, trunk similar to a soda-water bottle. The natives refresh themselves with the mucilaginous sweet substance, and make nets of its fibre.

BRACHYPTERNUS AURANTIUS. *Linn.* The orange-coloured woodpecker of Ceylon. B. Ceylonus and B. rubescens also occur there.

BRACHYPTERUM SCANDENS. *Benth.* A creeper of Coromandel, Konkan, Travancore, Siam, Bengal, and Assam, with small pale rose fragrant flowers, well adapted for trellis work.

BRADDOCK, LIEUTENANT, a Madras officer, wrote on balances for delicate weighing in the Mad. Lit. Soc. Trans.; On the Assay of Silver; On the Induration of Chunam; On Chemical Tests; On the Sculptures at the Seven Pagodas. —*Dr. Buist's Catalogue.*

BRADLEY, DR. W. H., a Bombay medical officer, who wrote a statistical memoir on Circar Dowlatabad in Mad. Lit. Trans. xvi. p. 481; A Statistical Memoir on the Circar of Pytun, ibid.

235; On the Meteorology of Ellichpur, Bom. Geo. Trans. 1844, 1846, vii. p. 167; Desultory Observations on the Gond Tribes, with a Vocabulary of the Language spoken by them, ibid. 209; Some Account of the Topography of Chikuldah, ibid.—*Dr. Buist's Catalogue.*

BRAGANTIA WALLICHII. *R. Br.*

Apama siliquosa. | Alpam, . . . MALEAL.

A shrub of the natural order Aristolochiacea, growing in the western parts of the Peninsula of India, the S. Konkans, Wynad, and Travancore. It is about 3 feet high; root and leaves demulcent and tonic. The root is supposed to be an antidote to poison, and is used in snakebites and applied to ulcers. B. tomentosa is intensely bitter, and used as medicine in Java.—*Drury, Useful Plants.*

BRAHM, or Para Brahm, SANSK., the Supreme Being, is a name that first appears in Hindu religious books, in some of the best upanishads, or appendages to the Vedas, of later date than the first three, and introducing a different and superior theology. It seems to have been a first effort towards the recognition of a Creator; and many Hindus of the present day recognise that the almighty, the infinite, the eternal, incomprehensible, self-existent being, he whose power is too infinite to be imagined, is Brahm! creator, preserver, and destroyer of the universe, from whom all souls come, and to him again return. While the learned Brahmans thus acknowledge one God, they have confined their doctrines to their own school of philosophy, and have tacitly assented to, even taught in public, a religion in which the most discordant fictions have been erected, and have woven a mythology of the most extensive character. A philosophic few excepted, Hindus are worshippers of a superstitious and idolatrous polytheism, and Hindus erect no altars to Brahm (Hindoo Pantheon, p. 4). The Narayana of the present Hindus is rather the Spirit of God (Ins. of Menu, chap. 1., v. 10), though the two Hindu sects claim for Vishnu and Siva the title of Narayana, and Brahma himself is sometimes called Narayana. At present there will not be found two Hindu families whose belief is identical, though almost all the educated of the people recognise one God under one name or another. From time to time great reformers rise, condemning the prevailing Hindu idolatry, and so anxious are the people to know the truth, that every new teacher immediately gathers round him a number of disciples. But it is without the basis of a recognised revealed religion, and the zeal of the pupils soon calms down. In the meantime the bulk of the Hindu people are engaged in spirit-worship and hero-worship; in the worship of the manes of ancestors; in the worship of plants and animals; of the inanimate objects of nature and of natural phenomena, of forms of men and women, and of shapeless blocks of stone and wood. Some forms of Hindu belief are systems of rationalism, others are systems of philosophy, and others are physiological doctrines, with emblems to illustrate views entertained as to cosmogony and production which take the place of religion. The human form in its natural state, or possessing the heads or limbs of various animals, the elements, rivers, fountains, stones, and trees, have been deified, and become objects of religious adoration. The sun, moon, and all the heavenly host; fire, earth, and all natural phenomena,—all nature, indeed,—the passions and emotions of human beings, their vices and virtues, are transformed into persons, and act appropriate parts in the history of man. —*Taylor; Moor, Hindoo Pantheon; Coleman; Wilson.* See Upanishad.

BRAHMA, a word supposed by some to be from the Sanskrit 'vrih' or 'brih,' to increase. Brahma occurs in a hymn of the Rig-Veda, and, according to Dr. Haug, this word originally meant the strewing of the sacrificial grass on the spot appointed for the immolation. One of the earliest meanings of the word, as used in the Veda, was 'food,' also riches. In the Rig-Veda, a more frequent meaning is sacrificial food. But in the same work Brahma is repeatedly used to express the song of the soma singers, a magic spell; and is applied to ceremonies having a song of praise as their characteristic. In the language of the Zendavesta, 'baresman,' an absolutely identical word, is found, which the Parsees interpret to mean a bundle of twigs tied together with grass, used in the fire-worship like the bundle of kusa grass used by the Brahmans in the soma sacrifices. In both worships the bundle is a symbol of 'growing,' 'increase,' or 'prosperity;' and the name of the symbol was transferred to the texts, hymns, sacrifices, and ceremonies used in the rites. 'As sacrifice among the Vedic Hindus was the chief means of obtaining all earthly and spiritual blessings, but was useless without the Brahma, *i.e.* success, the latter was at last regarded as the original causes of all being.' The Imperial Gazetteer says Brahma means a prayer; and Brahman, a praying person.

Brahma, with Siva and Vishnu, form the triad of Hindu deities. There is nothing extant to show either that Brahma ever had much consideration shown him, or that his worship was overwhelmed by the intrusion of the Vaishnava and Saiva religions. Brahma in former times is said to have had temples the same as Siva and Vishnu, and to have been worshipped separately, but the followers of the two last are said to have entirely destroyed the temples and worship of Brahma. Brahma alone of the three is mentioned by Menu (Kennedy's Researches, p. 270). He seems to have had some sort of pre-eminence in ancient times, but there is no evidence that he was ever much worshipped. According to Colonel Tod, he has now but one temple in India (Tod's Rajasthan, vi. p. 774); and though invoked in the daily ritual, his separate worship is almost entirely neglected. His Sakti or consort, Saraswati, has not fallen so completely out of notice. A figure of Brahma is shown in a temple at Gumli, three-faced, seated cross-legged on two hansa, with two female attendants, and to his right is Siva, three-faced, with Nandi below, and two females.

A Saiva legend, in the Tamil book Arunasala Puranam, is to the effect that Brahma and Vishnu endeavoured to overthrow the religion of Siva; that Vishnu abandoned the attempt, and Brahma was overpowered, and condemned to have neither temple nor worship for evermore. Also the Brahma-koond, in Brindapur, is a little square tank, supposed to be of natural excavation, and regarded as the sacred spot of Vishnu's triumph over Brahma. In Benares they make Vishnu worship Siva. In Brindabun they make Brahma worship Vishnu, to assert the superiority of sect over sect (Tr. of Hind. ii. p. 65). At the present

day, Brahma is worshipped or reverenced at Bittur on the Ganges (Oudh Census, p. 114). He is particularly reverenced at Pushkara, near Ajmir, as also at Bittur in the Doab, where, at the Brahmavarta ghat, he is said to have offered an Aswa Medha on completing the act of creation. The pin of his slipper is still worshipped there. On the full of the moon Agrahayana (November and December) a mela or fair, a meeting that mixes piety with profit, is anuually held at that place.—(*Wilson.*) There is no doubt that he is the least important, at the present day, of the Hindu deities, though termed the creator, or the ancestor of gods and men. He has been imagined to correspond with the Saturn of the Greeks and Latins. He is usually represented as a red or golden-coloured figure with four heads. He is said, by the Saiva sect, to have once possessed five; but as he would not acknowledge the superiority of Siva, as Vishnu had done, that deity cut off one of them. He has also four arms, in one of which he holds a spoon, in another a string of beads, in the third a water-jug (articles used in worship), and in the fourth the Veda or sacred writings of the Hindus. He is frequently attended by his vahan or vehicle, the hansa, a goose or a swan.—*Moor's Pantheon; Tod's Rajasthan*, vi. p. 774; *Sonnerat's Voyage*, p. 5; *Kennedy's Researches*, p. 270; *Hindu Theatre*, ii. p. 58; *Travels of a Hindoo*, p. 65; *Sir G. Campbell*, p. 61; *Wilson; Oudh Census*, p. 114.—*Imp. Gaz.*

BRAHMACHARYA. SANSK. The state or period of pupillage of a Brahman, Kshatriya, Vaisya, or Sudra youth, who is thus called a Brahmachari. It is also applied to men who are mendicants, but affect to be students. Mr. Sherring says this name is given to a sect of Brahman ascetics who wear red cloth and the rudraksha, let their hair and beard grow, and besmear their bodies with ashes. They are worshippers of Siva. The Brahmacharis live as recluses apart from their families, and at death their bodies are burnt.—*Sherring's Tribes*, p. 265.

BRAHMA DANDA PURANA, a religious book of the Hindus, the object of which is similar to that of the Skanda Siva Purana and Linga Purana, viz. to inculcate the worship of the lingam. See Lingam.

BRAHMADANDI. SANSK. Argemone Mexicana.

BRAHMADICA, supposed by Hindus in their mythology to be the first created beings; but in their cosmogonies their origin and names are variously explained. It is said, in the Institutes of Menu (chap. i. 32), that the Almighty Power, having divided his own substance, became male and female, and from that female produced Viraj. Viraj produced the first Menu, named Swayambhuva; he, the ten Brahmadica or Prajapati, whom he calls the ten lords of created beings, also the sons of Brahma. They produced seven other Menu, whose names were Swayambhuva, Swarochesha, Uttama, Tamasa, Rivata, Chacshusha, and Satyavrata. These Menu are by some authorities said to have produced the seven Rishi; but others state the seven Rishi to have sprung immediately from Brahma. Their usual names are Kasyapa, Atri, Vasishta, Viswamitra, Gautama, Jamadagni, and Bharadwaja.—*Wilford, As. Res.* v. p. 246. The seven Brahmadica are, however, according to Coleman, named Marichi, Atri, Vasishta, Palastia, Angiras, Pulastia, and Kritu. Colonel Wilford, in the Asiatic Researches, has considered the Brahmadica, the Menu, and the Rishi to be seven individuals only. The names of some of the Brahmadica correspond with those of some of the Rishi.—*Cole. Myth. Hind.* p. 8. In an account of Viraj, translated by Mr. Colebrooke from the White Yajur Veda, it is said He (the primeval being) felt no delight; therefore man delights not when alone. He caused his own self to fall in twain, and thus became a husband and wife, and the human race was produced; and, changing their forms, all created beings appeared. Another account makes Rudra assist in the theogony. Brahma said, 'Rise up, O Rudra, and form man to govern the world.' Rudra immediately obeyed. He began the work, but the men he made were fiercer than tigers, having nothing but the destructive quality in their composition, and they soon destroyed one another, for anger was their only passion. Brahma, Vishnu, and Rudra then joined their different powers, and created ten men, whose names were Nareda, Daksha, Vasishta, Bhrigu, Kritu, Puluha, Pulastya, Angira, Atri, and Marichi (that is, Reason, Ingenuity, Emulation, Humility, Piety, Pride, Patience, Charity, Deceit, Morality), the general name of whom is the Muni. Brahma then produced Dharma, Justice, from the breast; Adharma, Injustice, from his back; Labha, Appetite or Passion, from his lips; and Kama, Love or Desire, from his heart. The last was a beautiful female, and Brahma looked upon her with amorous emotions; but the Muni telling him she was his own daughter, he shrank back, and Ladja, Shame, a blushing virgin, sprang from him. Brahma, deeming his body defiled by its emotions towards Kama, purified himself by partially changing it into ten females, who were respectively espoused by the ten Muni.—*Moor, Hindoo Pantheon*, p. 91; *Colebrooke; Wilford, As. Research.* v. p. 246; *Coleman, Mythology of the Hindoos*, p. 8; *Menu*, i. 32.

BRAHMAGUPTA. Colebrooke thinks that Brahmagupta and the author of the Sūrya Sidhanta were contemporary about the seventh century, A.D. 628, of the Christian era. Brahmacharya and Brahmagupta are supposed by some to be one and the same astronomer, the inventor of the system disclosed in the Sūrya Sidhanta; by others to be two distinct commentators of that shastra.—*Capt. E. Warren, Kala Sanhita.*

BRAHMAKUND, in lat. 27° N., and long. 96° E. It is a pool 70 feet by 30, twelve days' journey up the Lohit, into which several minor streams break over a precipice. It is considered by Hindus as sacred a spot as Gangotri, and it was at one time largely resorted to by pilgrims.

BRAHMA-LOKA. SANSK. The abode or heaven of Brahma. In the Buddhism of Ceylon, it is the highest of the celestial worlds, sixteen in number.—*Hardy*, p. 434.

BRAHMAN. This is written Brahmana, but the final a is dropped in conversation. It is the designation of the highest of the Hindu castes, whom it is usual to call the priestly class. Their duties, according to Menu, are—(1) Performances of holy sacrifices; (2) assisting at the performance of such by others; (3) reading the Vedas; (4) teaching the Vedas; (5) making gifts; (6) accepting gifts. If any of these means of existence failed, they were permitted to resort to certain

trading occupations, being restricted, however, as to the articles in which they might trade. But now-a-days Brahmans employed in sacerdotal functions are considered to be in a degraded position. The author of the Gita says, 'The prescribed duties of the Brahmans are peace, self-restraint, zeal, purity, patience, rectitude, wisdom, learning, and theology' (Gita, p. 130). The word Brahman, according to Weber, means drawing forth, as well in a physical sense 'producing,' 'creating,' as in a spiritual sense 'lifting up,' 'elevating,' 'strengthening' (Weber).

The Maha-brahman of Hindustan, who performs funeral ceremonies, is deemed so unclean that other Brahmans will not touch him. Gunga-putra or Ghat Brahman is a byword; and the Panda or temple priests, the Barna Brahmans who conduct the worship of the lower castes, the Gyawal and Prayagwal who rule over the ceremonies connected with pilgrimages to Gya and Allahabad, the Ojhas exercising the vocation of wizards, the Dayabagya, the Ganak, and the Jaudi Brahmans who cast horoscopes and predict events, are all looked upon by other Brahmans as lower classes. Menu writes in high-flown terms (Instit. chaps. ii. iii. vii. viii. ix.) of the sacred character of the Brahman learned in the Vedas, but comments with an equal severity on the unlearned of this class.

There are ten great divisions of Brahmans, viz. five Gaur, the Kanya-Kubhya, Saraswat, Gaur, Maithala, and Utkala; and five Dravidian, viz. Dravida, Telinga, Karnata, Maharashtra, and Gurjara. These have many subdivisions. The Gaur tribe, for instance, has 56 branches; the Kanoujia are divided into Sarwaria, Sanaudha, Jijhotia, and Bhunhar, and these again have subdivisions. Some of the subdivisions' names are taken from the district to which they originally belonged, others are named from their sects, or literary acquirements. The Chaturji of Bengal are so named from their acquaintance with the four Vedas, Chaturpadhya. The Chuckerbutty of Bengal are the Chakravarti, meaning a prince or ruler. Smartta is the name of a religious sect of Brahmans founded by Sankaracharya, whose expositions of the principle of unity, according to the Vedanta doctrine, they professedly follow. Siva is held by them in especial honour.

Brahmans are also recognised as of three classes, viz. Loukik or secular; Vaidik or theologian; and Bhikuk, whose sole means of support is the alms obtained by begging.

The Brahman as a distinct class seems to be first mentioned in the Atharva Veda, the oldest of the Vedas. They were known before the great war between the Kaurava and Pandava, but were seemingly in humble positions. Arjuna disguised himself as a Brahman when he competed at the Swayamvara of Draupadi, and won her, as he hit the golden fish with his arrow after all the rajas had failed. Draupadi became the wife of the five Pandu brothers.

The great bulk of the Brahmans of India are admissibly of Aryan origin,—tall, robust men, and light yellow in colour. In the Tamil and Telugu countries of Southern India, the recognised Brahmans are all undoubtedly of the same stock. Some of them can converse in Sanskrit, although they use the vernacular language of the district in which they reside, and are styled Dravida, Kerala, and Karnatica, etc., with reference to the language of their district. Brahmanical tribes are as much separated as are other castes. Some of them may eat together, but they do not intermarry; and the first approach at union is seemingly to be with the Konkan, Mahratta, and Gujerat Brahmans, amongst whom the influence of European knowledge has had more effect than upon any of all the other races in India. Good seed has fallen there on a good soil; and from a body of mendicants, these have become active, powerful, and useful men.

There are Brahmans in the hills north of the Panjab, in the extreme N.W. of India, occupying both the valley of Kashmir and the hills immediately to the west and south of it. Kashmir itself is a Brahman country,—all its people, though long since converted to Mahomedanism, having been of the Brahmanical race. The educated class there, who maintained their own tenets and are still very numerous, are known as pandits, and form quite an aristocracy. They are all educated, are exceedingly clever, and are an excessive and somewhat oppressive bureaucracy, which has ruled Kashmir under every successive government, and has sent out colonies to seek their livelihood in Northern India. The features of the Kashmir Brahmans proclaim them to be one of the highest and purest races in the world. They are of quite high Aryan type, very fair, handsome, with chiselled features. In many the nose is high and slightly aquiline, but not Jewish; but in others the nose is straight. Their brow is a little more raised and their nose more arched than in the Greek statues. The ordinary Kashmiri has a strong athletic figure, but none of them are martial; and the Brahmans in these respects correspond,—they rule by the brain and pen. They have a greater refinement and regularity of feature than the Afghans and others of a rougher type, with, however, a less manly-looking physique, a colour less ruddy, and more induced to a somewhat sallow fairness. The Kashmir Brahmans eat meat, and are excluded by the Indian Brahmans alike from the five Gaur and from the five Dravid, and form a separate Brahmanical class, being more secular than the priestly Brahmans of Hindustan and the Dekhan, than whom they are altogether looser in their observances.

Kashmiri pandits are known all over N. India as a very clever and energetic race of office-seekers; as a body, they excel in acuteness the same number of any other race with whom they come in contact. Almost all the secular pandits use the Persian character freely. They are perfectly versatile, and, serving abroad, will mount a horse, gird on a sword, and assume at a push a semi-military air.

The lower classes of Kashmir have long since been converted to Mahomedanism, but they seem to be ethnologically identical with the Brahmans; and tradition asserts that they are of the same race.—*Campbell.* The Brahmans of Kashmir are regarded by those of Bengal as of an inferior order, and the agricultural Brahmans on the Saraswati banks are similarly regarded. Brahmans are numerous in Kamaon and Garhwal, where education is more advanced and the Nagri character used. People of Brahmanical origin, approximating to the Panjabi, but in language, habits, manners, and dress quite different from the Kashmiri, dwell in the hills between Kashmir and

the Panjab, but they have abandoned the Hindu religion, and are now partly Sikhs and in part Mahomedans. Their language is a dialect of the Panjabi. They are good soldiers. Mr. Campbell thinks that the Brahmans of the frontier hills are even handsomer than the Kashmiri, the people in general of these hills being the handsomest of the human race. Bamba dwell in the hill frontier beyond the Jhelum. They are of Brahmanical origin, but now profess Mahomedanism. On the eastern side of the Jhelum the hills are shared with other races by a numerous tribe of Sikhs, converts from Brahmanism. Their Brahman ancestors became converts to the Sikh religion before it became a political power, and entirely threw off their Hinduism. They are very useful soldiers and servants. There are some Brahmans at the foot of the N.W. Himalaya. They are not found beyond the Indus, but are pretty numerous in part of the Rawal Pindi district. South of the Salt Range, in the plains, the Rajput and Jat occupy the country. But there are villages of agricultural Brahmans in the fertile plains under the hills in the districts of Sealkote, Goordaspur, and in the valleys of the broken country between Hushearpur and Kangra, and in parts of the Umballa district and the adjoining Simla hills. They are not numerous near the source of the Saraswati; but lower down its course, in the somewhat desolate countries of Marwar and Jeysulmir, where the lands are moist, the Brahmans are still numerous, and are good cultivators, and claim to have occupied the country before the Jats and Rajputs became dominant.

In Central India, the town of Palli seems to be a Brahmanical centre. The Marwari or Saraswati Brahmans form a considerable portion of the most industrious of the cultivators in Malwa. The Saraswati Brahmans seem to have kept much to the tenets of their forefathers. They are called in the south, Kashastale Brahmans. The oldest of the Brahmanical race are the people of the upper hills in the western Himalayas, who date from a time anterior to Hinduism. The Kashmiri were a civilised and literary Brahmanical people, not yet fully Hindu. The Saraswati Brahmans were the earliest, most simple, and pure Hindus of Vedic faith; and those of the Ganges and the rest of India are in various phases of modern Hinduism. There are ten classes of Saraswati Brahmans, who are supposed to come from the N.W. of India.

In the Panjab, Sind, and countries about the Saraswati, having been superseded by other races, there are few Brahmans, except in the eastern part of those tracts, where they are industrious cultivators, and claim to be the ancient occupants of the country.

Hindustan.—The main country of the Brahmans is that part of Hindustan lying between the Vindhya on the one side, and the Himalaya on the north, from the longitude of Kanouj and Lucknow to near the frontiers of Bengal, with a large segment of more especially Rajput country cut out of the centre of this tract. The Brahmans of Hindustan are generally good-sized, and, on the whole, well-looking men, with good features, not particularly fair. They are not of the high Aryan type. The greater number are quite illiterate. The priests and pandits have never adopted the Persian writing character. They are not very clever, have little social position, but serve humbly as soldiers and servants about courts and jails.

From the Gulcheter down to Dehli, and in the country about Dehli, there are Brahman villages, quite industrious and intelligent, the women working as well as the men; but Brahmans do not form a large proportion of the agricultural population. They were kind to and protected fugitives during the mutiny. Some of the less pure agricultural Brahmans of these parts are called Tuga or Gaur Tuga. All the Dehli country is occupied by Gaur Brahmans. South of Dehli, in the Jaipur country, Brahmans are numerous; and in the Saharunpur districts there are a good many Brahmans following secular pursuits, besides the priests of Hurdwar.

About Benares and the greater part of Behar are a numerous class of Brahmans called Bahman or Bhaban, or, according to Sir H. Elliot, Bhoonhar, to which the raja of Benares and all the great landholders of Behar belong.

Brahmans are many in the Banda district, and numerous in Baghelcund or Rewah, and there they condescend to very menial vocations, and groomed most of the horses on the Jubbulpur road. In the proper Brahman country, some of them affect the Rajput prejudice against actually holding the plough, though performing every other agricultural labour, and take the names of Dobi, Tewari, and Chaubi, *i.e.* men with a knowledge of two, three, and four Vedas, and are considered to be of very high caste. Between the Ganges and the Gogra, as we recede from the Ganges, the population becomes more Rajput than Brahman, but there are many Brahmans about Ajodiah, the old Oudh. Beyond the Gogra is a numerous Brahman population, humble, not soldiers. Thence to the north of the Gogra and Ganges, all the way to Tirhut, there are many Brahmans. South of the Gogra, and thence across the Ganges into the Arrah district (Bojpur), runs the Rajput dominions.

The Tuga Gaur Brahmans seem to be identical with the Bhuinhar, and the Bengali Tagores (properly Thakur) may be an offshoot from them. Like the Bhuinhar, the regular Brahmans repudiate all connection with them; and Mr. Beames even says there seems no reason for supposing them to be anything but low Aryans.

Bengal.—The Brahmans of Bengal are numerous. They claim for themselves a northern origin, but they differ much from the Hindustan Brahmans in language, dress, and habits. They are fairer and larger than the mass of the Bengali population, and some are fine-looking men in size and feature. They are largely employed as clerks and accountants, in learned professions, merchants and bankers, sharing the scriptory work with Kayasths. They are acute and intellectually capable, but not energetic. In Bengal about nine per cent. of the Hindu prisoners in jails are Brahmans. They will not put their hands to the plough, are aristocratic, but altogether unwarlike and effeminate, and in mercantile business are not equal to the Marwari. They are not numerous in Eastern Bengal. There are many in Orissa and in the Urya portion of the Ganjam district. Many of the Urya Brahmans are cultivators and traders, and are stated to be also brickmakers and bricklayers.

In Gujerat, the Brahmans are numerous, and are employed in public offices and in trade.

In the Peninsula, the Brahmans are numerous from Damaun to Goa, and from Bombay to Nagpur and the Wain Ganga, that is, all through the Mahratta country. They principally trace their got or clan from Kasyapa, the first Rishi. There are two classes intermixing here,—the Konkani Brahman and the Mahratta Brahman. *Mahratta* Brahmans are a highly intellectual race, and have been distinguished as accountants and clerks. Some of them, as Peshwas, put aside the descendants of Sivaji, ruled over the greater part of India, and took the command of Mahratta armies. The *Mahratta* or Deshasth Brahmans are dark, swarthy men, much shorter than the Konkani Brahman, often squat, with large, coarse features, large lips, and becoming in advancing life unwieldy. The men are not good-looking, and the women are decidedly plain. The men are largely engaged in public offices as accountants and clerks. They are stolid men, inactive, and of sedentary habits, with literary tastes, and may be justly proud of their poets.

The *Konkani* or Konkanistha Brahmans belong to that small strip of land lying between the Syhadri mountains and the Indian Ocean. They are all fair men, not large, but with lithe and agile frames, and decidedly of Aryan descent. They are good-looking, though in this respect inferior to the Afghan and Rajput races; and their women are fair and have pleasing countenances, with good figures, but even by their own relations are not considered to be equal to other of the women of India, amongst whom the fair Jewesses of Western India may be quoted. The race were agricultural until the British became supreme. The men are ready to move abroad in search of employment, and are met with amongst the Mahratta nation, throughout Berar, and are largely employed in the various public offices as accountants, clerks, in the educational department, and in mercantile houses. They are not military nor agricultural, nor do they engage in trade. The Konkan Brahman has a pleasant expression, is easily moved to laughter, much enjoys a joke, and is of an active turn of mind. They are easily distinguishable by the peculiarly large turbans which they wear.

Konkani and Mahratta Brahmans eat together, but do not intermarry. They do not marry in their own tribe or got; but the Mahratta Brahman will marry his mother's sister's daughter, and the Konkani Brahman will not marry a relative unless very remotely related.

The Mahratta or Deshasth Brahman is a reserved man, little inclined to seek friendships, and rarely seen to laugh. They at one time filled almost every office under the Peshwa and under the British, and even in Madras till the middle of the 19th century the revenue accounts were kept in Mahrati by these Brahmans; and in their own country they were zamindars, deshmookhs, and deshpandi, and almost all the village accountants were Deshasth Brahmans. Both these castes have to compete for employment with the writers known as Purbhu (Prabahu), of which there are two classes, the Patri Purbhu and the Kayasth Purbhu.

Canara, Mysore.—Mr. (Sir George) Campbell mentions (pp. 74,130) that in the N. Canara district, in the high hilly country above and about the ghats, and on the adjoining parts of Mysore, there is a large population of Brahmans, industrious and thriving cultivators and landowners. Most of these are called Haiga Brahmans, and the culture of the betel-nut is their especial pursuit. They are very fair, with large eyes and aquiline noses. In the Nagar district of Mysore they are very numerous, not very literary or highly educated, but devoted to agriculture.

In *South Canara* and the *Tuluva* country are many Brahmans, who do much cultivation; and all down the west coast to the extreme south of India, the country is said to have been extensively colonized by Brahmans led from Calpee by Parasarama.

They have been, from political and hostile circumstances, much removed from Malabar, but they are very numerous in Travancore and Cochin; and in the Palghat valley they are numerous, and are industrious and good cultivators.

Travancore.—On the south-west coast the chief class of Brahmans are the Namburi, who have some very peculiar customs, but they principally engage in priestly offices. The Namburi Brahmans resemble the Nair and the Hindu population of the S.W. coast, but are fair.

Brahmans are scattered through *Telingana* and through the *Tamil* country, all tall, fair, and portly men; are aristocratic, do not engage in any menial avocation, but restrict themselves to priestly offices, to clerking in Government establishments; but in these the Sudra Naidu or Naik of Telingana, and the Mudali and Pillay Sudra of Tamil districts, and Vaisya Chettyar, East Indians and Portuguese, descendants of Europeans, largely compete with them.—*Mr. (Sir George) Campbell*, pp. 57–67.

In the festival of Bhaubij, on the 2d day of the month Kartik, the wives of all Brahmans, whether of the Saiva or Vaishnava sects, worship their husbands, standing before them, sacrificing with the lamp and ghi, and pouring rice over their heads.

In Canarese-speaking countries the Brahmans are largely employed as accountants and office clerks. They are much disliked by the Vira-Saiva lingaets. A village of lingaets near Kaladgi abstained from digging a well in their village, to avoid attracting Brahmans amongst them.

Among the population of Southern India, out of a total population of about 32 millions, over one million belong to the Brahman caste,—547,027 males and 548,418 females. In 1871, of the 547,027 male Brahmans in the Madras Presidency, 332,934 were occupied as follows:—

Professional,	Government Civil Service,	8,887
	Military or Police service,	747
	Learned Professions,	18,499
	Minor ,,	55,504
Domestic,	Personal service,	19,584
Commercial,	Traders,	12,910
	Conveyors,	969
Agricultural,	Cultivators,	132,443
Industrial,	Dress,	165
	Food,	1,778
	Metals,	20
	Construction,	55
	Books,	40
	Household goods,	16
	Combustibles,	11
Indefinite and Unproductive,	Labourers,	5,384
	Property,	64,545
	Unproductive,	15,529
	Others,	1,898

Over 24 per cent. are agriculturists, and over 11 per cent. are classed as deriving income from property. In the southern districts, especially, a large proportion of the Brahmans are agriculturists. In Tinnevelly over 40 per cent. of them come under this head. But as a rule these Brahmans do not work with their own hands in agricultural pursuits, and employ labourers to till the ground. In the northern districts and Tanjore the Brahman landowners figure chiefly as owners of land, and as deriving their income from property.

Avocations and Customs.—Among the earliest functions of the Indian priestly tribe was that of Purohita, or house-priest attached to a princely household. But their character and avocations have altered with changing circumstances. The descriptions in the Vedas show us a primitive race of shepherds and husbandmen praying to the gods for the safety of their flocks and crops, but as the Arians came into India they seem to have risen above manual labour; and Menu (iii. 165, iv. 5) even denounces agriculture as absolutely degrading. There are, however, in Orissa numerous Brahmans who cultivate vegetables, but they are stigmatized as yam-growers, also lokik or worldly Brahmans; also brickmakers and bricklayers. In the Himalaya, in Chamba and near Dalhousie, they are shepherds. In Kangra, the Doab, and Benares, Brahmans guide the plough. In Central India there are peasant Brahmans; and in Southern India Brahmans are to be seen as betel-leaf growers and fishermen; while throughout the Tamil and Telugu countries they are to be found as blacksmiths and goldsmiths, who wear the sacred thread, and refuse precedence to the recognised Brahmans; and in Ceylon the descendants of an imported race, the Goi Bamano, are cultivators.

Almost every Indian province contains two or more distinct classes of Brahmans, descendants of different immigrations. The Chamba Brahman shepherds are a fierce, stalwart race, very fair, and their women singularly handsome. In the *Simla hills* the Brahman population consists indiscriminately of shepherds, husbandmen, day-labourers, cooks, and menials. In the inner hills they marry the widows of their elder brothers, like the lower castes of Orissa, and sell their daughters into a slavery faintly disguised by the name of concubinage. The *Patiala* Brahmans engage as day-labourers and are palanquin-bearers. Bishnuvi cultivators and graziers are numerous in Dhat; some in Chore and in Oomerkote, Dharnas, and Mitti.

In *Benares* and the districts along the Ganges to the southward, a large peasant population claim the title of Brahman; and their claim was recognised by the native governments exempting them from capital punishment. The Buinhar or Babhan of *Behar*, a peasant Brahman, number three-fourths of the whole Brahman population of the Bhagulpur district. They resemble the ordinary husbandmen.

There have been at times large manufactures of Brahmans by rulers. Some princes have imported Brahmans from distant localities, and other princes have raised lower castes to the dignity of Brahmans. Jeypore has a class of ploughing Brahmans, as regards whom a tradition relates that a warlike prince required a vast concourse of priests to give dignity to his sacrifice, and accordingly created five tribes of Brahmans out of the surrounding populations. They migrated into Oudh, where also is one of the Brahmanical families, who derive their origin from a prince whose self-importance would not allow him to offer sacrifice until he had 125,000 priests in attendance, and who accordingly invested the common people of the country with the sacred thread. In Behar the mass of the peasant Brahmans attribute their origin to a manufacture of a hundred thousand priests in prehistoric times. In Malabar, Parasurama made the whole fisherman population into Brahmans. They claim a very exalted rank. The Konkani Brahmans also are descendants of a fisher race; and to the present day the casting of a net and the catching of a fish form part of their wedding ceremonial.

Adisur, the founder of the Sen dynasty, brought from Kanouj five Sagnic Brahmans of the tribes or gotra, Sanhila, Kashyapa, Vatsa, Saverna, and Bharudwaja. Several Sudra families, Ghose, Bhose, Dutt, Guha, Mittra, etc., accompanied them, and these take the position of Kulin Kayasths. In the reign of Bullal Sen, about 284 years before the Mahomedan invasion, all these Kulin Brahmans and Kulin Sudras had greatly increased, and, though degenerated in learning, they arrogated to themselves a position above all the Sapta-sala or aboriginal Brahmans; and Bullal Sen ennobled those Brahmans by giving to them the title of Kulin. The Kulin Brahman subsequently consented to marry the daughters of the aboriginal Brahman, who eagerly seek alliances with the Kulin; and the Kulin have taken advantage of this, and have established a scale of fees for condescending to accept a daughter of an inferior. They marry gold. Of the Kayasths who came from Kanouj, Bhose, Ghose, and Mittra were ennobled by Bullal Singh into Kulin Kayasths, and are still in Bengal. The Dass, Day, Dutt, Guha, Kar, Paulit, Sen, and Sing hold a second rank.

Kulin Brahman women are married with difficulty, and generally to aged men. In 1868 there were 11 Kulin men in Hoogly and 1 in Bardwan, each of whom had contracted 50 to 80 marriages; 24 in Hoogly and 12 in Bardwan, who had contracted from 20 to 50 marriages; and 48 in Hoogly and 20 in Bardwan, who had contracted between 10 and 20 marriages. Kulinism is thus a great polygamic institution, and a few Kulin women have become prostitutes. In 1867 the abolition of this polygamy was contemplated, and will doubtless soon be carried out (*Cal. Rev.* May 1868).

Agnihotra Brahmans are the remnant of the worshippers of Agni, who still preserve the family fire, but in other respects conform to some mode of popular Hindu devotion. According to prescribed rule, where a perpetual flame is maintained, it is used to light the fire round which the bride and bridegroom step at the marriage ceremony, and the funeral pile of either; but the household fire is preserved only by this particular sect, the Agnihotra, and the great body of the people have nothing of the kind. In this case they distinguish between the sources whence they obtain the kindling flame according to the purposes of its application, and the fire of the marriage rite is taken from the hearth of a respectable person, or from a fire lighted on some auspicious occasion; whilst for the funeral pile any unpolluted fire may be used. It is only necessary to avoid taking it from

another pile, or from the abode of an outcast, of a man belonging to the tribe of executioners, of a woman who has lately borne a child, or of any person who is unclean.

The *Agnicula* was a supposed Scythic race, whom the Brahmans, in order to oppose the Buddhists, formed into a religious confederacy.

Aradhya Brahmans profess the Jangam creed, but adhere to their caste views. They are chiefly in the Canarese country. In other sects of Hindus, the Brahman uniformly take precedence of other castes; but among the Jangam or Vira-Saiva he is degraded beneath all others. Hence there is a perpetual feud between the Aradhya Brahman and the Jangams, who (unless at funerals, where all are bound to assist) treat these Brahmans with contempt (*Brown on the Creed and Customs and Literature of the Jangams*, p. 8).

The emigration of the Brahmans to peninsular India appears to have been subsequent to the first great change in their religious system. The religion they introduced was probably a rudimental form of Saivaism, with a tendency to the mystical and mythological system of the Puranas. There is not the least reason to suppose that the Vedic or elementary system was ever known in the Tamil country, either as an indigenous religion or as introduced by the Brahmans.

The Brahmans deeply impressed Alexander by their learning and austerities. One of them, Kalanos by name, was tempted, notwithstanding the reproaches of his brethren, to enter the service of the conqueror. But, falling sick in Persia, Kalanos determined to put an end to his life. Alexander, on hearing of his philosopher's resolve, vainly tried to dissuade him; then loaded him with jewels, and directed that he should be attended with all honours to the last scene. Distributing the costly gifts of his master as he advanced, wearing a garland of flowers, and singing hymns, the Brahman mounted a funeral pyre, and perished in the flames.

The Brahmans of the present day are a race of the highest culture, the result of 3000 years of hereditary education and self-restraint, and they have evolved a type of mankind quite distinct from the surrounding population. Even the passing traveller in India marks them out alike from the bronze-cheeked, large-limbed, leisure-loving Rajput or warrior caste of Aryan descent, and from the dark-skinned, flat-nosed, thick-lipped, low castes of non-Aryan origin, with their short bodies and bullet heads. The bulk of the Brahmans stand apart from both, tall and slim, with finely-modelled lips and nose, fair complexion, high forehead, and slightly cocoanut-shaped skull,—the man of self-centred refinement. He is an example of a class becoming the ruling power in a country, not by force of arms, but by the vigour of hereditary culture and temperance. One race has swept across India after another; dynasties have risen and fallen; religions have spread themselves over the land, and disappeared. But since the dawn of history, the Brahman has calmly ruled, swaying the minds and receiving the homage of the people, and accepted by foreign nations as the highest type of Indian mankind (*Imp. Gaz.* vol. iv.).

Brahmanism is the ordinary designation of the Hindu religion at present prevailing. It is accommodating to anything that partakes of idol-worship; similarly as a Roman would worship Isis and Osiris, so a Hindu makes offerings to apotheosized Mahomedans, such as Shaikh Sadu, Ghazi Mian, and Shaikh Madar in Northern India; and throughout all India there are multitudes of figures of local divinities who have been admitted into the Hindu Pantheon as avatars of Vishnu or Siva, the chief gods of the modern Hindus. The Vaishnava doctrine raises Vishnu to the highest place, and adores his different avatars, together with a multitude of other deities, powers of nature, and mythical persons. The Saiva doctrine places Siva highest in the rank of the gods. The professors of this doctrine number many millions more than the professors of Vishnuism. Although Siva is the god of destruction, he is also the god of reproduction, considered with respect to the idea, which ever pervades the doctrine of Brahma, namely, that death is but the recommencement of a new life. Vedantism, so named after the Vedanta of Vyasa, has few adherents, consisting of some philosophical Brahmans. Of the thousands of temples in India consecrated to various deities, only one, it is said, is consecrated to this doctrine, in which Brahma is worshipped alone.

Various ceremonies are attendant upon Hindu boys between infancy and the age of eight years. After that age, and before a Brahman lad is fifteen, it is imperative upon him to receive the poita, yadnupavita, zonar, janavi, or jhandiam, the sacred thread, which the Brahmans in their secret ceremonies call Yadnupavita. In the investiture, the priest offers a burnt sacrifice, and worships the salagrama, repeating a number of prayers. The boy's white garments are then taken off, and he is dressed in yellow or red, and a cloth is brought over his head, that no Sudra may see his face; after which he takes in his right hand a branch of the vilva, Ægle marmelos, and a piece of cloth in the form of a pocket, and places the branch on his shoulder, with shoes on feet and umbrella in hand. A poita of three threads, made of the fibres of the suru, to which a piece of deer's skin is fastened, is suspended from the boy's left shoulder, falling under his right arm, during the reading of the incantations or invocations. The father of the boy then repeats certain formulas, and in a low voice pronounces three times, the Gaitri, O'm! Bhurbhuvă ssuvâhā, O'm! Tatsa vit'hru varennyâm, B'hargo devâsyâ dhimahi dhiyo yonaha pracho dayath. O'm! earth, air, and heaven, O'm! 'Let us meditate on the adorable light of the divine Sun (Savitri), may it guide our intellects.' After this prayer the suru poita is taken off, and the real poita, or sacred thread, put on. The receiving of the poita is considered as the second birth of a Hindu, who is from that time denominated 'dwija' or twice-born. A Brahman boy cannot be married till he has received the poita. The sacred thread must be made by a religious Brahman. It consists of three strings, each ninety-six hat'h (forty-eight yards), which are twisted together; it is then folded into three, and again twisted; these a second time folded into the same number, and tied at each end in knots. It is worn over the left shoulder (next the skin, extending half-way down the right thigh) by the Brahman, Kshatriya, and Vaisya castes. The first are usually invested with it at eight years of age, the second at eleven, and the Vaisya at twelve.

The period may, from especial causes, be deferred; but it is indispensable that it should be received, or the parties resisting it become outcastes. An individual is not fully a member of this class until he have assumed this emblem. It is like the Roman lad's assumption of the toga virilis.

A *Kulin Brahman* can marry as many wives as he likes; but there are certain Brahmans in Bengal who find the greatest difficulty in getting married to even one wife. These are the Bangshaja Brahmans of the Shrotriya class. While a Kulin Brahman gets for every wife that he marries a handsome bribe, a Bangshaja Shrotriya Brahman has to pay down a large sum of money to the father of the girl whose hand he seeks to obtain. The consequence is that, owing to their poverty, numbers of Bangshaja Shrotriya Brahmans never get married at all. To remedy this evil, in Eastern Bengal, when in any village the number of unmarried Shrotriya becomes inconveniently large, one of the ghatak of the place—those underservants of Bidhata who take a prominent part in all marriages—goes to Shrihatta in Sylhet. There, with the assistance of his agents in the district, and by means whether fair or foul, he procures a number of girls, to whom he holds out the prospect of a pleasant settlement in life. The girls may not all be Brahman girls, some of them may be of the Chandal caste, and others may be young widows; but whatever may be their caste, character, and antecedents, they are huddled together in a boat, often fifteen or sixteen in number, and taken to the ghat of the Shrotriya village. The faces of the old Shrotriya bachelors become lighted up with joy, when they hear of the arrival of the hymeneal boat. The sensation which these highly-favoured boats create in Eastern Bengal, is infinitely greater than that produced in Calcutta by the orange-boats of Sylhet, or the mango boats of Malda. The Bangshaja bachelors besiege the boat in numbers. Each one selects a girl according to his taste, a bargain is struck with the ghatak, and the celebration of the rites of marriage, according to the forms prescribed in the Shastras, soon follows. The plain-looking girl, for whom no Shrotriya may have a fancy, is employed as a maid-servant either of the ghatak himself, or of any other who may stand in need of her services.

The influence on India of the Brahman races has been great. They developed a noble language and literature. They were the priests and the philosophers of their race; also the lawgivers, administrators, men of science, and poets. They have brought the mass of the backward races into the social and religious organization of Hinduism. They wrote the Vedas, Brahmanas, Sutras, and Upanishads, meaning the science of God and his identity with the soul; the Aranyakas, or tracts for the forest recluse; and the more recent Puranas, or traditions. The six Darsana, or schools of philosophy—Sankhya, Yoga, (3, 4) Yedanta, (5) Nyaya, and (6) Vaiseshika—originated from them. They treated philosophy as a branch of religion. They had also a circle of the sciences, the Science of Language. Panini, B.C. 350, was the founder of Sanskrit grammar. Under every dynasty and government in India, Brahmans have held the highest executive offices alike in the civil executive and in the political administration of the country, for, until the middle of the nineteenth century, all learning and science centred in them. The introduction into India, by the British, of the western forms of education, and the system of grants-in-aid to schools, however, have permitted, particularly in the south of India, all the Sudra and Vaisya races to compete with the Brahmans, who are being largely displaced from their former exclusive position, though they are still a great power in the state.

There is no being more aristocratic in his ideas than the secular Brahman or priest, who deems the bare name a passport to respect. The Kulin Brahman of Bengal piques himself upon his title of nobility, granted by the last Hindu king of Kanouj (whence they migrated to Bengal), and in virtue of which his alliance in matrimony is courted. But although Menu has imposed obligations towards the Brahman little short of adoration, these are limited by him to the learned in the Vedas: he classes an unlearned Brahman with an elephant made of wood, or an antelope of leather, —nullities save in name.

Owing to the segregation which all the Hindu races practise, Brahmans have never formed a compact body, and their influence and power have been local. Learned Brahmans are much respected. At festivals, weddings, and feasts for the dead, they are invited to the houses of the wealthy, are feasted, treated with honour, and on their departure receive gifts of value, dresses, gold and silver vessels, ornaments of numerous kinds, food, and also money. A man of learning often takes one or more of his scholars to such assemblies, both to enhance his own reputation and to accustom them to respectable society; and the students also obtain a share of the presents. From gifts of this kind the larger number both of teachers and students in the Hindu schools of learning are supported, their food procured, and their house accommodation provided. Tolas, or native colleges of this kind, are scattered all over the province of Bengal, and one or more may be found in all the great villages. The Zillah of Bardwan, for example, though not particularly celebrated for learning, contained, a few years ago, 190 Sanskrit schools and 1350 students. Some places are more celebrated as seats of learning than others. In North India, for instance, Nuddea, Santipur, Tirhut, and above all Benares, contain a large number of colleges. In South India they are chiefly found in the provinces of Tanjore and Madura. These schools are divided into three classes,—those wherein general literature is studied, the schools of law, and those of philosophy. In the first the subject-matter of study embraces grammar, lexicology, poetical works, and rhetoric. According to Bunsen, Brahmans have systematically adulterated and adjusted the early history of India (iii. 513). Brahmans were acquainted with the Talmud; and Sir W. Jones thought that Genesis ii. 21, 23 is referred to in the form of Siva and Parvati, known as Art'hanesvari, of which the right hand half is Siva and on the left hand Parvati.—*Brown on the Jangams; Bunsen's Egypt*, iii. 513; *Chow-Chow*, p. 44; *Mullen's Hindu Philosophy*, pp. 10, 11; *Coleman's Mythology*, p. 154; *Calcutta Review*, May 1868; *Tod's Rajasthan*, i. p. 512; *Taylor, Mackenzie MSS. Bhagavad-Gita; Sir George Campbell's Ethnology; Bowring's Ethnology in B. As. Soc. Jo.; Darwinism in Morals*, p. 279; *Hunter's Orissa; Imp. Gaz.; Moor's*

Pantheon; Weber's Indian Literature; Wilson's Glossary.

BRAHMANA, Sanskrit prose works, of later date than the Vedas; the oldest is the Aitareya, which has much historical information. The several Brahmana are chiefly liturgical, ritualistic, and legendary, and, in the various Upanishad, passing into the rationalized state, and becoming metaphysical and mystical. Their professed objects are to teach the sacrifice; they appeal continually to earlier authorities, and evolve their dogmas under the guise of free Mimánsá or discussion. They are the work of several individuals, and Professor Müller limits their age to the two centuries from B.C. 800 to 600, if not prior thereto. Each of the Sanhitas or collection of hymns has its Brahmana, and these generally maintain the essential character of the Veda to which they belong. The Rig-Veda has the Aitareya Brahmana, also the Kanshitaki or Sankhayana; the Yajur-Veda, in its Taittiriya Sanhita, has the Taittiriya Brahmana; and its Vajasaneyi Sanhita has the Satapatha Brahmana. The Sama Veda has eight Brahmanas, and the Atharva one.—*Weber; Müller; Dowson.*

BRAHMANABAD, a ruined city in the Hyderabad district in Sind, supposed to have been destroyed by an earthquake; and recent excavations show whole households overwhelmed together, men and women at their work, and cattle in their stalls. Sculptures, engraved gems, carved ivory, earthenware and coloured glass, have been found. Tradition says it was destroyed in the seventh century by the gods, in punishment for king Doloras' iniquities.—*Imp. Gaz.*

BRAHMANA WANSE, a race in Ceylon who take a high place amongst the Hindu races of the island.

BRAHMANDA, in Hinduism, the mundane egg created by Brahma; also the visible sky, which is supposed to be the shell of this egg.

BRAHMANI, a name of Saraswati as goddess of learning; also any Brahman woman.

BRAHMANICAL CAVES. See Architecture.

BRAHMANICIDE, the sin of killing a Brahman.

BRAHMANISM. Early writers on the religions of India, who drew their information exclusively from Sanskrit and Brahmanical sources, amongst whom was Klaproth, inclined to favour the pretensions of Brahmanism as more ancient than Buddhism; but in later times the translations of the Pali records and other sacred volumes of Buddhism in Western India, Ceylon, Burma, and Nepal, have inclined the preponderance of opinion in favour of at least a contemporaneous development. A summary of the arguments in favour of the superior antiquity of Buddhism is to be found in the notes, etc., by Colonel Sykes, in the twelfth volume of the Asiatic Journal, and in the Essai sur l'Origine des Principaux Peuples Anciens, par F. L. M. Maupied, chap. viii. The Rev. Mr. Gogerly says the sacred Buddhist books in Ceylon expressly demonstrate that its doctrines had been preached by the twenty-four Buddhas who had lived in succession prior to Gautama or Sakya, in periods incredibly remote, but that they had entirely disappeared at the time of Gautama's birth, so that he re-discovered the whole, and revived an extinguished or nearly extinct school of philosophy. (Notes on Buddhism by the Rev. D. J. Gogerly, appendix to Lee's translation of Ribeyro, p. 265, quoted in Tennent's Christianity of Ceylon, p. 197.) Bunsen says (iii. 516) the worship by the Aryan immigrants and the institution of castes seems to have commenced after they crossed the Sutlej river; and the original seat of this worship extended from the Indus to the Ganges and to Bengal (Behar). He adds that Brahmans, after crossing the Sutlej, introduced Siva and other deities, and threw those of the Vedic period into the shade. According to Bunsen, also, it was about the year 3000 B.C. that the schism took place amongst the Aryans, when all India east of the Sutlej adopted Brahmanism, and the religious views, forms, and habits of Bactria were for ever abandoned. According to Menu, the world had passed through four yogas when Brahmanism was introduced.

Fa Hian, the Chinese priest of Buddha, who travelled through Tartary to India and Ceylon in the fourth and fifth centuries A.D., mentions that in the whole of that vast route, including Afghanistan and Bokhara, he found a Buddhist people and dynasty, with traditions of its endurance for the preceding thousand years. As to Hindustan itself, he says, from the time of leaving the deserts of Jeysulmir and Bikanir and the river Jumna to the west, all the kings of the different kingdoms in India are firmly attached to the law of Buddha, and when they do honour to the ecclesiastics they take off their diadems. See also Maupied, Essai sur l'Origine des Principaux Peuples Anciens, chap. ix. p. 209.

According to Strabo (Dionysos, p. 117), Siva was worshipped in the mountains (Rudra, Soma, Siva); Herakles (Indra, Vishnu) in the plains. Brahmanism was found established in Hindustan by Megasthenes, ambassador of Seleucus at the court of Chandragupta, and at the time of the Periplus the very southernmost point of the Peninsula was, as now, a seat of worship of Siva's wife.

From the above it would appear that prior to the preaching of Sakya Sinha, there were in India numbers who entertained doctrines with some similarity to those which he taught; but until Asoka (B.C. 257) adopted the Buddhist beliefs, the followers of the Vedic and Puranic doctrines, as expounded by the Brahmans, were by far the most numerous. The two creeds were, however, coexistent throughout India, and in the same towns, but Brahmanism fell into the shade for about a thousand years, from the time of Buddha, B.C. 623-5, till the reappearance of Brahmans at the court of Vikramaditya, A.D. 490-530, when the religion they recognised began to assume the form which it still presents in India, a confused mass of local superstitions and myths. About B.C. 700-1 Brahmans had became a recognised caste, who shared power with the Kshatriya; the Vaisya, as merchants, had become a power; and the Sudras had become a recognised division of the population. Between the times before Sakya's advent and the centuries after Brahmans began to rise in power, the old Vedic books and their doctrines had been pushed aside by other old writings, now known as the Puranas. The Brahmanism of the Vedas and that of the Puranas are of very different characters, the change having been greatly influenced by the rise and progress of Buddhism which intervened between the two forms.

The change from Buddhism to Brahmanism was brought about often with much violence and cruelty, by great efforts of the Brahmanical sectarians. The great champions of Brahmanism were Kumarila Bhatta, who was a violent opposer of the Buddhists; Sankara Acharya, the great Vedantic reformer, who flourished in the 8th or 9th century; Ramanuja, who lived in the 12th, Madhavacharya in the 14th, and Valabhacharya in the 16th century A.D. The last three were Vaishnava teachers. Ramanuja was the first to inculcate the Bhakti doctrine, and he was followed by several others, including Chaitanya in Bengal. Brahmanism is at present synonymous with Hinduism, and the Brahmanical religionists are of three classes, the worshippers of Vishnu, of Siva, and of the Sakta or female energies of the gods. But it is in some places a nature-worship, in others an idolatry, in others a hero-worship, in others a physiology, in others a philosophy, perhaps in all a spirit-worship.

Learned Hindus, however, have six schools of philosophy, called the six Darsana, viz. Nyaya, Vaiseshika, Sankhya, Yoga, Purva Mimansa and Uttara Mimansa. These have one starting-point, *ex nihilo nihil fit;* and all have the same final object, the emancipation of the soul from future birth and existence, and absorption into the supreme soul of the universe. Besides these six are a later system, known as the Puranic and the Eclectic school.—*Weber's Indian Literature; Elphinstone's India; Bunsen's Egypt; Tod's Rajasthan; Rebeyro's Ceylon; Tennent's Christianity*, p. 199; *Calcutta Review; Dowson's Classical Dictionary; Weber.*

BRAHMANY, a river of Orissa, rises in the Palamow table-land, lat. 23° 25′, long. 84° 13′. It is formed by the South Koel and the Sankh rivers, at the prettiest spot in the Gangpur state of Chutia Nagpur, from which it passes through the Bonai, the Talcher, and Dhenkanal states and the Cuttack district into the Bay of Bengal, near Pt. Palmyras. Length, 410 miles. The confluence of the South Koel and the Sankh is said by local tradition to be the scene of the amour of the sage Parāsara with the fisher-girl Matsya Gandha, who became the mother of Vyasa, the reputed compiler of the Vedas and the Mahabharata.—*Imp. Gaz.*

BRAHMANY BULL, a term applied to the humped cattle of India and the Archipelago; the Bos Indicus of authors, partly wild and partly domesticated; also the votive liberated bull, set free by Hindus to roam. See Bovidæ; Bijar; Brihhotsarg; Saur.

BRAHMANY DUCK, Casarca rutila.

BRAHMANY KITE, the name given in the Peninsula of India to the Haliastur Indicus. It receives its name from Europeans because Hindus reverence it, and regard it as the vahan of Vishnu. It is often fed by Hindus, on whose call of Hari! Hari! the birds assemble, and animal food is tossed to them. This is to be seen daily, everywhere. The birds are expert fishers. See Garuda; Vahan.

BRAHMA PURA, the fabled city or heaven of Brahma on the top of Mount Meru.—*Dowson.*

BRAHMA PURANA, the first of the Puranas. It chiefly relates to sun-worship, hence another name, Saurya Purana.—*Dowson.*

BRAHMAPUTRA, a river in the N.E. of India, flowing into the Bay of Bengal. It has not been traced from its source, but is generally believed to rise among gigantic glaciers to the S.E. of lake Manasarowara. An old Lama told Abbé Desgodins that in his youth he had visited nearly the whole of Tibet, and had followed the great river from its source, in or near the lakes of Too-ma-pang, in the western part of the province of Nogaré, the most western of Tibet, and the Lama said that some days to the east of Lassa the river turns towards the south, making a long bend, and traverses the Tibetan district of Hia-yul, a rich and well-peopled district just to the north of Lhopa. The river enters the country of the wild Lhopa tribe, and winds its way among steep and rugged bare rocks, without roads, and which can be passed only by means of wretched ladders made of lianas. After a certain course among the Lhopa, the river falls over a high rock into a valley which is not known. The height of the fall is so great that the Lama said it made him giddy to look down. At this place, he said, the river is almost as considerable as the Kin-sha-kiang at Bathang.

The Imperial Gazetteer says that the Dihang is believed to be the continuation of the Sangpu or Narichu Sangpu of Tibet, which rises on the further side of the Himalayas, in about 31° N. and 83° E., and flows past Lassa eastwards through the whole of Tibet, but the continuity has not been verified, owing to the difficulties of the mountainous region and to the inhospitable character of its occupants. The main stream in the Assam valley is made up by the confluence of three swift rivers, the Dibang, Dihang, and Brahmaputra proper, in lat. 27° 70′ N. and long. 95° 50′ E.; the two latter are supposed to penetrate the Himalaya by a rocky gorge.

On entering the valley of Assam, the united stream rolls for 450 miles from the N.E. to the S.S.W. through the plain, with a vast expanse of water, broken by innumerable islands. On leaving Assam near Dhubri, it turns sharply due S., sweeping round the spurs of the Garo hills, and runs S. for 180 miles through the plain of Eastern Bengal as far as its confluence with the Padma, or main stream of the Ganges at Goalanda. Here the conjoint delta of the two rivers commences. The great bulk of the waters of the Brahmaputra flow toward the S.W., and ultimately reaches the sea by the broad estuary known as the Megna. Shortly after leaving Assam, what is at present (1882) the chief channel of the Brahmaputra takes the name of Jamuna, the bed along which it flowed in the middle of the 18th century running past Maimansinh further to the east, and, retaining the original name, to re-unite with the larger body of water by means of the Megna. After the confluence of the Brahmaputra, Dibang, and Dihang, as it rolls to the sea it receives successively the Subansiri, 180; Bhoroli, Manas, 189; Gadadhar or Sankas, 160; Dharla and Tista, 313, on the right bank; and the Noa Dihing, 100; Buri Dihing, 150; Di Sang, Dhansiri, and Kapili, on the left. All of these are navigable by country boats of the largest size.

The Brahmakund, a place of Hindu pilgrimage, is a very deep basin-shaped enlargement of the river, just before it emerges from the mountains to descend into the plains of Assam. The velocity of the current, which both above and below the Brahmakund is very great, suffers a great diminution at this point. In its S.W. course, along the whole length of the left shore

of the Brahmaputra, and nearly parallel to the broad valley through which it runs, we meet with a longitudinal range of secondary hills, inhabited by the various scattered tribes of the Naga, Khassya, Jaintia, and Garo, in the Patkoi, Khassya, and Garo hills. These latter hills run south-east, skirting the rice-fields of Maimansinh, Comillah, and Noa Colly, and forming the greater part of Chittagong and Arakan down to the Irawadi. The level of the Brahmaputra at Sadia is 210 feet, the fall from Sadia to the delta consequently amounting to half a foot per mile. Sadia is situated near the spot where the most considerable of its affluents join the Brahmaputra, viz. the Dihang, a river seemingly identical with the Tibetan Zambu, or Sang-pu. The ebb and flood of the tide extend, in the season when the river is low, upwards beyond Dacca. The branches of the Brahmaputra, together with those of the Ganges, intersect Lower Bengal in such a variety of directions as to form a complete system of inland navigation. The Brahmaputra begins to rise in April, owing to the melting of the snow at its alpine sources. About the 1st July it is at full flood, and all the level country is submerged; herds of buffaloes, deer, and hogs then swim for refuge to the hills. The Brahmaputra drains Assam in every direction. It is known in Assam by the name Hiranyo or golden. In the rainy season it rises 30 or 40 feet above its lowest level, overflows its banks, and inundates the country like an inland sea. In the dry season it is a labyrinth of half-filled channels, rendering the navigation intricate, and fit only for steamers of light draught. It is not navigable for steamers higher than Dibrugarh; 800 miles. As seen from Ogri hill, near Tezpur, the river is sweeping along in a bed of from ten to twelve miles in breadth, with numerous islands, covered with canes and shrubs. The chief towns on the banks of the river are Bishnath, Durrung, Gowhatty, Goalpara, Nasseerabad. It is navigable from the Bay of Bengal to Dibrugarh near the head of the Assam valley, within 500 miles of Pengshaw, on the Yang-tze-kiang river. Of these 500 miles, 300 are known, and if this route can be opened, the rich province of the Yang-tze-kiang may hereafter be opened to India.—*Schlagentweit's General Hypsometry of India*, ii. p. 98; *Imperial Gazetteer*. See Assam; Megna.

BRAHMA RAKSHASI. TAM. Fourcroya cantala.

BRAHMA-RANDHRA, Pineal gland. See Yug-byasa.

BRAHMARI. TEL. Clerodendron serratum.

BRAHMA-RISHI, five patriarchs of the Hindu people who founded clans or gotra of Brahmans, viz. Kasyapa, Vasishta, Angiras, Atri, and Brighu.

BRAHMA SAMPRADAYI, or Madhavachari, a small Vaishnava sect of Hindus in Southern India, founded by Madhavacharya, a Brahman, son of Madhige Bhatta, born A.D. 1199 in Tuluva. At Udipi, Madhyatala, Subrahmanya, and other places, he established temples, and eight maths in Tuluva, below the Ghats. The superiors or gurus of the Madhava sect are Brahmans and Sanyasis, or profess cœnobitic observances. The disciples, who are domesticated in the several maths, profess also perpetual celibacy, lay aside the Brahmanical cord, carry a staff and a water-pot, go bareheaded, and wear a single wrapper stained of an orange colour with an ochrey clay. They are usually adopted into the order from their boyhood, and acknowledge no social affinities nor interests. They regard Vishnu as the supreme spirit, as the pre-existent cause of the universe, from whose substance the world was made.—*Wilson.*

BRAHMA SAVARNI, one of the 14 patriarchs who are supposed to preside successively over the 14 Manwantara of the Calpa.—*Warren, Kala Sanhita.*

BRAHMA SIDDHANTA, the second of the authentic Hindu Shastra.

BRAHMA SUTRA, or Brahma Mimansa Sutra, aphorisms on the Vedanta philosophy, by Badarayana or Vyasa.—*Dowson.* See Sutra; Veda.

BRAHMA VAIVARTA PURANA contains 18,000 stanzas; a sectarian work on the youthful Krishna and Radha.—*Dowson.* See Sacta.

BRAHMAVARTA, according to Menu, a tract of land immediately to the westward of the Jumna, between the rivers Saraswati (Sersooty) and Drishadwati (Dhrisdavati) (Caggar), about 100 miles to the N.W. of Dehli, and in extent about 65 miles long and from 20 to 40 miles broad. Its customs are models to pious Hindus. The country between that tract and the Jumna, and all to the north of the Jumna and Ganges, including North Behar, is called Bramarshi by Menu; and Brahmans born within that tract are pronounced to be suitable teachers of the several usages of men.—*Elphin.* p. 205.

BRAHMESWARA, in Cuttack, not far from Bhubaneswara. Here a slab was found with an inscription in Sanskrit verse. It commemorates the temple of Brahmeswara being erected to Siva by Kolavati, the mother of Udyotaka. The era Samvat 18 is used. The temple was no doubt erected after that to Siva at Bhubaneswar, which Mr. Stirling says was completed A.D. 657, and that at Kanarak A.D. 1241. If the Samvat era 18 be that of Gaur of the dynasty that subverted the Bhupala, it corresponds to A.D. 1141.—*J. A. S. B.* v. p. 660, vii. p. 557.

BRAHMO, a name applied by Mr. Hodgson to the Kusunda, a Bhot tribe occupying the dense forests of the central region of Nepal.

BRAHMO-SAMAJ'H, a small reforming Hindu sect, who regard their views as a pure theism, recognise the absolute unity and spirituality of God, the abolition of caste, and the elevation and instruction of woman. During a very few years, Brahmoism ran through three different stages. In the first it had for its foundation Vedic testimony tempered by reason; in the second stage, reason and philosophy; and about 1870 it was supposed to stand on intuition guided by reason. But quite one-fourth of the total number of Brahmo rest on Vedic testimony, and nearly one-third look up to reason alone. And though the intuitive Brahmo have done away with Srads, Anoprashans, etc., their brethren of the first stage perform those Hindu ceremonies in all their forms. The Brahmo of the second stage hold a middle place. On its decline, another theistical body arose, the Dharma Sabha. Brahmoism, in all its phases of development, has carried on a crusade against the institution and usages of caste. Its leading members have strongly advocated a repudiation of two great social customs, that of infant marriages and the prohibition of widow marriages. They have deprecated polygamy, and have striven to place

the marriage institution on a footing similar to that which has received the moral and practical sanction of civilised communities. In 1880 there were 149 Samaj'hs scattered throughout India. In Calcutta alone there were 20; in Bengal, 54; in Assam, 7; Chutia Nagpur, 3; Behar, 7; Orissa, 2; N.W.P., 8; Central Provinces, 1; Punjab, 5; Sind, 3; Gujerat, 3; Bombay, 6; and Madras, 6. Of these, 44 have mandirs, or places of worship. In connection with the society eighteen different periodicals were published. Of these, six were in English, nine Bengali, one each in the Hindi and Uria languages, and one in Anglo-Mahratti. There are schools kept up by the society, besides schools and classes kept up by the local Samaj'h.

BRAHMYA, in Hindu astronomy, the Yoga Star of the 25th lunar mansion, 'a' Pegasi.—*Warren.*

BRAHUI, the dominant race in Baluchistan. Their tribes, above 70 in number, are nomades, residing in one part of the country in summer, migrating to another for the winter season, and constantly shifting for pasturage. The Baluchi has a tall figure, long visage, and raised features. The Brahui have short, thick bones, with round faces and flat lineaments, are stout and squat, and numbers of them have brown hair and beards. Their name is said to be from an affix 'boan,' and 'roh,' a hill; and the name of the Narui, or Baluch, race is said to mean 'not mountaineers.' The Brahui have no religious men, whether syud, pir, mullah, or fakir. The tribes reside in tomans, or collections of tents. These tents are made of goat's hair, black or striped. The furniture is very simple, —a few metal cooking-pots, a stone hand-mill, and some rough carpets and rugs, with a distaff for spinning wool, and a hookah, are all that are usually found in a Brahui tent. That of the chief may perhaps be better furnished, and he is richer than his neighbours in flocks and herds. The dress of the lower orders is made up of a long tunic, trousers loose at the feet. The Kamburani, the chief tribe, are divided into three distinct gradations of rank, called Ahmedzai, Khani, and Kamburani. The first supplies the khan; the Khani are of the secondary rank of chiefs. The word Kamburani includes all the remainder of the tribe, but in common is applicable to the whole body. They receive wives from, but do not marry their daughters into, other tribes. The typical Brahui are certain tribes in Saharawan and Jhalawan. The Brahui are Sunni Mahomedans. They have, both in feature and speech, indications of a Turanian element. Their political chief is the Khan of Kalat.

They are entirely illiterate; not a single book exists in their language, or specimen of their language reduced to any form of writing. It is called Kur-Gali, and, according to Dr. Caldwell, is mainly Panjabi, with a Dravidian element; according to Mr. Campbell, is mainly Aryan (Indo-Persic), with a Turanian element. Ethnologists are inclined to consider them to be of the same Scythic stock as the Dravidian races in the Peninsula, and infer from this that the passage of the Dravidian tribes from Turan was along the valley of the Indus.—*Mr. Campbell*, pp. 54–56.

BRAJ or Braj-mandal, a pastoral district extending in a circuit of 84 cos around the town of Mathura, celebrated in the traditions of Hindustan as the country where Krishna pastured his herds. The soil is poor and thin, with few trees, the nim, faras, and species of the fig tribe being the most prominent. The Jumna is the only great river; for the rainy season it is a mighty stream, a mile or more broad, but for eight months in the year, meanders, a mere rivulet, between wide expanses of sand. The untidy Jat and Gujar are the chief proprietary classes. Hindu pilgrims, commencing in August, perambulate its 24 groves or ripa ban and 12 ban or woods. The people are still pastoral; the villages contain much horned cattle. Braj-bhasha is a term applied to the Hindi tongue of that district.

BRAJBASI, a native of Braj; an armed attendant, a guard, a watchman or doorkeeper.

BRALLAH. MALEAL. A small tree on the Malabar coast, used for boats, and for timbers and knees in larger vessels; it is considered strong and durable.—*Edye, M. and C.*

BRAMATSA. HIND. Astragalus multiceps.

BRAMBANG. MALAY. A sour fruit used for chatnis and in curries, perhaps the Averrhoa bilimbi; also said to mean the onion, Allium cepa.

BRAM-BUG. See Insects.

BRAMI. HIND. Anemone, *sp.*; also Taxus baccata, BENG. Sarcostemma brevistigma.—*W.*

BRAN or Bren. HIND. Quercus annulata. Brankul, Ulmus campestris. Branna, U. erosa.

BRAN.

Meh-fu-tsze, . . . CHIN.	Sakam, . . . MALAY.
Bhusa, . . GUJ., HIND.	Towru, Toudu, TAM., TEL.

The thin light skin or husk of wheat, separated by means of the sieve from ground wheat.

Eau de vie, . . . FR.	Wino, ... RUS.
Brantewein, . . GER.	Aguardiente, . . . SP.

A spirit largely imported into India from France and England, obtained by distilling wine. Its qualities vary with the kind of wine employed. It is manufactured in the south of Europe, from white or pale red wines and the skins of grapes. Cognac is made from the palest, eau de vie is from dark red wines; British brandy is a compound of rectified spirits. Brandy began to be distilled in France about the year 1343, but used only as a medicine, and was considered as possessing such marvellous strengthening powers that the physicians termed it eau de vie, 'the water of life.' Raymond Lully, a disciple of Arnold de Villa Nova, considered that it was intended to reanimate and prolong the life of man.—*Statistics of Commerce.*

BRANSH BRANTI. HIND. Myrsine Africana.

BRANTEY. —? In Penang, a light, brown-coloured, weak wood, used for building.

BRARRAH, a wood-louse in Swat which infests mosques and houses where old mats are lying about; the place bitten by them becomes red and

inflamed. The insect is of the shape of a bug, but larger.—*Lt.-Col. MacGregor.*

BRAS. HIND. Rhododendron arboreum.

BRAS. MALAY. Rice.

BRAS-BRAS, the Glam tree of the Malay Peninsula; furnishes a paper-like bark much used in caulking the seams of vessels. Wood used as floats for fishing nets.

BRASILETTO WOOD, Cæsalpinia sappan.

Brass is an alloy of copper and zinc, generally the yellow alloy, with about an equal weight of zinc and copper, called yellow brass; copper alloyed with about one-ninth its weight of tin is the metal of brass ordnance or gun-metal. Similar alloys used for the brasses or bearings of machinery are called hard brass, and when employed for statues or medals they are called bronze. Brass is extensively used in India for domestic utensils, and is in greater request than copper among the natives. Generally, Mahomedans use copper, and Hindus brass utensils. In the Panjab, for smaller work, they prepare the alloy in their own kuthali, or crucibles; for making the larger sizes, however, the gagara, shamadan, etc., they prefer the fine sheet metals imported from Europe. A metal giving a beautiful sonorous ring when struck, and called Phul or Khani, is made in the Panjab; Roin, a genuine bell-metal, is also manufactured; also an alloy called Barth, and an inferior one called Kuth. A good brass may be made by fusing two parts of copper and one of zinc; but various proportions should be used according to the purpose required. The substances used in alloying are in various proportions by native braziers to form brass, gun-metal (lokam), pewter (satki), bell-metal (kansu), and bedery ware. Occasionally silver is added to form gongs and bells. In general, however, the proportions used are regulated by reducing the quantities of the more expensive and increasing those of the cheaper metal, as far as may be practicable. Repeated meltings, by drawing off the excess of zinc, leave a good malleable brass; and for this reason old brass is much sought after by smiths when they desire it for any work requiring it to be particularly malleable. Guns taken at Kurnool were little better than spelter. Ordinary yellow brass is rendered very sensibly harder by a small addition of tin, say a fifth or half ounce to the pound; on the other hand, by the addition of a like quantity of lead, it becomes more malleable and cuts sharply. Brass becomes a little whiter for the tin and redder for the lead; the addition of nickel to brass constitutes German silver. Gun-metal (copper and tin), by the addition of a small proportion of zinc, mixes better, and the malleability is increased without materially reducing the hardness. Lead in small quantities improves the ductility of the metal, but at the expense of its hardness and colour; it is seldom added.—*Tomlinson, M. E.; Mr. Rohde.* See Bells.

BRASSAK, a subdivision of the district of Pangkal-pinang, in the island of Banka, producing much tin. See Tin.

BRASS CAMPHIRE.

Brass-capur, GUJ., HIND. | Karpuram, . TAM., TEL.

This commercial term is a corruption of Barus camphor, also called Borneo and Malay camphor. It is the product of the Dryobalanops camphora of Sumatra, Borneo, and the Malayan Peninsula. It is found only in small quantities, in concrete masses, in the fissures of the wood. It is more fragrant, and less biting and pungent, than the common camphor, and is held in much higher repute. It is imported into Bombay from China. —*Faulkner.*

BRASSFOUNDER. The brassfounder or brazier trade in India is almost exclusively in Hindu hands. They form one of the five Kumalar or artisan classes, the other four being the goldsmith, blacksmith, stonecutter, and carpenter. These castes all wear the zonar or sacred string. They do not allow any Brahmanical interference with them, have their own priests and ritual, and they bury their dead in a sitting posture.

BRASSICA. *Linn.* A genus of cruciferous plants, containing several very important alimentary species.

Brassica campestris, *Linn.*, Sarson, HIND. This has been supposed to be the source of the Swedish turnip; it furnishes the colza oil of Europe. It is grown as a cold-weather crop in the plains of India, and as a summer crop at Ambala. It is cultivated in Afghanistan, and in Tibet up to 10,000 feet. The seed is being largely exported from Kurachee, but in N.W. India a bland oil is largely expressed from it.

Brassica eruca, *Linn.*, garden rocket.

Eruca sativa, . . . LAM. | Kala Sarson, . . HIND.

This is largely cultivated in the arid parts of the Panjab for its bitter oil from its seeds, which is used for lamps.

Brassica erucastrum, *Linn.*, of France, Italy, Switzerland, etc., is largely cultivated in the Panjab and Oudh for its seed and oil. The cost of the (Teorah) oil is from 3 to 10 seers per rupee. It is used for burning.

Brassica juncea, *Linn.*, Rai, Turia, and Khardil, HIND., is grown largely in the Panjab, also in the Himalaya, and up to 10,000 feet in Tibet; also in Afghanistan. Its oil, somewhat acrid, is burned, and occasionally used in cooking. Its seeds are an ingredient in pickles.

Brassica napus, *Linn.*, rape, wild cabbage; colza, cole seed, or sursul of Gujerat. Much cultivated in Europe. Used as salad similar to mustard; the leaves are eaten when the plant is in seed, but it is of no great value as a vegetable. This plant is cultivated for the sake of its seeds, from which oil is extracted by grinding and pressure.

Brassica oleracea, cabbage.

Thæm bau mung la, BURM. | Karam, Kopi, Gobi, HIND.

Amongst Europeans, both in Europe and India, a highly-esteemed vegetable; its varieties are—

a. Acephala, *D. C.*
- ramosa, cavalier cabbage.
- vulgaris, common green colewort.
- quercifolia, oak-leaved cabbage.
- sabellica, Scotch kale.

b. Bullata, *D. C.*
- major, Savoy cabbage.
- gemmifera, Brussels sprouts.

c. Capitata, *D. C.*
depressa, drumhead cabbage.
sphærica, great round Scotch cabbage.
obovata, Penton cabbage.
elliptica, early York cabbage.
conica, sugar-loaf cabbage.
rubra, red cabbage.
d. Caulo-rapa, *D. C.*, kohl-rabi.
e. Botrytis, *D. C.*
cauliflora, cauliflower, Phool-kopi.
asparagoides, broccoli.

The cabbage plant is supposed to be indigenous in the Kashmir valley at 5000 to 5500 feet.

Brassica rapa, *Linn.*, the turnip, rape.

Luft, ... ARAB.	Gonglu, ... PERS.
Shalgam, . BENG., PERS.	Gohheu, ... SIND.
Mung-la-do-waing, BURM.	

Turnips are grown in Europe, India, the Tenasserim Provinces, and in parts of the N.W. Himalaya up to 8000 feet, and in Ladakh up to 13,000.

Brassica Sinensis, *Smith*, Yun-tai, Yu-ts'ai, CHIN., is largely cultivated in the Yang-tze valley for the oil which is expressed from the seeds. It serves also for a cabbage.—*Smith; Von Mueller.*

BRASS LEAF, or tinsel, is manufactured by the Chinese to an enormous extent, for making the kin-hwa or 'golden flowers' used in worship. It is exported to India in boxes estimated to hold 50 catties.—*Morrison*, p. 143.

BRAT or Bart. HIND. A vow or fast.

BRATA. BENG. A religious ceremony with the Bengal Hindwani. The Siva puja, the Hari Krishna puja, the Sajooti Brata are the chief.

BRATA. HIND. Ephedra alata.

BRAUGBANG. JAV. Onion.

BRAZEN AGE. See Kalpa; Suryavansa.

BRAZIL CHERRY has spread itself all over the Neilgherry, the Pulney, and Shevaroy mountains of Southern India. It is the Cicca disticha, and the fruit is much prized.

BRAZILIAN BARK. See Inga.

BRAZILIAN ELEMI, also Accouchi balsam, a resin obtained from the Icica heterophylla.

BRAZIL WOOD, Queen's wood.

Bread may be leavened, or unleavened or unfermented. In the latter, flour, water, with perhaps the addition of salt, are alone employed. In the former, the substances employed are yeast in Europe, and in Eastern and Southern Asia the palm wines or toddies. And the substitutes for these are sesqui-carbonate of ammonia; carbonate of soda and hydrochloric acid; or carbonate of soda and tartaric acid. The breadstuffs of commerce consist of nutritious cereal grains, tuberous-rooted plants, and farina yielded by trees. Amongst them wheat, barley, oats, rice, maize, millet, Guinea corn, the sago of palms, the plantain and banana, the bread-fruit tree, the edible root crops, and starch-producing plants, the last a somewhat extensive class, the chief of which, however, are the common potato, yams, cocos or eddoes, sweet potatoes, the bitter and sweet cassava or manioc, the arrowroot and other plants.

Wheat and wheat-flour, maize, and rice form very important articles of commerce, and enter largely into cultivation in various countries for home consumption and export, a portion being consumed in the arts, as starch for stiffening linens, etc., and for other purposes not coming under the term of food. The kind of bread in common use in a country depends partly on the taste of the inhabitants, but more on the sort of grain suitable for its soil.

In India, in making bread of wheat, one process is first thoroughly to clean the wheat, and for this one woman will clean 430 lbs. in a day; then in the evening, the cleaned wheat is placed on a table and thoroughly wetted, and the water left to drain from it during the night. The next morning, the still moist grain is ground in handmills by women, a woman grinding 40 lbs. in a day. It is then sifted, and as much fine flour and soojie as can be obtained are laid aside. The remainder, then termed 'naka,' is subjected to a more powerful mill, and an inferior kind of soojie and a second sort of flour obtained from it. The residue is then ground in a large mill, and yields a coarse flour and bran.

Bran is what remains of wheat after the flour and soojie are extracted.

Soojie is the heart of the wheat, and is obtained by coarsely sifting the coarsely ground wheat with sieves and sooras, by which all the small particles of the bran are separated from it; one woman can thus clean 50 lbs. a day. It is semolina.

First sort flour is produced by finer sifting from the first grinding of the wheat.

Second sort flour is sifted from the first grinding of the wheat, after the fine is extracted, and also from the second grinding.

Bread.—The materials for bread are 60 lbs. of first soojie, 20 lbs. of second sort or naka soojie, and 20 lbs. of first sort flour. 100 lbs. of these ingredients produce 128 lbs. of bread.

Biscuit is made from second sort soojie and flour mixed in the proportion of 75 lbs. of naka soojie and 85 lbs. of second sort flour. This produces only about 85 lbs. of biscuit, which, after being well baked, is dried for two days in a kiln.

Barm or yeast sufficient for 800 loaves, 1 lb. each, is made of brown sugar, 2 lbs.; potatoes, 1½ lbs.; hops, ½ oz., with half a gallon of water. Boil and mash the potatoes; boil the hops until none appear on the surface of the water; strain and dissolve the sugar in the liquor. The potatoes are then added, and the whole is strained into a jar or small tub. The quantity produces about 3½ pints, and is generally ready for use in twelve hours. The addition of a small portion of the old barm hastens fermentation.

Wheaten bread is largely used in Northern India and by the Chinese. In Ho-nan, Shen-si, Shan-si, and Shan-tung, wheaten bread and pastry are staple articles of diet. Chinese bread is free from alum. It is raised by means of leaven, pearl-ash; and the small loaves or cakes are steamed in a very ingenious and simple way.

Cakes of wheat-flour, prepared on the girdle, are a common article of diet amongst the well-to-do races of Northern and Central India. Further south, on the table-lands of the Peninsula, the natives of India use unleavened cakes made of the flour of the Indian corn, the zea mays, rather less nutritious than that made from wheat, but more fattening, in consequence of the greater quantity of oil contained in it. Also, amongst the millets, bread is made of the great millet, Sorghum vulgare; the spiked millet, Penicilloria spicata; and the very poor of the people use the hard raggy, Eleusine coracana, in the form of cakes or porridge. Barley is occasionally used to the westward. Along the seaboard of all Southern Asia, and eastward into China, however, boiled rice is the great article of diet, and it is often cooked, with unfermented palm-wine, into the cakes familiarly known in India as 'hoppers,' the 'apa' of the people.

Rice flour is scarcely ever made into fermented bread, although it is said to be occasionally mixed with wheat flour for that purpose. The superiority of wheat to all other farinaceous plants, in the manufacture of bread, is very great. Its essential constituents are starch, also called farina or fecula, gluten, and a little sugar and albumen. It is occasionally adulterated with alum, which is added to whiten the flour, and to enable it to retain a larger quantity of water. Salt is also employed in the adulteration of wheaten bread, to whiten the flour and enable it to hold more water; and carbonate of magnesia is improperly used to obtain the same result.

In Eastern and Southern Asia, the well-known sago is made from the starch granules contained in the pith of several species of palms. It is largely used as an article of diet, alike for the robust labourer as for the invalid, and is extensively exported for the use of the sick and the nursery. Amongst the Arabs, burgoul is wheat boiled with leaven, and then dried in the sun. The dried wheat is preserved for a year, and boiled with butter and oil. Leavened bread is called khabz. —*Robinson's Travels*, ii. 132; *Tomlinson; Hassall, Simmonds*, p. 217; *Royle; Bombay Times; Stewart; Smith; Powell; M'Culloch.* See Cereal Grains.

BREAD-FRUIT TREE, Artocarpus incisa, *Willde.* When cultivated, its seeds are abortive. It is grown in Ceylon, in some parts of India, and its fruit is a staple food of the South Sea islanders. Their principal bread-fruit season is in March and April, but some kinds ripen considerably later or earlier, whilst in some districts the season itself is altogether later, and it may be said that there is ripe bread-fruit, more or less abundant, throughout the year. . . . The fruit is made into puddings, or simply boiled or baked. Quantities of it are preserved underground to make native bread. The tree is hollowed out as a canoe; its gum forms a good pitch; its bark can be made into a cloth. The skin of the fruit being pared away, the pulp is sliced and roasted, or baked in ovens.—*Dr. Seeman, Viti; Montgomery*, p. 222.

BREJ or Brege pam is an article which is occasionally brought to the Panjab from Siberia (Sebere, Seetha or Seth, by the natives of the N.W. Himalaya and Panjab, Scythia?). It is seen usually as a lining to postins, caps, stockings, gloves, neckties, etc. From its nature it cannot be spun into thread. It is of a white colour, with a certain gloss, and is supposed to be a species of eider down. It is fancy-priced.—*Powell, Handb.*

BREN. HIND. Quercus annulata, also Breri, Ulmus erosa.

BRES. HIND., of Kulu; also Karma-bres. Fagopyrum esculentum, buckwheat.

Mattone, ... IT.	

A building material formed of clay, hardened either by the sun's rays or the heat of a furnace, the former being called sun-dried bricks, and the latter burnt bricks. The various argillaceous earths are for the most part unfit to be used alone for brickmaking. Some are almost pure clay or alumina, and are strong and exceedingly plastic, but cannot be dried without splitting; light and sandy clays or loams are too loose to be made into bricks without the admixture of lime as a flux to bind the materials; others, again, natural compounds of alumina and silica, if free from lime, magnesia, or metallic oxides, are exceedingly valuable clays, being, from their infusible nature, well adapted for making fireclays for lining furnaces, for making crucibles, glasshouse pots, etc. Fireclay is found in many places in India. Bricks, burnt almost to vitrifaction, are much employed as a road material on all alluvial lands of India. Sun-dried unburnt bricks of a very large size were formerly employed in building, and they may still be seen in the basements of some of the old ruined Jain temples at Hira Tumbal in the Ceded Districts, Anagherry in the Southern Mahratta country, and in the walls of the mud forts at Gudduk, Dummul, and other localities. The bricks appear to have been usually 2½ feet in length by 15 inches in breadth, and 7 or 8 inches in thickness. The seams are apparent from the effect of the weather, but the bricks cannot be separated without breaking. The basement and a good deal of the interior of the solid muntapums or pyramidal towers of these Jain temples were built with unburnt bricks; and the masonry and carved slabs, ornaments, and pillars were erected over this foundation of earthwork. This accounts for the dilapidated condition of parts of these temples. In some of the old forts in Southern India the lower part of the walls is made of unburnt bricks and the upper part of hewn stones. The more modern forts are chiefly constructed of mud embankments, cased in large blocks of stone, very accurately fitted, but not cemented with lime or mortar. In the ancient buildings of India, brickwork does not appear to have been extensively employed, although in some of the temples we find the upper storeys made of brick, while the lower ones are of stone. The earth-walls of the Bellary district are formed of sun-dried bricks of great size.

The material used in Babylon was unburnt

brick. Many of the ancient ruined cities of Persia are built of unburnt bricks, beaten up with straw or rush to make the ingredient adhere, and then baked in the sun. In the days of the Egyptian bondage, Pharaoh commanded the taskmasters of the people and their officers, saying, 'Ye shall no more give the people straw to make brick as heretofore; let them go and gather straw for themselves' (Exodus v. 7). 'And they had brick for stone, and slime had they for mortar' (Genesis xi. 3). Assyria abounds with asphalt, or bitumen. Herodotus and many ancient authors affirm that the walls of Babylon were cemented with it; and Arrian says, 'The temple of Belus, in the midst of the city of Babylon, was made of brick, cemented with asphaltus.'—*Mignan's Travels*, p. 166; *Dr. Hunter in M. E. J. R.*

BRICK TEA, Tung-k'au, CHIN., is tea compressed into a solid form. This article, and the khata, or 'scarf of felicity,' are great articles of trade between China and Tibet. A prodigious quantity of these goods is exported annually from the provinces of Kan-su and Sech-u'en. In Ya-tcheon or Ya-tzon, the last large town of Western China, brick tea gives occupation to thousands of workmen either in its manufacture or transport to Ta-tsien-lu. This tea can only be made with a particular leaf. The tree which furnishes it grows on the banks of the river Yaho. It attains often 15 feet in height, and the leaves are large and rough to the touch. The cultivation requires little care. It is planted often on the borders of fields, or round the houses. Each grower gathers his little harvest of leaves, and finds a ready sale for them in the market of the town. The manufacture of brick tea is a monopoly secured to the dealers of this town, and for which they pay a considerable sum to the Chinese Government. For the first quality tea, the leaves are gathered in June and July, before the spring rains commence. The leaves at this period of the year are about an inch in length. As soon as detached, they are spread in the sun, and, when slightly dried or withered, they are rolled with the hand until they become humid by the exudation of the sap. They are then made into balls about the size of a large teacup, and left to ferment. When they are in fermentation, they are placed between wooden moulds or lever presses secured by pegs or bolts. These moulds are then placed over a wood fire. The tea is taken out in a compact mass, and forms the brick tea of commerce. They are then delivered to the merchants of the town, by whom they are wrapped in yellow paper, on which is impressed the stamp of the Government and the mark of the dealer who exports it. They are then packed in baskets of plaited bamboo, about four feet long. One of these baskets, weighing about twenty pounds, is the unit of trade. The baskets are carried on men's backs to Ta-tsien-lu, a distance of two hundred miles. There they are carefully wrapped in fresh hides, to prevent the tea from imbibing moisture. They are then fit to be sent to Lassa, or even beyond. A basket costs about twelve taels, that is, at the rate of 4s. 8d. the English pound. A second kind is made with older and yellow leaves. The mode of preparing is the same. It is sent chiefly to Lithang and Bathang. At the latter place it sells for about five taels the basket, or at the rate of 1s. 6d. the pound. A third quality is made with the waste and *débris* of the leaves. The bricks of this quality resemble those sometimes made with the young shoots of the tea tree cut up. The manufacture differs from the two other sorts, inasmuch as it is necessary to add rice water to combine the substance and to make it retain the form of the mould. This quality is only sold at Ta-tsien-lu and its neighbourhood, and fetches 9d. per pound. The quantity of brick tea exported annually from Ya-tcheon to Tibet is roughly estimated at six million pounds. The high price of tea in the markets of Tibet arises from the monopoly of the Chinese, which is increased by that of the Lamas, who keep in their hands the retail sale. And as tea is an article of prime necessity in Tibet, the Celestial Empire keeps in dependence the Lamas, and by them the people of Tibet. Brick tea is cooked in a varied manner. Mr. Atkinson (Orient. West. Siberia, p. 477) was given it mixed with milk, butter, salt, and flour, presenting the appearance of thick soup. The form of bricks was doubtless given to it for the convenience of carriage.—*Mr. Cooper in Statesman; Huc, Chinese Empire.*

BRIDELIA LANCÆFOLIA. *Roxb.* A tree of considerable size, native of Bengal.

BRIDELIA MONTANA. *Gibson.*

Goonjun Mara, . . CAN. | Asanna, . . . MAHR.

Found in Canara, common in Dandelee, where it reaches a great size. Hardly inferior to teak, and stands water equally well. It seems well worthy a trial for naval purposes. In Cuttack, sells at 6 annas per cubic foot. It is a light brown-coloured wood, and strong. Plentiful in the Santal jungles from Ranibahal to Hasdiha, used for beams, planks, and building purposes generally. The tasar silkworm feeds chiefly upon this tree.—*Cal. Engineer's Journal*, July 1860; *Dr. Gibson.*

BRIDELIA MOONII. *Thw.*

Cluytia retusa, *Moon's Cat.* | Pat-kaa-la-gass, . SING.

Common in Ceylon up to an elevation of 2000 feet. The Singhalese consider this quite distinct from B. retusa, which it, however, very closely resembles, differing in its somewhat larger leaves, axillary not spiked, inflorescence, and ovoid fruit. They are probably mere varieties of one species. The timber of both is useful for building purposes. —*Thw. Zeyl.* p. 279.

BRIDELIA RETUSA. *Linn., Spreng.*

B. spinosa, *Roxb.*
B. crenulata, *Roxb.*
Cluytia retusa, *Linn.*

Kosi, ... GUMSUR.
Kat takaa la-gas, SING.
Adamaruthu, . . . TAM.
Duriamaddi, . . . TEL.
Koraman, Koramaddi, ,,

This is a large and very valuable timber tree. It is common in most jungles and dry forests throughout Ceylon and the Madras Presidency, in Ganjam, Gumsur, Bengal, in the lower spurs of the Himalayas. The wood is of a dirty red or copper colour, very stiff, strong, close-grained, and durable, but not easily worked. Its extreme height is 30 feet, circumference 3 feet. A cubic foot unseasoned weighs 68 to 70 lbs., and 60 lbs. when seasoned, and its specific gravity is ·960; it is used for house-building, construction of carts, agricultural implements, railway sleepers, rafters; spinning-wheels, and a variety of other purposes, and it stands the action of water; the bark is a strong astringent. Cattle eat the leaves greedily, and they are supposed to act as a vermifuge.

In Gumsur it is also burnt for firewood, the tree being very common. The leaf is used medicinally for itch. The bark of this tree is said to be poisonous, and a preparation of it is often used for the purpose of destroying life, particularly by Oriya widows, among whom suicide is a frequent occurrence.—*Captain Macdonald; Beddome, Fl. Sylv.* part xxii. p. 260.

BRIDELIA SPINOSA. *Willde, Roxb.*

Cluytia spinosa, *Roxb. C. Pl.*

Assanna, Asun, MAHR.	Mulla vengay, . . . TAM.
Mullu vangay, . MALEAL.	Kora manu, Duria
Katu Kœta Kœla, SINGH.	madde? . . . . TEL.

This large tree is a native of several parts of Southern India; in the alpine jungles of Coimbatore it attains a considerable size, in the Godavery forests, where its wood is esteemed as very strong and good. It is rather a common tree in the Bombay forests, both coast and inland. The wood is strong and tough, and stands the action of water well; hence it is often used for the frames of wells, whereon the superstructure of masonry is erected. It is also used as beams for houses. This wood deserves, in Dr. Gibson's opinion, to be more extensively known than it is; cattle eat the leaves voraciously. They are said to destroy worms in their bowels. The undooroo wood of the Northern Circars is a species of Bridelia.—*Drs. Roxb., O'Sh., Gibson, Wight, and Cleghorn; Captain Beddome, Flor. Andh.*

BRIDGE.

Pont, ... FR.	Bashi, ... JAP.
Brucke, Steg, . . GER.	Pul, Pool, HIND., PERS.
Ponti, ... IT.	Puente, ... SP.

Bridges in the S.E. of Asia are built of stone, brick, wood, iron, rope, bamboos, canes, and twigs. Hindu and Mahomedan rulers in India built but few bridges. The Bhot, Mongol, and Tartar races of the Himalaya and Burma have numbers of them. In Burma, bridges are seldom wanting near villages where nullahs or inundated fields obstruct the communication; near towns they are sometimes of extraordinary length. The construction there never varies. Large teak posts are driven in pairs or triplets, with bays between, not exceeding twelve or thirteen feet. Mortice holes are cut through those parts in which cross bearers are laid, with beams and solid planking over those, and a railing is added.

The most characteristic of Hindu bridges are composed of stone posts, several of which form a pier, and are connected by stone beams. Others are on thick piers of masonry, with narrow Gothic arches.

Turner tells us of a simple bridge for the accommodation of single passengers, constructed between two opposite mountains, which consisted of two large ropes made of twisted creepers, stretched parallel to each other, and encircled with a hoop (Embassy, p. 54). This is the original of the jhula or rope bridges of the Himalaya. In the early part of the 19th century, Mr. C. Shakespear advocated rope bridges in India, and one of 160 feet span was erected over a stream at Benares. The bridges of Kamaon are of four kinds,—a simple spar thrown across from bank to bank; the sanga, by successive layers of timber, those above gradually projecting to form an arch; the *jhula* of ropes stretched from bank to bank, with a suspended ladder; and (4) a single cable across a stream along which a basket traverses. In Jummoo the *chiha* or haul bridge is in use; a smooth rope of several strands is hung across from bank to bank, on which traverses a wooden ring, from which is suspended a loop. In this the traveller seats himself, and another traversing rope pulls the ring and traveller across. Down the curve the passage is quick, but the pulling up is tedious. The ordinary bridge is of three ropes, made of birch or other twigs, and hung, one for the foot to traverse, the other two a yard above it for the traveller to steady himself.

The *jhula* consists usually of three ropes stretched across the stream, at a height of 8 or 10 feet, between two buttress piers. The three ropes are suspended like the letter V, two parallel ropes forming the upper plane and a central one the lower plane. This disposition is secured by large V-shaped prongs of wood, which at intervals of four or five yards are secured in position above and below by thongs of raw hide, and further strengthened above by a cording, which is passed across between the two upper points where they are fixed to those ropes. It is crossed by the traveller walking on the lower of the ropes, which is sometimes of double or triple strands, and holding his balance with the hands on the upper ropes, which run at each side on a level with his shoulders.

The *Kaddal* bridge of Kashmir is made of wood, and is very strong and durable. It consists of undressed logs of pine and cedar timber, the undressed trunks of the trees supported on piers 20 to 25 feet apart. The piers rest on a foundation of stones embedded in the muddy bottom of the river, and protected by a cutwater pointing up the stream, and built of loose stones filled into a frame of logs of wood. Those above Serahan, opposite Miru, and at Poari, whether swinging or suspension bridges, are unsuited for the passage of sheep and mules. The elevation of the rope bridge (jhula) at Tuni on the Tonse river is nearly 3000 feet above the sea.

The *Nara*, over the Nyn Sukh, near its junction with the Jhelum, consists of a single cord stretched across from bank to bank, and secured on either side to some projecting rock or firmly set tree. The cord is furnished with a loop-cradle, which is slung on to it by a forked piece of wood. This last forms the upper part of the cradle, which, when once adjusted, is irremoveable from the cord, though it slides freely backwards and forwards on it by shaking the cord. The cord is made of a climbing plant, with the straight twigs of a species of indigofera.

In the N.W. Himalaya the timbers used for ordinary wooden bridges are Alnus, *sp.*, Bombax heptaphyllum, Cedrela toona, C. serrata, Phœnix dactylifera, P. sylvestris, and Salix alba. For swing bridges, Andropogon involuta, Betula bhojputra, Cotoneaster obtusa, Indigofera heterantha, Olea Europæa, Parrotia Jacquemontiana, and Salix alba.

A writer in the Bengal Asiatic Society's Journal (vol. xiii. p. 614) mentions that he had seen half a dozen bridges, within as many miles of Cherra, made by intertwining the growing india-rubber tree. The rope bridges of the Panjab Himalaya, made of the twigs of the Parrotia Jacquemontiana, *Decaisne*, have often a span of 300 feet. Lt. Wilcox, in 1825-28, described a bridge or *saku* near the Dihang river, consisting of two strong canes stretched between stages

of bamboo, which are secured in piles of the largest portable stones heaped up around them; the points of suspension were 80 yards distant. A cradle or long basket, in which a passenger may sit or lie, is hung on the canes by two loops, and two or three men pulled it across when loaded.

The three rivers of Western Yunnan are the Lan, Lu, and Lung. The suspension bridges, which are the pride of Yunnan, are all constructed on the same principle,—five or more chains, formed of oval links about 6 inches in the long diameter and ¾ inch thickness, are strained very tightly across, the ends being imbedded in rock or masonry. The way consists of planks laid on these, not suspended from them; and two other chains, hung from massive gatehouses at both ends, form a protection and assistance to the passenger. In some cases the road chains are tied with bars. The bridges vibrate considerably, but the curve is not great.

It is mentioned in the Bengal Asiatic Society's Journal (xiii. 613), that on the top of a huge boulder by the river-side was growing a large india-rubber tree, clasping the stone in its multitude of roots. Two or three of the long fibres, whilst still easily pliable, had been stretched across the stream, and their free ends fastened on the other bank. There they had struck firmly into the earth, and now formed a living bridge of great and yearly increasing strength. Two great roots run directly one over the other, and the secondary shoots from the upper have been bound round and grown into the lower, so that the former affords at once a hand-rail and suspending chain, the latter a footway. Other roots have been laced and twisted into a sort of ladder as an ascent from the bank to the bridge. The greatest thickness of the upper root is a foot, from which it tapers to six or eight inches. The length of the bridge is above eighty feet, and its height about twenty above the water in the dry season. One bridge measured ninety feet in clear span. They were generally composed of the roots of two opposite trees (apparently planted for the purpose) bound together in the middle.

On the Wa-lingtia, or larger branch of the river, were several other remarkable bridges. One on the suspension principle, across a precipitous gorge on the road between Cherra and Tringhai, was about 200 feet long. It was composed of long rattans stretched between two trees, at a height of forty feet above the river in the dry season. The footway was a bundle of small canes lashed together, and connected with two large rattans forming hand-rails, but these so low and so far apart, that it must be difficult to grasp both together. The hill Kasias are afraid to trust themselves on it, but the War, or men of the valleys, cross it drunk or sober, light or laden, with indifference and security. Still further up the river, and near the little village of Nongpriang, immediately under Cherra, is another specimen of Kasia engineering and ingenuity,—a bridge of about 80 feet span, composed entirely of strong bamboos, bent into a semicircular arch, affording a sound footing and firm rails for the hand.

The bridge has been metaphorically in use with many nations to indicate the means of passage of the soul of the dead. The Zoroastrians were devout believers in the immortality of the soul and a conscious future existence. They taught that immediately after death, the souls of men, both good and bad, proceeded together along an appointed path to the bridge of the gatherer, Chinvat-neretu (Haug). This was a narrow road conducting to heaven or paradise, over which the souls of the pious alone could pass, while the wicked fell from it into the gulf below, the place of punishment, in the kingdom of Angromanyus. The good soul was assisted across the bridge by the angel, 'the happy, well-formed, swift, tall, Serosh;' and as he entered, the archangel Vohumano rose from his throne, greeting him with, 'How happy art thou who hast come here to us from the mortality to immortality.' Then the pious soul went joyfully on to paradise.

The modern Parsee has still the bridge Chinvat neretu that leads to heaven; and on life departing, a dog is brought to gaze on the dead (Sag-did), that its passage over Chinvat may be secured. And the Mahomedan has the Pul-i-Sirat, across which the good walk easily, but it is as sharp as a razor for the wicked, whom it cuts in two. There is a bridge for the dead in Java, and in N. and S. America. In Polynesia, a canoe is the object typified, as with the Greeks and Romans, with whom a boat was the supposed means of transport. The river Baitarani of Orissa is the Styx of the Hindus.—*Drew, The Northern Barrier; Turner; Drs. Cleghorn, Stewart, and Mason; Jour. of Asia. Soc.* xiii. p. 614; *G. Rawl.* ii. p. 339.

BRIGGS, a general officer of the Madras army, author of Letters on India; Translation of Ferishta, Lond. 1829, 4 vols.; A Short Account of the Sheilly Family, Lond. As. Trans., vol. vi. 77; Description of a Persian Painting, ibid. vol. v. 314; On the Land-tax of India. Editor of the Persian Tarikh-i-Ferishta. He was Assistant Resident at Poona under Mr. Elphinstone as Resident, and was there when the last Baji Rao moved out of Poona and burned down the Residency, and with it his manuscript of the translation of Ferishta. When peace was restored, he re-translated and printed it.—*Dr. Buist's Catalogue.*

BRIGGS, H. G., author of Cities of Gujarashtra, Bombay 1849; On the Parsees, Bombay 1852. —*Dr. Buist's Catalogue.*

BRIGU, in Hindu mythology, is a Vedic sage. Many traditions are related of him; his name is frequently found in the Hindu writings.—*Cole. Myth.*

BRIHADRATHA, of the line of Pandu, father of Jarasandha, one of the Barhadratha dynasty of Indian kings. According to Bunsen, he ruled B.C. 866 to B.C. 847.—*Bunsen*, iii. p. 547.

BRIHASPATI, also Brahmanaspati, a deity of the ancient Hindus, to whom several positions are assigned.—*Dowson.* See Hindu; Vrihaspati.

BRIHAT-CHAKRAMED. HIND. Sesbania aculeata.

BRIHATCHITRA. HIND. Cassia sophora.

BRIHATEE. BENG. Solanum ferox.

BRIHAT SANHITA, an astronomical work by Varaha Mihira.—*Dowson.*

BRIJ BHASHA, the Hindi tongue proper. See Braj.

BRIKHOTSARG, Brishotsarga, or Vrishotsarga, is the marriage ceremony performed in the name of the bull which the Hindus of N. India liberate on the eleventh day of mourning for a near relative. In the Northern Dekhan, in Oudh

and the N.W. Provinces, these are known as saur (taurus) bijar, and the British call them Brahmany bull. They are a nuisance in the streets. See Banotsarg; Jalotsarg.

BRIKU. BENG. Agati grandiflora.

BRIMDU, Brimla. HIND. Celtis Caucasica.

BRIMO or Duno. TIBETAN. The yak cow.

BRIM POSH. HIND. Nymphæa alba.

BRIN. KASH. Arctomys bobac.

BRINDA. SANSK. Ocimum sanctum.

BRINDABAN is an ancient town in Muttra (Mathura), on the right bank of the Jumna, in lat. 27° 23′ 20″ N., and long. 77° 44′ 10″ E., and 6 miles north of Muttra; population, 21,004. It is the centre of the Vrinda Vana of ancient India, the pastoral and forest land near Mathura, where Krishna and the Gopin shepherdesses sported. Hindus of Northern India regard it as one of their holy cities, and it contains a large number of ghats, wells, tanks, temples, shrines, and sacred sites. The temple of Govind Deva was erected 1590, by raja Man Singh of Ambar; that of Madan Mohan is at the upper end of the town, Gopi-nath, built by Raesil Jai about 1580, and the great temple of the Sikhs, 1845–51, dedicated to Rangji, which cost 25 lakhs. The Brahmakund and Govindkund tanks possess great sanctity for Hindus, to whom, since the middle of the 16th century, they have been places of pilgrimage. Hindus also make many other pilgrimages — to Pooshkur in Rajputana, to Dwarka in Gujerat, to Jaganath at Puri, to Badrinath in the Himalaya, to Benares on the Ganges, to Ramisseram near Ceylon, to Punderpur on the Bhima, to Tripati near Madras, Hinglaz on the coast of Makran, etc. Their religious mendicants even travel to Baku, the site of a sacred fire on the Caspian.—*Cal. Rev.* See Temples.

BRINJ. PERS. Properly Birinj, husked rice.

BRINJAL, Egg-plant.

Bengan,	HIND.	Bodingan,	SUMATRAN.
Tarung, Trung,	MALAY.	Kattarikai,	TAM.
Vartaka,	SANSK.	Vankaia,	TEL.
Dirgavartaka,	,,		

For culinary purposes, the vegetable egg, or brinjal, Solanum melongena, is one of the best vegetables in India. Several varieties are extensively cultivated and eaten by all classes. One variety is a large round-shaped fruit, both purple and white; another is white, thin, and long; a smaller species, again, is pear-shaped, red and purple striped; and there is one seldom exceeding the size of an egg. They are all dressed alike, and used both in curries and other native dishes, and are much on the tables of Europeans. Their propagation is by seed, at the commencement of the rains. The young plants are placed at about 18 inches apart, and require watering every third or fourth day.

BRINJARA. See Banjara.

BRINKOL. HIND. Berchemia, *sp.*

BRINRAJ BUNGRA. HIND. Eclipta erecta.

BRISARI. HIND. Edwardsia mollis.

BRISHABDEO, properly Vrishabdeva, has the same meaning as Nandeswar of the Saiva sect, the bull being the effigy of both. In order to distinguish the particular pontiff to whom any Jain shrine is consecrated, it is only requisite to look on the pedestal for the symbol, as the bull, the serpent, the lion, etc., each having his peculiar emblem.—*Tod's Travels*, p. 97.

BRISTLES.

Borstels,	DUT.	Ruma,	MALAY.
Soies,	FR.	Szezeciny,	POL.
Borsten,	GER.	Schtschetina,	RUS.
Setole,	IT.	Cerdas, Setas,	SP.

The strong hair from the back of the hog and wild boar, used by brushmakers, shoemakers, saddlers, etc. Russia is the great mart for such bristles. Those of the elephant's tail, hedgehog, and bandycoot rat, are also utilized.—*Faulkner; M'Culloch, Dict.*

BRISYA, called Vishu in the Karnatic. In Hindu astronomy, the 15th year of the cycle of Jupiter.—*Warren.*

BRITAIN. The United Kingdom of Great Britain and Ireland is a dominion in the extreme west of Europe, which now sways the destinies of British India, and has many colonies. It is ruled over by a sovereign, with responsible ministers, and two Houses of Parliament, viz. the House of Commons and the House of Lords. And for the government of India, there is, in London, a minister with a council of twelve, composed of men acquainted with India; it also sends to British India for administration, a Viceroy and Governor-General, with a Governor for Bombay and one for Madras; appoints councillors and finance ministers, with judges for the High Courts of Calcutta, Madras, and Bombay, and for the North-West Provinces. For the command of the three British-Indian armies, Great Britain sends three Commanders-in-chief, with several generals of divisions. The United Kingdom of Great Britain has many colonies and dependencies, and its entire dominions are usually designated the *British Empire*, over which it rules by means of viceroys, governors-general with councils, governors with councils, parliaments, and commissioners. The area and population are as under:—

	Sq. Miles.	Population.
Brit. N. America, Gt. Britain, and Brit. India,	5,438,000	188,514,000
British Feudatory India,	596,700	47,909,109
Colonies of Great Britain,	4,562,000	161,486,000

In *Europe*, it includes Heligoland, with five square miles of territory; Gibraltar, with less than two; and Malta with 115,—the last two being military stations, with garrisons amounting to some 14,000 men. The population of Heligoland in 1871 was 1813; of Gibraltar, 26,216; and of Malta, 29,084.

In *America*, in the Dominion of Canada, a population but slightly exceeding that of Scotland inhabits a country ten times the extent of Scotland, and is increasing steadily, but not rapidly, at something like an average rate of 14 per cent. in the decade. Of the several provinces of which the Dominion is made up, Ontario (which contains the purest Anglo-Saxon population) had in 1871, 1,620,851 inhabitants, Quebec had 1,191,516, and New Brunswick had 285,594. Nova Scotia had 387,800. Prince Edward Island, which joined the confederation in 1873, had 94,021; and Newfoundland numbers 146,000 inhabitants. Besides these are Manitoba (formerly known as the Red River Settlement), British Columbia, and the sparsely-peopled territory formerly ruled by the Hudson's Bay Company.

With the Bermudas, but excluding the unenumerated provinces of the North-West, the total population of this section of British dominions

is set down at 3,789,670, inhabiting an area of 3,376,925 square miles.

The *West India Islands*, with an area of 13,109 square miles, have a population of a little more than one million, and there is abundant room for the development of the human race in their splendid climate and genial soil. Jamaica, which had 377,000 inhabitants in 1844, and 441,000 in 1861, reached in 1871 the aggregate of 506,154; and in the last ten years there has been no devastating epidemic. In Barbadoes, the black and mixed population is growing in numbers, while the whites are dwindling.

Passing from the islands of the Mexican Gulf to the continent, there is British Honduras or Belize, a dependency of Jamaica, with a population of 24,710, of whom only 377 are whites. British Guiana reckons 193,491 inhabitants, excluding the 'aborigines,' but including 48,976 'coolies,' immigrants from Asia. The Falkland Islands, with 803 inhabitants, close the list of British American possessions.

In the *African Continent* and the adjacent islands, Britain claims 236,860 square miles of territory, peopled by 1,813,450 inhabitants, of which the island of Ascension has 27, and that of St. Helena 6241. On the mainland, Sierra Leone had 38,936 inhabitants in 1871. The Gambia Settlements, 14,190 inhabitants; the Gold Coast about 400,000. The island of Lagos, which was ceded in 1861, has 62,021 inhabitants, of whom 94 are whites. In South Africa, the colonized or partially colonized settlements—the Cape, Griqualand, and Natal—comprise an area of 229,582 square miles, and have an estimated population of 961,505 inhabitants.

In the *Indian Seas*, the Mauritius, with its dependent islets, has its area of 708 miles, closely packed with a thriving population of 330,460 inhabitants, the Indian immigration numbering here on the census day 153,703. West Australia has not yet been, in the proper sense of the word, colonized, and has only 24,785 inhabitants to its 978,000 square miles of domain. South Australia, with an area of 760,000 square miles, has 185,626 whites and 3369 aboriginal inhabitants. Victoria, with an area of 84,000 square miles, has 731,528 inhabitants (including 17,935 Chinese and 1300 aborigines). New South Wales has on its 323,437 square miles, 503,931 inhabitants, the population in 1821 having been no more than 29,000. Queensland has 120,104 inhabitants. Tasmania's present population of 99,328 is only 10 per cent. greater than that registered in 1861. Norfolk Island contains a total population of 401 souls. New Zealand white population numbered, in 1871, 256,393, while the aborigines (all, except a couple of thousands, established in the North Island) were estimated at 37,500. In 1851 the immigrant inhabitants were only 26,000 in number.

The island of Ceylon showed a population of 2,405,287; Singapore had 97,000 inhabitants; Penang, 67,000; Province Wellesley, 71,000; and Malacca, 77,000. The island of Hong-Kong and the peninsula of Kow-loon have an aggregate population of 120,000.

India is divided into twelve provinces, two ruled by governors, three by lieutenant-governors, and seven by chief commissioners, the Viceroy being supreme over all; it is distributed for administrative purposes into 53 divisions, 231 revenue and judicial districts, and 1114 executive subdivisions. The village is the 'recognised territorial unit,' and averages in area something like the fourth part of an English parish. The population of the British Empire in India under direct British control, in 1881, was 209,217,694; and within its borders, under sovereigns in alliance or as feudatories, the people numbered 43,323,596, being a total of 252,541,210. In British India and its feudatory states, about 190,000,000 profess some form of the Hindu or aboriginal religions, about 45,000,000 are Mahomedans, and 3,000,000 Buddhists and Jains. *The empire* possesses 7,769,449 square miles of territory. The United Kingdom, 121,608 square miles; the colonies, 6,685,021; India and Ceylon, 962,820. There are 38 persons to a square mile in the empire; 260 in the United Kingdom, 201 in India, and 141 in the colonies. It should be observed, however, that in some parts of India the density of population more than equals that of Britain. The Empress Queen Victoria, the British sovereign, rules over 234,762,593 souls; her people dwell in 44,142,651 houses.—*Times.*

BRITASTAN, mentioned in the Brahmanda Purana as the place of religious duty, is supposed by some to be the island of Great Britain. It is also called Switadwip, or the White Island, and Suvarnadwip, or the Golden Island; is conjectured also to be Ireland. The British islands are (it is said by some) sometimes called Chundradwip, and likewise Tricalasa, or the island with three peaks, viz. Rajatakuta, Ayacuta, and Suvarnacuta. The British isles are supposed to be the sacred western isles of the Hindus.—*Warren, Kala Sanhita.*

BRITISH GUM, Mien kau, CHIN., is made by heating common wheaten flour up to 400° Fahr. It is very useful in the treatment of starch bandages.—*Smith.*

BRITISH INDIA is a name which is applied to a great collection of different races, with different religions and different forms of government. Its people, in manners and habits, are as diverse as their climates, or as the plains and the mountains, fruitful valleys and savage jungles, that they occupy. The British are only recent arrivals. In 1625-26 the East India Company established a factory at Armagam, on the Coromandel coast. In 1629 a mercantile agency was formed at Surat; in 1634 the emperor of Dehli granted permission to trade in Bengal. In 1645, Gabriel Broughton, a ship's surgeon, obtained for the East India Company the additional privilege of planting factories in Bengal. In 1881 the British territories and those of the allied and feudatory chiefs had a population of 252,541,210, as under:—

The island of Ceylon and the Straits Settlements, though in the East Indies, are British colonies, and are not included in British India.

The British had been trafficking in the East Indies for some time prior to the grant, by Queen Elizabeth, of a charter to a company of merchants, who, under various re-grants, up to 1833 continued to trade with India, while they were also waging wars with, and acquiring dominions from, its previous rulers. Amongst the earliest of their possessions was the island of Bombay, which Charles II. received as a dower with his Portuguese bride. The British power did not, however, rise to its present magnitude over the ruins of ancient kingdoms, or by dispossessing dynasties that had long held sway. But the fortunes of war set aside a few families whose dominant position was almost ephemeral, and whom the British succeeded in the rule over the various populations. And, brief as has been the British dominion, at no period within historic times have so many portions of British India been so long under one paramount rule. The population of all India by the 1881 returns is 252,541,210. Its foreign trade—imports and exports—is £124,840,000, consisting in round numbers of imports, £50,000,000; exports, £74,000,000. Yet, as a recent writer has well remarked, there never has been anything like a British conquest of India. No plan of such conquest was ever formed in Britain. No armament ever left the British shores for such purpose, nor did the British exchequer ever furnish subsidy or supply with that object; and further, no British viking, no one like the Norman chiefs of the middle ages, ever left Great Britain to found a nation or to acquire a principality in the East Indies, but a trading company and their officials gradually became transformed into the most powerful oligarchy that the world has ever seen. The first occasion of the natives of Britain coming in contact with a force of natives of India, was in 1664, when Sivaji attacked and plundered Surat, on which occasion Sir George Oxenden won the applause of Aurangzeb by an uncommon display of valour. With the formation of factories and the hiring of troops to defend them, was laid the foundation of a central power, which has gradually grown in strength sufficient to control and shelter the various races, and extend its sway from Cape Comorin to the Indus.

Madras was constituted a Presidency in 1639, Bombay in 1662, and Bengal in 1682. In 1773, the Governor of Bengal was made Governor-General of India, with certain powers, chiefly political and financial, over the other two. In 1784, a Board of Control was created in Britain, composed of the king of Great Britain's ministers, who in that capacity bore the title of Commissioners for the Affairs of India; and this system of superintendence continued until the year 1858, when British India was taken under the direct control of the Crown. During that interval the home administrators of India had consisted of a board of 18 members, called the Directors of the East India Company, and the President of the Board of Control. These directors had mostly all the patronage as to appointments, except to the higher offices and commands which were made in communication with the British ministry, who likewise originated all questions of peace and war, possessed the power of reversing the acts of the East India Company and those of the Government of India, and also of sending out instructions on special matters to the Governor-General, without consulting the Directors.

Sir George Birdwood has furnished the following list of the acquisitions of territory:—

1757, 20th Dec., the Twenty-four Parganas, from the Nawab of Bengal.
1759, 14th May, Masulipatam, from the Nizam.
1760, 27th Sept., Bardwan, Midnapur, and Chittagong, from the Nawab of Bengal.
1765, 12th Augt., Bengal, Behar, and Orissa, from the Emperor of Dehli.
1765, 30th Augt., Chingleput, from the Nawab of Arcot.
1766, 12th Nov., the Northern Circars, from the Nizam.
1775, 21st May, the zamindari of Benares, from the Vizir of Oudh.
1776, 22d May, Salsette island, from the Mahrattas.
1778, 17th June, Nagore, from the Raja of Tanjore.
1778, 18th Sept., the Guntur Circar, from the Nizam.
1786, Penang island, from the King of Queda.
1792, 17th March, Malabar, Dindigul, Salem, Bara Mahal, from Tipu Sultan.
1795-96, Ceylon, from Holland; in 1801, made a colony.
1799, 13th July, Coimbatore, Canara, Wynad, Neilgherry hills, from Tipu Sultan.
1799, 25th Oct., Tanjore, from Raja of Tanjore.
1800, 12th Oct., the Ceded Districts, from the Nizam.
1801, 31st July, the Carnatic, from the Nawab of Arcot.
1801, 10th Nov., Gorakhpur, Lower Doab, Bareilly, from the Vizir of Oudh.
1802, 31st Dec., Districts in Bundelkhand, from the Peshwa.
1803, 17th Dec., Cuttack and Balasore, from the Raja of Berar.
1803, 30th Dec., Upper Doab, Dehli territory, etc., from Sindia.
1805, 21st April, districts in Gujerat, from the Gaekwar.
1815, 2d Dec., Kamaon and part of Terai, from Nepal.
1817, 13th June, Saugur, Huttah, Dharwar, etc., from the Peshwa.
1817, 6th Nov., Ahmadabad farm, from the Gaekwar.
1818, 6th Jan., Kandesh, etc., from Holkar; Ajmir, from Sindia; Poona, parts of the Konkans, and Southern Mahratta country, from the Peshwa; districts of the Nerbadda, Sumbulpore, Patna, etc., from the Raja of Berar.
1820, 17th Dec., Southern Konkan, from the Raja of Sawuntwaree.
1822, 12th Dec., Bijapur and Ahmadnaggur, from the Nizam.
1824, 2d Aug., Singapore, from the Raja of Johore.
1825, 9th Aug., Chinsura and Malacca, from Holland, in exchange for Bencoolen.
1826, 24th Feb., Assam, Arakan, Tavoy, Tenasserim, from the King of Burma.
1832, Cachar, lapsed.
1834, Coorg, from the Raja of Coorg.
1839, Aden, captured.
1841, Bhutan Dwars, from the Raja of Bhutan.
1843, Sind.
1845, The Jullundur Doab; Serampur and Tranquebar.
1849, The Panjab and Satara.
1849, Jeitpur, Bundelkhand.
1850, Sumbulpur, S.W. Frontier.
1850, Bughat, Cis-Sutlej.
1852, Part of Sikkim.
1852, Oodeypur, S.W. Frontier.
1852, Part of lands of Mir Ali Murad.
1852, Pegu.
1853, Part of N. Cachar.
1853-54, Nagpur and Jhansi.
1856, Oudh and Tanjore.
1865, Boodawal in Kandesh.

The statistical abstract, also, shows, as follows, the increments in the area and population since 1839-40:—

Year.	Sq. Mls.	Pop. Millions.	Year.	Sq. Mls.	Pop. Millions.
1839-41	618,000	147·99	1850-51	773,000	167·41
1841-43	628,000	149·44	1851-52	779,000	167·93
1843-46	670,000	151·18	1852-53	806,000	169·85
1846-47	688,000	155·83	1853-54	830,000	172·58
1847-48	694,000	156·94	1854-55	834,000	172·82
1848-49	768,000	166·73	1855-66	858,000	184·04
1849-50	769,000	166·84	1866-82	860,000	184·13

Boundaries.—British India is enclosed on its north, its west, and its east by mountain ranges, amongst which are to be found the highest summits in the world. The *seaboard* on the south extends from Cape Monze, in lat. 24° 50′ N., and long. 66° 43′ E., to the Pakchan river in the Mergui district of Tenasserim.

The *inland* boundary, on the *west*, extends from the Arabian Sea to the Himalaya, running northward from Cape Monze along the Hala, the Suliman, and the Safed Koh mountains, up to the Kābul river; thence it skirts the lower slopes of the Himalaya along the plain of Peshawur up to the river Indus, and, crossing this great river, the boundary penetrates the Himalaya up to the north-western extremity of the British district of Hazara, in lat. 35° 2′ N., and long. 74° 9′ E., separating Kashmir from a group of independent tribes, up to the Chinese province of Ili or Yarkand. The passes through the enclosing mountains are not numerous, and are all difficult, particularly those on the north and on the west. On the north-west are the Khaibar, 3373 feet, and the Kuram, leading into Afghanistan; and on the west are the Gwalari near Dera Ismail Khan, the Tal near Dera Ghazi Khan, and the Bolan, which at top is 5800 feet. The districts on the British side of this western frontier are occupied by many tribes, under the administrative control of the Commissioner of Sind and the Lieutenant-Governor of the Panjab; the foreign side being occupied by similar Baluch, Brahui, and Pathan tribes under democratic constitutions.

On the *north*, British India is bounded throughout by the *Himalayas*, the native principality of Kashmir occupying their north-western angle; among their more southern ranges lie the independent states of Nepal and Bhutan and Sikkim; and up to long. 97° 5′ E., the mountain face of Assam is occupied by many uncivilised, even barbarous, tribes.

Turning south from Assam in 97° 5′ E., the *eastern* boundary runs conterminous with other tribes, and with native Burma as far as the Karen highlands and the Salwin river, where it joins the frontier of the kingdom of Siam, and runs south with it to the Pakchan river, in lat. 10° 48′ 14″ N., and long. 98° 55′ 40″ E.

Several *mountain ranges* and several rivers traverse the region within these bounds. The Vindhya north of the Narbada, with the Satpura hills south of that river, separate Hindustan from the Dekhan, and from prehistoric times their forests and valleys have given shelter to aboriginal tribes whom intruding races had driven from the plains. The *Vindhyas* run eastwards from Gujerat across Malwa and the central parts of India, rising from 1500 to 4500 feet high, and the Rajmahal Hills jut into the valley of the Ganges in long. 80° 45′ E.

The *Satpura* stretch from east to west for 600 miles. Amarkantak is their eastern boundary. Their plateaux are elevated between 3000 and 4000 feet above the sea.

From the north-east angle of the Himalaya spurs and chains project southwards. They are known successively as the Abar, Naga, Patkoi, and Barel ranges, culminating, in lat. 22° N., in the Blue Mountain, 7100 feet high, and then stretch south under the name of the Arakan Yoma, which also are sheltering many uncivilised tribes. The Arakan Yoma range, starting from the Blue Mountain, in 22° 37′ N., strikes southwards from the mountains of S.E. Assam, separating Arakan from Independent Burma in the north, and from British Pegu in the south, and terminating at Cape Negrais. The Pegu Yoma, starting from Independent Burma, separates the valleys of Sitang and Salwin, and terminates near the head of the Irawadi delta. Further southwards, the mountains on the Tenasserim coast mark the boundary line to the Pakchan river, already noticed.

Within these outer barriers are less prominent ranges running north and south, and detached hilly tracts and spurs tenanted by tribes in various stages of civilisation, but mostly of a low type, several of them utterly barbarous, addicted to human sacrifice, and one at least, the Birhor, still cannibals.

On the east of Assam and Bengal, the low ranges and the valleys of *Hill Tiperah* are occupied by the Tiperah, the Nowattia, and the Riang populations, numbering 75,792 in an area of 3876 square miles.

The *Garo* hills, in the S.W. corner of Assam, between lat. 25° 9′ and 26° 1′ N., and long. 89° 52′ and 91° 3′ E., are occupied by a race with polyandric customs. The *Khassya* and *Jaintia* hills have an area of 6157 square miles; they lie between lat. 25° 1′ and 26° 14′ N., and long. 90° 47′ and 92° 52′ E. They form the central section of the watershed between the valleys of the Brahmaputra and the Surma. The Garo and the Syn-teng of the Jaintia have both fought with the British for independence; the Syn-teng so recently as 1862-3.

In Rajputana, the *Aravalli* hills, from 6 to 60 miles broad, and rising 1000 to 2855 feet above the sea, run for 300 miles in a N.E. and S.W. direction between the Rajput states and Ajmir-Mhairwara, dividing the plain of Marwar from the high table-land of Mewar, and merging into the Vindhyas near Abu. It is sparsely occupied by the Mhair and other Mongoloid races. Mhairs of the Ajmir-Mhairwara hill tract are still a small body of 69,234 souls, in an area of 602 square miles. They are brave mountaineers, but were wild and highly predatory, until Lieutenant-Colonel Dixon transformed them into disciplined soldiers.

In Southern India are the *Eastern Ghats*, commencing in Orissa, and skirting the east coast southwards to Tinnevelly, affording shelter to many large tribes,—Gond, Juang, Kandh, Saura, Chensuar, and Yenadi.

The *Western Ghats* run from the valley of the Tapti southwards for 800 miles, and terminate in Cape Comorin, presenting several high peaks about Mahabaleshwar above 4000 feet, and in the Neilgherries up to 8000 feet elevation. In their most northerly parts they give shelter to the Bhil and the Koli, and in their southern forest and hill tracts to the Kadar, Pulliar, Malai Arasar, and Maleali, with Irular, Toda, Badaga, and Kurubar.

The great alluvial low-level tract of Northern India, watered by the Ganges and Indus and their tributaries, is known as the *Indo-Gangetic plain.* It is an immense expanse of flat country stretching from sea to sea, entirely composed of alluvial deposits of very late geological age, and separating the hilly ground of the Peninsula from the various mountain and hill ranges of Sind, the Panjab, the Himalaya, Assam, Burma. The *geological* formations of the peninsular area are arranged in the

Manual of Geology as recent and post-tertiary, cænozoic, mesozoic, palæozoic, and azoic, the last comprising the Vindhyan series, the transition, and the metamorphic or gneissic. The formations in extra-peninsular territories being recent and post-tertiary, pliocene, miocene, eocene, cretaceous, jurassic, trias, permian, carboniferous, and silurian and infra-silurian, all the infra-silurian being non-fossiliferous.

Rivers.—The navigable rivers of India are the Ganges, the Indus, the Brahmaputra, the Irawadi. The *Ganges* rises in the Garhwal State, in lat. 30° 56′ N., and 79° 6′ 40″ E., and enters the Bay of Bengal by many mouths, after a course of 1557 miles. Under the name of Bhagirathi, it issues from an ice-cave at the foot of a Himalayan snow-bed, 13,800 feet above the sea. Twelve rivers of British India are deemed holy by the Hindus, and the pushkaram festival is held at them. But the *Ganges* is the most sacred. To live on its banks, or near it, is a happiness; and to die on its banks, or in its waters, a great privilege. It is used for navigation and for irrigation. Its catchment basin is 391,100 square miles, and maximum flood-discharge 1,800,000 cubic feet per second.

The *Jumna*, Jamna, or Yamuna, joins the Ganges at Allahabad, after a course of 680 miles. Its source is in Garhwal, in the Himalaya, 5 miles N. of Jumnotri, 10,849 feet above the sea; and its catchment basin is 118,000 square miles. On its banks are the cities of Hamirpur, Agra, and Dehli; the eastern and western Jumna canals have been led from it at Faizabad and above Agra, but in the hot weather it dwindles to a small stream. The Jumna at Agra, and at other places, since many years had been bridged by a line of boats, and now splendid railway bridges span it at Dehli, Agra, and Allahabad.

The *Brahmaputra* river course is 1800 miles; and it is navigable for steamers up to Dibrugarh, 800 miles from the sea. Its drainage basin is 361,200 square miles. Its valley is the province of Assam, and many tribes occupy both its banks. At Goalanda, about half-way between the delta head and the sea, the Ganges unites with the main stream of the Brahmaputra, and farther down with the Megna. Their combined waters represent the drainage collected by the two vast river-systems from an aggregate catchment basin of 752,000 square miles on both sides of the Himalaya, together with the rainfall poured into the Megna from the Burmese watershed.

The *Indus* river was known to the Greeks as the Sindhu or Σινθος. It rises in lat. 32° N., and long. 81° E., on the north-western slope of the Kailas mountain, the Sutlej river rising on its southern slope, and the Brahmaputra, under its Tibetan name of Tsang-pu, at some distance from its eastern base, in lat. 31° N., and long. 83° E., and 16,000 feet above the sea, the Dihang river being supposed the connecting link between the Tsang-pu of Tibet and the Brahmaputra of Assam. The Indus pours its waters into the Arabian Sea after a course of 1800 miles, its drainage basin being 372,700 square miles.

The *Ravi* in the Panjab is the Hydraotes of Arrian, the Sanskrit Airavati. This stream has been utilized to supply the Bari Doab canal. In March and April its depth on the borders of the district of Amritsar is not more than a foot. Between June and September it rises to 18 or 20 feet. The main bed alters but little, and the greatest volume of water only floods a mere fringe on either bank. In 1870 it carried away a Sikh shrine near Dera Nanuk, and it still threatens damage.

The *Irawadi* river (Airavati), after a course of 900 miles, disembogues by several mouths into the Gulf of Martaban. It rises, by two branches, from the Patkoi mountains, one of them in lat. 27° 43′ N., and long. 97° 25′ E., the other a little to the east, the Myit-gyee and Myit-gne, which unite about lat. 26° N., and run to the south along a catchment basin of 158,000 square miles. It is navigable above 500 miles north to Bhamo; and at Mogoung, when at its lowest, the bottom was not sounded at 40 fathoms.

The *Koladyn* or Kuladan, a river of Arakan, is supposed to have its origin near the Blue Mountain (22° 37′ N.), and it passes the town of Akyab to enter the Bay of Bengal. It is navigable for 50 miles for vessels of 300 or 400 tons.

The chief rivers of the Peninsula of India, are the Mahanadi, Godavery, Kistna, and Cauvery, and, though not navigable, are valuable for irrigation.

The *Mahanadi* rises in the Raipur district, in lat. 20° 10′ N., and long. 82° 3′ E., and, after a tortuous course of 520 miles through the Central Provinces and Orissa, falls into the Bay of Bengal. Its catchment basin is estimated at 43,800 square miles; its flow is rapid, and its flood-discharge 1,800,000 cubic feet per second. An elaborate system of canals has been constructed to husband its water, and designed to irrigate 1,600,000 acres.

The *Godavery* river, rising near Trimbak, in lat. 19° 55′ N., and long. 73° 34′ E., 50 miles from the sea, runs through the Hyderabad dominions into the Northern Circars, where it forms a delta of 3000 square miles, and enters the Bay of Bengal by seven mouths (three of which are large), after a course of 898 miles. Its drainage basin, 112,200 square miles. A great dam has been constructed across it at Dowlaishwaram, the head of its delta.

The *Kistna* river is south of the Godavery. It also has been largely utilized for irrigation, by throwing a dam across it at Bezwara. It rises near Mahabaleshwar, in lat. 18° 1′ N., and long. 73° 41′ E. Its catchment basin is 95,500 square miles, and its maximum flood discharge is 1,188,000 cubic feet per second.

Still further south is the *Cauvery*, the Χαβηρος of Ptolemy, with a river basin of 27,700 square miles. It flows across the southern parts of the Peninsula. It rises in the Western Ghats, in lat. 12° 25′ N., and long. 75° 34′ E.; and its length is 465 miles. It is one of the twelve holy rivers of the Hindus, who call it the Dakshina Ganga. Crowds of Hindu pilgrims annually visit its banks. Its waters are utilized for irrigation in Mysore and in Coimbatore; and at Srirangam, near Trichinopoly, a prehistoric Hindu king constructed a dam, and led off its waters into the Cauvery proper and Colerun; 835,000 acres in the districts of Trichinopoly, Tanjore, and S. Arcot are now irrigated by it, yielding a revenue of £353,000. In the benefits it bestows on those districts, it vies in usefulness with the canals of the Godavery, the Ganges, and the Indus.

In the river system of British India there is a

peculiarity which merits notice. Shortly after issuing from the mountains among which they rise, the rivers run through low-lying valleys to the sea. Their fall is so gentle, that, following their windings for even 1000 miles from the ocean, they are still found in beds only seven or eight hundred feet above the level of the sea. Where the united streams of the Panjab join the Indus, the altitude is only 369 feet at a distance of 450 miles from the sea; the confluence of the Ganges and Jumna at Allahabad, 846 miles from the sea, is 340 feet. This peculiarity is the more worthy of notice, because, throughout these territories, there are no natural inland lakes or seas which can be used for commerce, most of them being only fit for purposes of irrigation. The largest natural waters in the country are equalled, and in many cases surpassed, by the magnificent tanks which have been formed in several places by throwing embankments across great valleys. The many shallow marine lagoons, known as backwaters, found running close around the shores of the Bay of Bengal and of the Indian Ocean, some of them from 20 to 50 miles long, are, however, well meriting notice, and greater attention than has hitherto been given to them, as they afford facilities for a safe inland traffic along the coast line, the violence of the monsoons and the few sheltered harbours on the eastern coast of the Peninsula rendering navigation at times perilous, and periodically impossible. After the East India Railway was opened, steamers ceased to ply upon the Ganges, but they still run on the Brahmaputra and its tributary the Barāk, also on the Irawadi, and on the Indus.

Ancient India.—Dr. Vincent was inclined to believe that in the very earliest ages, even prior to Moses, the communication with India was open; that the intercourse with that continent was in the hands of the Arabians; that Thebes had owed its splendour to that commerce; that Memphis, from the same cause, came to the same pre-eminence, and Cairo succeeded to both in wealth, grandeur, and magnificence. Passing by the mythological Bacchus, also Semiramis, queen of the Assyrians, who is said to have crossed the Indus about B.C. 1960, and to have been defeated by Stabrobates, as also Sesostris, king of Egypt, who is said to have led an army to the Ganges B.C. 1308, we come to the first mention in the Bible, of India, by that name, in the book of Esther about B.C. 450.

Of the *ancient dynasties* who ruled in India, Colonel Tod, in his Rajasthan (i. p. 44), endeavoured to bring together what was known of the Solar and Lunar races. The wrecks of almost all the vast cities founded by them are yet to be traced in ruins,—the cities of Ieshwaca and Rama on the Sarjoo, Indraprest'ha, Mat'hoora, Soorpoora, Poorag on the Yamuna, Hastinapura, Canyacubja, Rajgraha on the Ganges, Maheswar on the Narbada, Arore on the Indus, and Koosusthulli Dwarica on the shore of the Arabian Sea.

Menu calls India Aryavarta, the abode of the Aryans. Bharata or Bharata-varsha is the classical Sanskrit name; and in Sanskrit poetry it is mentioned as Jambu-dwipa. The name as known to Europeans is derived from the river Sindhu, pronounced by the Aryans Hindu, and known to Europe as the Indus. The Greeks named the people Ἰνδοί. The seven rivers, Sapta Sindhavah, in old Persian or Zand were called Hapta Hindu; and to the present day, all along the western frontier of British India, s and h continue interchangeable.

The first Greek who speaks of India by name is Hecatæus of Miletus, B.C. 509–486. Herodotus, who wrote about B.C. 450, appears to have heard but indistinctly of any but the western part of it, and that only by its being tributary to Persia. He informs us (book iv.) that Darius Hystaspes had despatched Scylax of Caryandra to explore the Indus, about B.C. 508, and that he departed from Caspatyrus and Pactya, which were situated near the head of the Indus. Herodotus continues to say that the Indians who inhabit towards the north, and border on these territories of Caspatyrus and Pactya, resemble the Bactrians (that is, their neighbours) in manners, and are the most valiant people of all India. The eastern part of India, says he, is rendered desert by sands; which description applies only to the country lying east of the Indus and south of the Panjab, and this was the eastern limit of Herodotus' knowledge. Following him, Ctesias, the physician, B.C. 401, brought back from his residence in Persia only a few facts about the products of India.

Prior to Alexander the Great, B.C. 327, there are doubts as to anything historical in the Indian accounts, for the Sanskrit-speaking Indians had no historical pursuits; and east of the Indus was earliest made known by the learned men who accompanied Alexander, and particularly by the writings of Megasthenes, who, B.C. 306–298, was the Greek ambassador at the court of the Hindu prince of Pataliputra-pura. Other of the Greek writings have been lost, but Strabo, Pliny, and Arrian have given them in a condensed form.

Most of the writers about Alexander call the inhabitants of the hilly region to the south of the main ridge of Caucasus and near the Indus, Indians, and also mention an Indian tribe or nation who inhabited the seashore on the western side of the Indus; and close to the Indus, especially on the lower part of its course, there were other Indian tribes, though less considerable than those two. The Indians on the seashore were named Oritæ and Arabitæ, and are recognised by Major Rennell (Memoir, p. 21) as the people called Asiatic Ethiopians by Herodotus. Their country was the narrow tract between the mountains of Baluchistan and the sea, separated from Makran on the west by the range of hills which form Mount Arboo, and on which still stands the famous Hindu temple of Hinglez. The Indians whom Herodotus includes within the satrapies of Darius, are probably the more northern ones under Caucasus, for he mentions (Thalia, pp. 101, 102) that those in the south were independent of the Persian monarchy. Arrian (Indica, pp. 8, 9) denies the alleged invasions of Bacchus, Hercules, Semiramis, Sesostris, and Cyrus; and Strabo (lib. xv. near the beginning) denies the mythological invasions, adding that the Persians hired mercenaries from India, but never invaded it (see Diodorus, lib. ii.). The other Greek writers, though they speak of Indians beyond the Indus, strictly limit India to the eastern side of that river; and Arrian, though he called the mountaineers Indians, from the place where Alexander entered Paropamisus, is careful to explain that India lies east of the Indus; and Strabo (lib. xv.) declares the Indus to be the western boundary of India from the mountains to

the sea. Pliny, indeed, states that some consider the four satrapies of Gedrosia, Arachosia, Aria, and Paropamisus to belong to India, but this would include two-thirds of Persia. The ancient Sanskrit writers also regard the Indus as the western boundary of India, and class the nations beyond it as Yavana and barbarians; and there is a tradition that Hindus ought not to cross that river, the town of Attock taking its name from this prohibition. Later on, the countries between Hindustan and China came to be called the Further India, or India extra-Gangem; whereas Hind, or India, was restricted to the country of the people called Hindus or those of India intra-Gangem.

Conquerors from the North-West.—From the earliest historic times, Persian, Greek, Scythic, Arab, Turk, Moghul, and Afghan conquerors from the N.W. have been coveting the wealth and the fertile plains of the Gangetic valley, and dynasties professing Buddhism, Hinduism, and Mahomedanism have been striving for possession within.

Scythic races appeared in India in the early centuries of the Christian era. They came from the inhospitable mountain and desert lands in the north and north-west; and after them Turk, Moghul, Arab, and Afghan have continued to the present day to seek dominion in the more genial climate of India, and to engage in its commerce. Darius Hystaspes, B.C. 518, had conquered to the N.W. part of it. The Greeks appeared under Alexander B.C. 327–325, and under Seleucus B.C. 312, and Menander B.C. 181–161. During his two years' campaign in the Panjab and Sind, Alexander captured no province, but he made alliances, founded cities, and planted Greek garrisons. At Taxila (Deri-Shahan) and Nikaia (Mong) in the Northern Panjab, at Alexandria (Uchh) in the Southern Panjab, at Patala (Hyderabad) in Sind, and at other points along his route, he established military settlements of Greeks or allies. A body of his troops remained in Bactria; and in the partition of the empire after Alexander's death in 323 B.C., Bactria eventually fell to Seleucus Nicator, the founder of the Syrian monarchy.

During the next six hundred years the Greeks were followed by Scythic tribes of the Su, the Saka, the Hun, the Naga, and the Getæ, who made continuous, several of them successful, efforts to remain. About B.C. 126, the Tartar tribe of Su are said to have driven out the Greek rulers from Bactria. The Græco-Bactrian settlements in the Panjab were overthrown by the Tue-Chi; and during the rule of Kanishka, who held the fourth Buddhist council about A.D. 40, Scythic settlements were formed as far south as the districts now known as the Central Provinces. Scythian races more than once overthrew prior rulers, and more than once sustained great defeats; but some of the Rajput dynasties, and also the Jat, the ancient Getæ, now about 9,000,000 in the Panjab, retained a permanent hold on the country east of the Indus and southwards to the mouth of that river, and Jat princes are still ruling in Bhartpur and Dholpur.

The Sah of Saurashtra (B.C. 70 or 60), the Gupta of Kanauj (A.D. 319-470), and the Valabhi of Cutch (A.D. 480–722), seem to have opposed successive hordes of Scythians. But Mr. Fergusson believes that it was the White Huns who overthrew the Gupta dynasty between A.D. 450 and 475, and that the Saka and the Hun were finally defeated at the great battles of Karur, near Multan and Maushari, which that learned writer supposes to have been fought between A.D. 526 and 544.

During these struggles for dominion, Vikramaditya, a king of Oojain, about B.C. 57, drove back one Scythic invasion, and his victory gave rise to the Samvat era still current in India. Salivahana, another king of Southern India, is supposed to have successfully checked another Scythic invasion, A.D. 78, from which event the Saka era is reckoned; but the repulse was not permanent, for Cosmos Indicopleustes, who traded in the Red Sea about A.D. 535, speaks of the Hun as a powerful nation in Northern India in his day.

Tradition names Nushirwan, king of Persia A.D. 521–579, as having invaded Western India and left descendants there; but from that time till near the 19th century, it was Arab, Turk, Moghul, and Afghan races who were the invaders, till Portuguese, British, Dutch, Danish, and French appeared on the scene.

The Khalif Usman (A.D. 636) sent an expedition to Thana and Broach. A few years later (A.D. 662 and 664), raids were made towards Sind, which the youthful Kasim (A.D. 712–714) conquered, again to be lost and again regained (A.D. 828), only to be finally lost again.

The Valabhi dynasty of Cutch, Malwa, and the N.W. districts of the Bombay Presidency (A.D. 480–722), seem to have been overthrown by the Arab invaders of Sind in the 8th century; and since then the Mahomedan dynasties who have ruled in India have come from Central Asia, and their families have reigned for various periods from 20 to 331 years.

The Jat settled in the country as cultivators of the soil, and they continue to the present day engaged in husbandry, but with the Mahomedan dynasties, the Turk Mahmud, the Moghul Timur, the Persian Nadir, and the Afghan Ahmad seem to have been attracted by the hopes of plunder. Mahmud of Ghazni twelve times (A.D. 1001–1026) made inroads on the south-western parts of the country, carrying back with him immense wealth; Timur (A.D. 1398-99) sacked Dehli and Meerut, and left fifteen years of anarchy, famine, and pestilence behind him. Nadir Shah (A.D. 1738–39) took away with him from Dehli eight or nine millions in gold and silver money; Ahmad Shah, in his invasions, obtained the Panjab (1751–52) and sacked Dehli (1756); and his invasion of 1759 led to the assassination of Alamgir II., but after he overthrew the Mahrattas at Paniput (1761) he left India never to return to it.

The duration of such of the invading dynasties as obtained a hold of the country, was as under :—

House of Ghazni (Turki), .	A.D. 1001–1186	Years	185
,, Ghor (Afghan), .	,, 1186–1206	,,	20
Slave Kings (chiefly Turki),	,, 1206–1290	,,	84
House of Khilji (Turki), .	,, 1290–1320	,,	30
,, Taghalak (Panjab Turks),	,, 1320–1414	,,	94
Timur (Moghul), . . .	,, 1398–1399	,,	—
Syuds, ...	,, 1414–1450	,,	36
Lodi (Afghans), . . .	,, 1450–1526	,,	76
House of Baber (Moghul), .	,, 1526–1857	,,	331

Whilst these races were striving for the possession of the Indo-Gangetic plain, several dynasties of prior occupants in the south of India were overwhelmed by Mahomedan armies, and families professing Islam formed kingdoms in Gujerat, Kulburga, Beder, Golconda, Bijapur, Ahmadnagar, Malwa, Kandesh, Bengal, Berar, Sind Hyderabad, Mysore, and Arcot.

In the 14th century (1347), Hasan Gangu, surnamed Bahmani, headed a successful rebellion in the Dekhan against Mahomed Taghalaq, and drove the armies of Dehli across the Narbada. Hasan was an Afghan of humble origin, but had attained distinction in the Peninsula, and, on declaring for independence of the empire, he fixed his capital at Kulburga. His descendants reigned 179 years (1347–1526), through thirteen generations. Their territory, when at the height of their power, comprised the central parts of the Dekhan from sea to sea, and from Berar in the north, southwards to Conjeveram; and when at length the dynasty became effete, several smaller houses assumed sovereignty:—

Adal Shahi of Bijapur, ...	1489-1579
Nizam Shahi of Ahmadnaggur, . .	1490-1595
Kutub Shahi of Golconda, . . .	1512-1580
Imad Shahi of Berar, ...	1484-1560
Barid Shahi of Beder, ...	1498-1572

Almost contemporaneously (1336-1565) a Hindu race had been dominant at Vijayanagar. But it fell to a combination of four of these Mahomedan dynasties, who were victorious at Talikata. The aged monarch, Rama Raja, was taken prisoner, and put to death at Kala-Chabutra in cold blood. The Vijayanagar monarchy at that time comprehended almost all the south of India, but mutual jealousies prevented the victors from extending their respective frontiers, and they, too, in succession shortly disappeared.

During the 14th and 16th centuries, Bengal, Kandesh, Malwa, and Gujerat saw many changing Mahomedan monarchies; but in the 17th century (1662) a great Hindu power was formed in the Peninsula by Sivaji, a Mahratta, a brave and skilful leader, between whom and the Mahomedans no faith was held, and, on his death, a Brahman tribe, with the title of Peshwa, continued to direct the energy which Sivaji had evoked. The emperor of Dehli, Aurangzeb (Alamgir I.), during a long life strove to hold the Central Dekhan, but from his death, A.D. 1707, the Moghul dominion there was practically at an end, and for the next fifty years the empire even of all India wavered between the Mahrattas of Poona and the Moghuls of Dehli. The Peshwas, however, never recovered from the destruction of their army at Paniput (1761); and the British under Clive, and Hastings, and Coote, and Laurance, and Hector Munro, obtained a prominence which they still maintain; the Mahratta territories of the Peshwas became partitioned into many separate states, often at war,—Kolhapur, Satara, Gujerat, Gwalior, Indore, Tanjore, and Berar, with many Hindu chiefships along the valleys of the Kistna and its affluents. During the convulsions, Mahomedans of Arab, Afghan, Pathan, and Turk descent seized on Cuddapah, Hyderabad, Kurnool, Banaganapilly, the Carnatic, and Mysore; chief officers of the Mahrattas retained the jaghir lands which had been assigned for their own salaries and that of their followers; and rajas of Sundur, Mudhol, Akalkot, and sirdars of the Dekhan, still hold these estates.

The power of the Walajah family of Arcot in the Carnatic, closed after a few troubled years. Hyder Ali and his son Tipu, after a brief sway in the Mysore, which they had won, were followed by a Hindu monarch. Numerous Hindu polygar chiefs apportioned among themselves the lands of the Pathans of Cuddapah; Satara, Berar, and Tanjore disappeared as Mahratta dynasties; and in 1839 the Pathan ruler of Kurnool, dreaming of conquests, was overthrown in battle at Zorapore.

In the north-west, since many thousand years, the Panjab has been a battle-field of the races contending for empire; and within historic times, Greek and Scythian, Hindu and Buddhist, Turk and Moghul, Arab, Persian, Afghan, and British have been there. At the close of the 18th century, Ranjit Singh, an able ruler of the Sikh faith, established his sway over all the parts of it west of the Sutlej, and he conquered also Kashmir. But anarchy followed his death (1839); and the latest contest for dominion was by the East India Company, who fought for safety at Moodkee, Firozshah, Aliwal, and Sobraon in 1845, and at Gujerat in 1849, on which maharaja Dhulip Singh transferred his sovereignty to the British. A few years later on (1856), the king of Oudh, hereditary wazir of the Moghul empire, was set aside for utter misrule. The following year the titular Moghul dynasty of Dehli threw in their lot with mutineers, and were swept away. And the Mahomedan states of Hyderabad, Bhopal, and Banaganapilly, with the Hindu kingdoms at Bhartpur, Dholpur, Baroda, Cochin, Mysore, Jodhpur, Jeypore, Oodeypur, and Travancore in Hindustan, in Rajputana and in the Dekhan, remain the oldest dynasties among the princes of India,—the most ancient, perhaps, in the world, being the Rajput houses of Oodeypur and Jodhpur.

Within historic times, except for brief intervals and in very small principalities, the ancient people of India have never had rulers of their own races. Periodical literature not infrequently alludes to British domination as a foreign rule. But the imperial dynasties ruling from Dehli had merely a military occupation; the cultivators of the Rajput states, and of the Gaekwar, of Holkar, and of Sindia, are largely of the Kurmi, Kunbi, Kach'hi, and Mali races, and of the aboriginal Gond, Koli, Meena, Mhair, Bhil, and others. Hyderabad, in the Dekhan, is a very compact Mahomedan state, with eleven millions of population, but its people are almost all Teling, Canarese, Mahratta, and Gond, in nearly equal numbers. The population of Mysore is of a most varied character; and the Hindu kingdom of Travancore, another compact state, has rulers of the Nair race, and the bulk of their subjects professing some form of Hinduism, has only 440,932 Nair in a population of 2,311,379.

Cities.—With such continuous revolutions, the people have never had time to collect into large town populations. Tradition tells of Ajodhya as a great city, covering an area of ninety-six miles, but there are now, perhaps, more large towns than India has ever before known, and even yet only 139 of them have more than 20,000 inhabitants. The former unsettled state of the country, and the craving of the people for protection in their peaceful labours, are well illustrated by the histories of the strictly British towns of Calcutta, Madras, and Bombay. At these three cities, fortresses were erected by the British, and the people have gathered around them. The great capital of British India, which now contains a population of 794,645 souls, was, at the close of the 17th century, a cluster of three small mud hamlets. The only previous notice of 'Kalikata' is a brief entry of it as a rent-paying village in the emperor

Akbar's great statistical survey of 1596. But in 1686 the English merchants at Hoogly, being compelled to quit their factory in consequence of a rupture with the Moghul authorities, retreated, under their president, Job Charnock, to Sutānati, a village on the east bank of the river, now a northern quarter of Calcutta. In 1696 they built the original Fort William, and a few years later purchased the three villages of Sutānati, Kalikata, and Govindpur from Prince Azim, son of the emperor Aurangzeb. But with the security given by its fortress and its bordering river, the population is now approaching a million of souls.

Madras, as it is called by the British, is still only known to the people as a collection of several hamlets, Chinapatan, Mutialpet, Vepery, Nangambākam, and others. In March 1639, Francis Day, chief of the commercial settlement at Armagon, obtained from the representative of the Vijayanagar dynasty a grant of the site on which Madras now stands, and a factory with some slight fortifications was at once constructed. It may be doubted if there were a thousand people in all the hamlets. But the natives settled around the factory, a better fort was built, and at the census of 1881 the population numbered 406,117.

Bombay Island formed part of the dower of Catharine, queen of Charles II. of England, who in 1688 transferred it to the East India Company for an annual payment of £10. The population was estimated at 10,000 souls. The Company strengthened the fortifications; in 1673 the inhabitants numbered 60,000; piracy was put down; its island position further protected it, and in 1881 its population had increased to 773,196.

Similar increments are going on in and around all the sites taken up by the British as cantonments and military stations. Secunderabad, for instance, had no existence until the British Subsidiary force, during the reign of Secunder Jah (1803), encamped on its present site; but its inhabitants in 1868 numbered 32,000 in 7938 houses.

In the war with Burma of 1852–53, Rangoon, on a branch of the Irawadi, was taken by the British, and its population was estimated at 25,000; in 1872 it had 89,897 (99,745) inhabitants, but in 1881 its population reached 134,176 souls.

The great towns, Calcutta, Bombay, Madras, Rangoon, continue to attract immigrants from all parts of Asia. The 1881 census showed the foreign residents to be,—Asiatics not natives of India, 540,989; British, 75,734; Europeans, 38,463; Africans, Americans, Australians, 6961.

The 540,989 Africans and Asiatics not natives of India comprised—

Abyssinians,	90	Jew,	7,626
Afghans,	3,191	Malay,	1,493
Arabs (Bombay 6090),	8,311	Mekrani in Kurachee,	5,285
Armenians,	1,254	Manipuri (in Assam),	11,866
Baluch, Panjab,	235,123	Nepalese,	31,182
,, Bombay,	144,772	Parsee,	69,476
Bhotia in Assam,	339	Persian,	3,545
Brahui,	845	Siamese,	58
Kashmiri,	142	Syrian,	69
Chinese (Burma 12,109),	13,340	Turk,	923
Japanese,	3	Others,	2,056

Most of the Parsees are permanent residents, and portions of the others must also be so classed, but the numbers suffice to show the continuous stream of immigrant races.

On the other hand, several of the Kolarian and Dravidian races emigrate freely. Rangoon, Tavoy, Mergui, Malacca, Penang, and Singapore contain many of them; and the more distant Mauritius, Bourbon, S. Africa, West Indies, and Central America have received numbers. From 1876–77 to 1880–81, the following—

1876–77,	Left British India	10,036	Returned	4,485
1877–78,	,,	25,219	,,	4,400
1878–79,	,,	22,092	,,	5,586
1879–80,	,,	17,426	,,	7,185
1880–81,	,,	16,794	,,	7,061

Population.—The census taken of India in 1881 *has not yet* (*October* 14, 1882) *been checked.* It showed a population of 252,541,210 in an area of 1,477,763 square miles. In these numbers, however, are included provinces which are British proper, and also territories belonging to native princes and chiefs under treaty, subsidiary or other alliance, as here shown:—

	Pop.		Area.	Sq.m.
British Districts—				
Bengal (Sikkim wanting)	68,829,920		155,997	401
Madras,	30,839,181		140,333	226
Bombay Brit. territory,	13,978,488			
Bombay Native States,	6,941,631		126,445	130*

* Population details for Sikkim wanting. Excluding Naga hills, not censused.

† Excluding population of the Lahoul, Spiti, and Hazara Districts, not censused.

‡ Approximate.

§ Population details for Paegah Districts wanting.

Note.—The difference of 11,163,512 between the grand total of columns 3 and 4 and that of column 2 is accounted for by the absence of sex details for the whole of Rajputana, for the Paegah Districts of Hyderabad, and for Independent Sikkim.

Food and Races.—Taking the populations and their means of subsistence, from the purely agricultural point of view, the country, as a whole, is under-peopled. In certain districts in Bengal and the N.W. Provinces, there are more cultivators than the land actually requires; but in Assam, the Panjab, Sind, the Madras plateau, and Burma, there are vast tracts of arable land unploughed. Even in portions of Bengal there are still reserves of virgin soil. The difficulty is to induce the population to distribute itself; though several of the races of India, the Tamil, and Teling, and Dhangar, in particular, freely emigrate to remote countries.

The supremacy of British India, while it has brought peace within the borders and improved the salubrity of localities, has not been unattended with difficulties. The population, which was kept down by the wars, pestilences, and famines of former times, has rapidly increased. In the ten years 1871 to 1881, the increase was 12,788,865, notwithstanding the occurrence of a severe famine, causing great loss of life in Mysore, in the Carnatic, in parts of Bombay, and in the N.W. Provinces. In the year 1789, one-third of the land lay unoccupied, but many jungle tracts and swamps have since been reclaimed. Some districts and provinces have become over-peopled; the surplus of some of the races are emigrating to Ceylon, to the Malay countries, to the Mauritius, Bombay, Africa, South America, and the West Indies; and the Government of India is looking at sparsely-peopled Burma as a country to be filled. In Burma, Assam, Berar, and Sind, the increase was the greatest; but in the years 1876 and 1877, a severe famine, and consequent disease, occurred in parts of the Peninsula, which carried off numbers, and in the decade the decrease in the Bombay Presidency was 0·3 per cent., in that of Madras, 2·3 per cent., and in Mysore, 1,130,987, or 17 per cent.

During the decline of the Moghul empire and the raiding expeditions of the Mahrattas, several of the predatory races were actively plundering; armed bands of dacoits made their attacks even on large towns; and the armed and disciplined bodies known as Pindara, composed of all races, traversed the country, till they were finally swept away in the war of 1817–18–19.

But the greatest alteration in the martial habits of the people has occurred amongst the north-west frontier tribes, who had long been inured to war. When first, after the fall of the Sikh power, the British came in contact with the Pathan, Brahui, and Baluch races of the N.W. Frontier, not a year passed by without raids on the Indian territories, and armies were needed to repel them; but these raids are now extremely rare, and the democratic Councils are ready to afford redress. Perhaps the most remarkable instance of civilising a border race has occurred with the Karen on the borders of British Burma, where the Baptist missionaries, and notably Dr. and Mrs. Mason, have done more to subdue and civilise that race than armies could have accomplished.

India is pre-eminently *agricultural*. The (*unchecked*) census shows that the adult male population in 1881 was 62,002,461. Of these, 37,393,055 were engaged in agriculture, 8,137,082 were then labourers, and 8,749,270 were engaged in industrial avocations. Also, 4,136,430 were in domestic employ, 3,425,738 in commerce, and 2,401,630 in professions and Government service.

The bulk of the agriculturists profess some form of Hinduism. In the extreme south of the Peninsula, the Tamil-speaking race, who assume the titular designations of Mudali and Pillai, are there the most numerous; further north are the Canarese-speaking race, who are all agricultural; several tribes in Telingana, the Reddi, the Naidu, the Kamavaru, westwards as far as Beder, and southwards to Mysore and the Carnatic, are engaged in tillage; further north are the Uria race and the Gond, the great Kunbi and Mali races of the Mahratta country; and throughout the plateaux and the plains of Northern India, are the Jat, Kurmi, Kach'hi, Koeri, Lodhi, Mali, Kaibartta, Sadgop, Khasa, and Gujar, with the pastoral Ahar, Ahir, Dhangar, Gadariya, Gop, Goala, Kurubar, and Rangar, the labouring population being the numerous landless, broken, non-Aryan tribes and clans, as the Pariah, Dher, Mhar, Mang, Dom, and others, who are dispersed, are scarcely yet freed from a condition of predial slavery, and evince no inclination to abandon their own fetish and shamanist cults.

The mountain ranges harbour many tribes, who have fled to them for shelter, or been thrust into them by more powerful races; and similarly the corner provinces, as of Kattyawar and Orissa, have a diversified population. In Kattyawar, of the old ruling races there remain the Jaitwa, Churasama, Salunki, and Wala, who exercised sovereignty in the country prior to the immigration of the Jhala, Jarija, Pramara, Kathi, Gohil, Jat, Mahomedans, or Mahrattas. So, in Orissa and Ganjam are the Bhumij; Bhuiya, Gond, Kandh; Khaira, Kol; Pan; Santal, Savara, Teling, and Urya.

The frontiers of British India are nowhere conterminous with any highly-civilised state. On the north Kashmir, on the north-west Nepal, and in the south-east Burma and Siam, alone can claim possession of a literature. Both within the British bounds and beyond are many tribes and nations under democratic rule. The most powerful of these are on the north-west, and may be thus shown:—

Independent Tribes, dwelling along the outer face of the north-west frontier, and inhabiting hills, viz.—

Adjoining frontier of Hazara district,—Hussanzai.
Adjoining frontier of Peshawur district, — Judoon, Bunoorwall, Swati, Ranizai, Osmankheli, Upper Mohmand.
Adjoining frontier of Peshawur and Kohat districts,—Afridi.
Adjoining frontier of Kohat district,—Buzoti, Sipah, Orakzai, Zaimusht Afghan, Turi.
Adjoining frontier of Kohat and Dehra Ismail Khan districts,—Waziri.
Adjoining frontier of Dehra Ismail Khan district,—Sheorani, Oshterani, Kasrani, Bozdar.
Adjoining frontier of Dehra Ghazi Khan district,—Khutran, Kosah, Lughari, Gurchani, Murri, Bugti, Muzari.

British Tribes within the frontier, and British subjects, inhabiting partly hills and partly plains—

Hazara district,—Turnouli, Gukkar, Doond and Sutti, Kaghan Syud, and other tribes of Hazara.
Peshawur district,—Yusufzai, Khaleel, Mohmand of the plains.
Peshawur and Kohat districts,—Khuttuk.
Kohat district,—Bungush.
Dehra Ismail Khan district, — Bunnoochi, Murwuti, Butani, chiefs of Tank, chiefs of Kolachi, chiefs of Dehra Ismail Khan, Nootkani, Loond.
Dehra Ghazi Khan district,—Dreshuk, Muzari.

The number of their fighting men has been estimated at about 170,000, which would represent a total population of one million. The fighting men of the principal tribes being—

Muzari,	2000	Kasrani,	1500	Mohmand,	16,000
Bugti,	1500	Ustrani,	900	Otman Khel,	5000

Laghari,	3700	Turi,	5000	Judun,	2500
Khosa,	4000	Zaimusht,	4500	Chigurzai,	?
Khutran,	4500	Orakzai,	29,500	Hussanzai,	1700
Bozdar,	2700	Kabal Khel, Afridi,	? 23,500	Akazai,	1000

The *Himalaya* on the north is the meeting ground of the Aryan and Turanian races, who in some places are curiously intermingled. In the extreme north-west are found the Dard, an Aryan race abutting on the Afghans on their west, and with the Balti, a Turanian race of Mahomedanized Tibetans, on the east. Here also are the Champa nomades who wander about the high level valleys of Rupshu, and likewise the Ladakhi cultivators in the valleys of Ladakh. The other Aryan races are the Pahari or mountaineers, the Kashmiri and the Dogra and Chibali who inhabit the outer hills.

The people occupying *Garhwal* and *Kamaon* are the Kanawari inhabitants of Bushahr, the Nilang, who do not differ from those of Hundes, and the inhabitants of the Bhotia Mahal of Kamaon and Garhwal, who are of mixed Tartar and Indian descent.

Farther to the east of these, the numerous valleys interspersed throughout the mountains of *Nepal* are occupied by various races. The features of the aboriginal tribes mark them as of Mongoloid origin. They are in the eastern part of the country. West of the Kali river the people are of Hindu origin. Proceeding from west to east, the following tribes occur in Nepal, Sikkim, and Bhutan, viz. the Tibetans or Cis-Himalayan Bhutia, the Sunwar, the pastoral Gurung, the Magar, the Jariya, the Newar, the Dhenwar, Manjhi, Bhutia, Bhaura, Murmi, Newar, Kiranti, Limbu, Lepcha who inhabit Sikkim, and the Bhutanese or Lhopa.

Assam and the north-east frontier province of British Burma have many tribes in their valleys and on their borders, some of them still barbarians. Assam province is bounded on the north by the Himalaya, the frontier tribes from west to east being successively the Bhutia, Aka, Dofla, Miri, Abor, and Mishmi. On the north-east the Mishmi hills sweep round the head of the valley. Along its southern borders are (from west to east) the Kuki or Lushai tribes, the state of Hill Tiperah, the Kom Naga, Angami Naga, Singpho, Shan, Khamti, and Kunoung, and the races in Munipur.

Between lat. 25° and 26° N. are tribes in the Garo, Khassya, and Jaintia hills, and in the valley are the Aham (128,980), Chandal (122,457), Chutia (51,482), Kaibartta (128,525), Koch or Rajbansi (300,000), and Kolita (179,000).

Other tribes occupy the Abar, Naga, Patkoi, and Barel ranges, as also the Chittagong and Arakan hill tracts, and the Yoma mountains separating British India from Independent Burma. These are the Shandoo, Khyen, Ka-mi, Khyn, Mri.

There are other and larger tribes of non-Hinduized aborigines interspersed amongst the civilised nations. In 1872, exclusive of those in the Madras Presidency and in the Feudatory States, they were estimated at 17,716,825.

Bengal,	11,116,883	Berar,	163,059
Assam,	1,490,888	Mysore,	89,067
N.W. Provinces,	377,674	Coorg,	42,516
Oudh,	90,490	British Burma,	1,004,991
Panjab,	959,720	Bombay,	711,702
Central Prov.,	1,669,835		

Nearly all that is known of their early history or origin has been derived from their physical appearance, which has proved them to belong to one or other of the great families of mankind. Mr. B. Hodgson writing from the Himalaya, and Mr. Logan writing from Penang, have laid great stress on this means of ascertaining their first appearance in India, in preference to the linguistic test.

Nearly sixty different tribes are specified among the aboriginal races in the provinces of Bengal and Assam. The most numerous of these are the *Santal*, of whom there are 850,000 in British territory alone, exclusive of others in the Tributary Mahals. The Santal dwell in villages in the jungles or among the mountains, apart from the people of the plains. They give their name to a large district, the Santal Parganas, 140 miles north-west of Calcutta.

The *Gond* are in numerous tribes, many of them semi-barbarous, others of them under rulers who claim a Rajput descent. They are partly under the Hyderabad Government, partly under the British in Chutia Nagpur, Berar, Orissa, and Ganjam, with 1,500,000 of them in the Central Provinces. The Maria Gond still use strong bamboo bows, which they hold with their feet and draw with their hands.

The *Bhumij* of Orissa, of Chutia Nagpur, and dispersed through various districts of Bengal,

numbering in all about 200,000, were known formerly as the Chuar, and distinguished for their martial habits.

The *Bhil* have no language of their own. They are scattered through a wide extent of country, from Dowlatabad in lat. 19° 57′ N. to Mewar in 25° 26′. They are careless, indifferent cultivators, are decidedly predatory, and have suffered severely from all the regular governments; but they are unyielding, and only in 1882 compelled the Mewar Government to give in to their wishes. There are few wilder or more lawless tracts throughout the length and breadth of the Indian Peninsula than the hilly region occupied by the Bhil. The natives of Bombay style them Kala-Puruj, or black men.

Similar observations might be made regarding the widely-dispersed Gujar race, extending from the Panjab to Gujerat, which takes its name from them; or the great Kol tribes of the Vindhyas; or the Koli of the northern parts of the Bombay Presidency; or the Meo, the Mhair, the Mina, the Ramusi, the Kollari, the Maravar, or the Baidara (Pindara). In the Animally Hills are a whole series of broken tribes. Hamlets of long-haired, wild-looking Puliar, who live on jungle products, mice, or any small animals they can catch, and worship demons; Mundaver, who shrink from contact with the outside world, and possess no fixed dwellings, but wander over the innermost hills with their cattle, sheltering themselves under little leaf sheds, and seldom remaining in one spot more than a year; thick-lipped, small-bodied Kaders, 'Lords of the Hills,' a remnant of a higher race, who file the front teeth of the upper jaw as a marriage ceremony, live by the chase, and wield some influence over the ruder forest folk.

Princes and Chiefs of India.—Around and within the borders of British India are many Native States,—feudatories, tributaries, or in subsidiary alliance; and France and Portugal have small possessions, aggregating 1264 square miles, with populations numbering 729,639 souls. The Native States are as under:—

Central India and Bundelkhand (1881 census, 9,200,881), area, 89,098 sq. m.; pop. 8,360,571—

	Sq. M.	Pop.

British Empire of India, its Empress and its Princes.—Since the year 1858, the position of Great Britain has been Imperial. The changes introduced in the government of British India on the suppression of the mutiny, altered the position of the native princes. Up till that time, many native states had affected an equality with the British Indian Government, as administered by the East India Company, and that assumption had even led to a war with Gwalior in 1843. But the mutiny swept away the last relics of the Dehli Empire, and with them the East India Company's rule, and the princes of India found themselves brought face to face with their sovereign, Queen Victoria. The maharaja of Patiala then sought for the recognition of himself and his house as an Indian noble of the British empire. Above all rewards for his great services to the empire in those days, he asked for perpetuity for his house and honours, and Sir John Lawrence, Lieutenant-Governor of the Panjab, worked out the chief's idea into a recognition of the right of adoption on the failure of natural heirs; and, after a reference to Her Majesty's Government, the following sunnud or patent of nobility, of 11th March 1862, was framed:—'Her Majesty being desirous that the governments of the several princes and chiefs of India, who now govern their own territories, should be perpetuated, and that the representation and dignity of their houses should be continued: In fulfilment of this desire, this sunnud is given to you, to convey to you the assurance that, on failure of natural heirs, the British Government will recognise and confirm any adoption of a successor made by yourself, or by any future chief of your state, that may be in accordance with Hindu law, and the customs of your race. Be assured that nothing shall disturb the engagement thus made to you, so long as your house is loyal to the crown, and faithful to the conditions of the treaties, grants, or engagements which record its obligations to the British Government. (Sd.) CANNING.'

The following is a list of princes to whom it has been given, but others have since been honoured with it, and all who hold that patent are nobles of the British Indian Empire:—

Ajeygurh, Raja, Bundelkhand.
Akulkote, Raja, S. Mahratta Country.
Alipoora, Jaghirdar, Bundelkhand.
Bansda, Chief, Kolhapur.
Banswarra, Chief, Rajputana.
Baonee, Nawab, Baonee.
Beejah, Chief, Panjab.
Behree, Jaghirdar, Bundelkhand.
Behut, Jaghirdar, Bundelkhand.
Belaspore, Chief, Panjab.
Benares, Raja, Benares.
Beronda, Raja, Bundelkhand.
Bhaghul, Chief, Panjab.
Bhopal, Begum, Bhopal.
Bhownaggar, Chief, Sholapur.
Bhughat, Chief, Panjab.
Bhujjee, Chief, Panjab.
Bhurtpur, Maharaja, Rajputana.
Bikanir, Maharaja, Rajputana.
Bijawur, Raja, Bundelkhand.
Bijna, Chief, Bundelkhand.
Boondee, Raja, Rajputana.
Bulsun, Chief, Panjab.
Bunganpully, Jaghirdar, Ceded Districts.
Bussahir, Chief, Panjab.
Bustar, Raja, Central Provinces.
8 Callinjer Chobeys, Bundelkhand.
Cambay, Nawab, Cambay.
Cashmir, Maharaja, Panjab.
Chumba, Chief, Panjab.
Chutterpore, Raja, Bundelkhand.
Cochin, Raja, Cochin.
Cooch-Bahar, Raja, Cooch-Bahar.
16 Chiefs Tributary Mahals, Orissa.
Dewas, Chief, Central India.
Dhar, Chief, Central India.
Dhami, Chief, Panjab.
Dholepore, Rana, Rajputana.
Dhoorwye, Chief, Bundelkhand.
Doojana, Nawab, Doojana.
Durkote, Chief, Panjab.
Dhurmpore, Chief, Kolhapur.
Doongurpore, Chief, Rajputana.
Dufflay, Jaghirdar, Satara.
Duttia, Raja, Bundelkhand.
Edur, Chief, Kolhapur.
Furreedkote, Raja, Panjab.
Gerowlee, Jaghirdar, Bundelkhand.
Ghurwal, Raja, N. W. Provinces.
Gourihar, Jaghirdar, Bundelkhand.
Gaekwar, Baroda.
Holkar, Central India.
5 Hasht Bhya Jaghirdars, Bundelkhand.
Hyderabad, Nizam, Hyderabad.
Jeypore, Maharaja, Rajputana.
Jheend, Raja, Panjab.
Jhallawar, Rana, Satara.
Jignee, Jaghirdar, Bundelkhand.
Joobul, Chief, Panjab.
Jodhpur, Chief, Rajputana.
Jusso, Jaghirdar, Bundelkhand.
Jeysulmir, Chief, Rajputana.
Karonde, Raja, Central Provinces.
Keonthul, Chief, Panjab.
Kerrowlee, Chief, Rajputana.
Kishengarh, Chief, Rajputana.
Khulsea, Chief, Panjab.
Kolhapur, Raja, Kolhapur.
Koomharsein, Chief, Panjab.
Koonhiar, Chief, Panjab.
Kotah, Chief, Rajputana.
Kothur, Chief, Panjab.
Kothee, Jaghirdar, Bundelkhand.
Kunnya Dhana, Jaghirdar, Bundelkhand.
Kuppoorthulla, Raja, Panjab.
Kutch, Chief, Gujerat.
Logassie, Jaghirdar, Bundelkhand.
Makraie, Chief, Central Provinces.
Moodhole, Chief, S. Mahratta Country.
Mundee, Chief, Panjab.
Mungal, Chief, Panjab.
Myhere, Chief, Bundelkhand.
Mylog, Chief, Panjab.
Nabha, Raja, Panjab.
Nagode, Chief, Bundelkhand.
Nahun, Chief, Panjab.
Nalagurh, Chief, Panjab.
Nimbalkur, Jaghirdar, Satara.
Nowanuggur, Chief, Kolhapur.
Nyagaon Behai, Jaghirdar, Bundelkhand.
Oodeypur, Maharaja, Rajputana.
Paharee, Chief, Bundelkhand.
Puducottah, Chief, Puducottah.
Punnah, Raja, Bundelkhand
Punt Prithee Nidhee, Satara.
Partabgurh, Raja, Rajputana.
5 Putwurdhuns, S. Mahratta Country.
Patiala, Maharaja, Panjab.
Rajpeepla, Chief Kolhapur.
Rewah, Raja, Bundelkhand.
Satara, Jaghirdars, Satara.
Sawantwari, Chief, Sawantwari.
Serohi, Chief, Rajputana.
Shahpura, Raja, N. W. Provinces.
Sindia, Central India.
Sohawul, Chief, Bundelkhand.
Sooket, Chief, Panjab.
Sundur, Chief, Bellary, in Ceded Districts.
Sumpthur, Raja, Bundelkhand.
Sirdar Shumsher Singh, Sindhanwallah, Panjab.
Sureela, Chief, Bundelkhand.
Tehree, Chief, Bundelkhand.
Tej Singh, Panjab.
Toree, Chief, Bundelkhand.
Travancore, Maharaja, Travancore.
Turoch, Chief, Panjab.
Ulwar, Chief, Rajputana.

The sunnud nobles alone constitute the patriciate of India; they govern a population and area larger than those of France and Belgium. Their troops far outnumber the British European and sepoy army; and their ordnance, even that part of it which is serviceable, is equal in number to the British. According to the *Times* newspaper of 29th July 1879, they have 5252 guns, with 314,625 soldiers, viz. artillerymen, 9390; cavalry, 64,172; and infantry, 241,063.

In 1881 the entire number of princes and chiefs of British India was 601, as under; but only about a fourth part of their number have the patent of hereditary nobility:—

ee. Assam, viz. Manipur.

The most powerful of these rulers are the nizam of Hyderabad, the maharajas Sindia, Jeypore, Travancore, Jummoo and Kashmir, Jodhpur, Holkar, Patiala, Oodeypur, Bhartpur, the Gaekwar of Baroda, and the Begum of Bhopal. Some of the princes and nobles are wealthy, as also are many of the great zamindars who hold lands on a permanent settlement, and keep up an almost regal state. Many of them freely aid in schemes for improvement.

Titles.—Asiatics are ceremonious in all the duties of life; they have been so from the most ancient times, and their rulers have likewise had the custom of displaying standards and of using crests or armorial symbols, such as the chank shell, the peacock, a palanquin, a lamp, a lion, a sunshade, an umbrella; these were not humble honours, the satrap of the Greeks being the Chatra-pati, lord of the umbrella. Queen Victoria marked the relative rank of the princes of India by an order in Council of the 26th June 1867, regulating the number of guns to be allowed in saluting them.

8 princes had 21 guns.	5 princes had 13 guns.
9 ,, ,, 19 ,,	31 ,, ,, 11 ,,
13 ,, ,, 17 ,,	11 ,, ,, 9 ,,
17 ,, ,, 15 ,,	

and seven nobles had personal salutes allowed of 13 to 21 guns.

Timur had ⁘ as his arms, supposed to represent the three regions over which he ruled. His full titles in the height of his power were Sultan, Kamran, Amir, Kutb-ud-Din, Timur, Kur Khan, Sahib-i-Kuran, meaning 'sovereign, ruler, noble, polar star of the faith; Timur, of the lineage of sovereign princes, lord of the grand conjunctions.' Amongst other titles, three of the emperor of China are, Tien-tsze, son of heaven; also Kwa-jen, the man who stands by himself, and Kwa Kuin, solitary prince. Anak-Agong, son of heaven, is a title of the raja of Lombok.

In 1808, Fattah Ali Shah, emperor of Persia, instituted the order of the Lion and Sun, Sher-o-Khurshid, to decorate foreign envoys who had rendered services to his government, and it is now given to Persian subjects. In the treaty of peace with Persia of 4th March 1857, the emperor is styled 'His Majesty, whose standard is the sun; the sacred, the august, the great monarch, the absolute king of kings of all the States of Persia.' At the same time, his ambassador, then at the court of France, was styled 'His Excellency, the abode of greatness, the favourite of the king; Firokh Khan, Amin-ul-Mulk, the great ambassador of the mighty State of Persia.'

In Mewar, the bala band, a head fillet, the diadem of the Greeks, is the symbol of honour; in Burma, the tsal-wee chain is a badge of nobility; in China, small globes, or buttons, as they are called, of mother-of-pearl and other substances, are used for distinction. In Burma the figure of a peacock and of a hare are painted on the king's throne, a peacock is borne on the royal standard, and Ne dwet bhu yeng, sun-descended monarch, is one of the Burmese royal titles.

The titular designations of the Mahomedan rulers of Southern Asia are almost all formed of Arabic words, with a few derived from the Persian; but in addressing the chiefs of British India, Arabic, Persian, Hindi, and English words are now all intermixed. Along the borders and within, the ordinary royal titles of Mahomedan princes are amir, khan, khakan, malik, malikah (feminine), mir, nazim, nizam, padshah, shah, shahinshah, sultan, bahādur, jung, khan, daulah, umra, jah, and nawab; royal Hindu titles being adiraja, jam, rae, raja, rao, rana, rawal, maharana, maharawal, rama-raja, siwai, thakur, wali, zamarin; and both Mahomedans and Hindus assume takhallus or literary titles.

The Indian Government addresses the Rajput ruler of Jummoo and Kashmir as 'His Highness Ranbir Singh Bahadur, Grand Commander of the Most Exalted Order of the Star of India, Companion of the Indian Empire, Sipar-i-Sultanat (Shield of the Sovereignty), Councillor of the Empress of India, Honorary General in the Imperial Army, Chief of Jummoo and Kashmir;' similarly Kalab-ali-Khan, the Mahomedan ruler of Rampur, is styled 'His Highness Farzand-i-Dil-Pazir-i-Daulat-i-Inglishia, Kalab Ali Khan, Nawab of Rampur, K.G.C.S.I. and C.I.E.,' the Persian words meaning Heart-loved Son of the British Government. The Governors-General have always followed it. In 1805 Sir George Barlow's seal was engraved with Persian words, signifying the cream of the princes, mighty in dignity, high in honour, exalted in position, the noble of nobles, Sir

George Hilaro Barlow, Baronet, Bahadur, Governor-General of the Countries under the Government of the English Company in India, Devoted Servant of the victorious Emperor Shah Alam Bahadur, 1805, year 1220 Hijri. The British Indian Government has now adopted the practice of the native princes in freely granting titles.

Administration. — In 1784, Mr. Pitt, while Prime Minister of Great Britain, brought in a bill to establish a Board of Control over the East India Company. It consisted of six members of the British ministry. It became known as the India Board, and the duties allotted to it were to check, superintend, and control all acts, operations, and concerns which in any way related to the civil and military government of the East India Company's territories; and a secret committee was at the same time authorized, consisting of the President of the Board of Control, with the chairman, or the deputy-chairman, or one of the East India Company's directors.

The directors of the Company consisted of twenty-four members, elected by the votes of the shareholders. The directors elected their own chairman and deputy-chairman, each of whom received a salary of £500 a year, the pay of each of the other directors being £300. Their patronage was great. Governors for India, commanders-in-chief, judges, and bishops were nominated by the British ministers, but the directors appointed all other covenanted and commissioned officers for the civil, military, medical, and naval services—and they averaged about 374 annually.

The mutiny of the Bengal army, and the rebellion in Northern India, was yet scarcely suppressed in 1858, when, on the 1st September of that year, the Court of Directors was abolished, and the government of British India was transferred from the East India Company to Queen Victoria, and a proclamation to the princes, chiefs, and people was made at Allahabad on the 1st November. A Secretary of State, a member of the British Cabinet, with a Council of fifteen members, took the directors' places. The Council is now appointed for ten years, but may be re-appointed for a further five years for special reasons. In 1861, the Indian Councils Act was passed, augmenting the Councillors by the addition of non-official members, the Governor-General was raised to the rank of Viceroy; and by another Act the supreme courts of Calcutta, Madras, and Bombay were amalgamated with the courts of Sadr Adalat of the three presidencies, and the united body designated the High Court of Judicature.

In the proclamation of 1858, Queen Victoria accepted all the treaties made by the East India Company, disclaimed all desire for extension of territory, or to impose the Christian religion on the people; the public service was declared open to all the Queen's subjects, of whatever race or creed; and royal clemency was extended to all, except such as had taken part in the murder of British subjects. In that proclamation, the British sovereign was designated,—Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, and of the colonies and dependencies thereof in Europe, Asia, Africa, America, and Australia, Queen, Defender of the Faith. And subsequent to this, on the 28th April 1876, Queen Victoria assumed the title of Indiæ Imperatrix, Empress of India, with the royal style and titles of Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, Defender of the Faith. Proclamation of this was made by the Viceroy on the 1st January 1877, in an imperial camp at Dehli, at which the princes of India were present. The maharajas Sindia of Gwalior and Ranbir Singh of Jummoo were raised to the rank of generals; and the orders of the Bath were bestowed on Sindia and the rajas of Bundi, Bhartpur, Benares, Kolhapur, Dhar, Drandra, the jam of Nawanagar, and the nawab of Banaganapilly. That part of the 1858 proclamation which related to employment in the public service was a repetition of 3 & 4 Will. IV. c. 85, sec. 87, which declared that no native of the said territories, nor any natural-born subject of His Majesty resident therein, shall, by reason only of his religion, place of birth, descent, colour, or any of them, be disabled from holding any place, office, or employment under the said Company.

The British administration in India was long purely that of a military government, and the entire policy necessarily conformed to military necessities. Only towards the middle of the 19th century has the condition of the country permitted its British rulers to throw the energy of the government into the path of peaceful development of its resources. The East India Company had governed the country on the simple terms of cheapness and non-intervention. But India has since taken its character from British rule, and has expressed a more positive policy than before. Great improvements in the laws have been made; more economical justice, more extended education, increased irrigation works, and larger appliances of European capital and energy to the undeveloped resources of the country. The prominent Secretaries of State for India have been Lord Stanley, Sir Charles Wood (Lord Halifax), Earl de Grey, Viscount Cranborne, Sir Stafford Northcote, Duke of Argyll, Marquis of Salisbury, Marquis of Hartington.

British India since 1860 has been subdivided into local administrations: Assam, Bengal, Bombay, British Burma, Central Provinces, Madras, N.W. Provinces and Oudh, Panjab. Berar is temporarily assigned. The Government of India has retained direct control over Ajmir, Berar, the Andaman islands, Nicobar islands, Coorg, the provinces of Central India and Bundelkhand, also over the political relations with Baroda, Hyderabad, Manipur, and Rajputana, and with the princes and tribes on the borders; all these are supervised by a Viceroy and Governor-General in Council. But the presidencies of Madras and Bombay, each with a Governor, Commander-in-chief, and a Council composed of officials, are in direct correspondence with the Secretary of State as well as under the Governor-General. Berar is administered for the nizam of Hyderabad. The provinces are administered by a covenanted civil service, an uncovenanted civil service, and military officers of the staff corps in civil employ. Each province is subdivided into zillahs or districts, under collector-magistrates or deputy collectors and commissioners, with joint, deputy, and assistant magistrates. In the Bengal Presidency, these districts are in most cases grouped into divisions, each under a commissioner, supervised by a revenue board or financial commissioner. In

Great Britain, counties average 1000 square miles in extent. In India, the total number of Districts is about 238. They vary greatly in size and number of inhabitants. The average area is 3778 square miles, ranging from 6612 square miles in Madras to 1999 square miles in Oudh. The average population is 802,927 souls, similarly ranging from 1,508,219 in Madras to 161,597 in Burma. In Bombay there are two revenue commissioners, between whom the superintendence of the collectorates are divided. These revenue commissioners correspond immediately with Government, and are also police commissioners of their divisions.

Madras, Bombay, and Bengal have each a Legislative Council, as well as a High Court of Judicature. These Councils, as well as the Legislative Council of the Governor-General, consist of executive members of Government, of two representatives of the British mercantile community, and two or three representatives of the natives, as extraordinary members. The United North-Western Provinces and Oudh have a High Court, and the Panjab a Chief Court. The Governor-General's Council for making laws, legislates for all India in general, and for the provinces which have no legislatures of their own, in detail, these provinces being represented by officials. Every Act of the three subordinate councils must receive the sanction of the Governor-General before it can become law; and the Secretary of State for India may advise Her Majesty to veto any act of the Governor-General's Council.

The following may be accepted as representing the portions of India governed directly by British officials, and those administered indirectly through native chiefs with subsidiary sovereign powers:—

British,	Sq. m. 902,500	Pop.	191,411,434
Feudatory,	,, 575,263	,,	49,096,627

With the increase of empire, the Governor-General's Council had become overburdened with details, and Lord William Bentinck, Sir Charles (Lord) Metcalfe, Lord Dalhousie, and Mr. Bayley had advised that there should be for all India, one Governor-General, one Supreme Executive Council, one Legislative Council, and one Commander-in-Chief, with four subordinate generals under lieutenant-governors, each with a council or board and four lieutenant-generals, and that details should be left to the local governments. These views, somewhat modified, are being gradually given effect to. In 1853 the Governor-General ceased to exercise any more direct supervision over Lower Bengal than over the rest of India. In 1874 Assam was separated from Bengal and made into a chief commissionership; and in 1877 Oudh and the N.W. Provinces were amalgamated, under a lieutenant-governor. In 1882 there is one Commander-in-Chief of all India, who specially attends to the Bengal army and European corps, with Commanders-in-Chief of the Madras and Bombay Presidencies, all of whom have seats in Council.

Every order issued from any of the secretariat departments of the supreme Government, runs in the name of the Governor-General in Council. Up to Lord Canning's administration, all matters were in truth so disposed of; but Lord Canning remodelled it into the semblance of a cabinet, with himself as president, and each member of the Government now holds a separate portfolio, and, with the permanent Government secretary, despatches the ordinary business connected with it on his own responsibility, only reserving matters of exceptional importance for the opinion of a colleague or the decision of the assembled Council. These bureaux, or secretariats, in 1882, comprise the military, financial, home, revenue, agricultural, and commerce.

The particular branch of administration which Lord Canning and succeeding Viceroys reserved for their own special charge, is the Foreign Office, the duties of which relate to all chiefs and princes in India, and all neighbouring foreign princes beyond the limits. With such nations as Persia and China, where there is a diplomatic representative of the British Government, the Governor-General acts in concert with the British Government.

Under the constabulary system introduced by Act 5 of 1861, each district has a superintendent of police, and the districts are grouped for police purposes into circles, under deputy inspectors-general, while the whole police force of each province is under an inspector-general. The constabulary, except on the North-Eastern and Trans-Indus frontiers, is a purely civil force, organized on the Irish system, and subject in all respects, except internal discipline, to the civil authorities, that is, to commissioners of divisions and deputy-commissioners, or collector-magistrates of districts. The districts are approximately as under:—

Provinces.	Square Miles.	Population.	No.
Bengal,	155,997	68,829,920	44
Assam,	45,303	4,815,157	13
N.W. Provinces,	81,748	32,699,436	37
Panjab,	107,010	22,647,542	32
Oudh,	24,213	11,407,625	12
Central Provinces,	84,208	11,505,149	19
Bombay and Sind,	126,445	23,325,053	24
Berar,	17,711	2,670,982	6
Coorg,	1,572	178,283	6
Madras,	140,333	30,839,181	21
British Burma,	87,220	3,707,646	19
Ajmir and Mairwara,	2,711	453,875	1
Total,	902,500	217,266,248	234

In 1880-81, the Administration cost in India, £1,291,483, which included the salaries of the Governor-General, Governors, Councillors, Secretaries, Political Officers, and Revenue Boards.

The more eminent of the presidents of the Board of Control were, Viscount Castlereagh, the Earl of Minto, Robert Dundas, afterwards Lord Melville, George Canning, Earl of Ellenborough, Charles Grant, Sir John Cam Hobhouse, and Sir Charles Wood, afterwards Lord Halifax.

The famed amongst Governors and Governors-General have been, Warren Hastings, Lord Clive, Earl Cornwallis, Marquis Wellesley, Marquis of Hastings, John Adam, Lord William Bentinck, Sir Charles (Lord) Metcalfe, Marquis of Dalhousie, Earl Canning, and Sir John (Lord) Lawrence.

Of the financial members of the Government of India may be named, James Wilson, Samuel Laing, W. N. Massey, and Sir Richard Temple.

The presidents of mark in the Council of the Government of Fort St. George, were Lord Macartney (1781); Major-General Medows (1788 and 1790) at Bombay and Madras; Lieutenant-General Harris (1798); Lord Bentinck (1803); and Major-General Sir Thomas Munro (1820). Bombay has seen Mountstuart Elphinstone (1819), Sir John

Malcolm (1827), Sir George Clarke, and Lord Elphinstone (1856). Robert Lord Clive (1758 and 1765) distinguished himself alike as a soldier and in civil administration as Governor of Bengal; and since 1854, when Bengal was put under a Lieutenant-Governor, the most eminent have been, Sir George Campbell (1871), Sir Richard Temple (1874), and Sir Ashley Eden (1877–1882).

There were six Lieutenant-Governors of the Panjab in the nineteen years 1859 to 1877, amongst them Sir John (Lord) Lawrence and Sir Robert Montgomery (1859–1865). Between 1856 and 1876 there were seventeen Chief Commissioners of Oudh; and the distinguished Sir James Outram, Sir Henry M. Lawrence, Mr. (Sir) Charles Wingfield, and Mr. (Sir) William Muir were amongst the number.

In the Central Provinces there were thirteen Chief Commissioners in eleven years, 1861–1872.

Amongst others of the officers who distinguished themselves in civil and political administration, may be named Sir Bartle Frere in Sind, Sir John Peter Grant, Sir Henry Pottinger in Sind and China, Sir Charles Edward Trevelyan, Sir Arthur Phayre in Burma, Sir George Balfour in the military finance and controul departments.

The appointments of governors, bishops, commanders-in-chief, judges, filled up by the British ministers, were highly paid, the Governor-General's salary being £25,000 annually, but did not carry any pension. It was customary, however, when pre-eminent services had been rendered, for the Directors to reward them in that manner. Amongst civilians who were thus honoured, may be named Warren Hastings, Marquis Wellesley, Marquis Dalhousie; and the following military officers had special pensions for distinguished Indian services:—

Nott, Sir William, G.C.B.,	£1000
Hardinge, Lt.-Gen. Viscount, G.C.B.,	5000
Gough, Lord, G.C.B.,	2000
Pollock, Major-Gen. Sir George, G.C.B.,	1000
Wilson, Major-Gen. Sir Archibald, Bart., K.C.B.,	1000
Campbell, Sir Colin, Lord Clyde,	2000
Outram, Major-Gen. Sir James, Bart., G.C.B.,	1000
Stewart, Gen. Sir Donald, G.C.B., C.I.E.,	1000
Roberts, Major-Gen. Sir F. Sleigh, G.C.B., V.C., C.I.E.,	1000

The East India Company was uniformly just and liberal-handed to its servants. The action of the British nation towards them has been fitful and uncertain. Lord Clive served the East India Company from 1744. He laid the territorial foundations of the British Indian empire, and returned to Britain in 1767. At first he was well received, but he was subsequently impeached before Parliament, and only escaped trial by his death in November 1774. Warren Hastings' service extended from 1750 till his final return to Britain in 1785. He, too, was well received by the King and Queen; but he, too, was impeached by Messrs. Burke, Fox, and Sheridan for alleged acts of oppression. The trial went on for seven years, and he was acquitted in February 1788. He lived till 1818. Shortly before his death he entered the House of Parliament to give evidence, and all the members rose from their seats to do honour to the aged man. Lord Clive had laid the territorial foundations of the British Indian empire in Bengal. Warren Hastings was the administrative organizer of the dominion, reorganized the Indian service, reformed every branch of the revenue collections, and created courts of justice. The Court of Directors allowed him £4000 a-year.

Army.—The native rulers who preceded the British, and all the existing chieftaincies, have had strongholds on which they placed reliance; and Clive's defence of Arcot, the Bhartpur resistance to Lord Lake, the Gurkha mountain campaign, Mulraj in his hold of Multan, all have indicated that the ways of the people are suitable for that mode of defensive warfare. The British, likewise, have formed fortresses at Calcutta, Madras, and Bombay; also strongholds at Dehli, Allahabad, and Secunderabad; and there are many dismantled forts in various parts of the country, all of which could be held against a sudden rush. But the British have hitherto largely trusted to their readiness to hold the open country. The composition and strength of the British Indian forces have, however, constantly been changed in organization and strength. From the first appearance of the British in India, their soldiers have consisted of European and native troops, the latter being wholly raised and maintained as a part of the Indian army. From 1754 till 1861, the European branch of the army of India has been composed partly of detachments of royal troops of Great Britain, and in part of Europeans specially raised for service in India as a part of the Indian army, both arms being maintained out of the revenues of India.

In 1755 the first British regiment, the 39th Foot, reached India. In 1794 the Indian armies numbered 70,000, including 13,500 Europeans. In 1808, at the end of the Mahratta war, Bengal and Madras had each 64,000, and Bombay 26,500; total, 154,500 soldiers. In 1844 there were 235,446 native soldiers. In 1857 a mutiny occurred of almost all the Bengal native army. At its outbreak, in May of that year, there were in India, as a nominal establishment—European soldiers, 45,000 of all ranks; sepoys, 244,000; semi-military police, 80,000. About 250,000 native troops arrayed themselves against the 45,000 British and about 60,000 native soldiery who stood firm. It was a contest for supremacy, and it was severe; but before the end of the year a Sikh army from the Panjab had increased the reliable native forces to 150,000, before July 1858 the British soldiers had been increased to 80,000 of all arms, and before the middle of 1859 India was re-won. After that revolt the established strength was made to stand at about 66,000 Europeans and 120,000 natives of all ranks; and the year 1879–80 saw the respective numbers at 64,520 and 124,978.

Artillery,	12,232	Europ.	902	Nat.
Cavalry,	4,429	,,	18,548	,,
Infantry,	47,519	,,	102,283	,,
Engineers and Sappers,	349	,,	3,245	,,

The armies of the princes and chiefs of India have always far exceeded those of the British, their numbers being about 300,000, fairly drilled and fairly disciplined.

The table given in the London *Times* of 29th July 1879 shows the strength of the forces kept up by the various princes of India, with the population and revenue of the states furnishing these contingents, viz.:—

States.	Population.	Revenue.	Cavalry.	Infry.	Guns.

In addition to the troops which the princes and chiefs retain for their own purposes, several of them subsidize parts of the British Indian army; and, in the year 1880–81, their tribute, chouth, contributions for the pay of local corps and succession fees amounted to £742,209.

It has been suggested that the troops of the princes should consist of their own subjects, restricted to the number required for their own territories, and that they should be kept at the highest state of discipline, and well armed, so as to be able to hold their own dominions against any foreign aggression, whilst the British attended to the general defence of India. Of the 7428 strength of the Hyderabad Contingent, more than half have been recruited in Hindustan. Nearly all the men in the Bhopal regiments belong to British territories; and recruits for the Nair Brigade are obtained from Tanjore, Madura, and Tinnevelly.

In 1882, the native non-commissioned officers, drummers, buglers, rank and file, serving in the British Indian army, had been drawn from the following provinces:—

Wars.—The Natives of British India have hitherto been largely employed in the British Indian armies, because they have been considered equal to any troops that could be brought against them, and because of their comparative cheapness, being healthier, and receiving smaller pay. The following are the annual costs of an artillery, cavalry, and infantry soldier of the native army:—

	Artillery.	Cavalry.	Infantry.
Bengal,	...	Rs.401·13·9	Rs.155·1·11
Madras,	...	512·10·0[2]	173·14·5[4]
Bombay,	Rs.165·5·8	473·13·5[3]	184·7·4[4]
Panjab,	169·5·4[1]	397·6·6	141·2·6
Hyderabad Contingent,	158·14·11	476·14·5	162·5·7
Central India,	...	371·13·1	137·2·8
Rajputana Agency,	...	385·10·10	140·9·2
Average yearly,	Rs.164·13·11	Rs.440·0·3	Rs.156·6·4
Monthly,	13·11·9	36·10·3	13·0·6

[1] Huts provided by the State.
[2] Clothing, accoutrements, hutting, horses, provided by the State.
[3] Good conduct pay, good shooting, not allowed to Bombay Native Cavalry.
[4] Do. including rations at Aden and Burma.

The military charges vary with the conditions of peace or war, but the following table of military expenditure of the three years before the mutiny and of the latest available years, will show the gross military charges during peace and war:—

	In India.	At Home.	Total.	
	£	£	£	
1854–55,	9,501,408	1,559,821	11,261,229	Peace.
1855–56,	10,019,436	1,672,757	11,492,193	
1856–57,	11,013,121	1,770,038	12,783,159	
1857–58,	15,569,925	3,165,958	18,735,883	Mutiny.
1858–59,	21,080,948	4,368,856	25,449,804	
1859–60,	20,909,307	2,730,994	23,640,301

1881–82,	14,644,800	4,085,100	18,730,000	

Difficulties are experienced in separating ordinary and war expenditure, but the total cost of the Afghan war of 1879–82 has been estimated at £21,611,000, namely, £17,551,000 for military operations, and £4,060,000 for frontier railways.

In their wars the East India Company had been almost continuously successful. A reverse was sustained by a brigade in Afghanistan in 1842, and many thousand soldiers and followers perished in retreat. But the most severe trial occurred in 1857 and 1858, in which years the Bengal native army revolted, and many of the Hindu and Mahomedan races rebelled. Much has been put forward as to the cause of that disaffection. In the beginning of 1857 the number of British soldiers had fallen very low. The British regiments withdrawn from India for the operations against Russia had not been replaced in India, and the recruits to maintain the full strengths of the regiments remaining in India had not been supplied, and it has been supposed that the disaffected soldiery of the Bengal army took that opportunity to revolt; but a general impression has been that it had its suggestion in the losses during the Afghanistan and Panjab wars, though doubtless a great change had been effected in the temper of a naturally arrogant oriental race, who respect, almost worship, might, by introducing amongst them rules and regulations suitable only for an army drawn from nations advanced in civilisation.

The contest for supremacy was severe and long continued. In May 1857 there were on the establishment in India—European soldiers, 45,000 of all ranks, furnishing about 36,000 rank and file; native army, 244,000; semi-military police, 80,000; and about 250,000 sepoys arrayed themselves against 45,000 Europeans and about 60,000 reliable native soldiery. The latter, before the end of 1857, were increased to about 150,000, by the addition of a Sikh army from the Panjab, and before July 1858 there were over 80,000 British soldiers in India. The successive features of the revolt and re-establishment of authority were as under:—

Revolt commenced at Barrackpur by the 19th Ben. N.I., 26th Feb. 1857.
Outbreak of the native cavalry at Meerut, 10th May 1857.
Dehli massacre occurred 11th May 1857.
At Ghazi-ud-Din Nuggur the mutineers were defeated on the 30th May 1857.
The Shahjahanpur massacre occurred 31st May 1857.
5th June 1857—Mutiny at Jhansi; on the 8th the massacre occurred.
Massacre at Cawnpur of the Futtehghur fugitives, 12th June 1857.
Massacre at Gwalior occurred 14th June 1857.
Massacre of the British at Cawnpur by Nana Rao, 27th June 1857.
Massacre at Cawnpur, 15th July 1857, by Nana Rao, of British women and children.
20th August 1857—Dehli recaptured.
Lucknow entered 25th August 1857, by Generals Havelock and Outram.
Dehli assaulted 14th Sept. 1857.
Lucknow relieved by General Havelock, 25th Sept. 1857.
The second relief of Lucknow effected by Sir Colin Campbell, 17th Nov. 1857.
Cawnpur relieved by Sir Colin Campbell, 28th Nov. 1857, and the Gwalior Contingent routed.
The battle of Nawabganj in Oudh, 14th June 1858.
Gwalior recaptured by Sir Hugh Rose, 28th June 1858.
10th April 1861—The Indian and British-European armies were amalgamated, and the native armies reorganized.

Since the suppression of the mutiny, the relative proportions of the European and native troops have been changed. The European and native forces in India were as under in the years—

	Europeans.	Natives.		Europeans.	Natives.
1839–40,	35,604	199,839	1858–59,	106,290	196,243
1842–43,	46,726	220,947	1865–66,	73,362	131,317
1856–57,	45,522	232,224	1881–82,	66,066	125,894

In 1857 there were on the establishment, or authorized strength, 6944 European and 8963 native artillery; 3136 European and 30,473 native cavalry. But since the revolt of the native army, the policy has been to augment the European arm, remove all native soldiers from the scientific corps, and reduce their numbers.

The composition and establishment of the Indian army in 1857, 1865, 1879–80, and 1881–82, were as under:—

	1857.		1865.		1879-80.		1881-82.	
	Eur.	Na.	Eur.	Na.	Eur.	Na.	Eur.	Na.

Total,	43,334	224,483	71,880	118,345	64,520	124,978	64,728	115,957

In 1796 the formation was tried of double battalions, and this continued till the early part of the 19th century.

In 1882 four cavalry and eighteen infantry regiments were reduced, and, excluding local corps, the establishment was fixed at 31 cavalry and 113 infantry regiments, with eight European officers to 550 natives of all ranks in the cavalry, and to 822 natives in the infantry.

Revenue.—Up to the year 1856 the increase of territory had been so continuous, that any comparing of the revenue, expenditure, and debt, of preceding with those of subsequent years, would be uninstructive, except as a matter of history. Since 1792–93, the Carnatic, the Ceded Districts, most of the Dekhan territory ruled over by the Peshwas, the greater part of the North-West Provinces, all the Panjab and Sind, the Central Provinces, part of Burma, Assam, Tenasserim, Orissa, Oudh, Satara, and other parts, have been added to British territory; and even since 1849, when the Panjab wars closed, about a hundred thousand square miles of territory have fallen to the paramount power, with a population of over seventeen millions.

It may, however, be interesting from a historical point of view, to contrast the conditions of 1792–3, 1868–9, and 1881–2.

Year.	Gross Revenue.	Gross Charges.
1792–3,	£8,225,628	£6,940,833
1868–9,	51,657,658	54,431,688
1881–2,	70,981,000	74,999,000

The following have been the amounts of revenues, charges, and debt since 1839–40:—

Year.	Total Receipts.	Total Charges in India & England.	Debt. Millions.
1839–40	£20,124,038	£22,228,011	29
1845–46	24,270,608	25,662,738	38
1849–50	27,522,344	26,960,988	45
1855–56	30,817,528	31,637,530	50
1858–59	...	...	...
1859–60	39,705,822	51,861,720	89
1860–61	...	...	94
1861–62	43,829,472	43,880,100	...
1862–63	45,143,752	45,143,752	96
1863–64	44,613,032	44,613,032	90

'66-7 (11 mo.)	42,122,433	44,639,924	93
1867–68	48,534,412	50,144,569	95
1868–69	49,262,691	53,407,334	96
1869–70	50,901,081	53,382,026	101

Amounts of revenues, charges, and debt since 1839–40, *continued*—

Year.	Total Receipts.	Total Charges in India & England.	Debt. Millions.
1870–71	£51,413,686	£49,930,696	104
1871–72	50,110,215	46,986,038	106
1872–73	50,219,489	48,453,817	105
1873–74	49,598,253	51,405,921	107
1874–75	50,570,171	50,250,974	118
1875–76	51,310,063	49,641,118	122
1876–77	55,995,785	58,178,563	127
1877–78	58,969,301	62,512,388	134
1878–79	65,199,602	63,165,356	137
1879–80	68,484,666	69,667,615	153
1880–81	...	...	157

The following will show that there have been great alterations in the Home Charges, owing to financial operations and changes in the rate of exchange:—

Year.	In India.	In Britain.	Year.	In India.	In Britain.
1839-40,	£19,649,045	£2,578,966	1869-70,	£42,791,013	£10,591,013
1845-46,	22,618,671	3,044,067	1875-76,	44,008,789	9,902,958
1849-50,	24,210,051	2,750,937	1879-80,	58,108,249	24,654,558
1855-56,	28,372,901	3,264,629	1880-81,	65,331,500	14,991,577
1859-60,	44,622,269	7,239,451	1881-82,	58,573,400	16,426,600
1865-66,	41,120,924	5,048,228			

Land Tenure.—During all ages, the rulers of India have regarded the land as the property of the state, and the bulk of the public revenues has ever been obtained from it. In 1856 it furnished more than one-half of the total revenues of the East India Company. In 1864–65, during which other taxes were levied, out of a total of £45,652,897, the large revenue of £20,087,728 was obtained from the land. In 1878–79, when the ordinary revenue amounted to £58,624,372, that from the land was £22,330,586. During the 18 years ending 1878–79, the ordinary revenue has been increasing, other branches of revenue having improved faster than that of the land. In that period the land ranged between £19,570,147 in 1862–63 and £22,330,586 in 1878–79, but the total revenue ranged between £43,829,472 in 1861–62 and 58,624,372 in 1878–79.

There are three great forms of tenure on which the land is held, viz. the zamindari, the pattadari, and the ryotwari. The last-named prevails in Madras and Bombay, but in the North-West Provinces and in the Saugor and Nerbadda territories, the zamindari and pattadari tenures exist co-extensively. In Madras and Bombay, therefore, there is a joint ownership of the ryot cultivator and the Government.

Under native rulers, a fixed proportion of the gross produce was taken; but the British Indian Government deals with the surplus or net produce which the estate may yield after deducting the expenses of cultivation; and the directions to the revenue settlement officers provide that at least one-third of this net produce shall always be left to the cultivator as his profit. The native powers usually took at least a half of the produce, and not infrequently more; the British rulers have reduced the charge to an average of about 5 per cent.

The late James Mill, writing on this part of the revenue, remarked: 'As far as this source goes, the people of the country remain untaxed. The wants of Government are supplied without any drain either upon the produce of any man's labour or the produce of any man's capital.' Except the British, under the administrations of Lord Cornwallis and Lord Canning, during whose governments were introduced systems of permanent

settlements of portions of the country and a right to purchase free holdings, every dynasty has kept this source of revenue intact. Grants of the royalties of the lands, in the form of jaghir, were usual; but the joint-proprietorship in the soil has remained in the hands of the communities and descendants of the individuals who cleared it a thousand years ago. Although Mahomedan dynasties have been ruling large portions of India for a thousand years, Mahomedans of Arab, Turk, or Moghul descent, have few lands. Converts to Mahomedanism from Indian races, and Pathan, Brahui, and Baluch tribes, retain their proprietory customs.

In Bengal, in 1793, Lord Cornwallis made a permanent settlement with zamindars, a class of middlemen whom he found collecting land revenues, by which these pay direct to Government a sum equal to a little more than one-half what they receive as rent. By that measure Government ceased to have any direct participation in the agricultural improvement of that part of the country. Statesmen have deemed that arrangement a grave error, which has lost to the State several millions of revenue yearly; and there is now much show of reason in the contention that the landowners might reasonably be called to contribute more largely than at present to the expenses of the State. The land is a source of revenue on which the State can, in all circumstances, confidently rely, and than which none is more easily collected or more willingly paid; and the most recent orders permit a redemption only for the land needed for dwelling-houses, factories, gardens, plantations, and similar restricted purposes.

About 1839, a thirty years' lease was made in the N.W. Provinces, and this has been followed in the Panjab. It is estimated that in this mode the assessment was about two-thirds of the surplus, after deducting the expenses of cultivation, profits of stock, and wages of labour; and in the revised settlements it was reduced to one-half the yearly value.

In the Madras Presidency the zamindari tenure exists in a few localities, but principally in the Northern Circars, since the settlement of 1802. Another system, that of village-renters, is in operation, in which the villagers stand in the place of the zamindar. In the Madras ryotwar system, the Government, as the joint landlord, treats direct with the holder, who is recognised as the proprietor so long as he pays the regulated assessment. He can sub-let, sell, transfer, or mortgage it. The assessment is fixed in money, and does not vary from year to year, unless when water is obtained from a Government source of irrigation. An annual settlement is made, not to reassess the land, but to determine upon how much of his holding the ryot shall pay.

In Bombay the ryotwar system prevails, but the assessment is open to revision every 30 years.

	Acres Assessed.		Incidence per Acre.
	1850.	1875-76.	On dry land
Madras,	9,750,000	20,000,000	4½d. and on irrigated land 5s.
Bombay,	12,500,000	20,300,000	

Where the occupants hold directly of the State, as in the Bombay and Madras Presidencies and parts of Upper India, the tenure is secure: tenants' improvements cannot be made the ground of enhancement, and the tenant can surrender the whole or any part of his holding at pleasure. Where, however, as in Bengal and the North-Western Provinces, a landlord class intervenes between the Government and the occupant of the soil, great uncertainty as to the tenants' rights prevails, and gross oppression is frequently practised. The attention of the Indian Government has been long directed to the subject. But though there are certainly not less than six million peasants in Bengal with small holdings, their troubles and grievances are borne with unbroken silence and in unquestioning submission to the law.

The North-Western Provinces and the Panjab have practically one land system. In that part of India, the village community has preserved its integrity more completely than elsewhere. Government therefore recognises the village, and not the zamindar's estate or the ryot's field.

Oudh, the Indian province most recently acquired, has a peculiar land system, arising out of its local history. The Oudh talukdars resemble English landlords more closely even than do the zamindars of Bengal.

How to provide revenue for legitimate State expenditure is a constant subject of thought to the rulers. The poverty of India makes it a country in which it is a matter of extreme difficulty to raise the necessary revenue. New taxes are not easily found, and they are accepted with great unwillingness. The country needs opening up by roads, railroads, and navigation canals; improvements of rivers and of channels, education and sanitation, are urgently needed; and to accomplish these, money has been obtained by loans. Up till the years of the mutiny, the public debt was usually about eighteen or twenty months of the amount of the gross revenue. Since the mutiny, the debt has been equal to twenty-five or twenty-six months' revenue:—

Year.	Gross Rev. £	Debt. £	Year.	Gross Rev. £	Debt. £
1812-13,	16,336,290	30,313,311	1871-72,	50,110,215	106,981,559
1820-21,	21,352,241	33,010,651	1872-73,	50,219,489	105,470,986

1869-70,	50,901,081	..	1879-80,	68,484,666	151,728,065
Excl. outlay on product. works.			1880-81,	72,559,978	..
1870-71,	51,413,686	104,437,274			

Of the amount raised for revenue, 24 millions in no sense represent taxation, being derived partly from opium, partly from the earnings of public works, and the rest from the gross receipts of departments, such as the post-office, which are on the whole an expense to the state. It in no case exceeds 7½ per cent. of the value of the gross produce; in Madras it is little over 6 per cent., and in the Panjab 5·6 per cent.; while in Bengal and the Central Provinces it sinks to less than 4 per cent. The other items of taxation bring up the total incidence to 4s. per head of the population. Dividing it into classes, and apportioning each tax among the classes who pay it, it may be said generally that the landed class pay, including land revenue, 5s. 6d. per head; the labourers pay 7d. per head on salt, or, assuming a family of three persons, 1s. 9d., equivalent to about four days' wages of a man and his wife. Artisans contribute 2s. apiece, or say the earnings of five working days; traders, 3s. 6d.

In 1878-79 the total gross revenue was £58,624,379.

Land revenue,	£22,330,586
Tributes and contributions from Native States,	703,660
Forest timber and products, also sawn, and miscellaneous,	605,433
Opium,	9,399,401
Services of law,	1,091,734
,, telegraph,	426,694
,, post-office,	911,806
,, railways,	10,822
Public works,	571,076
Canals, irrigation,	168,619
Other sources,	22,404,548

About £19,000,000 was raised by taxation, viz.:

Capitation tax in Burma,	£ ...
Assessed taxes,	900,920
Customs,	2,326,561
Excise on spirits and drugs,	2,619,349
Provincial rates,	2,638,835
Stamps (judicial),	3,110,540
Salt,	6,941,120

In that year the total incidence of taxation on the 200,000,000 of population was under 2s. per head; adding the land revenue, the total burden was about 4s. per head.

The salt revenue is entirely an impost of the British Indian Government, and the quantities and the duties were as under:—

Year.	Quantity. Maunds.	Duty. Rs.	Year.	Quantity. Maunds.	Duty. Rs.
1868-69,	22,733,359	5,46,40,640	1875-76,	25,742,236	5,88,99,582
1869-70,	22,646,384	5,71,50,030	1876-77,	25,457,359	5,99,44,050
1870-71,	23,030,790	5,92,98,280	1877-78,	24,715,214	6,20,10,253
1871-72,	22,783,285	5,73,50,150	1878-79,	25,436,794	6,52,45,882
1872-73,	23,673,343	5,91,59,526	1879-80,	27,318,743	6,92,48,600
1873-74,	23,564,703	5,88,87,627	1880-81,	27,240,489	6,73,50,664
1874-75,	23,972,620	5,91,96,694			

It is a tax which is recognised to press unequally on the means of the people, and there have been repeated modifications of it. In 1882-3, the salt duty was reduced to a uniform rate of Rs. 2 per maund everywhere except Burma and the Trans-Indus districts of the Panjab, where the existing lower rates are maintained. This involved a reduction of duty amounting to 30 per cent. in Bengal, and to 20 per cent. elsewhere. The loss of revenue was estimated at £1,423,000, but this has not been the result. The chief blot on Indian taxation is that it falls too heavily on the poor, and leaves many of the wealthy classes wholly untouched. A rich person, for instance, with a couple of millions in the funds, pays literally no taxation but an infinitesimal charge on the salt which his family consume.

The revenue from opium has been as under:—

Year.	Receipts.	Charges.	Year.	Receipts.	Charges.
1861-62,	£6,359,269	£1,449,465	1871-72,	£9,253,859	£1,596,646
1862-63,	8,056,476	1,856,278	1872-73,	8,684,691	1,814,268
1863-64,	6,331,999	2,306,493	1873-74,	8,324,879	2,001,280
1864-65,	7,361,405	2,376,981	1874-75,	8,556,629	2,341,546

The opium manufactured in British territory is a Government monopoly; but about an equal quantity is prepared in Native States, on which a heavy transit duty is levied. It produces a net sum of £6,000,000 to £7,000,000, which is raised without the smallest hardship, without the smallest suffering, without the smallest complaint from the people of India, and, indeed, is almost the only source of revenue which can be raised in India without inflicting some hardship and causing a great deal of discontent. It has been regarded by many persons in Britain as differing from spirits and other drugs, but there is no difference between them.

Languages.—The languages of British India have been investigated by many of the learned of Europe, and a fairly continuous series of inscriptions on rocks, on pillars, and on copper plates, enable us to trace back the Indian alphabets to the 3d century B.C. The Asoka inscriptions, 250 B.C., were in two characters. The northern variety, or Ariano-Pali, is recognised to be of Phœnician origin; the southern variety, or Indo-Pali, is believed by some scholars to be of western origin, others holding it to be an independent Indian alphabet; and an attempt has been made by General Cunningham to trace its letters back to an indigenous system of hieroglyphics in prehistoric India.

Arabic is the only one of the Semitic tongues to any extent used, and even that only in the Koran, as the sacred book of the Mahomedans. Sanskrit is known to all the learned Brahmans of India, and is the language of their sacred texts. Neither Arabic nor Sanskrit is vernacular. But the Sanskritoid tongues, Hindi, Urdu, Bengali, Cutchi, Gujerati, Konkani, Mahratti, have many infused Arabic and Persian words, and the Urdu has grown out of the union of all of these. The Hindi abounds in Sanskrit words, and has many dialects. The tongues spoken in the whole of Upper India, including the Panjab, from the Himalayan to the Vindhyan range, may be said to be Hindi, as also the languages of Kamaon and Garhwal, all along the sub-Himalayan range as far as the Gogra river; the impure dialect of the Gurkhas, the Brij-bhasa (or Baka, as it is pronounced on the Ganges), the Panjabi, Multani, Sindi, Jataki, Herati, Marwari, and, it is said, Konkani. The Bengali is a form of Hindi, but so highly polished as to be classed as a distinct tongue; and Baluchi and Pushtu have relations with the Sanskritoid tongues. At the close of the census of 1871, it was estimated that 41 millions were speaking Bengali, 4 millions Urya, 2 millions Assamese, 60 millions Hindi, and 40 millions (40,882,537) Urdu. These and their dialects comprise the languages of the Aryan stock.

Dr. Hunter (Imp. Gaz.) supposes the languages of the non-Aryan races to indicate that the earlier occupants of India belonged to three great stocks, which he designates the Tibeto-Burman, Kolarian, and Dravidian. He says of the *Tibeto-Burman* tribes, that in some prehistoric time they had dwelt in Central Asia, side by side with the fathers of the Mongolians and the Chinese; that they crossed over the Himalaya into India by the north-eastern passes, but have continued to cling to the skirts of the Himalaya and their north-eastern spurs; and several of the hill languages in Eastern Bengal still preserve Chinese and Mongolian terms. The Tibeto-Burman tongues prevail southwards through the Eastern Peninsula, till they become intermixed with the Mon Anam, and with the Siamese or Tai group, and finally meet the Malay races in the extreme south of the Eastern Peninsula. The Tibeto-Burman tribes have but little amalgamated, some of them being still in a semi-savage state. The known languages and dialects in use amongst them are

above a hundred, and only a few of them are written tongues. The principal are the Aka, Burmese, Cachari or Bodo, Dhimal, Garo, Gurung, Kanawari dialects, Khyeng, Kuki dialects, Lepcha, Manipuri, Mikir, Miri, Mishmi dialects, Murmi, Naga, Newar, Singpho, Tibetan or Bhuteah, Tipura or Mrung.

The *Kolarians*, another non-Aryan race, are scattered in the north-eastern parts of Central India, and in parts of its Western Peninsula. They also are supposed to have entered India through the north-east passes of the Himalaya. The Santal, the largest of the Kol tribes, dwell in the extreme eastern edge of the table-land, where it slopes down into the Gangetic valley; the Kurku, another Kolarian tribe, inhabit a patch of country about 400 miles to the west, and the Santal and Kurku dialects are almost the same. The Savara, once a great Kolarian nation, mentioned by Ptolemy, are now a broken tribe of woodcutters, dwelling in the forests of the northern part of the Eastern Ghats. Other tribes with dialects of the Kolarian group, are the Mundari, Ho or Larka Kol, the Bhumij, the Korwa, Kharria, the Juang, the Kuri, the Kurku, and the Mehto. These mark distinct and isolated tribes, which have never within historic times held any large portion of the country.

The chief *Dravidian* languages are the Tamil, Telugu, Canarese, Malealam, and Tulu, with several uncultivated dialects of the Tamil and Canarese, viz.: Kudaga or Coorg, Toda, Badaga, Kota, several Gond dialects, also the Kandh or Ku, the Uraon or Dhangar, and Rajmahali or Maler, the Yerakala?, Korawa?, Yenadi, and other broken tribes.

Neither the time of the incoming of the Dravidian tribes nor the routes which they followed, are known. They now occupy much of the northern part and lowland of Ceylon; and nearly all the Western Peninsula, several of them in great nationalities. Mr. Hislop and Dr. Caldwell suppose that they entered India through the N.W. passes, and that some Dravidian and Kolarian tribes converged and crossed each other in Central India, ultimately taking up the positions which the Kol and the Gond hold in the mountainous tracts there, —the great bodies of the Dravidians, however, swerving to the south of the Peninsula, and into Ceylon. Forty-eight millions of people speak Dravidian tongues.

The census of 1871 showed the people speaking Telugu to be 11,610,000 souls in the Madras Presidency, besides whom the south-eastern portions of Hyderabad, westwards to Beder and Dangapura, have Telugu as their vernacular; and Teling colonies are in Mysore, about three millions more.

Tamil is spoken in the Madras Presidency by 14,715,000, with colonies in Ceylon and the Straits, and in all the large cantonments of Mysore and Hyderabad.

The Canarese-speaking people of the Madras Presidency number 1,699,000; but the southern portion of the Bombay Presidency, 2,101,931, and the S.W. part of the Hyderabad Dominions, and most of Mysore, are Canarese, and their total number may be 5½ millions. The Imp. Gazetteer says 9 millions; which seems an over-estimate.

Malealam is spoken by 2,324,000 in the Madras Presidency, and by about 1,902,533 in the Travancore State.

The Tuluva people are ceasing to speak Tulu, only 29,000 now using it, and 640,000 speak the Uriya and hill languages.

How languages and dialects become intermixed even at the present day, is shown by the variety of tongues spoken in the N.W. corner of the Peninsula, forming part of the Bombay Presidency. Mahratti is spoken there by 7,751,497 persons; Gujerati by 3,103,311; Canarese by 2,101,931; Sindi by 2,051,726; Hindustani by 871,421; Baluchi by 149,519; Marwari by 141,229; and Brahui by 24,520. Other eastern languages are represented by 5418 persons speaking Arabic, 634 Bengali, 65 Burmese, 310 Chinese, 26 Kashmiri, 26 Kurgi, 325 Malealam, 2052 Negro dialects, 13 Nepali, 23,966 Panjabi, 8498 Pushtu, 4230 Persian, 45,541 Goanese, 2 Singhalese, 2 Uriya, 7830 Tamil, 110,237 Telugu, 595 Tulu, and 203 Turkish. European languages are represented by 26,340 English, 2 Danes, 3 Dutch, 145 French, 322 Germans, 58 Greeks, 80 Italians, 24 Maltese, 4005 Portuguese.

Mr. E. L. Brandreth, in vol. x. of the Royal Asiatic Society's Journal for 1877, gives the following list of the Non-Aryan languages in India:—

Dravidian.				Kolarian.
Tamil.	Gond dialects, viz.:			Santali.
Tamil, schen.	Maha-deo.	Gaeti.		Mundari.
Malealam.		Rutluk.		Ho or Larka Kol.
Telugu.	Raj.	Madi.		Bhumij.
Canarese.	Maria.			Korwa.
Badaga.	Khond or Ku.			Kharria.
Tulu.	Oraon or Dhangar.			Juang.
Kudaga or Coorg.	Rajmahal or Maler.			Kuri.
Toda.	*Miscellaneous:*			Kurku.
Kota.	Naikude.	Yerukala.		Mehto.
	Kolami.			Savara.
	Keikadi.	Gadaba.		

Tibeto-Burman.

i. Cachari or Bodo.
Mech.
Hojai.
Garo.
Pani Koch.
Deori Chutia.
Tipura or Mrung.

ii. Tibetan or Bhotia.
Sarpa.
Lhopa or Bhutani.
Changlo.
Twang.

iii. Gurung.
Murmi.
Thaksya.
Newar.
Pahri.
Magar.

iv. Lepcha.

v. Dophla.
Miri.
Abor.
Bhotia or Lo.

vi. Aka.

vii. Mishmi dialects.
Chulikata.
Taying or Digaru.
Mijhu.

viii. Dhimal.

ix. Kanawari dialects.
Milchan.
Tiberskad or Bunan.
Sumchu.

x. Kiranti, with 17 dialects, viz. Bahingya, Balali, Chhingtangya, Chourasya, Dumi, Dungmali, Khaling, Kulungya, Lambichhong, Lohorong, Nach-chereng, Rodong, Rung-Chenbung, Sangpang, Thulungya, Wa-ling, Yakha.

ii. Limbu.
Sunwar.
Bramu.
Chepang.
Vayn.
Kusanda.

xi. Naga dialects.
Namsang or Jaipuria.
Banpara or Joboka.
Mithan or Muthun.
Tablung.
Mulung.

xii. Naga dialects.
Khari.
Nougong.
Tengsa.
Lhoto.

xiii. Naga dialects.
Angami.
Rengma.
Arung.
Kutcha.
Liyang or Koreng.
Marām.

xiv. Mikir.

xv. Singpho or Ka Kyen-Jili.

xvi. Burmese; Mugh of Chittagong and Rukhong of Arakan.

xvii. Kuki dialects.		Khyeng.
	Thado.	Manipuri.
	Lushai.	Maring.
	Hallami.	Khoibu.

Arabic, Persian, and Urdu are written in modifications of the same character; Sanskrit, Hindi, Mahratti, similarly; but Gujerati, Bengali, Karnati or Canarese, Malealam, Tamil, Telugu, Tulu, and Uriya have each their own writing character; and since the early part of the 19th century, propositions have been made to substitute for them all the Roman printed and Italian cursive characters, but the suggestion has not been carried out. Sir Erskine Perry, about the middle of the century, successfully advocated the introduction of the Arabic numerals in the official documents of the Madras and Bombay Presidencies.

In summing up this part of the subject, it is necessary to mention that since the middle of the 19th century every educated native of India aspires to an acquaintance with the English; and the public examinations for scholastic and collegiate honours show a comparative neglect of their respective vernacular tongues.

Literature.—The literature of India has marked features. In the north, the Indo-Aryan or Sanskrit language and literature was developed by the Brahmans. To them the Hindus are indebted for their sacred Vedic books, with their Sanhitas, Brahmanas, Sutras, and Upanishads, and for the later Puranas. The Sanskrit writers produced works of great beauty in epic, dramatic, lyrical, and ethno-didactic poetry; from early times, the science of language, philosophy, and astronomy, were highly cultivated by them. Medicine seems to have been an independent development. They advanced the arts of music, painting, sculpture, and architecture. Law and religious worship received great attention; and six darsana or schools of philosophy grew up amongst them, and are still fully recognised.

During the 18th and 19th centuries, many of the learned of Europe and India engaged in the study of the Sanskrit writings; and Aufrecht, Ballantyne, Bhau-Daji, Buhler, Burnell, Burnouf, Colebrooke, Goldstücker, Haug, Kern, Lassen, Max Müller, Rajendra Lal, Roer, Rost, Roth, Schlegel, William Taylor, Weber, Westergaard, M. Williams, and H. H. Wilson have been prominent.

Until the middle of the 19th century, it was customary for Indian students of Sanskrit literature to commit the books to memory, and manuscripts older than the 11th century have not been found. The Vedic hymns detail the mythology and domestic customs of the East Aryans till their arrival in India. The Mahabharata, an epic by a Vyasa, describes a war between the Pandava and Kaurava branches of the Lunar race. Another epic, the Ramayana, by Valmiki, relates the exile of Rama, a Solar prince, and his expedition to the south to recover Sita, his wife, whom Ravana, a ruler of Ceylon, had carried off, and the recognition of his two sons, Kusa and Lava. The Puranas relate to modern Hinduism. The Vishnu Purana is supposed to have been written about A.D. 1045, and the date of the Bhagavat Purana is unsettled. Kalidasa, the author of the Raghuvansa, the Kumara Sambhawa, the Megha Duta, and Sakuntala, was the father of the erotic lyric. Jayadeva, author of the Gita Govinda; the astronomical works of Varaha Mihira, Brahmagupta, and Brahmacharya; and the writings of the physicians Charaka and Susruta, also of Panini the grammarian, B.C. 300; and the stories of the Vrihat Katha and the drama of the Toy Cart, the Mrichch'hakati, and Nala and Damayanti, are known to all Europe. The Hindi vernacular, says Dr. Hunter, owes its development into a written language partly to the folk-songs of the peasantry and the war ballads of the Rajput court bards, but chiefly to the literary requirements of the Vaishnava faith. The three best known sets of their religious treatises are the voluminous works ascribed to Kabir (A.D. 1380–1400) and his followers, preserved in the Kabir Chaura at Benares; also the Grant'h, or scriptures of various Bhagats or Vaishnava religious founders, especially of Dudu in Rajputana, and of Nanak and succeeding gurus of the Sikhs; and the Bhaktamala, or 'Garland of the Faithful,' compiled by Nabaji about the fifteenth century, and popularized by Narayan Das (1627–58), Krishna Das (1713). The Prem Sagar, one of the Vaishnava sacred love songs, relating the loves of Radha and Krishna, is prized throughout all Northern India. Chand, the Hindu court bard of Prithwi Raja of Dehli (1193), wrote the Prithwi Rāsan, a ballad chronicle, one of the earliest poems in Hindi.

But in the south of India the Tamil people, certainly from the earliest centuries of the Christian era, developed an independent literature. Some of their books, written by Pariahs, take a very high place in ethics, as the Tolkappayam; Kural of Tiruvalluvar, a Pariah; the five books of Auvaiyar, the Matron, also a Pariah; the Chintamini; and Nannul. The Rev. Dr. Bower says of Auvaiyar, 'She sang like Sappho; yet not of love, but of virtue.'

The literature of foreign countries has also ever been largely available. Aryans, and Semites, and Turks, and Moghuls, brought with them the writings of their own nations, and, while dominant, contributed largely to the literature of the country. The Arab, Moghul, Turk, and Persian were decidedly literary. Timur wrote his Institutes; the autobiography of Baber was written in Chaghtai Turki; Akbar spoke and wrote in Turki; and up to comparatively recent times, the Turk and Persian formed two distinct, often opposing, parties at Dehli. Sir Henry Elliot and Mr. Dowson's labours in writing a history of India, as told by its own historians, have made known many Arab authors. Persian, during the 18th and 19th centuries, was the court correspondence language of all Mahomedan and Hindu rulers; and since the latter years of the 18th century, the dominant British have given to India numerous works in English, and have made widely known the writings of preceding races. The scheme on which this Cyclopædia has been planned requires separate notices of the chief authors, and their names will therefore be found in their respective places, but Sir William Jones, Mountstuart Elphinstone, Sir Henry Pottinger, and Sir John Malcolm are recognised to have led the way to history and travels. The better known of the Asian writers have been as under:—

Abbas Khan, Sarwani.	Abu-l-Hasan.
Abdullah, Wassaf.	Abu-l-Kasim Hasan bin Ahmad, Ansari.
Abd-ur-Rahim.	Abu Rihan, al Biruni.
Abd-ur-Razzaq.	Abu Talib.
Abu-l-Fada.	Abu Zaid-ul-Hasan, Sirafi.
Abu-l-Fazl.

Politics,	7	8			

A few officers of the East India Company's service—Gilchrist and Roebuck for Urdu, Brown and Morris for Telugu, and Molesworth for Mahratti—have done much to purify the vernacular tongues. The Christian missionaries have prepared hundreds of works, suited both for schools and for general circulation, in the fifteen most prominent languages of India and in several of their dialects; they are the compilers of several dictionaries and grammars, and they have written important works on the native classics and the Hindu and Buddhist systems of philosophy. During the ten years from 1852, they issued 1,634,940 copies of the Scriptures, chiefly single, and 8,604,033 school-books and books for general circulation. During the ten years between 1862 and 1872, they issued 3410 new works in thirty languages, and circulated 1,315,503 copies of books of Scripture, 2,375,040 school-books, and 8,750,129 Christian books and tracts. In 1870-71 two valuable works were brought to completion, the revision of the Bengali Bible, and the first

BRITISH INDIA.

publication of the entire Bible in Sanskrit. Both these were the work of the Rev. Dr. Wenger of the Baptist Mission in Calcutta. (See Bible.)

In 1852 the scholars numbered 81,000, and in 1872 the number was 142,952. Between 1862 and 1872, 1621 students matriculated out of them, 513 passed the first examination in arts, 154 took the degree of B.A., 18 the degree of M.A., 6 that of B.L. Zanana schools and classes are maintained and instituted through missionary agency for the houses of Hindu gentlemen.

Religions.—The chief religions, represented in one part or other of British India, are eight in number:—

i. Judaism, with the Old Testament from Hebrew.
ii. Christianity, with the New Testament from Greek, and in most of the languages current in the East Indies.
iii. Mahomedanism, with the Koran in Arabic, Persian, Urdu, Tamil, Burmese.
iv. Buddhism, with the Tripitaka in Pali and Sanskrit.
v. Brahmanism, with the Vedas and Puranas in Sanskrit.
vi. Zoroastrianism, with portions of the Zendavesta.
vii. Confucius, ethics in 5 volumes or 'King' in Chinese, viz. Yi, Shu, Shi, Li-ki, and Chun-tsin King, and the four 'Shu' or books, some of which were written by Mang-tsze, the Mencius of European writers.
viii. Lao-tsze system, the Tau-te-Kang book of reason and virtue in Chinese.

The Jewish, the Christian, and the Mahomedan religions originated amongst the Semitic races. The Aryans produced the Brahmanical, Buddhist, and Parsee religions, with their sacred books. The (unchecked) census of 1881 returned as under the followers in British India of the several creeds:—

	Towns and Villages.	Hindus.	Sikhs.	Mahomedans.	Buddhists and Jains.	Christians.	Others and religion not known.	Total.
Bengal, . . .	177,042	38,975,418	...	19,553,831	84,974	90,763	1,797,911	60,502,897

The Jews on the western coast (7626) are of little social influence.

The *Parsees*, another small body (69,476), are chiefly in the Bombay Presidency. They follow the modified Zoroastrianism which their ancestors in Persia had formed. They are wealthy and enterprising, are largely engaged in foreign trade, and are taking their share in all municipal and civil duties; but they have never served in the Indian army, nor aided, in arms, any of the Indian rulers who have protected them, and they have hampered themselves with some Brahmanical restrictions. There are Jews of fair and others of black skins, showing that at some former time they made converts, but at present neither they nor the Parsees proselytize; and the same may be said of the Jains and of the Buddhists of India; but Sir J. E. Tennent describes as violent the polemical literature of the Buddhists of Ceylon.

The *Christians* of British India proper, at the last census, were found to be 897,682. They are chiefly numerous amongst the non-Aryan races, particularly in Southern India and in Burma,—533,760 being in the Madras Presidency, 126,063 in Bombay, 84,219 in Burma, and 25,676 in Mysore. In 1875, in Travancore there were 468,518 Christians; in Cochin, 140,417; in Puducottah, 11,360. Christians of the Romish sect in French territory number 33,544, and in Portuguese territory 245,318, which makes 1,038,940 Christians for British India and the Native States. Almost all the Christian sects have missionaries from the Mediterranean to China and the Archipelago, zealous propagandists. The Romish clergymen have been the more successful, though the effect of Dr. and Mrs. Mason's teaching amongst the Karen, and of Dr. Caldwell's amongst the Shanars, has been great. The Protestant missionaries have largely used their influence to promote secular education, and Hindus have widely taken advantage of the opportunities their schools have afforded, to acquire a knowledge of English; the Catholic missionaries from France and Italy having rather fostered the vernacular tongues.

The *Sikh* religionists, 1,174,435 in number, are almost exclusively in the Panjab. They had their origin in the semi-Hindu semi-Mahomedan teachings of Nanak. In the early part of the 19th century they were a compact body, and zealous. They were almost exclusively converts from amongst the Jat, who have largely colonized the Panjab and the Indus valley, and have spread eastwards into the N.W. Provinces. Under the maharaja Ranjit Singh, in the early part of the 19th century, they became a truly formidable sect. Nanak preached the abolition of caste, the unity of the Godhead, and the obligation of leading a pure life. From Nanak, ten gurus are traced down to Govind Singh in 1708, with whom the succession stopped.

The *Buddhists and Jains*, in the 1871 census returns, numbered 2,832,851, and of these 2,447,831 were in Burma. But Chinese from Yunnan are immigrating in great numbers into that part of India, and 3,251,589 was the number returned as dwelling there in 1881.

All the *Burmese* and most of the *Chinese* immigrants follow the teachings of Buddhism. The Tripitika, the sacred book of the Burmese Buddhists, is in Pali; but the Chinese have also brought

with them into Burma, a knowledge of the moral philosophies of Confucius, of Lao-tsze, and Mang-tsze, the Mencius of European writers.

The *Mahomedans* in 1881 numbered in India 40,867,125. They are partly descendants of immigrants from Arabia, and of invading and immigrating races from Persia and Central Asia; but the ancestors of the bulk of those in Bengal (and in 1881 these were near twenty millions [19,553,831], with 1,104,601 in Assam) are recognised to have been of a Mongoloid family whom the Mahomedan conquerors found in that region. Their sacred book, the Koran, has been translated into Persian, Urdu, Tamil, Burmese, and Malay, but it is chiefly read in the original Arabic, and their hadees or traditions have almost equal authority with the Koran.

The political animosity which resulted in the death of Ali and his two sons, continues to separate these religionists into the two great sects of Sunni and Shiah, who, even in British India, barely restrain their animosity. It is a feud of 1300 years. The small Mahdavi sect are fanatical. The Ismaili in India are commercially occupied, and the reforming sect, to whom the designation Wahabi has been given, are apt in their zeal to infuse political questions into their social life. They all distinguish their ethnic, or race, descent by the terms Syud, Shaikh, Pathan, and Moghul, as of Arab, Afghan, Persian, Moghul, and Turk origin respectively, and all the converts are classed as Shaikhs. The Syuds, descendants of Mahomed and Ali, are not numerous, and are quiet-mannered men, and mostly Sunni. Many of the Jat and some Rajput clans, during imperial Moghul sway, adopted the Musalman faith.

Hindu is a term ordinarily applied by Europeans to all the idol-worshippers of India, to all who are not Jews, Buddhists, Jains, Parsees, Christians, or Mahomedans. The people themselves restrict the term to their Sudra section, and distinguish by their caste names the higher caste Brahman, and the Rajput, Kshatriya, and the Seth, Chettiar, Banya, Vaisya, and servile races. The non-Aryan Pariahs and other similar races are never called Hindu. Hindus are eminently followers of some part or other of the religious or philosophical doctrines which the Brahmans teach regarding the chief deities and their incarnations, and to some extent are versed in the mythologic tales about Brahma, Vishnu, and Siva, one or other or all of whom, or their avatars or incarnations, Brahmans of the post-Vedic times have come to regard as supreme. But their worship is largely directed to the wives of the deities, to heroes whom they have deified, to plants, to animals, to sculptured images, to shapeless pieces of wood or stone; also to the sun and moon and planets; and everywhere and amongst all classes, to spirits and snakes, and to the weapons or implements of their avocations; and their theological imaginings are as varied as their gods. Brahma has few shrines,—it is said only one at Bithur; Siva is chiefly worshipped in the lingam emblem, and Vishnu in the form of one or other of the avatars in which he is believed by them to have appeared on earth to save mankind, or to punish arrogance and vice. Saraswati, goddess of learning, the wife of Brahma, has escaped the oblivion into which her spouse has fallen. But Siva and his consort Parvati, and Vishnu, with Lakshmi his spouse, claim as worshippers the bulk of those whom Europeans call Hindus. In 1881, Hindus were returned as 139,343,820 in British India; but there was another body, 5,746,673, whose religion at the time of the census was not ascertained.

Castes.—The numbers of Hindus and their higher civilisation have secured for them a recognised superiority over the non-Aryan aborigines, and over all fragmentary tribes. To these, Hindus apply the term m'hlecha, which has the same signification as Gentile had to the Jew, as Barbarian had to the Greek, and as E has to the Chinese. But the whole of the idol-worshippers, alike Aryan and non-Aryan, are separated from each other into a multitude of sections, who neither eat together nor intermarry, but dwell apart in different sections of their towns. These sections, known to Europeans as castes, are designated by the people, Varna, colours, or Jat or Zat, race. Their Varna and Zat names indicate differences in race, or place of birth, or nationality, or avocation, or even simply of the customs they follow. The number of such separate castes in Bengal alone is not short of a thousand. In Maharashtra Dr. Wilson enumerated 145 castes, 23 of whom were deemed unclean, and not permitted to dwell within the town walls. But, to Europeans, much of the action of the Hindus as to caste purity seems strange. Ghi is a food article in use with every Hindu, and it is carried in great leather bottles; yet the bottle-maker is one of the unclean artisans. Many, perhaps most, of the servile races are broken up nations and tribes whom wars and revolutions in prehistoric times have reduced to their present standing. To Europeans it might even seem impossible, under these conditions, for society to exist; but they are held together by an ordinance of Menu, their lawgiver, who laid down the rule that every man is pure in his respective trade.

Prominent amongst the Hindu castes are the *Brahmans*, though they, too, are separated into small sections by differences of religion, philosophy, and descent. Ages of intellectual culture have produced in them a race of recognised ability. For nearly 3000 years they have filled, under the reigning princes, all important executive and administrative offices. Once only, and that in modern times, they attained to dominion under the title of Peshwa; but their power lasted barely about sixty years, and was destroyed in 1761, by their complete defeat at Panipat.

The *Rajput* is generally accepted as representing the ancient martial Kshatriya. Clans of them hold villages in the N.W. Provinces and Oudh, where they were dominant till the 13th century; but they are still ruling in Rajputana and Gondwana, over aboriginal races, who instal their Rajput princes by making with their blood the tika mark of sovereignty.

The *Vaisya*, a third caste, are at the present day admitted to embrace all the Hindu sections who are engaged in trade; but their physical appearance indicates the most diversified origin.

Sudra, the fourth caste, includes all who are Hindus, other than the Brahman, the Kshatriya, and the Vaisya.

The *Jat* race, who followed and pushed the Rajputs farther into N.W. India, are eminently agricultural and pastoral; and, with the tall, robust Kat'hi, dominant in Kattyawar, are of a stock who still maintain many Scythic rites. There are two Jat sovereignties, Bhurtpur and Dholpur, and

several powerful Jat chiefs in the N.W. parts of India. The Jat in the N.W., the Tamil, Teling, and Canarese in the south, and the Karen on the frontiers of Burma, have given the most numerous converts to Hinduism, as nations.

All the Hinduized aborigines of the Kolarian and Dravidian stocks have been admitted into the *Sudra* section. The major part of the Canarese, the Mahratti, the Tamil, and the Telugu speaking races who are engaged in agricultural occupations, are of this division.

Castes.—It might be thought that one Brahman, or Banya, or Kshatriya family might eat or intermarry with any other Brahman, Banya, or Kshatriya household, or that any one Kunbi, or Kurmi, or Pariah, or Dher might eat with or obtain a wife from others of their own caste; but differences in their tribal or clan descent, or in their occupations, keep them apart. In the many languages current, the names of identical trades and avocations necessarily vary, and even that forms a sufficient reason to keep apart the people following them. The respective castes exercise strict supervision over their members. Fines and penances are imposed on parties who deviate from recognised rules,—even excluding them from their caste. In ancient times, neglect of religious rites seems to have been a reason for depriving a person of caste. Menu says (x. 43, 44) the following Kshatriya tribes have gradually sunk into the state of Vrishala, from the extinction of sacred rites, and from having no communication with Brahmans:—Paundraka, Odra, Dravida, Kamboja, Yavana, Saka, Parada, Pahlava, China, Kirata, Darada, Khasa. At the present day, the penalty of exclusion from caste is inflicted on Hindus who have sailed to Europe, notwithstanding that the mercantile Rajputs of Cutch have been trading for centuries on the east coast of Africa, and Hindus are met with westwards through Central Asia to Russia in Europe. Also, Java and Bali, in the Archipelago, were conquered by a Hindu dynasty, and Bali is still Hindu; the Teling and Tamil soldiery of the Madras Presidency, and the Sikh and Hindu soldiery of the Bengal army, have conquered in Burma, China, Persia, Aden, Egypt, and Abyssinia.

A peculiar feature of the Brahmanical supremacy has been the servile position which they have enforced on the non-Hinduized aboriginal tribes, few of whom have, or only partially, adopted Brahmanism. This is not confined to the semi-barbarous forest and mountain tribes, whose long seclusion has superinduced timidity in intercourse with their fellow-men; but outside the walls of every village throughout British India are families of the Pariah, the Dher, the Mahr, the Mhang, the Ramusi, the Koli, Chamar, the Bhil, the Dhor, the Bhur, the Dom, the Mhair, the Mina, who, since two or three thousand years, have been retained in feudal slavery, who have recognised in succession the Hindu, Buddhists, Mahomedans, and Christians as their masters, and have been doing all the servile work, but have nevertheless adhered to their own fetish forms of worship, uninfluenced by their masters' creeds. Many of them are intellectual. They are brave, truthful, docile, and gentle; but the religion of their village authorities has never commended itself to them. There are small, homeless, broken tribes wandering through the country, as the Bazigar, Doomar, Korawa, Kunjar, Nuth, Sansiah, Yerkala, of whom little is known. They almost all are predatory, and pitch their reed mat or grass huts in lone parts of the outskirts of towns.

Sacred Books.—Hindus arrange the whole of their sacred and learned works under eighteen heads, and speak of them as embracing eighteen kinds of knowledge, viz. the four Vedas, the four Upaveda, the six Anga, the four Upanga.

The *Vedas* of the ancient Aryans, styled the Rig, the Yajur, the Sama, and Atharva, are acknowledged by nearly all Hindu and Jaina sects. They consist of collections of hymns, containing a ritual, are in the Sanskrit language, and are supposed to have been composed about fifteen centuries B.C. The Sanhita of the Rig Veda is the earliest record of the eastern Aryans extant. The Sama Veda is a reproduction of parts of the Rig Veda. The Upanishads are books containing the doctrine of the Vedas explained and enlarged.

The *Puranas*, literally the old books, are eighteen in number, are of different ages, between the 8th or 9th and 14th or 15th centuries A.D. They likewise are written in the Sanskrit language, in simple sloka metre, and each treats of five subjects, viz. (1) the creation of the universe, (2) its progress and the renovation of worlds, (3) the genealogy of gods and heroes, (4) mythological chronology, and (5) heroic history, containing the achievements of demigods and heroes. They superseded the Vedas, and are the proper religious books of the modern Hindus; they are practically polytheistic, and yet essentially pantheistic.

The Hindu systems of *philosophy* are six in number. They grew out of the Upanishads, and are sometimes called the six Sastra, or bodies of learning, sometimes the Shad Darsana, or six Demonstrations. They are, (1) the Nyaya, founded by Gautama, which corresponds to the Peripatetic school; (2) the Vaishishika, by Kanada, corresponding to the Ionic; (3) the Sankhya of Kapila, corresponding to the Italic school; (4) the Yoga, founded by Patanjali, resembles the Stoic philosophy; (5) the Maimansa of Jaimini corresponds to the Platonic; (6) and the Vedanta of Vyasa or Badarayana, is likewise a Platonic philosophy.

Their philosophical speculations as to the nature of the soul and its relation to the Supreme, are derived mostly from three great apostles of the Vedantist schools, who flourished in Southern India, viz. Sankaracharya in the 9th century, his follower Anandagiri, author of the Sankara Vijaya; Ramanuja, a Vaishnava, in the 12th century, and Madhavacharya, a Saiva, a little later, in the 14th century; and their several views have separated them into believers in the Adwaita philosophy of Sankara, the Dwaita of Tirthachari, and the Viseshta-dwaita of Ramanuja.

Charvaka founded the materialistic school of the Hindus; he was the Pyrrho and Epicurus of India.

The Hindu mind, particularly in such as are of Aryan descent, is pre-eminently speculative, always ready to go after some new thing in the region of religion or philosophy. While the Arab, Turk, Moghul, and Persian races have been largely historical in their writings, the Hindu mind has revelled in myths, in poetry, and the drama. Their writings are clothed with images; much in them is beautiful and sublime, but so defective in all that relates to their history, that the dates even of their most famed events, the eras in which their celebrated personages have lived, cannot be

more than guessed at. When, and by whom, their great epics, the Mahabharata and Ramayana, or their sacred Vedas and Puranas, were written, has not been determined. The age in which Krishna lived is only surmised; and although he is now worshipped as an avatar of Vishnu, the date of his apotheosis is only supposed to have been about the 5th century of the Christian era. Neither as to the origin of the Saiva and Vaishnava cults have they any information on which the historian can definitely rely. Amos v. 26 gives more information about the era of Siva than all that the Hindu books contain.

What can be traced of the history of the country since the 8th century, discloses continuous religious movements amongst the people. Devout men, in all grades of Hindu society, have drawn followers around them, forming new sects of greater or less importance. The tendency of all of these has been to enjoin faith in the Supreme; and all the great leaders have founded their views on a belief in the brotherhood of man and the abolition of caste restrictions, but each in succession has become as exclusive as any of the Vaishnava sects from which they separated.

Modern Hindus barely recognise or even know several of the gods of the Vedic times. Indra, the Vedic god of the air and of the heavens, the king of the gods, compared with ancient times, is now seldom alluded to. Varuna, god of the waters, with Pavana, god of the wind, Kama, god of love, and Kartakeya, of war, are in similar neglect. Agni, god of fire, with Surya, the sun, Soma, the moon, Kuvera, god of wealth, and Yama, god of the infernal regions and judge of the dead, are better known. But the prominent deities in their invocations and worship are, Brahma the creating principle, Vishnu the preserving and Siva the destroying principles. Each of these has corresponding female divinities, who are mythologically regarded as their wives, but metaphysically as the active powers which develope the principle represented by each of these divinities. The names of these energies or sakta are respectively, Saraswati, the goddess of learning and eloquence, who continues to be invoked by the learned; Lakshmi, the goddess of plenty, who is worshipped in all households; and Parvati, who is largely worshipped, and is known also as Devi, Bhawani, and Durga. Ganesha is invoked at the commencement of all undertakings, as the remover of difficulties, and as such he presides over the entrances to all edifices.

Siva is entitled Eswara, lord, or Mahadeva, great god. He has many temples under various names, and his usual emblem relates to their physiological idea of the cosmogony.

Many of the deities now worshipped—Balaji, Kandoba, Vithoba—have been local deities in pre-Hindu times, whom the Brahman missionaries admitted into their mythology as incarnations of Vishnu and Siva.

There are many saiva sects:—

Aghori.
Akasmukhi.
Avadhuta.
Brahmachari.
Dandi and Dasnami.
Gudara.
Jangama.
Jogi or Yogi.
Kara Lingi.
Naga.
Nakhi.
Paramahansa.
Rukhara.
Sanyasi.
Sivachari or Sri-Saiva.
Sukhara.
Ukkara.
Urd'ha Bahu.

The more important of the vaishnava sects are:—

Charan-Dasi.
Dadu Panthi.
Harischandi.
Kabir-Panthi.
Khaki.
Mad'havi.
Madhavachari or Brahma Sampradayi.
Maluk Dasi.
Mira Bai.
Naga.
Radha-Vallabhi.
Ramanandi or Ramawat.
Ramanuja or Sri-Sampradaya or Sri-Vaishnava.
Raya-Dasi.
Sad'hna-Panthi.
Sak'hi-Bhava.
Sanyasi.
Sena-Panthi.
Vairagi.
Vaishnava or Veshnab of Bengal.
Vallabhachari or Rudra Sampradaya.

Sakta sects are:—

Dakshina or Bhakta.
Vami or Vamachari.
Kan Chuliya.
Karari.

The Tantras are the Sakta sacred books.

Reformers.—From time to time Hindu reformers have appeared, and at the present day Hindu missionaries are actively extending their faith amongst the forest tribes. The more noteworthy have been Kumarila Bhatta, about the middle of the eighth century, followed by his disciple Sankaracharya, the great apostle of Saivaism in the middle of the ninth century, and his historian Anandagiri; Jayadeva, author of the Gita Govinda, lived about the 12th century; Ramanuja, in the middle of the 12th century; his follower, Ramanand of Benares, about the end of the 14th century; Kabir, a follower of Ramanand, about the end of the 14th and beginning of the 15th centuries (1380–1420); Chaitanya, in the latter part of the 15th century; Valabhacharya, in the beginning of the 16th century.

The tendency of all Hindu reformers has been towards monotheism; and the Sad'h or Sad'hnami, the Siva Narayani, and the Brahmo Samaj'h have been the prominent and important theistic movements of the 19th century. The last originated with Dwarkanath Tagore, and was followed up by Keshab Chandra Sen. Separations early occurred amongst them, but they may be characterized as distinctively monotheists in belief, and philosophical rationalists.

Looking at the ordinary everyday life of the people, it may be said that all classes worship the Grama-devata or village gods, and Griha-devata or tutelary divinities; and demons, the cobra snake, the sun; the spirits of the dead are recognised by all,—spirits of their own ancestors, of other Asiatics and of Europeans, of British and French officers, and ladies of Great Britain, to all of whom sacrifices are made, with offerings of flowers or fruits, or alcoholic fluids. When a pestilence breaks out, the malignant deity whom the pestilence is believed to represent, is conveyed in a procession beyond the bounds of the village with music and banners. This is the Bolwan, and is often a cause of violent quarrel with the villages to which the pestilence has been conveyed.

Religious Mendicants.—Byragi, Gosain, Jogi, and Sanyasi amongst the Hindus, all the Buddhist priests and the Qalandar fakir amongst Mahomedans, are ascetic mendicants, as also are the Man Bhao friars and nuns, and some of the followers of Chaitanya.

Mother-worship is adhered to by all the non-Aryans of the south, in the form of the Ai of the Mahratta, and the Amma or Amman of the Tamil people. It is founded on the physiological idea of development from the female principle, which

they have incorporated into all their cosmogonies, and into their saiva religion. Barth, writing as to one form of mother-worship, says (p. 202) the Vedas have a cultus very similar to that of the Tisro Devi, or the three goddesses. In the Mahabharata they are the mothers of Skanda, the god of war, and appear in the inscriptions of the Chalukya and the Kadamba, and are up to 120 in number in different parts of the country.

Spirit and astral and mother worship, in one form or other, prevails amongst all the Aryan and non-Aryan races in India. With the non-Aryans, malignant demons, bhuta, vetala, pai or pisacha, preta, yaksha, vidyadhara, rakshasha, receive attention; with the Aryan Hindus, it is the manes of ancestors that are worshipped, are brought back to the house to be again released, and have offerings presented to them periodically.

Snake and sun worship are adhered to by all castes and classes professing Hinduism. That of the sun has been continued from Vedic times, is a daily duty, and with special rites at the summer and winter solstice and at the spring and autumn equinox; that of the cobra snake also daily and periodically.

Batho is the name of the chief deity of the Cachari or Bodo. He is represented by the Euphorbia plant, which is grown in the courtyard of every Cachari house. The Euphorbia is also worshipped by tribes in Orissa and in Chutia Nagpur. The Bengali people suppose the Euphorbia ligularia to be sacred to Manasa, the goddess of snakes, and it is worshipped on certain days of June to September.

The tulsi plant, Ocimum sanctum, is sacred to Vishnu; and a small plant of it, grown in every vaishnava courtyard, is worshipped every morning by the women of the house. The leaves and flowers of other trees are offered to their deities,—the Phyllanthus emblica, the Ægle marmelos, and others to Siva, the Ficus religiosa, Melia azadirachta, and others to Vishnu. It is also to Vishnu that the Salagram is sacred, and worshipped daily in every vaishnava home, although it is only an ordinary fossil ammonite from the Gandak river. Murmi of the Nepalese hold the Portax pictus (antelope) as sacred, Murmi being their name for that animal. The Santal believe that a wild goose from the great ocean alighted at Ahiri Pipri, and there laid two eggs, from which issued the two first parents of the Santal race. A heron is the emblem of the Baori tribe, and must not be eaten by them; and the dog also is sacred to them. The Oojla Bhil reverence a white ram, and will not eat any white animal. The Oraon tribes are named after plants and animals, and these are tabooed to the tribes bearing their names.

The *gurus*, or spiritual chiefs, may be men of any caste; indeed, Mira Bai, a woman, was a guru in the 16th century, Sahaji Bai in the 18th century, and the Karta-bhaja of Bengal had a female head. Tiru Valluvar, author of the Kural, was a Pariah. The Valluvar are the priests or pujari of the Pariahs. Auvaiyar, authoress of many ethical works, was a Pariah; Valmiki, author of the Ramayana, is said to have been a Koli; Vyasa, author of the Mahabharata and the Puranas, was the illegitimate child of a Brahman and a girl of the fisher caste; Sankaracharya, the great advocate of the Saiva doctrine, is said to have been of humble origin, but has come to be regarded as an incarnation of Siva. Kabir, also, is revered by his followers as an incarnation of the deity, who style him Jnanin, the seer, the one who has knowledge. He is supposed to have been a real personage, and to have lived about A.D. 1449. He left no writings, but his sayings have been preserved in verse, in which he opposes Hindu superstitions, ridicules the Shastras and Puranas, rejects caste and all idolatry, and demands moral purity.

A Hindu prays to avert evil. A Mahomedan prayer is a meditation on the power and majesty, the wisdom and the mercy of God; the Christian idea of a filial relation on the part of the worshipper to the Being whom he worships, which enables him to lay all his wants before God as before a father, is almost wanting in Islam. The religious services of the prayer ritual of the Mahomedans may be conducted in their mosques or in their homes. In India, the Wāz or sermon is rarely given.

A large part of the landed property of the country is in the hands of religious corporations, and the religious duty of feasting and giving alms to Brahmans is said to be at least as onerous a tax as the liability to tithe. One of the best-intentioned measures of the British Government was the transfer of the funds of Hindu and Mahomedan religious bodies from the exchequer of the state to the custody of trustees elected by the worshippers. This was about the middle of the 19th century; but nothing done by the Government is said to have been more profoundly unpopular. In native opinion, not only are endowments just, but the proper protector of them is the Government. Mr. Hunter even asserts that the deepest grievance of the Indian Musalmans was the compulsion put upon them to elect their own Kazi, or ecclesiastical registrar. They said that his appointment could only be validly made by the Government; and though it was true that the Government was of another faith, such a government was better for these purposes than none at all.

Much has been done by Christian missionaries of all denominations. Nothing is known of the martyred St. Thomas, whose supposed remains are shown in a cathedral in the Madras suburbs, nor is anything certain of the early days of the Cochin and Travancore Christians, who have Sassani or metal title-deeds of early centuries of this era; but the great St. Xavier effected much permanent good around the shores of these countries, and in later times, Dubois, Carey, Ward, Marshman, Rottler, Rhenius, Wilson, Duff, have continued his benevolent labours. The influences of Christianity, spiritual, educational, and social, have been felt far and wide. The downtrodden Shanar and Choga, and the despised Pariah and Pulliar, have been raised from their state of demoralization, while many of the objectionable practices that obtained among the higher castes have either entirely disappeared or been greatly mitigated.

Arts, Manufactures, and Trade.—The artisans of India have been famed from the earliest times for excellence in the decorative and ornamental arts. Sir George Birdwood believes that the secret of their continuous success lies in the fact that the arts of India are indissolubly bound up with the popular institutions of the country, and in the patience, perseverance, and

thoroughness of Indian handicraftsmen. Their skill in architecture, displayed in the grandeur of their designs, their fresco paintings, their work in metals for ornamental jewellery and domestic use, the beauty of their woven fabrics, both silken and mixed, as seen in their Kimkhab, Hemroo, and Mushroo, and the taste displayed in their arrangement of colours, have won the admiration of all nations. Notices of these will be found under their respective headings, and reference also may be made to the articles on architecture, armour, arts, Beder ware, Bombay work, brass, carving, carpets, colours, enamel, inlaying, jewellery, lace, sculpture, shawls, silk.

Since the advent of Europeans, with ways and habits different from orientals, and displacement of the wealthier princes, the high art of Indian workmen has suffered, while the yearly value of the trade in the raw and special products of the country, and in the cheaper manufactures of Europe, has increased. Western Asia and Northern Africa have traded with India from prehistoric times; the land routes have changed with the rise and fall of empires, but Povindah caravans still successfully fight their way from India through Central Asia. Since the early part of the 19th century, the sea-borne traffic has increased twenty-fold. Reference may be made to the headings cotton, gunny, hides, jute, leather, opium, pottery, silk.

The production of some of the articles of older trade—raw silk, shawls, sugar—has decreased; but the exports to foreign countries by land and sea have increased beyond the most sanguine expectations—in 1879-80 to the value of £67,212,363. These consist of wheat, rice, and other food-grains, oil-seeds, hides and skins, fibres of coir, cotton, jute, and wool, cinchona, coffee, tea, tobacco, and opium, with indigo and other vegetable dyes, and coal for internal consumption. On the other hand, importing to the value (1879–80) of £41,166,003, chiefly of manufactured articles. Of the exports, the value of the opium sent abroad was £14,324,146, and of raw cotton £11,145,453; while the imported cotton piece goods, twist, yarn, thread, etc., and of woollens, was valued at £19,669,053, £20,697,511.

The cramping effect of the sair or transit duties on traffic was early recognised, and in the early part of the 19th century they were entirely abolished, and a watch has been kept over the action of the municipalities, in their levy of octroi duties, to prevent the reintroduction of the sair in another form.

The growth which, of late years, has taken place in the foreign trade of India, is due in a large measure to the extension of railway communication. The quantity of merchandise, exclusive of minerals, conveyed by railways, increased from 2,633,687 tons in 1870, when the mileage was 4775, to 9,319,421 tons in 1880, when 9325 miles were open. In the same period, the value of exports increased from £55,336,186 to £74,517,957, and of imports from £34,469,119 to £50,278,875. Wheat and other raw products from the distant Panjab, a thousand miles from the sea, are successfully competing in Britain with the products of America. Coal is worked in Bengal by upwards of 60 collieries, the total output being not far short of 1,000,000 tons per annum. Dye-works, tanneries, soap-works, sugar refineries, silk-works, and paper mills are in operation; the Indian breweries turn out 2,000,000 gallons of beer every year. The success of cotton spinning and weaving mills in Bombay led to an extension of this industry in other parts of India, where there is an abundant population from whom to draw for labour, and who are also the consumers of the manufactured fabrics. The jute mills in Bengal have eclipsed the special industry of Dundee,—Dundee capital and Dundee skill having been transferred from the banks of the Tay to the banks of the Hoogly; and the trade in seeds and cereals in India is sufficient to take off any extra quantity of jute bagging that may be produced. Up to 1882 there had been 58 cotton mills established in India, for mule yarn, mule twist, cotton twist, twist and yarn (St. Tab. Br. Ind., 1882), 44 of them in the Bombay Presidency, where the enterprising Bhattia and Parsee have been the leading races in all mercantile transactions; six of the cotton mills are in Bengal, and three in Madras.

Nothing in the history of commercial progress is more healthy than the course of the trade of India, both foreign and coasting, since the mutiny of 1857. The foreign commerce—and it partly feeds the coasting trade—has more than doubled in value since 1855–1856. The figures show the annual averages for quinquennial periods of both merchandise and treasure:—

Years.	Imports.		Exports.

With the increasing imports and exports, the number and tonnage of the shipping engaged in the foreign trade has grown from 2189 vessels, aggregating 314,139 tons, entered and cleared in 1858–59, to 3083 ships of 555,220 tons in 1880–81. The size of the ships trading from Europe has been increased from 300 and 400 to 2000 and 3000 tons, but the trade to other foreign countries continues to be carried in small vessels, averaging 143 and 180 tons.

Seasons.—In India generally there are three well-marked seasons, the cold, the hot, and the rainy. The cold season of the year corresponds with that of all northern latitudes, and lasts from the middle of December to the middle or end of February; and although it is only in the N.W. Provinces of Bengal or on the Neilgherry hills in the S., and occasionally on the table-lands of Central India, that the thermometer sinks below the freezing point, the dry winds which then blow over the plains and elevated tracts, cause a sensation of great cold. It is in this season that the thermometer has the greatest daily range, varying from 19° to 39°.

The hot season commences in March. By May the heat is intense everywhere but on the mountains. The rivers dry up, and the earth is scorched and fissured by the great heat. The country seems a desert; all nature is hushed; it is the stillness of the winter of the poles. This is succeeded by a few sultry days in the end of May, the forerunner of the rains of the S.W. monsoon; in June and July this monsoon has carried the rains to almost every part of India, reaching the different provinces according to their proximity to the southern oceans, or to the direction given by the mountains to the winds. The face of the country then becomes green with its natural vegetation and the crops of the cultivators, the rivers are all full, and parts of the lowlands flooded, particularly in Bengal, where in several places the ryots go to their fields on rafts. This monsoon is ushered in with great electric changes, and prevails till the end of September, when it disappears with thunder and lightning as it came; the occurrence of these electric phenomena marking the breaking up of the monsoon. The fall of rain, while this monsoon lasts, varies from 12 to 250 inches in the different provinces, but it is distributed to a greater or less extent over almost all India, the only part deprived of it being the Karnatic, where, so far N. as Ongole, only slight showers fall in July. The hot weather consequently continues in the Karnatic from April until November, when the winds change to the N.E., and bring the rains of that monsoon across the Bay of Bengal.

The N.E. monsoon rains, however, only last for six weeks or two months, and do not extend so far inland as those from the S.W. Indeed, at places in the Western Peninsula within a hundred miles of its Eastern Ghats, it is marked only by the occurrence of heavy showers. At Madras, on the Coromandel coast, the annual fall of rain is about 50 inches.

Besides these, in Northern India a well-marked season of winter rain also occurs, commencing about Christmas and extending to February.

The period and the amount of rain differ greatly in the several provinces of India. The fall is very heavy on the tracts offering a front to the S.W. monsoon, as on the Western Ghats, and on the tract between them and the sea, being as much as 70 to 100 inches at the sea level, and as much as 250 inches on the mountain face. Similarly, along the Tenasserim, Pegu, and Arakan coasts, on the mountains of Assam, and along the foot and outer slopes of the Himalaya throughout its whole extent, reaching 100 inches or more.

The country may be classed generally into three regions,—the portion of India E. of the 80° meridian has a rainfall of more than 40 inches; the portion W. of the same meridian has less than 40 inches; and a third region, in which the fall

is less then 30 inches, includes almost the whole of the Panjab, a considerable part of the N.W. Provinces, a large part of Rajputana and Kattyawar, as well as almost the whole plateau of the Dekhan and Mysore. In Sind, and in the southern portion of the Panjab and most western part of Rajputana, the rainfall is less than 15 inches, and is extremely small and irregular, and the country is either actually desert, or agriculture is only possible with the aid of artificial irrigation.

Wars have aggravated distress; but all Indian famines are caused by drought, and the districts most subject to droughts are the western and southern portions of the N.W. Provinces and that part of the Panjab territory which lies east of the Sutlej, also the western and northern states of Rajputana and of the central plateau which border on the N.W. Provinces; likewise the districts of Bombay above the Western Ghats, the western region of Hyderabad, all Mysore, and the districts of Madras above the Eastern Ghats, and those along the E. coast and at the extremity of the Peninsula. The region whose total rainfall is from 20 to 35 inches has frequently suffered from severe scarcity, and within it have occurred the great famines of 1837-38 in the N.W. Provinces, of 1868-69 in Rajputana, and of 1876-77 over nearly the whole of the Peninsula of Southern India. These were mainly due to the failure of the S.W. monsoon. The drought of 1865-66 and some of the earlier scarcities in the Madras Presidency arose from failures of the rain of the N.E. monsoon on the east coast, a failure which in that year extended into Western Bengal.

How varied are the amounts falling at different places, will be seen from the following list:—

Kotri, ...	Inches 2	Bellary, . . .	Inches 22
Soopa, ...	,, 5	Secunderabad, .	,, 27
Multan, ...	,, 6	Honore, ...	,, 114
Sassur, ...	,, 6	Vingorla, . . .	,, 118
Indapore, ...	,, 7	Darjiling, . . .	,, 130
Sirsa, ...	,, 13	Akyab, ...	,, 219
Lahore, ...	,, 15	Mahabaleshwar, .	,, 254
Jhelum, ...	,, 17	Malcolmpet, . .	,, 262
Coimbatore, . . .	,, 21	Cherrapunji, . .	,, 524

In 1861 the rainfall at Cherrapunji was 805 inches, of which 366 fell in July; 559 and 615 inches also have been measured.

The main agricultural operations of the country correspond with the principal seasons of rain, and their relative importance is in a great degree dependent on the local distribution of the rainfall at the various seasons of the year. Where the natural rains have alone to be relied on, only one crop is obtainable; but with an abundant water supply from inundant channels or tanks, two or even three crops are had, the three harvests being spring (arit), asu or autumn, and paush or winter. The fluctuations of the total rainfall from year to year in all parts of the country are very considerable, and scarcely a year passes free from anxiety as to some part or other of India suffering from scarcity of food, or actual famine, caused by drought.

Famines.—However great may be the injuries from Indian rivers, the area affected by an inundation, though large according to European notions, is really insignificant compared with that ruined by an endless hot season. Even the tidal wave which swept over Sandip in 1876, and Saugor island in 1833, and again in 1864, filling the tanks with brackish water, and sweeping away human beings and cattle, with houses and chattels, in the space of three or four minutes, never produced such intense suffering or left such traces as the famines of Orissa, of the N.W. Provinces, and of the Madras Presidency. In Mysore the famine of 1876-77 is calculated to have caused a loss of population of 1,650,000, another estimate being 2,130,987.

Since 1769, with the exception of Burma, the most eastern parts of Bengal and Sind, hardly any part of India has escaped the visitation of severe famine, and over considerable portions acute distress has recurred frequently. Of 21 famines and scarcities recorded up to 1880 in any part of India, the proportion is 24 years of bad seasons to 85 years of good, or about two bad to seven good; in each case, on an average, one-twelfth of the population of the whole country—that is, about 20,000,000—may be approximately taken as the portion affected, so that the result might be said to be equivalent to a famine or scarcity over the whole country once in 54 years. Of these calamities eight may be classed as intense famines, nine as famines, and four as severe scarcities. Omitting severe scarcities, there have been 17 famines affecting 20 years, and occurring at an average interval of five years. Of the 8 greater famines, affecting 11 years, 5 have occurred in the 19th century, and have affected 202,000,000 of people, so that each on an average has been felt by 40,000,000, or one-sixth of the population of India. In Bengal, during the 110 years over which the records extend, four droughts only have occurred, of which two were very severe. Previous to the Orissa famine in 1866, Bengal had enjoyed complete immunity from famine for 81 years; and on this occasion, as well as in 1873-74, only the western parts of the province were affected. In the N.W. Provinces nine droughts are recorded, of which two were intense and three very serious. The two greatest famines in this part of the country, those of 1783 and 1837-8, were separated by an interval of 53 years; but there was a frequent and highly irregular occurrence of less important droughts. In Bombay nine seasons of drought appear, of which two were extreme; and in Madras there were eight such seasons, of which two were excessive. Excluding Bengal, the average interval between the several recorded droughts, great and small, in any one province, is about 11 to 12 years, and between those of the severest type about 50 years. The Government of India has to be prepared for the occurrence of scarcity, in some degree of severity, and in some part of the country, as often as two years out of every nine; and great famines may be anticipated at average intervals of twelve years. Seasons of drought do not occur simultaneously in Southern and Northern India, though some tendency is shown for a bad year in the north immediately to follow a bad year in the south. On the assumption that no famine is likely to be worse than that of 1876-8, which affected a population of 36,000,000, the Famine Commissioners were of opinion that the largest number likely to be severely affected by famine at one time may be put at 30,000,000, of which 15 per cent., or 4 millions, would probably be in receipt of relief in the worst months, and about seven or eight per cent., or from two to two and a half millions, continuously for the space of a year. It was considered by them that a loss of

harvest amounting to less than 50 per cent. of a full crop will not produce famine; but where the whole out-turn of the year is diminished to 25 per cent., it may be taken as certain that intense famine will prevail; whilst an estimated failure of even a third of the year's out-turn will always demand the utmost vigilance and preparedness on the part of the authorities, as relief measures may at any moment become necessary.

British India grows more grain food than the people require. The Famine Commissioners in their report state that the Madras Presidency, during the terrible visitation of 1876-78, was able to draw on the surpluses of Bengal to the extent of two million tons of food-grain, almost all rice, which was not an extension of a pre-existing trade, but the sudden creation of a new one. The same Commissioners estimated the aggregate surpluses of all the provinces, available in case of need for the supply of each other's deficiencies, and for foreign export, at five million tons in a year free from drought, a condition which rarely exists in all the provinces at once. The following is an estimate of the grains under culture:—

Provinces.	Percentage of Food-grain Area under—			Popn. eating Rice.
	Wheat or Barley.	Millet.	Rice.	Millions.
Panjab, . .	54	41	5	1
N.W. Provinces,	57	34	9	4
Bengal and Assam,	...	...	...	...
Central Provinces,	27	39	34	3
Berar, . .	17	82	1	...
Bombay, . .	7	83	10	2
Madras, . .	...	67	33	10
Mysore, . .	...	84	16	1

With augmenting means of intercommunication, it will daily become easier to deliver the food-grains used by man, but no amount of railway extension can possibly suffice to lay down in a famine district the forage needed by its cattle.

Political and Social Reforms.—Dr. Hunter has recorded the opinion that the modern history of the British in India, as benevolent administrators, may be said to begin with Lord William Bentinck. The inscription upon his statue at Calcutta, from the pen of Lord Macaulay, says: 'He abolished cruel rites; he effaced humiliating distinctions; he gave liberty to the expression of public opinion; his constant study was to elevate the intellectual and moral character of the nations committed to his charge.' His two most memorable acts are the abolition of sati, or widow-burning, and the suppression of the thugs.

Much has been done to promote civil and religious liberty. Up to 1882, about 1000 towns had been granted municipalities, a step towards self-government of the country generally. Liberty of conscience is assured to all classes. A Hindu can change his religion, and retain his property. A Hindu widow can re-marry. Courts of justice have been established, and appeals to the British throne permitted.

A code of criminal law has been introduced, and made applicable to all the people; and in civil law, the different races have had their own traditions applied to them.

In 1833, the British Government determined that a body of substantive law, criminal and civil, should be framed for India, and Mr. (afterwards Lord) Macaulay was appointed head of a commission for this purpose. A penal code was the first fruits of this. In 1853, a Legislative Council for all India was formed of Government officers; but in substitution of this, a supreme legislature was appointed in 1861 for all India, and from 1861 to 1871 a commission in London was engaged in preparing drafts of laws. Up to 1870 they submitted draft Acts for civil and criminal procedure; succession, contract; evidence acts, negotiable securities, and transfer of property bills. A law of limitation has been passed.

The Presidencies of Madras and Bombay, and the Lieutenant-Governorships of Bengal and of the North-Western Provinces, have each a High Court, supreme both in civil and criminal business, with an ultimate appeal to the Judicial Committee of the Privy Council in England. Of the minor provinces, the Panjab has a Chief Court, with three judges; the Central Provinces, Oudh and Mysore, have each a Judicial Commissioner, who sits alone; while in Assam and British Burma, the Chief Commissioner, or supreme executive officer, is also the highest judicial authority; and magistrates and judges, European and native, are in numbers in the districts, with Small Cause Courts in all the great towns.

The laws administered in the Indian courts consist mainly of the enactments of the Indian Legislative Councils (imperial and provincial), and of the bodies which preceded them; also statutes of the British Parliament which apply to India; likewise the Hindu and Mahomedan laws of inheritance, and their domestic law in causes affecting Hindus and Mahomedans; and the traditional customary law affecting particular castes and races.

The Hindu and Mahomedan codes of law are observed in all matters relating to marriage, inheritance, adoption, partition of property, testamentary disposition, management of religious institutions, and the like.

A system of police has been introduced throughout all British India, which has been largely imitated by Native States; and jails have been erected for criminals, in place of the mutilation, blindings, and other barbarous punishments. Hitherto, however, mortality in Indian jails has been far higher than that of the adult population.

Amongst the people, the annual death-rate has been 32·57 per 1000. In the native army, in 1877, it was 13·38 per 1000, and the mortality amongst the European troops was 12·71 per 1000, the lowest on record.

Prisoners.	1877.	1878.	1879.
Convicts, . . .	73	92	76
Under trial, . .	70	45	44
Civil, . . .	22	25	21
Total prisoners, . .	118,456	135,227	122,675

The police force in 1879 had 16,180 officers, and 126,189 men, armed in equal numbers with muskets or swords, or only batons.

The British have endeavoured to lighten the forms of the land tax, as they found it prevailing in the acquired provinces, and the ryotwari, the zamindari, and the village tenures now in force, have resulted from the changes made. The zamindari system resembles that of the estates of Great Britain. As before mentioned, it was introduced into Bengal by Lord Cornwallis in his Code of 1793; and by his permanently alienating districts for a rental far below the present value, there

has been lost to the general revenue millions yearly, while the cultivators have been rendered more dependent than in other parts of the dominion. How to remedy the error of 1793 is a constant thought to the rulers. Under Native rule, a simple order would have done it.

In the land laws enacted in 1859, the British Government have endeavoured to protect the cultivators of Bengal, by classing them into—

(1) Tenants since 1793, whose rents the zamindars could not augment;

(2) Tenants of twenty years' standing, whose rents also could not be increased;

(3) Tenants of twelve years' holding, to whom occupancy rights were granted;

And, in 1879, a commission sat for further inquiry, and the twelve years' tenancy was made into a joint proprietory.

Education.—The British Government has founded universities, with colleges, where classics, with the vernacular tongues, also the sciences, are taught. Under the princes of India, both Hindu and Mahomedan, the learned men had been training scholars, mostly private pupils, in all the branches of learning customary in the east, but there never had been more than one or two Mahomedan or Hindu collegiate institutions. Education has received a continuous attention from the British. Warren Hastings, in 1781, established in Calcutta a Madrassa for the Mahomedans; the Marquis Wellesley formed the College of Fort-William; and Lord Amherst, Sir Thomas Munro, and Lord William Bentinck aided in its advancement. In 1880 there were 71,435 colleges, technical, secondary, and primary schools, with 1,951,909 students. Of these institutions, 40,662 were aided by Government, and 14,286 unaided. The receipts were Rs. 1,62,07,138, and the expenditure Rs. 1,61,59,383.

The desire for education has been vastly stimulated by restricting admission into the employ of Government, to such as pass a successful examination. In Britain, any one may appear for the covenanted civil service or for a commissioned military appointment, but only those who attain the highest marks are accepted—about 16 per cent. Similarly, the great uncovenanted civil service of India is also open to all who are successful in a public examination; in all the services, age being the sole limit. In India, in the ten years 1871-1880, the results of the examinations in the lists of passed candidates were as under at the universities:—

	Passed.	1st Arts.	Arts M.A.	Law.	Medi.	Civil Eng.
Calcutta,	9842	2462	269	687	754	53
Madras,	7106	1553	12	88	37	18
Bombay,	2915	503	29	57	292	243

From the earliest arrival of Christian missionaries, especially in the south of India, parents of all creeds, Christian, Hindu, and Mahomedan, have sent children to their schools, though the education they impart is openly and avowedly founded on a Christian basis. Since the middle of the 19th century, universities, with medical, engineering, and other colleges, have been established at all the great centres of government, where the highest branches of western learning are taught; and by grants of money in aid of private efforts of missionary and educational bodies, the masses have been reached. In 1857 the pupils were 200,000. In 1877 they numbered 1,700,000. Museums have been founded at Madras, Calcutta, Bangalore, Allahabad, Bombay, Travancore, and Nagpur; libraries have been formed in many of the cities and towns; model farms have been opened to instruct in agriculture. Agri-horticultural and botanical societies are aiding in the introduction of economic plants. Great efforts have been made to gather and husband the water supply; to protect the trees by means of a forest department; to discover the causes of cattle murrain, through the agency of the veterinary officers; and a meteorological department has been established to aid in spreading information as to possible droughts.

The literature and history of the country during Buddhist, Hindu, and Mahomedan times, are being traced by the Asiatic societies, which were originated in India by the British in the 18th century. Liberal grants have been annually made for marine, topographical, and trigonometrical surveys, for cadastral field survey, for a geological survey, also for a meteorological department, and for geographical and archæological research.

It is amongst the non-Aryan races that Christian missionaries and Government officers have been most successful in their efforts to impart a higher civilisation. Xavier converted to Christianity many of the fisher races of the Indian and Malacca Peninsulas; Augustus Clevland, a civil servant, did good amongst the races of the jungle Terai of Rajmahal; General Sir James Outram, while yet a young officer, was able to make an impression amongst the Bhils; Colonel Dixon, amongst the Mhair race; the Rev. Dr. Mason and Mrs. Mason, among the Karen; and Bishop Caldwell, amongst the Maravar and Shanar.

In ancient times the Hindus had a really scientific acquaintance with the practice of therapeutics and surgery. They appear to have acquired their knowledge and skill from dissection and other methods similar to that of modern Europe; and it is to the rigid imposition of the shackles of caste, forbidding contact with dead or morbid matter, that the decline of this science is to be attributed. But since the early part of the 19th century, the Brahmanical races of Bengal have again taken to the study of medicine.

Private and official correspondence have been largely facilitated by the British. A letter under a tola (180 grains) is carried from one end of India to another for half an anna, equal to 0·75 of a penny. In 1871 the letters, etc., sent through the post-office were 85,689,823. In 1880 the number rose to 142,977,644; but above one-third of all the letters were registered. Improved postal services, with the introduction of telegraphic communication, the opening of roads, railroads, and canals, and the construction of bridges, have done much to extend the range of commerce, and of these the influence of railroads and the Suez Canal has been marked. The Suez Canal is 100 miles long, and ships of many thousand tons burden pass through it.

In 1857 there were 274 miles of railway open. In 1876 there were 6832 miles, and at the commencement of 1881 there were 9619 miles of railway open to traffic, and 646 under construction. During the year 1881, 318 were opened to traffic, and the commencement of 1482 miles was sanctioned. The total capital outlay on railways to the end of 1883 will be £138,937,000,

namely, £68,292,000 on guaranteed railways, £31,852,000 on state lines, and £38,793,000 on the East India Railway.

In 1857 there were 1,825,000 passengers by rail; in 1875, 26,779,000; and in 1880, 48,040,940½, besides season ticket holders. The Government have opened the great thoroughfares, the great trunk lines. They have secured a certain amount of communication between all parts of India; but there remain great tracts of country, some extremely rich in agricultural wealth, some rich in mineral wealth, which have not yet been opened up.

Irrigation.—Canals, inundation channels, dams, and wells, have been constructed both by former rulers and by the British, in order to obtain water for irrigation; and some of the ancient and modern works are on a gigantic scale. Of the cyclopean Ghorbasta builders of Baluchistan, nothing is known; but to have undertaken such gigantic works, they must have been pressed to the utmost. The lands adjoining these, as also the hillsides of the Himalayas, and of the islands in the Archipelago, are levelled and terraced for cultivation.

The Dravidian races of the Peninsula have formed multitudes of tanks. No view can better show the labours of this race, than is to be obtained from the top of a hill in the Karnatic at the close of the N.W. monsoon, when the whole country is seen studded with tanks. Bhandara is watered by the Waingunga, and noted for no less than 3648 tanks made by native engineers, who availed themselves of the dips and hollows of an undulating country, and constructed dams wherever the ground sloped. In the Mewar state in Rajputana, are several fine artificial lakes; that near Debar is 25 or 30 miles in circumference. At Hyderabad, the Husn Sagor tank is about 8 miles in circumference, and the Mir Alam tank has a small steam yacht. At Cumbum, a lake of 15 square miles has been formed by damming up the Gundlakamma river. The Chambrambakam tank supplies 10,000 acres of rice cultivation. In fourteen Madras districts there are 53,000 tanks, with about 30,000 miles of embankments. These are mostly the work of pre-British dynasties.

In the south of India, canals have been led from the Tumbudra; in the deltas of the Godavery, Kistna, and Pennar; the Palar in Chingleput and N. Arcot, the Vellar in South Arcot, the Colerun in the delta of the Cauvery, the last-named a monument of the skill of Colonels Sim and Sir Arthur Cotton.

The eastern and western Jumna canals are the oldest of the perennial canals of Northern India. They were constructed during the Moghul empire, but since 1819 the western canal has been somewhat improved by the British. The eastern Jumna canal in 1875 was 130 miles long, with 618 miles of main distributaries.

The Ganges canal was commenced by the British in 1848, and opened in 1854. Its principal head is about 2½ miles from Hardwar. In 1875 its length was 519 miles, with 3386 miles of distributaries, and with an irrigated area of 889,167 acres.

The Bari Doab canal has been led from the left bank of the river Ravi; it was commenced in 1850.

In the Dehra Doon and Rohilkhand there are five canals, 66 miles in aggregate length; and in Rohilkhand and Bijnaur are a series of badly constructed canals about 300 miles in length. The Sarkand canal leads from the Sutlej, the Agra canal from the Jumna, the Son canal from the Son, and the Orissa canals from the Mahanadi.

In Bundelkhand, canals have been led from the rivers Betwa and Dassan.

The Lower Sutlej and Chenab canals are 19 in number, and 418 miles in aggregate length. The four Upper Sutlej canals have 47 miles of length.

The Indus canals, 13 in number, have an aggregate length of 577 miles. They are all drawn from the right bank of the river in the Dehra Ghazi Khan district.

In the Shahpur district are 18 inundation canals.

In Sind are the Sakhar and Shahdadpur perennial canals, and 8 inundation canals, the Sind, Ghar, Eastern and Western Nara, Bigari, Mitran, Thar, Fallali.

On the Bombay side are the Jamda in Kandesh, the Krishna, and the Ahmadnagar canals.

Forests.—It had long been acknowledged by all writers that trees have a great influence on the humidity of a climate, but it was not until the middle of the 19th century that any regular care was taken of the forests of India. The subject was brought by the editor to the notice of the Madras Government, and the Directors of the E. I. Company ordered the appointment of conservators of forests, but Act vii. of 1865 was the first Forest Act passed by the Government of the country. The continuous denudation of extensive tracts in such fine districts as Midnapur, Bankura, Birbhum, and Bardwan, without any corresponding development of agriculture, is said to have perceptibly decreased the rainfall and the power of the soil to store water. The *forest* reserves in 1879–80 were 15,344 square miles, as under:—

British—			
Bengal,	Sq. m. 2945	Assam,	Sq. m. 2015
N.W. Provinces,	2200	Coorg,	200
Oudh,	1079	Ajmir,	101
Panjab,	795	*Non-British*—	
Central Provinces,	2535	Mysore,	454
British Burma,	1612	Berar,	1388

In the ten years 1871 to 1880 the forest revenues amounted to £5,949,099, and the charges to £4,114,927. With every year the object has more and more been rather to preserve and restore by replanting, than to profit by the sales. Indeed, the destruction has been so great in many places, that the state for many a year to come might expend all in replanting.

The *coffee* plant was not a gift of the British, though its cultivation has been much fostered. It is said to have been introduced into Mysore about the middle of the 17th century, by Bawa Budan, a Mahomedan fakir, and the cultivation extended into Ceylon, and, since the early part of the 19th century, largely into other parts of Mysore, Coorg, Travancore, and Cochin. In 1880 the number of plantations and plants and approximate yield were as under:—

District.	Plantations.	Plants.		Yield, lbs.
		Mature.	Immature.	
Bengal,	1	5	3	320
Madras,	18,315	63,026	10,561	18,513,138
Mysore,	24,843	...	...	4,004,656
Coorg,	4,685	39,750	7,500	7,603,120
Travancore,	119	14,360	2,415	2,515,716
Cochin,	15	1,436	487	463,828
Total,	47,978	162,847	35,482	33,100,778

Cotton has been cultivated in India from prehistoric times; but in the early part of the 19th century, in the Peninsula, much outlay was incurred in efforts to improve the quality. In 1879-80 there were 10,708,031 acres under cotton cultivation, yielding 5,181,550 lbs. of cleaned cotton, or an average of 59 lbs. of cleaned cotton per acre. In the Central Provinces and in Mysore the yield was only 24 and 25 lbs. respectively; but in the Nizam's dominions, the Panjab, and British Burma, 68, 90, and 147 lbs. respectively were obtained.

Tea.—The introduction of tea-planting is wholly a British gift to India. The tea plant was discovered about the year 1825 growing wild in Assam, and it is now largely cultivated in several parts of British India.

District.	Plantations.	Plants.		Yield, lbs.	Average yield in lbs. per acre of Mature Plants.
		Mature.	Immature.		
Assam, . .	1,045	120,512	33,145	34,013,583	282
Bengal, . .	274	27,341	11,464	6,572,481	239
N.W.Prov.,	87	6,848	1,238	838,743	292
Panjab, . .	1,195	4,816	2,780	802,995	167
Madras, .	84	2,573	1,702	649,460	252
Brit. Burma,	6	25	154	16,120	105
Total, .	2,691	162,244	50,354	42,893,796	...

Cinchona trees, another grand gift to India, were introduced in the middle of the 19th century (1860), by Mr. Clements Markham, C.B., who twice visited South America, and twice conveyed to India different species of cinchona, which he and his scientific assistants had obtained there. In 1880-81 the state of the plantations was as under:—

	Sikkim.	Burma.	Neilgherry.	Mysore.
Acres, . . .	2,332	...	847	51¼
Plants, Cuttings, and Seedlings,	5,207,870	64,438	677,355	42,860

The organic constituents of cinchona barks are quina, chinchona, aricina, quinidia, quinia, chinconidia, tannic acid, quinonic acid. The medicinal forms are quinine, quinidine, chinchonine; chinchonidine. Quinine is being steadily superseded in India by a chinchona febrifuge manufactured in the country. It is now in general use in Government hospitals, and enters largely into private practice. Only 3964 lbs. of quinine were imported in 1880–81, as against 7409 lbs. in 1879-80.

Sati.—The efforts of the British to suppress barbarities and crimes have been continuous and successful. Animal sacrifices have decreased; slavery everywhere abolished, and devil-worship largely discouraged.

According to the Abbé Dubois (p. 198), a sati was extremely rare in the south of the Peninsula. During the rule of the Brahman Peshwas, they were of not unfrequent occurrence in the Mahratta territories; and, so late as the year 1835, on the death of Kurun Singh, raja of Ahmadnagar, his widow was forcibly made a sati, at midnight, in defiance of all the exertions of the Political Officer, Mr. Erskine, backed by a small body of troops, who were fired upon and their officer wounded. But now, sati, the voluntary, or at times forcible, immolation of the Hindu widow, has ceased; only rare instances occur of the samadh, or burying alive of lepers or others with incurable diseases; self-immolation beneath the wheels of the Jaganath car are rare; the ghat murders, at one time so common amongst the Hindus, are almost unheard of. Until the middle of the 19th century, human sacrifices occurred amongst the Kandh and the Gond; and instances do still occur, from time to time, amongst the semi-barbarous tribes on the north-eastern frontier, and even amongst fanatic Hindus of the saiva sect, but the criminals are readily detected and punished; the charkh puja, or swinging festival, has been put down, thuggi has been rooted out, and dacoity is only heard of when scarcity prevails.

In the suppression of sati all the native princes have imitated the British.

In 1850 an Act was passed declaring that change of religion should not involve a loss of property or civil rights. In 1856 an Act legalized the re-marriage of Hindu widows. In 1870 (Act viii. 18th March), infanticide was declared criminal.

All through the 19th century the British have striven to prevent infanticide. The sacrifice of children at Saugor was prohibited on the 20th August 1802, and the poisoning of infant girls has been largely checked, though still practised. The relative numbers of the sexes returned in the census of 1871 varied greatly. Excluding Rajputana, which did not furnish a sex return, generally, throughout India, there was an excess of males, in a population of 241,535,698, of 5,094,956. Considerably more than half of this disproportion appears on the face of the returns of the North-Western Provinces and the Panjab. In the North-Western Provinces, females were less than the males by 1,382,000, in a population of about 32½ millions; and in Oudh, in a population of nearly 11½ millions, the females were returned less by 314,000.

In the British districts of the Bombay Presidency, with about 14 millions of inhabitants, the females were 351,000 in excess; but in Sind and the Native States, with a population of 7 millions, the females were 218,000 fewer than the males. In Bengal the females, in a population of nearly 69 millions, were about 380,000 in excess. In Assam, in a population of something over 4¾ millions, the females were less than the males by about 116,000. In Madras, with a population of nearly 31 millions, the females show a preponderance in numbers of 355,000. Several of the Rajput races have a disinclination to state the number of the female members of their families, and men are attracted to the great centres of trade, as to the presidency towns, or to new territories, as Assam or Burma; but infanticide and neglect of girls' healths are supposed to be the causes of these differences.

BRITTANT-PATTA. HIND. The record of a decision given by a panchayat.—*Elliot.*

BROA. HIND. Rhododendron arboreum.

BROACH, Bharuch, or Baroach, a populous commercial town on the right bank of the Nerbadda, 27 miles in direct distance from the bar. The Nerbadda is here two miles broad, and boats of 50 tons come up the channel. It gives its name to a district lying between lat. 21° 26′ and 22° 17′ N., and long. 72° 32′ and 73° 11′ E., with an area of 1458 sq. miles, and a population of 350,322 in 1872. The Hindus, 277,032 in number, are

divided into 142 distinct castes, and these again into numerous subdivisions, whose customs and modes of life are the same, but who are socially separate. The Mahomedans of the Borah (Vohara), Memon, and Khoja sects are numerous; and other converts from Hinduism are the Molislami (formerly Rajputs), Malik, Momina, and Shaikhdas, all but the Borah in a depressed condition. The cultivators are Borah, Koli, Kunbi, and Rajput; the last are a quiet agricultural race. The aboriginal races are Koli, Talāvia, Talwada, and Bhil. Baroach town has 36,932 inhabitants. It has a Panjrapol, or hospital for animals. From ancient times it has been an important commercial site, known in the first century of the Christian era as Barugaza, a name said to be from the sage Bhrigu, who founded it, and named it Bhrigupur. It has since been held by many dynasties, Rajput, Mahomedan, and, since November 1772, by the British. It was twice (1536, 1546) sacked by the Portuguese. Bombay has since attracted many of its people, and the Bhargao Brahmans claim descent from Bhrigu.—*Imp. Gaz.*

BROADBILL, birds of the genera psarisomus and serilophus and family eurylaimidæ.

BROCADE, Kimkhab.

Brokade, . . .	Dut.	Intalas; Kimxa,	Malay.
Brokal, ...	Ger.	Sandus, ...	,,
Luppa; Kimkhab,	Hind.	Parstcha, ...	Rus.
Broccalo, ...	It.	Brocado, ...	Sp.

A fabric composed of satin, striped or purpled with gold or silver, manufactured at Surat, Benares, and Ahmadabad. The looms are very simple in their construction. The gold and silver pass through many hands before they are formed into thread. Brocades (Kimkhab), gold-woven scarves (dopatta), and silks are consigned from Benares, together with a kind of yellow silk dhoti called pitambar, and a dark-blue silk with white spots called bund, also the silk sari or scarves, exclusively for women's wear, forming both a skirt and a scarf.—*Faulkner; M'Culloch; Taylor.*

BROCCOLI, a variety of the Brassica oleracea.

BROMELIACEÆ, the pine-apple tribe or bromel worts, a natural order of herbaceous plants, remarkable for the hardness and dryness of their foliage. The pine-apple, Ananas sativus, belongs to this; also the genera Bromelia, Billbergia, Pitcairnea, and Tillandsia.

BROMICOLLA ALEUTICA, a sea-weed of the Aleutian islands, used as food.

BRONONG. Malay. Baskets.

BRONZE.

Stuck-good, . . .	Dut.	Gangsa; gongsa,	Malay.
Stuckmetall, . .	Ger.	Metal de Canones, .	Sp.
Bronzo, ...	It.		

An alloy of copper and tin much employed in the arts. See Alloys.

BRONZE LEATHER. Kimsana, Hind.

BROOKE, Sir JAMES, raja of Sarawak, was born in 1803 at Benares. At the age of sixteen he received a commission in the Bengal Infantry, and served in the first war against Burma, where he was severely wounded at the storming of a stockade. He lost his appointment by overstaying his home leave. On the death of his father, he succeeded to a handsome patrimony, and on the 27th of October 1838 his yacht 'The Royalist' quitted England for Sarawak. He found its ruler, Muda Hasan, engaged in the suppression of a rebellion, but with a few volleys from the European guns the insurgents surrendered, and Mr. Brooke was duly installed in the rank of raja of Sarawak, previously promised to him. The newly-acquired territory was swampy, and ill cultivated by the native Dyaks, who varied their occupations as tillers of the land by head-hunting excursions among neighbouring villages. He declared head-hunting a crime punishable by death to the offender, and he suppressed it and piracy. On revisiting Britain, the British Government recognised his position, ordered a man-of-war to take him to the seat of his new settlement, gave him the title of Governor of Labuan, with a salary of £1500 a year, with an extra £500 a year as a consular agent, and afforded him the services of a deputy governor, also on a good salary. He compiled a code of laws, declared trade to be free, all roads to be open, all property inviolable, instituted a current coinage, and rigorously suppressed head-hunting, and marauding expeditions gradually became extinct in the province. He died in 1868.

BROOME, Colonel ARTHUR, an officer of the Bengal Artillery, author of History of the Rise and Progress of the Bengal Artillery.

BROOM GRASS, Aristida setacea, *Linn.*

BROOMS.

Scope, ...	It.	Chiparu, ...	Tel.
Metlu, ...	Rus.		

Articles for sweeping floors, walls, ceilings, etc. They get the name of broom, because first made in Europe from the small branches of the plant of that name. In India they are made of the strong grasses which abound. That in Southern India is the torapum pilloo, broom grass; but vullakamar, the erkoo, bamboo branches, the midrib of date and of cocoanut and of the Phœnix sylvestris leaves, are also used, as likewise are the Vitex negundo and Ferreola buxifolia.—*Ains. Mat. Med.* p. 145.

BROONGA MALAGUM. Tam. See Oil.

BRORI. Hind. Ulmus campestris.

BROSIMUM ALICASTRUM. Swz. The Jamaica bread-nut tree and the B. utile, *Endl.*, the cow tree of the Caraccas, were both introduced into the Calcutta Garden. They have a tenacious gummy milk.—*Voigt*, 29. See Cow Tree.

BROTHER.

Akh, ...	Arab.	Fratillo, ...	It.
Frère, ...	Fr.	Brādar, ...	Pers.
Bruder, ...	Ger.	Hermano, . . .	Sp.
Bhai, ...	Hind.	Tambi, ...	Tam.

In eastern countries, this term is applied to relatives not so designated in Europe, as to cousins, also to persons of the same faith, or town, or country, or avocation. These last are supplemented by a class of friends, styled munh-bola-bhai, 'so-called brothers,' common throughout British India. This eastern use of the designation brother has caused difficulties to readers of the Christian Bible. Jude in connection with James, though called (Matthew xiii. 55) the 'brethren of Jesus,' were really his cousins, it being common with the Jews to call the first cousins brethren. They were the sons of Mary, the sister of the mother of Jesus, the wife of Cleophas. In Brittany, at the present day, if two cousins-german be married, the son of one

of these cousins will address the other as 'ma tante,' my aunt; he is her neveu à la mode de Bretagne. Amongst all the Mongoloid people of Asia, the Dravida of Southern India, the nations of the Malay family, and among the aborigines of America, the descendants of a common ancestor, if they are of the same generation, give one another the name of brother and sister.—*Milner's Seven Churches of Asia*, p. 47; *Peschel.*

BROTHER-MAKING. With the ancient Greeks, two persons would vow to each other permanent hospitality and protection for themselves and their descendants,—the Greek ξεῖνος. It is the German Gast-freund. This is practised amongst the Bedouins, who take an oath before one or two witnesses. Amongst the Rajput races of India, the women adopt a brother by the gift of a bracelet. The intrinsic value of such pledge is never looked to, nor is it necessary that it should be costly, though it varies with the means and rank of the donor, and may be of flock silk and spangles, or of gold chains and gems. The acceptance of the pledge is by the katchli or corset, of simple silk, or satin, or gold brocade and pearls. Colonel Tod was the Rakhi-band-bhai of the three queens of Udaipur, Bundi, and Kotah, as also of Chand-Bai, the maiden sister of the Rana, and of many ladies of the chieftains of rank. Though the bracelet may be sent by maidens, it is only on occasions of urgent necessity and danger. The adopted brother may hazard his life in his adopted sister's cause, and yet never receive a mite in reward, for he cannot even see the fair object who, as brother of her adoption, has constituted him her defender.

Hindus take a vow of friendship and mutual support with certain forms, and even in a community little remarkable for faith, it is infamous to break this oath. Part of the ceremony is dividing a bel or wood-apple (Feronia elephantum), half of which is kept by each party, and from this the compact is called Bel Bandhar.

Amongst the Oraon girls, sworn friendships or sister-making occur, called 'Gui,' between two. They each say—'Tu aor main gui jurabi; amren phul lagabi.' Then each plucks flowers and arranges them neatly in the other's hair; they exchange necklaces, embrace, and give a joint feast. When two Karen wish to become brothers, one kills a fowl, cutting off its beak, and rubbing the blood on the front of the other's legs, sticking on them some of the feathers. The augury of the fowl's bones is then consulted, and if favourable, the ceremony is repeated by the other party. If the omens be still auspicious, they say, 'We will be brothers (doh), we will grow old together, we will visit each other.' Brotherhood amongst the Burmese is termed doh, also thway thouk, blood-drinker, because they mix a few drops of blood from the arms of the contracting parties with water, and drink it. The following forms were observed, near the eastern frontier of the Akyab district, on the occasion of the reconciliation of two clans or villages of the Chin (or Khyeng) tribe, named Bainbah and Mantin, between whom a blood-feud had previously existed. At the foot of a Nyoung Bin, supposed to be the residence of a 'Nat,' a pot of khoung was placed half-buried in the earth. In the orifice of the pot some fresh leaves of the tree were placed, and through them, into the liquor, were thrust two pipes to suck with, a gun, a spear, a dah, alligators' teeth, tigers' tusks, and some bamboo sticks with notches, cuts, and splits of a mystic character. This being ready, one of the oldest of the Toungmin (hill chief) present killed a small pig, extracted its heart, and, filling the pot with water, commenced a harangue invoking the 'Nat' to pour down his wrath on the two Mantin and Bainbah men sitting by the pot, and cause their destruction by any of the ways indicated by the different articles thrust into the pot, if they bore each other ill-will, and did not remain friends thenceforth and for ever. This invocation being over, the Mantin took up the pig's heart, and, pressing a drop of blood from it into the liquor, the two men exchanged words, and commenced sucking up the liquor, adding more water. After them, two other representatives of the two villages had a suck, and then the different implements, etc. were removed, and all the other Chins present began drinking (by suction) out of the same pot, and another one supplied for general use. Some war dances were performed, and the Chins then cooked the pig, ate, drank, and were merry. The khoung pots were filled with fermented rice, to which water was added as required. The oath thus administered is said to be most binding on Chins, and, once taken, seldom if ever violated. Bin is the Burmese for tree. Nyoung includes a large number of the ficus tribe. Nat is the Burmese word used to translate the Indian Deva. Originally it denotes a local divinity, often a Hamadryad. Khoung is a kind of rice-beer made and used by the hill tribes all over Burma.

Mr. Burns thus related the ceremony of brother-making among the Kyans:—Singuding sent on board to request me to become his brother according to Kyan fashion. The ceremony is called by the Kyans Ber-biang, by the Borneons Ber-sahibah. I landed with our nakodah, and, after some preliminary talk to allow the crowd to assemble, the affair commenced; we sat in the verandah of a long house, surrounded by some hundreds of men, women, and children, all looking eagerly at the white stranger who was about to enter their tribe. Stripping my left arm, Kum Lia took a small piece of wood, shaped like a knife blade, and, slightly piercing the skin, brought blood to the surface, which he carefully scraped off; then nakodah Gadore drew blood in the same way from Singuding's right arm, the one next me, and a small cigarette being produced, the blood on the wooden blades was spread on the tobacco,—scarcely spread, for the quantity was as small as could be imagined. A chief then rose, and, walking to a sort of window, looked full upon the river, and invoked the spirits of good and evil to be witness of this tie of brotherhood; the cigarette was then lighted, and each of us took several puffs, and the ceremony was over.

In Hindu marriages, one of the necessary forms is for the bridegroom to place the bride's foot successively on seven lines drawn on rice in a platter. From this has been adopted the practice of any two persons pledging mutual friendship by taking seven steps, Saptapathi, together; and the term Saptapathinam has come to signify friendship.—*Elphin.* p. 193; *Tod's Travels; Jour. Indian Archipelago*, v. No. 12; *Forbes*, 290. See Sabat.

BROTO. Beng. A vow; a self-imposed devotional exercise.

BROUGHTON, GABRIEL, surgeon of the ship Hopewell, in 1636 was able to obtain the cession of Balasore to the East India Company. In that year he cured the daughter of the Emperor of India, who had been burned by her clothes taking fire, and in 1640 he successfully treated a lady of the emperor's zenana. When asked to name his own reward, he replied that he wished nothing for himself, but begged that his countrymen might be allowed to have a maritime settlement in Bengal. Accordingly, in 1642, a land factory at Hugli, and a maritime settlement at Balasore, were formed. Balasore was at once fortified, and became the key to the position which the British have since acquired in India.—*Imp. Gaz.*

BROUGHTON, Lieut.-Col. T. D., author of Specimens of the Popular Poetry of the Hindoos.

Killia, . . . Celebes.	Gluga, ... Jav.
Che, ... Chin.	

This is a shrub or small tree, with soft, brittle, woolly branches, and large hairy rough leaves, either heart-shaped and undivided, or cut into deep irregular lobes. It is a native of the isles of the Southern Ocean, as well as of China and of Japan, but has been introduced into the Indian gardens. In Tahiti or Otaheite, and other islands, they make tapa cloth of its bark; and it is said that the finest and whitest cloth and mantles worn by the principal people at Otaheite and in the Sandwich Islands were made of the bark, and this when dyed red takes a good colour. For the purposes of making cloth it is not allowed to become higher than about 12 feet, and about one inch in diameter. The bark, taken off in as long strips as possible, is steeped in water, scraped with a chank shell, and then macerated. In this state it is placed on a log of wood, and beaten with a mallet, three sides of which have longitudinal grooves, and the fourth a plain surface. Two strips of tapa are always beaten into one, with the view of strengthening the fibres, an operation increasing the width of the cloth at the expense of its length. Most of the cloth worn is pure white, being bleached in the sun; but printed tapa is also, though not so frequently, seen, whilst that used for curtains is always coloured. The chief dye employed is the juice of Aleurites triloba.

In Japan, they are said to cultivate this plant much as osiers are cultivated in Europe. There, for paper, the young shoots, being cut down in December, after the leaves have fallen, are then cut into good long pieces, and are boiled until the separation of the bark displays the naked wood, from which it is then easily separable with the aid of a longitudinal incision. In order to make paper, dried bark is soaked for a few hours in water, after which the outer cuticle and the internal green layer are scraped off. The stronger and firmer pieces are separated from the youngest shoots, which are of inferior quality. The selected bark is boiled in a ley of wood-ashes till the fibres can be separated by a touch of the finger. The pulp so produced is then agitated in water till it resembles tufts of tow. If not sufficiently washed, the paper will be coarse, but strong; if too much boiled, it will be weaker, but white. It is then beaten on a table, with batons of hard wood, into a pulp. Mucilage obtained from boiled rice, or from a plant called oreni, is added to the pulp. These three are stirred with a clean reed till reduced into a homogeneous liquor, and when of a due consistence are ready for conversion into sheets of paper.—*Dr. Seeman, Viti; Voigt.*

BROWN BEAR, Ursus Isabellinus. The white bear, Ursus arctos; Syrian bear, U. Syriacus; Himalayan bear, U. Tibetanus; Japanese bear, U. Japonicus; Malayan bear, Ursus Malayanus; Sloth bear, Ursus labiatus.

BROWN BUG or Scaly Bug, Lecanium coffeæ.

BROWN HEMP, the commercial name given in Bombay to the fibres of the Hibiscus cannabinus. It is the Ambaree or Mesta-pat of Bengal, and the Palungoo of Madras, and is also known as Indian hemp and 'hemp.' See Ambaree.

BROWN JAWARI. Anglo-Hind. Sorghum vulgare, *var.*

BROWN RAT, Mus decumanus.

B'R PUKHTUN, the language of the Afghan people about Kābul, Kandahar, Shorawak, and Pishin. See Afghan; India; L'r Pukhtun.

BRUCE (JAMES), Author of Travels to Discover the Source of the Nile in 1768-73.

BRUCEA ANTIDYSENTERICA is considered by the Wooginoos of Abyssinia a most valuable remedy in dysentery and severe cases of diarrhœa. The false angustura bark was long supposed to be the produce of this Brucea, and its active principle was accordingly named Brucine. It is now, however, established that the false angustura bark is that of the Strychnos nux vomica, the Kuchila tree of Bengal.—*O'Sh.* p. 626.

BRUCEA SUMATRANA. *Roxb. Fl. I.* i. 449.

Genus amarissimus, *Lour.*

Ampadoo Barrowing, Mal. | Lussa Raja, . Amboyna.

A plant of Assam, Cochin-China, Sumatra, and Moluccas, and has been successfully grown in the Botanic Garden of Calcutta. The leaves are intensely bitter, and possess the same medicinal properties as the Brucea antidysenterica.—*Christison, Dispensatory; Don, Gardener's Dictionary; Engl. Cyc.* p. 671; *Voigt*, 185; *O'Sh.* p. 226.

BRUCHUS. Two species of this genus of insects attack the poppy seed when stored.

BRUCK, Commodore, Indian navy. His report on the Persian Gulf enumerates as articles of trade, —silk, dried fruits, gums, dates, horses, pearls, and spices, to the amount of 60 or 80 lakhs annually. In 1820 he commenced the survey of the Persian Gulf, followed by Captain Haines, I.N., and by Lieuts. Constable and Stiffe in 1860.

BRUGH. Hind. Echinops nivea.

BRUGPA. See Dalai Lama; Hung-Kiao; Tibet.

BRUGUIERA PARVIFLORA. *W. and A.*

Rhizophora parviflora, *R.* | R. cylindrica, *Roxb.*
Pyu, Soung, . . Burm. | Uravada, Varavada, Tel.

This mangrove grows in the Moluccas, Sumatra, Cochin-China, the Malay Islands, in both the Indian Peninsulas, the Khassya mountains, Nepal, Orissa, Jellasore. It has small green and scented flowers. Berries dye black.—*Voigt; Elliot, Fl. Andhrica.*

BRUGUIERA RHEEDII. *L'Herit.*

B. gymnorrhiza, *Lam.* | Rhizophora gymnorr., *L.*
Kankra, ... Beng. | Pyu, Soung, . . Burm.

This species of mangrove is abundant all along the eastern coast of the Bay of Bengal, and it furnishes a hard and durable yellowish timber. The tree is easily distinguished from its associates, for it drops no roots from its branches, but the trunk is divided into numerous roots for half its height, like a small bamboo pavilion. It grows in Cochin-China, the Moluccas, Java, Tenasserim, Penang, the Sunderbuns, and in Malabar. Burmese apply the names Pyu and Soung to B. Rheedii, B. eriopetala, and R. parviflora.—*Mason; Voigt*, 41.

BRUH of Sumatra, species of Macacus, Bruh putik, Bruh sepotong, and Bruh-selapi, are Macacus nemestrinus, *Linn.*

BRUM BRUM. HIND. Hedera helix.

BRUMER ISLAND. The mode of salutation or expression of friendship amongst these islanders consists in first touching the nose with the fore-finger and thumb of one hand, and then pinching the skin on each side of the navel with the other, calling out at the same time, Magásúga! This habit resembles on one hand that of rubbing noses, so general in Polynesia, and, on the other, the custom of pinching the navel and repeating the name for that part, practised by the islanders of Torres Strait.—*Macgillivray's Voyage*, i. p. 258.

BRUMIJ. HIND. Celtis Caucasica, Echinops nivæa.

BRUMO or Dumo. TIBET. The yak cow.

BRUNEI, the capital of Borneo, and the seat of government. Its houses are built on piles in the river, and its population 20,000 souls. Communication by boats.

BRUSH KANGAROO is Macropus cœruleus. The tail and loins are the best for food.

BRUSH TURKEYS of Australia, the Talegalla Lathami, are of the Megapodidæ family, all of which hatch their eggs by the natural heat arising in a mound about 4 feet high, which they construct of vegetable materials, earth and sand. The male bird closely watches the temperature of the mound. The young bird leaves the nest on the second day, and on the third day can fly strongly.

BRYACEÆ, the moss tribe of plants, comprising many Indian genera, calymperes, dicranum, didymodon, grimmia, gymnostomum, orthodon, orthotrichum, schlotheimia, syrrhopodon, and zygodon.

BRYONIA, *sp.*, bryony.

Mala, ... BENG.	Nehoe-maka, . MALEAL.
Gurga-naru, . . HIND.	Linga donda, . . TEL.

A creeper growing all over India.—*Roxb.*

BRYONIA UMBELLATA. *Willd.*

Gwal kakri, . . . HIND.	Mohakri, ... HIND.

Not uncommon in the N.W. Himalaya at from 2500 to 7500 feet. The fruit is eaten, and on the Sutlej the root is said to be given for spermatorrhœa.—*Dr. J. L. Stewart, M.D.*

BRYOPHYLLUM CALYCINUM.

Ywet kya pen pouk, . . BURM.

This curious flowering plant, with a leaf like the house-leek, was introduced into India by Lady Clive from the Moluccas, and has been so naturalized on the Tenasserim coast, that it may be sometimes seen growing around old pagodas like a wild plant. The leaves readily produce buds upon their margins, capable of propagating the plant when laid upon damp soil. This marginal production of leaf-buds has been considered analogous to the development of seed-buds (ovules), which in plants generally are also normally marginal, being developed upon the margin of specially modified leaves (carpels).—*Mason.*

B'STAN-HGYUR is a compilation in Tibetan of all sorts of literary works, about 3900 in number, in 225 volumes, written mostly by ancient Indian pandits and some learned Tibetans in the first centuries after the introduction of Buddhism into Tibet. The Rgyud portion is on religious rituals and ceremonies, and the Mdo part on science and literature.—*Csoma Korosi in As. Res.; Weber*, 209.

BTSOD. TIB. Madder.

BUA or Buah. MALAY. Fruit. Bua angur, the grape; Bua dulima, pomegranate; Bua lontar, palmyra fruit; Bua minyak, olive oil; Bua nanka, jack-fruit; Bua pala, nutmeg, the Myristica moschata; Bua-rucum, Carissa spinarum. Bua-kaia-pet, a tree in Bawean which reaches a height of thirty feet, and when covered with its branches of deep red-coloured fruit, it presents a beautiful appearance; the fruit is milky, has an agreeable flavour, and some resemblance to the Sawo fruit.

BU-ALI-SINA, or Avicenna, a celebrated physician; his name was Abu Ali-ul-Husain, ibn Abid Ullah ibn Sina, q.v.

BUBAK, a small town in the Kurachee district, of 5703 inhabitants. The Mahomedan sections are Korichaki, Jamot, and Machi.—*Imp. Gaz.*

BUBALUS, *H. Smith*, a genus of mammals of sub-family Bovinæ; the horns are large, attached to the highest line of the frontals, inclining upwards and backwards; ribs, 13 pairs.

BUBALUS ARNI, the wild buffalo.

Bos arni, *Kerr, Shaw.*	B. bubalus, *Anct.*, wild var.
B. buffelus, *Blyth.*	
Arna (male), Arni (fem.), HIND.	Mung of . . BHAGULPUR.
Jangli bhyus, . . ,,	Gera erumi, . . GOND.

The wild buffalo is found in Assam, in the swampy Terai at the foot of the hills from Bhutan to Oudh, also in the plains of Lower Bengal as far west as Tirhut, but increasing in numbers to the eastwards, on the Brahmaputra and in the Bengal sunderbuns. It also occurs here and there through the eastern portions of the table-land of Central India, from Midnapur to Raipur, and thence extending south nearly to the Godavery; a few are found in the north and north-east of Ceylon. They adhere to the most swampy sites, and never ascend the mountains. Length, 10½ feet and upwards from snout to root of tail; height at shoulder, 6½ feet; tail short. The horns are of two kinds, the one very long, nearly straight, well thrown back, var. Macrocerus of Hodgson, the other much shorter and well curved, more directed upwards, Spirocus, *Hodgs.*; the horn reaches to 6½ feet in length. It lives in large herds; but in the rutting season in autumn the most lusty males lead off a few females and form small herds for the time. It gestates 10 months. The bull is of such power and vigour, as by its charge frequently to prostrate a well-sized elephant. They are uniformly in high condition, while the domestic buffalo is lean and angular.—*Jerdon, Mammals*, p. 308.

BUBBE-MARA. CAN. Calophyllum calaba.

BUBHAJIA. See Mishmi.

BUBLEE. SIND. Acacia farnesiana.

BUBO, a genus of birds of the tribe Nocturnæ, family Strigidæ, order Raptores, or birds of prey. They are arranged in the sub-fam. Buboninæ, viz. Nyctea, Bubo, Asio, Scops, Ketupa. Bubo maximus is the 'eagle owl' of Europe, Siberia, China, Asia Minor, Babylonia, Barberry, Himalaya? See Birds.

BUBUK. MALAY. Wormwood.

BUCCINIDÆ, a family of recent and fossil molluscs, comprising many genera and sub-genera.

BUCEPHALIA, a town built by Alexander, supposed to have been on the site now occupied by the town of Jhelum. It was named after his horse, which was killed in battle here. See Porus.

BUCEROTIDÆ, the hornbill family of birds, distinguished by the enormous size of their bills, and many with a casque or protuberance at the base of the bill on the culmen. The genera and species in S.E. Asia are—

Homrauis bicornis, *Linn.*, Peninsula of India.
Buceros rhinoceros, *Linn.*, Malay Peninsula.

And others. —*Jerdon*, i. 248–50.

BUCH. BENG. Zingiber zerumbet; DUK., sweet flag, Acorus calamus.

BUCHANAKA. SANSK. Arachis hypogea.

BUCHANAN, DR. FRANCIS, a medical officer of the Bengal army, who afterwards added the surname of Hamilton. In 1800 and 1801, made a 'Journey from Madras through the countries of Mysore, Canara, and Malabar,' under the orders of the Marquis of Wellesley, investigating the state of agriculture, arts, and commerce, and his report was printed. He introduced into his Commentary upon Rheede's Hortus Malabaricus, published in the Linnæan Society's Transactions, vols. xiii., xiv., and xv., descriptions of several new peninsular species. His writings are—An Account of Nepaul, Edinburgh, 1819, 1 vol.; Travels through Mysore, Canara, and Malabar, Lond. 1807, 3 vols.; Geographical and Statistical Description of Dinapore, Calcutta, 1833, 1 vol.; Fishes of the Ganges, Edin. 1822; On a map of Burma in Jameson's Journal.

For his Mysore journey he set out on the 23d of April 1800, and completed it on the 6th July 1801. The first edition appeared in 1807. It is an almost unique encyclopædia, and how one man, however indefatigable, could have produced, in so short a space of time, such a mass of reliable information about a country in which he was a stranger, is indeed astonishing. His survey of the north-eastern districts of Bengal, 1807–1813, are still in MS. in the India Office. Mr. Montgomery Martin, in 1838, printed from them three volumes of History, Antiquities, Topography of Eastern India.—*Buist's Catal.; Imp. Gaz.*

This is a straight-growing, handsome, large forest tree, with fragrant flowers, common for some distance west of the Jumna, in the lower hills. It grows in Ajmir, Panjab, and Garhwal. In the Bombay Presidency, is found more inland than in the coast jungles. In Canara and Sunda it is most frequent above the ghats, particularly north of Dandellee, and the wood is rather strong and tough, but seldom squaring above four inches, The tree abounds in Mysore and Cuddapah; in Cuttack is worked up generally into furniture, house doors, windows, presses, tables, etc. It requires to be polished, otherwise it stains of a burnt-sienna colour any cloth brought into contact with it. Brandis says that in Burma it is a soft, light wood, and not used. The fruit, when ripe, in May is gathered, then soaked in water to soften the outer pulp, when it is washed and rubbed off by the hands; the little nut is then dried in the sun, and afterwards broken between a common chuckee or stone hand-mill, such as is used for grinding wheat; the kernels are then shifted and winnowed, and much used in native confectionery, roasted and eaten with milk, and considered a great delicacy. They abound in a straw-coloured, sweet-tasted and limpid oil, which is seldom extracted. Its bark is used by tanners. In Hindu poetry, its handsome white flower furnishes a simile for pretty eyes, and is held to be sacred to Vishnu.—*Madras Exhibition; Eng. Cyc.; Drs. Roxb., Gibson, Voigt, Brandis, Irvine, Mason; Cal. Cat. of* 1862; *Useful Plants; Flor. Andh.; Powell*, p. 570; *Mr. Thomson; Beddome.*

BUCHANANIA VARIEGATA, the Kachnar of Chutia Nagpur, a tree with hard, whitish yellow timber.—*Cal. Cat. Ex.* 1862.

BUCHGOTI, a Rajput tribe in Jonpur and Gorakhpur, formerly notorious for turbulence; part of them became Mahomedans prior to Sikander Lodi's rule. The Bilk-huria, the Rajwar, the Rajkumar, are offshoots from the Buchgoti.—*Elliot.*

BUCKCHI. HIND. Fleabane; Conyza *sp.*

BUCKHANI. See Clothing.

BUCKINGHAM, JAMES SILK, editor of a newspaper in Calcutta. He urged freedom for the press, but was ultimately deported from India, and travelled in Western Asia. He published his travels.

BUCKLALL. HIND.? A close straight-grained wood, light, tough, and strong; grows sparse in the Santal jungles. Is suitable for timber bridges.—*Cal. Eng. Jour.* 1860.

BUCKLANDIA POPULNEA, *R. Brown*, a beautiful evergreen of the Sikkim Himalaya. One seen by Dr. Hooker had a trunk 21½ feet in girth, and was unbranched for forty feet. Ferns and the beautiful air-plant Cœlogyne Wallichii,

with other orchids, grew on its branches, while clematis and Stauntonia climbed the trunk. Its wood is brown, and not valuable as timber. It is also interesting in a physiological point of view, from the woody fibre being studded with those curious microscopic discs so characteristic of pines, and which, when occurring on fossil wood, are considered conclusive as to the natural family to which such woods belong. The whole natural order to which Bucklandia belongs, possesses this character, as also various species of Magnoliaceæ found in India, Australia, Borneo, and South America. B. populnea, *R. Brown*, is a large tree of the Khassya mountains from Cherrapunji to Sarureem. Flowers small and greenish.—*Hooker, Jour.* ii. p. 185; *Voigt*, 53.

BUCKLAT-ul-MALIK. ARAB. Fumaria officinalis, fumitory. Bucklat-ul-Mubarik, Portulaca quadrifida.

BUCKTHORN or Rhamnaceæ order of plants, comprising the genera, zizyphus, berchemia, sageretia, ventilago, rhamnus, scutia, hovenia, colubrina, vitmannia, and gouania. The dried red crushed drupes, both of rhamnus and zizyphus, are sold in the shops of China, under the name of Tsau-pi and Nan-tsau. The fruit of the Swan-tsau, a species of Chinese rhamnus, is purgative and deobstruent. The kernels of R. soporifer are sedative. The bark of a species of rhamnus is brought from Cheh-kiang, and is used to form a beautiful green dye.—*Smith.*

BUCKUM. HIND. Pterocarpus santalinus.

Fagopyrum emarginatum, *Meisn.*, and F. esculentum, *Mœnch*, both known as buckwheat, are cultivated abundantly in Central Asia and the Himalaya, at about 6000 feet on the Jhelum, 5000 to 10,000 on the Chenab, and on the Ravi 8000 to 9000. Dr. Thomson saw it at 13,000 feet in Zanskar, and Drs. Stewart and Cayley at 13,000 and 14,000 feet in Ladakh. Bears are more fond of this when growing than of any other food; the leaves are much used in Lahul as a pot-herb. In the hills, the buckwheat grain is considered inferior to millet, but much is taken to the plains, where it is used by the Hindus on their 'bart' or fast days, it being then 'phalahar,' or lawful. In the neighbourhood of Hankow in China, the crop of F. esculentum is much depended on; its small grain is very sweet and oily, and makes very nourishing food and pastry. The crop is cut before the frost. It is believed to be a native of Central Asia, and is supposed to have been first brought to Europe in the early part of the twelfth century, at the time of the crusades for the recovery of Syria from the dominion of the Saracens. In America, 30 to 60 bushels per acre are not unfrequently produced. The quantity of seed sown is 5 to 8 pecks the acre.—*Simmonds*, p. 259; *Dr. J. L. Stewart; M'Culloch; Smith*, p. 44.

BUD. PERS., HIND. Existence. Bud-o-bash, livelihood. Bud-nabood, life and death.

BUD-DA-THA-RA-NA. BURM. Canna Indica.

BUDDA TUMMA. TEL. Acacia Roxburghii.

BUDDERI. SANSK. Zizyphus jujuba.

BUDDHA. This title is usually employed to designate the eminent religious teacher, from whose doctrines have sprung up the forms of the Buddhist religion which are found prevailing in Ceylon, Nepal, Tibet, Tartary, Mongolia, Burma, Siam, Anam, Cambodia, China, Japan, Formosa, and Corea. Its votaries, it is supposed, outnumber those of all other creeds, except the Christian. The Rev. Mr. Hardy quotes a German estimate of the Buddhists at 369 millions; Major Cunningham has 222 millions, and even 500 millions have been estimated.

Buddha in Sanskrit means wisdom, supreme intelligence, and the words of nearly similar sound are mere varieties, in different parts of the East Indies, in orthography and pronunciation. The Chinese having no B or D in their alphabet, and their language being monosyllabic, they have further softened this term into Fo, Fo-e, or Fo-Hi; they also call him Sa-ka, a variation of Sakya, his tribal name.

Taking the term in the simple sense of a religious teacher, it is generally admitted that there had been several Buddha prior to the advent of Sakya Sinha, to whom the term is now restricted by the people of Europe. Sakya Sinha declares he was the twenty-fifth Buddha, and says of another, 'Bhagava Metteyo is yet to come.'

Colonel Tod is of opinion (i. p. 90) that there had been four distinguished Buddha or wise men, teachers in India of a monotheism which they brought from Central Asia, with their science and the arrow or nail-headed written character. The first Buddha he considers was Budh, the parent of the Lunar race, B.C. 2250. The second (twenty-second of the Jains), Naimnath, B.C. 1120. The third (twenty-third of the Jains), Parswanath, B.C. 650. The fourth (twenty-fourth of the Jains), Mahavira, B.C. 533.

Sakya Sinha was born in the 5th or 6th century B.C., at Kapilavastu, in the Gorakhpur district, in the reign of Bimbasara, the fifth of the Sisunaga dynasty of Magadha or Behar. He was the only son of raja Suddhodana, the chief of a tribe called Sakya, whose country lay among the spurs of the Himalaya, along the banks of the Rohini, or modern Kohana. Suddhodana was indeed one of the last representatives of the pure Aryan or Solar dynasties who held sway in Ayodhya, the modern Oudh, and were deposed by the Lunar dynasties of the mixed Aryan and Turanian races, and reduced to mere chieftains of tribes, who still maintained a precarious independence under the protecting shadows of the Himalaya. The Rohini divided the Sakya from the Koliyan on the opposite bank, and in times of famine the river was often the object of fighting between them. But during the rule of Suddhodana there was peace between the clans on either side of the Rohini, and Suddhodana had married two of the daughters of the Koliyan chief. Both continued childless, until, in her 45th year, the elder sister presented her husband with a son, the prince Gautama Siddartha. Buddhist legends describe the great rejoicing at the unexpected event; that Buddhas from afar came to worship the new-born babe, and aver that his incarnation was voluntary, and his conception immaculate. At 19 years old he was married to his cousin Yasodhara, the daughter of the Koliyan raja; and in the Pali scriptures we hear nothing more of him, until in his 29th year it is related that, one day, driving beyond his pleasure-grounds, he met an old man, and on another a paralytic, and again one suffering from the pest, and after that a corpse. These sights stirred the prince to new thoughts. About this time Yasodhara gave birth to a son, her only child. On hearing of it, Gautama only said, 'This is another strong tie I have to break.' That evening the nautch girls came as usual to dance before him, but he paid no attention to them, and gradually fell asleep. On awaking again at midnight, and seeing them lying about in the anteroom in inelegant postures, an overpowering loathing filled his soul, and he called at once to his charioteer, Channa, to get ready for his departure. He then went to Yasodhara's room, hoping to embrace his new-born boy while she slept, but, fearing that should she awake he would be moved from his resolution, he tore himself from the threshold of her door; and on the night of the full moon of the month of July, B.C. 594, the young Rajput prince went forth into the forests of Magadha, resolved never to return to his father's house, and to his wife and child, until he could come back to them as a teacher. This, in the Buddhist scriptures, is styled 'The Great Renunciation' of Gautama Buddha. He first went to Rajagriha, the capital of Magadha, the residence of king Bimbisara, where he attached himself to a Brahman named Alara, and afterwards to another named Adraka, by whom he was initiated into all the mysteries of the Hindu religion and philosophy. But not being satisfied, he retired to the jungle of Uruvela, on the north of the Vindhya range, where for six years, attended by five faithful disciples, he gave himself up to the severest asceticism, till his fame filled the whole of Malwa, or Central India, 'like the sound of a great bell hung in the canopy of the skies.' At last one day he fainted from extreme exhaustion, when, recovering, and seeing the folly of such useless self-denial, he thenceforward began to take food regularly, on which his five disciples deserted him and went to Benares. On the very day that they left him, he wandered forth, meditating painfully on their desertion just at the time when he most needed human sympathy, until at last he came to a village on the banks of the Nairanjara, where Sujata, the daughter of one of the villagers, compassionately brought him food as he sat under the Bodhi tree, Urostigma religiosum, or sacred fig-tree. He was greatly moved by the compassion of Sujata, and sat meditating under the tree through all the day and all the following night. First he was strongly tempted to give up his missionary life, and return to wife and child, wealth and power, but as the sun set the religious side of his great nature triumphed. His mind was made up to the belief that penances, self-tortures, and sacrifices were not the way of life and peace, but a pure heart; and that the only freedom from doubt and heresy was through overcoming impurity, envy, and hatred. The first enemy that must be conquered is sensuality, and the last self-righteousness; and the crown of purity, faith, and justice, without which all these are no more than self-righteousness, is 'universal charity.' As these truths flashed on his mind, he felt that he had become the Buddha, the Enlightened One, and he arose to proclaim his new-found joy to all the world around him. He first sought out his old teachers, Alara and Adraka, but they were dead. Then he went to his former five disciples at Uruvela, who were now living in the Deer Forest at Benares. As he approached, they determined not to receive him, but Gautama was a man of commanding presence and noble countenance, and had a rich, deep, thrilling voice, and as he drew near and addressed them, all their self-righteous resolutions failed, and in the end they followed him as their true teacher and master. Another of his converts in the Deer Forest was a rich young man named Yasa, who came to him by night out of fear of his relations, and afterwards succeeded in bringing many of his friends and companions into the new religion. He then returned to Uruvela, where he converted three fire-worshippers, one of whom was called Kasyapa, and other hermits who were living there, accompanied by whom he proceeded again to the court of king Bimbisara at Magadha. There great numbers joined him, including Sariputra and Moggallana, who afterwards became famous leaders of the new religion. At last, after seven years' absence, Buddha started for Kapilavastu. He entered the city with his mendicant's bowl in his hand, begging through the streets. The old raja Suddhodana was scandalized; but Gautama replied, 'My father, the customs of the Dharma (Law, or

Kingdom, of righteousness) are good, both for this world and the world which is to come. My father, when a man has found a treasure, it is his duty to offer the most precious of the jewels to his father first. Do not delay, let me share with you the treasure I have found.' Yasodhara did not go forth to welcome him. 'I will wait and see,' she said; 'perhaps I am still of some value in his eyes; he may ask for me, and I can better welcome him here.' Gautama, who had not seen her since the night of his renunciation, noticed her absence, and observing that doubtless the princess, knowing that a recluse could not be touched by a woman, had kept away, added, 'She may embrace me; do not stop her. Unless her sorrow be allowed to take its course, her heart will break.' Then he went in to Yasodhara, who, when she saw him whom she had known as a prince standing before her as a yellow-robed hermit, and though she knew it before, for the first time then realized the impassable gulf between them, she fell upon him, and held him by the feet and wept bitterly. Buddha praised her great virtue, and, when she afterwards entered into the new religion, she became the head of the first Buddhist nunnery of female recluses. For 45 years Gautama prosecuted his mission in Hindusthan, attended by his cousin Ananda. He also converted another cousin, Devadatta, who, in envy, incited king Ajatasatru, who had succeeded king Bimbisara in Magadha, against him. But in the end Ajatasatru was also converted. The common people, whose levelling instincts rebelled against the hereditary priesthood and crushing caste system of the Brahmans, joined him in multitudes. He died at the age of 80, B.C. 543. He was journeying towards Kasinagara, 80 miles east of Kapilavastu, and had rested in a grove at Pawa, presented to the new society by a goldsmith named Chunda. Chunda here prepared for him a meal of rice and pork, of which he ate incautiously, and was soon afterwards taken ill. Finding that Chunda was likely to be reproached for his mortal fit of indigestion, he quietly remarked to Ananda, 'After I am gone, tell Chunda he will receive in a future birth a very great reward; for, having eaten of his pork, I am about to pass into Nirvana. These are the gifts which will be blest above all others, namely, Sujata's gift before I attained wisdom under the Bodhi tree, and this gift of Chunda before I enter into the rest of Nirvana.' Afterwards, observing Ananda weeping, he said, 'O Ananda, do not weep. This body of ours contains within itself the powers which renew its strength for a time, but also the causes which lead to its destruction. Is there anything put together which shall not dissolve?' Then, turning to his disciples, he said, 'When I am passed away, and am no longer with you, do not think the Buddha has left you, and is not still in your midst. You have my words, my explanations, my laws, the Buddha has not left you.' And again, 'Beloved disciples, if you love my memory, love one another.' And after another pause he said, 'Beloved, that which causes life causes also decay and death. Never forget this. I called you to tell you this.' These were the last words of Gautama Buddha, as he stretched himself out and died under the great sal tree, the Shorea robusta, at Kasinagara.

His body was burnt with great reverence by the local rajas of Malwa, and his charred bones were distributed over the whole country, and in after times gave rise to the stupas, topes, or relic mounds which have been discovered in so many parts of India, from the valley of the Kābul river to the banks of the Kistna. For gradually the new religion grew mightily. The Sisunaga dynasty, which reigned at Magadha from B.C. 691 to B.C. 325, was followed by the Maurya dynasty, which reigned to B.C. 118. It is the most brilliant and best known of all the dynasties of ancient India. In the anarchy which followed the invasion by Alexander the Great, B.C. 330 (Herat) to 326, the last of the Sisunagas was murdered in revenge by a learned Brahman named Chanakya, through whose intrigues Chandragupta, the Sandracottus of the Greeks, was raised to the throne. His grandson, Asoka, the third king of the Maurya dynasty, established Buddhism as the state religion in India, B.C. 250. He was the first to raise stone architecture in India, the art of which was probably derived through the Greek invasion. He engraved his edicts on rocks and on pillars; and the Sanchi tope, and the tope of Bharhut, are probably remains of the 84,000 topes or stupas he is said to have erected in honour of Gautama Buddha and his most distinguished first disciples. Only eight of these mounds were shrines of actual relics of Sakya Muni himself, and these are distinguished by the name of dhagobas,—being derived from dhatu, a relic, and garbha, the womb,—that is, a 'relic-shrine.'

The legends relate that on his attaining perfect knowledge while resting under the pipal tree near Gaya, he celebrated the event with the stanzas:

'Through various transmigrations
Have I passed, (without discovering)
The builder I seek of the abode (of the passions).
Painful are repeated births!
O house builder! I have seen (thee).
No house shalt thou again build me;
Thy rafters are broken,
Thy ridge-pole is shattered:
My mind is freed (from outward objects),
I have attained the extinction of desires.'

According to tradition, a likeness of this great reformer was carved in sandal-wood from the life, and this became the model for such representations as exist. He appears in them as a smiling, smooth-faced, feminine-looking person, with long hair parted like a woman's, and formed into a knot at the top of the head. In early Buddhist belief, however, statues were not erected to him. There are none belonging to the eastern caves, nor any found at Buddh Gaya, Bharhut, or Sanchi. There are none executed as early as the Christian era. His statues on the façade at Karli and in the western caves are insertions of the 4th or 5th centuries, or later.

Before the end of his career, he saw his principles zealously and successfully promulgated by his Brahman disciples, Sariputra, Mangalyana, Ananda, and Kasyapa, as well as by the Vaisya Katyayana, and the Sudra Upali. At his death in B.C. 543, his doctrines had been firmly established, and eager claims were preferred by kings and rulers for relics of their teacher. His ashes were distributed amongst eight cities, and the charcoal from the funeral pile was given to a ninth; but the spread of his influence is more clearly shown by the mention of the numerous cities where he lived and preached. Amongst these are Champa

and Rajagriha on the east, Sravasti and Kausambi on the west. In the short space of forty-five years, this wonderful man succeeded in establishing his doctrines over the fairest districts of the Ganges, from the neighbourhood of Agra and Cawnpur to the Delta. This success was perhaps as much due to the corrupt state of Brahmanism, as to the greater purity and more practical wisdom of his own system. His success was also partly due to the politic admission of women. To most of them the words of Buddha preached comfort in this life, and hope in the next. To the young widow, the neglected wife, and the cast-off mistress, the Buddhist teachers offered an honourable career as nuns. Instead of the daily indignities to which they were subjected by grasping relatives, treacherous husbands, and faithless lords, the most miserable of the sex could now share, although still in a humble way, with the general respect accorded to all who had taken the vows. The Bhikshuni were indebted to Ananda's intercession with Sakya for their admission into the ranks of the Buddha community, and (Csoma's Analysis of the Dulva, Res. As. Soc. Bengal, xx. p. 90; also Fo-kwe-ki, chap. xvi. p. 101), in token of their gratitude, the Pi-khieu-ni, or Bhikshuni, at Mathura, paid their devotions chiefly to the stupa of Anan (Ananda), because he had besought Buddha that he would grant to women the liberty of embracing ascetic life. The observances required from the nuns are given in note 23, chap. xvi. of the Fo-kwe-ki. Though thus enrolled, their position was still humble. The female ascetic, even of a hundred years of age, was bound to respect a monk even in the first year of his ordination.

Sakya has become a saint in the Roman Catholic Church, under the name of St. Josaphat.

In Burma, his statues or images appear in Buddhist temples, sometimes seated cross-legged, in the attitude of teaching, sometimes resting on his right side supporting his head on his right hand. He is represented in those of India seated on the Sinhasana, or lion's throne, at first alone, but, under the Mahayana heresy, with other beings near, often with standing figures holding fly-flaps; or seated on a throne, the corners of which are upheld by two lions, with his feet on a lotus blossom, and his hands in front of his breast, the little finger of his left hand held between the thumb and forefinger of the right. This is the attitude of teaching, and is known as Dharma Chakra Mudra. Buddha and the Jaina Tirthankaras are also represented squatting with their legs doubled under them, and the hands laid one on the other over the feet, with the palms turned upwards. This is the reflective or meditative attitude, Jnana Mudra or Dhyana Mudra. A third attitude is called Vajrasana, also Bhumisparsa Mudra, when the left hand lies on the upturned soles of the feet, and the right, resting over the knee, points to the earth. He is also figured standing with the right hand uplifted in the attitude of blessing, or with the alms-bowl of the Bhikshu or mendicant. Also resting on his right side, with his head to the north, the attitude he took at his death.

Sakya Sinha, according to Tibetan books, died near the town of Kusha in Kamrup, beneath the shade of two sal trees on the southern bank of the Brahmaputra river, then called Hiranyo. The Pali books of Burma and Ceylon say B.C. 544, General Cunningham has B.C. 478, at the age of 80. In the middle of the 19th century, Professor Kern of Leyden, in a dissertation on Buddha, gives B.C. 388 as the date of his death; and Professor Weber, in the Literisches Central Blatt of 1874, adopted the view taken by Professor Kern. Mr. Fergusson gives as under the dates of events:—

Buddha born at Kapilavasta,	B.C. 560
,, became an ascetic,	,, 531
,, assumed Buddhahood,	,, 526
,, died,	,, 481
First Buddhist council,	,, 481
Second Buddhist council, held in the 10th year of the reign of Kala Varddhana,	,, 381
Alexander's invasion of India,	,, 327
Philip made satrap,	,, 327
Alexander left Patala after the rains,	,, 326
Philip murdered by mercenaries,	,, 326
Alexander's death,	,, 323
Porus allowed to retain the Panjab,	,, 321
Seleucus obtains Babylon,	,, 321
Chandragupta founds the Maurya dynasty,	,, 319
Bindusara succeeds, and rules 28 years,	,, 295
Bindusara's death,	,, 267
Asoka's coronation,	,, 263
Asoka converted to Buddhism,	,, 259
Mahendra, son of Asoka, ordained a Buddhist priest,	,, 257
Third Buddhist council, held in his 17th year,	,, 246
Mahendra sent to Ceylon in his 18th year,	,, 245
Death of Asoka's queen, Asandhi Mitra,	,, 233

He is known to the various races by various names and titles. He was called Sakya and Sakya Sinha from his clan; Sauddho-dani, as the son of Suddhodana; and from his mother Maya-Devi he got the name of Maya-Devi-Suta; Gautama was from his got or ancestral descent, and hence the Burmese Gaudama; Arka-Bandhu, or Kinsman of the Sun, from his descent as a Kshatriya of the Solar line; Bhagawa or Bhagavat, meaning saintly; Sakya Muni, or Sakya the hermit; Tatha-gata, he who has gone away; Sramana, the priest; Maha-Sramana, the great priest. He is the Buddas and the Sarmanes of the Greeks; the Mercurius Mayæ filius of the Roman Horace; Bud or Wud of the pagan Arabs; Toth of the Egyptians; Woden of the Scandinavians. His clan name of Sakya became the Xa-Ka of the Chinese and Japanese, and the Shakahout of Tonquin; and the Chinese, having no b or d in their monosyllabic language, style him Fo, Fo-e, Fo-Hi, and Fo-to; in Tibet he is Pot or Po-ti; also in Siam, Chom-dan-das, Sangs-gyas, and Sommo-no-Kodam.—*Ferg. and Burg. Cave Temples of India*, 24, 178.

BUDDHA-PRIYA, the compiler of the Rupa-siddhi, the oldest Pali grammar, now lost. It was compiled from the more ancient work of Kachhyayana.

BUDDHA-SARA. SANSK. The essence of the Buddha philosophy.

BUDDH GAYA or Budh Gaya, a village, lat. 24° 41′ 45″ N., long. 85° 24′ E., about 6 miles from the town of Gaya in Bengal. Sakya Muni, in the 6th century B.C., resided here for four years under a pipal tree (Urostigma religiosa), sitting

with his legs crossed in mental abstraction. That celebrated tree, the Bodhi-drum, or tree of wisdom, still exists, but in a very decayed state. The rajasthan, or palace, was the residence of the Buddhist king Asoka and his successors on the throne of Magadha. In front of the tree are the ruins of an ancient Buddhist temple, restored A.D. 1305–1306 by a Buddhist ruler, but only the mandir or shrine remains. It is largely visited by pilgrims, who deposit their offerings at the foot of the pipal tree. One inscription on a stone in Sanskrit, dated Samvat 1005 (A.D. 948), is said by Dr. Wilkins to import that the temple of Buddha at Buddha Gaya was built by Amara Deva, the author of the Amara Kosha; but it may mean restored, as it was seen before Amara Deva's time by Fa hian (v. p. 189). Another Pali inscription, of date 1305, in Burmese, says the chaitya or temple was first built by Asoka, 218 years after Buddha, or B.C. 325; often restored, and finally restored by the Burmese Envoys, A.D. 1306–1309 (v. p. 157). The vaulted cavern or Nagarjuni has other inscriptions, all short, and in every variety of the Deva Nagari.—*Beng. As. Soc. Journ.* vi. p. 671; *Tr. of a Hindu; Fergusson's Buddhist Architectural Remains; Hardy's Eastern Monachism*, p. 434; *Buddha-Gaya, the Hermitage of Sakya Muni, by Rajendralala Mitra, LL.D., C.I.E., etc.; Imp. Gaz.*

BUDDHI. SANSK. Perfect knowledge, the acquirement of which, with the Buddhists, frees from further transmigrations.

BUDDHISM is a religion which had its origin in the teaching of Sakya Sinha. In the year 1881, the population of the world was estimated at 1,500,000,000, of whom 470,000,000 were supposed to be Buddhists. Some circumstances, of which we are uninformed, must have prepared these regions for the reception of his ascetic doctrines. From its rise in the 6th century B.C., it gradually spread from the valley of the Ganges over the whole of India; it extended into Kābul, into Bamian in ancient Bactria, a district of Persia under Darius; traces of it early appear through Mongolia and Tibet; it was introduced into China by 500 Kashmirian missionaries in A.D. 65; through Hindustan it extended into the Peninsula and to Ceylon, into Nipal, Burma, Assam, Siam, Cochin China, the islands of Formosa and Japan; and, except in India, where it arose, and in Kābul, Bactria, Bamian, and Kashmir, it still flourishes in the countries named, and in Sikkim, Ladakh, Zanskar, Dras, Suru, Purik, Spiti, Nubra, Rong, Janskar, Hanle, and Rupshu. Buddhism made a great start in the time of king Asoka, and religious Buddhist counsellors assembled at Pataliputra with Asoka. After nine months' consultation, they sent out nine teachers, viz. one to Kashmir and Peshawur, a second to the country of the Narbada, a third to Mewar and Bundi, a fourth to Northern Sind, a fifth to the Mahratta country, a sixth to the Greek province of Kābal, Arachosia, a seventh to the country of the Himalaya, the eighth to Ava or Siam, that is, the 'golden land,' the aurea regio or the aurea chersonesus, and the ninth to Lanka or Ceylon.

It is known that Buddhism was introduced at the court of Ming-ti, emperor of China, in A.D. 65; into Java in A.D. 24 to 57; into Kaoli (Corea) in A.D. 372; into Pe-tsi, in Corea, in A.D. 384; into Tibet, under Hla-ta To-ri, in A.D. 407; into Sin lo or Sinra (in Corea), A.D. 528; in 552 into Japan; and in 632, under Srong dbzam gampo, Buddhism was introduced into Tibet generally.

About 450 A.D., missionaries from Ceylon permanently established their religion in Burma. The Burmese, however, allege that just after the Patna council, B.C. 207 and 244, missionaries came to Tha-ton, between the Sitoung and Salwin estuaries.

In Turkestan, Buddhism was still prevailing in A.D. 1419, in the cities of Turfan and Kamil, when Shah Rukh's ambassadors passed through; and Tagalaq Timur was the first Mahomedan sovereign of Kashgar of the lineage of Chengiz. There are now many Buddhist priests at the capital of Khotan; but Mahomedanism had been extensively prevalent in East Turkestan for centuries prior to its conquest by the Chinese in A.D. 1757, and the Buddhist priests and temples may have been since introduced.

In the first 500 years there were several assemblies of its eminent men, to discuss its condition and prospects. At the council held B.C. 543, when 500 of Buddha's disciples were assembled in a cave near Rajagriha, to gather together his sayings, they chanted the lessons of their master, in three great divisions—(1) the words of Buddha to his disciples; (2) his code of discipline; and (3) his system of doctrine. These became the three collections, Pitaka, or baskets of Buddha's teaching; and Sangiti, the word for a Buddhist council, means literally a singing together.

Even before the decease of Sakya Sinha, however, schisms had arisen amongst his followers. Ananda had been with him from the first, and to him Buddha had referred his disciples as the depositary of what he himself had said. Nevertheless, so rapidly had the views of Buddha been departed from, that Ananda was excluded from the deliberations of the first Buddhist council as an unbeliever, and only re-admitted when he had submitted to their views (Bunsen, God in Hist. i. 341). A century afterwards, B.C. 443, 381? in the reign of Kala Varddhana, a second council of 700 was held at Vaisali, to settle disputes between the more and the less strict followers of Buddhism; it condemned a system of Ten Indulgences which had grown up, but it led to the separation of the Buddhists into two hostile parties, who afterwards split into 18 sects (Imp. Gaz. p. 248). Eighteen heresies are deplored in the Mahawanso, within two centuries of Sakya's death; and four distinct sects, each rejoicing in the name of Buddhists, are still to be traced amongst the remnants of his followers. Not reckoning the doctrines cherished among the Jaina of Gujerat and Rajputana, its mysteries, as administered by the Lamas of Tibet, are distinct from the metaphysical abstractions propounded by the monks of Nepal, or the philosophies of the Burmans. Its observances in Japan have undergone a still more striking alteration from their vicinity to the Sintu sect; and in China they have been similarly modified in their contact with the rationalism of Lao-tsze, and the social demonology or spirit-worship of the Confucians (Ten. Ceyl. p. 527).

The third council, B.C. 246, was assembled by Asoka at Patna; and the fourth and last council was held under king Kanishka, and it was at this fourth council that Nagarjuna introduced the Mahayana doctrine.—*Ferg.; Imp. Gaz.* Both

these rulers made Buddhism a state religion. Asoka had inscriptions recorded on rocks and columns, enjoining its doctrines, and some of these still remain. His son Mahendra, B.C. 243, carried to Ceylon Asoka's version of the Buddhist scriptures in the Magadhi language. He took with him a band of missionaries; and soon after, his sister, the princess Sanghamitta, who had entered the order, followed with a company of nuns. In the inscriptions, Buddhism appears as a system of pure abstract morality, no trace being exhibited of the worship either of Buddha himself, or of the serpent or tree.

Kanishka ruled in Kashmir and N.W. India, about A.D. 10–40, but his sway extended to both sides of the Himalaya, from Yarkand and Khokand to Agra and Sind. The assembly convoked by him consisted of 700 members. They drew up their commentaries on the Buddhist faith, which supplied in part materials for the Tibetan or Northern Canon.

The prominent sects are known as the Hinayana and Mahayana, the Lesser Vehicle and the Greater Vehicle. The original puritans belong to the Hinayana. They practised morality, with a few simple ceremonial observances. The Mahayana school was founded by the 13th patriarch, Nagarjuna, a native of Berar, about 500 or 400 years after Buddha. It taught an abstruse mystical theology, in which Buddha was pushed into the background by female personifications of Dharma or the Prajna Paramita, and other goddesses, by Jnanat Maka Buddhas, or forms of the senses (Ferg. and Burg. Cave Temples of India, 182). The Mahayana includes many later corruptions or developments of the faith, as originally embodied by Asoka in the Lesser Vehicle or Canon of the southern Buddhists, B.C. 244. The Buddhist Canon of China is a branch of the Greater Vehicle, and was arranged between A.D. 67 and 1285. It includes 1440 distinct works, comprising 5586 books; and the Buddhism of China and Japan is a grossly idolatrous religious system.

Kanishka and his council became in some degree to the northern or Tibeto-Chinese Buddhists what Asoka and his Patna council (244 B.C.) had been to the Buddhists of Ceylon and the south. But the ultimate divergence between the canons is great, both as to the historical aspects of Buddha's life and as to his teaching.—*Imp. Gaz.*

The rails of the dhagobas at Buddha Gaya, Bharhut, with the eastern caves, give a complete history of Buddhism as it existed in India during the Mauryan dynasty (B.C. 325 to 188). At Sanchi and the western caves is given a complete representation of the character it assumed from the 1st century before the Christian era till the third or fourth of it. At Amravati and the N.W. monasteries in Peshawur, are shown the modifications introduced before and during the 4th century; and from Ajunta and later caves are to be traced its history till it became almost Jaina, and then altogether faded away.—*Fergusson*, p. 206.

The gateways of the Sanchi tope belong to the first half of the 1st century of the Christian era, and, though subsequent to the Naga revelation, the sculptures scarcely indicate its existence. Buddha does not appear on the Sanchi sculptures as an object of worship. The serpent is there, but rare. The dhagoba, or depository of the relics of saints, is there, as also are the tree, the wheel, and other emblems, and, on the whole, the sculptures on the Sanchi tope may illustrate the Hinayana school of Buddhism, at the period when other doctrines were about to be introduced.

The Amravati sculptures, again, belong to a period 300 years later than that of Sanchi, and in them the new school of Mahayana Buddhism may be studied. In these, Buddha is an object of worship, but the serpent is his co-equal. The dhagoba, tree, and wheel are reverenced, and the sculptures contain all the legends of the later books, though in a purer form. Hindus, Dasyas, and other men, women, and animals, especially monkeys, appear in the sculptures worshipping the serpent and other gods. The serpents are all divine, five and seven headed; and representations are numerous of the Naga angelic orders,—the female Naga with one serpent only springing from the back, the male Naga with three. In the Amravati sculptures are tonsured priests, and other signs of a clerical order segregated from the laity, and of an established ritual. Sanchi is illustrative of the Hinayana Buddhist philosophy, 500 years before the oldest Buddhist book; and Amravati illustrates the Mahayana philosophy 600 years after its promulgation.

The frescoes of the caves of Ajunta illustrate a period 300 years later than the Amravati tope, and belong to the time immediately preceding the decline of Buddhism in India. In No. 19 chaitya cave, Ajunta, he is the object of worship, and occupies a position in front of the dhagoba itself, surmounted by the triple umbrella. A pure theism has become changed into an overwhelming idolatry.—*Fergusson*, p. 124.

Seemingly the symbols or idols first sculptured were the chakra, or wheel of the law, the Bodhi Tree, and the dhagoba (Dhatugarbha), a cupola-shaped structure intended to contain relics, and which, in the ancient sanctuaries, occupies exactly the place of the altar in churches of the Romish and episcopal forms. About the 4th century it was replaced generally by images of Buddha, but representations of him have been found on the coins of Kanishka, and his images were worshipped in the first century.—*Barth*, p. 128.

In Tibet Buddhism, relic-worship is not expressed either in their architecture or their religious forms. But it is a nation of priests; their monasteries are innumerable, some with 2000 or 3000 lamas; and, according to M. Huc, up to 15,000 at Sera, near Lhassa, where are long streets of cells, mostly surrounding courtyards, generally with a shrine or altar in its centre. That of Bouddha La is where the Delai Lama resides, outside of Lhassa. In its centre is a four-storeyed building, with a dome covered with plates of gold.—*Fergusson*, p. 312.

Buddhism prevailed in different parts of India partially for 1800 years. During this long period, Buddhism was swept from many provinces by great revivals of the Brahmanical creeds, generally brought about by migrations of Brahmans from Northern India, under whose teachings, and often with violence, Buddhism in British India became extinct. It had, however, triumphed throughout India from the time of Asoka, B.C. 255, up till the 5th century A.D., trampling upon the whole ceremonial of Brahmanism, with all its sacrifices, penances, and castes, and asserting the

paramount necessity for purity of mind and body, and a more elevated moral rule. Sacrifices of all kinds were especially excluded from the Buddhist ritual, the offerings of flowers to Buddhas being alone permitted. In A.D. 400, when Fa Hian visited India, Buddhism was still the dominant religion, but the Vaishnava sect were already rising into consequence. In the middle of the 7th century, although the pilgrim Hiwen Thsang found numerous temples of the Saiva sect, whose doctrines had been embraced by Skanda Gupta and the later princes of Patalipura, yet Buddhism was still the prevailing religion of the people. But the faith of Sakya was evidently on the decline; and though it lingered about the holy cities of Benares and Gaya for two or three centuries later, it was no longer the honoured religion of kings and princes, protected by the strong arm of power, but the persecuted heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire. In 1835, Major Cunningham excavated numerous Buddhist images at Sarnath, near Benares, all of which had evidently been purposely hidden under ground. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire; and Major Kittoe, who subsequently made further excavations, was of the same opinion. General Cunningham also dug up a colossal statue of Sakya in the Kosamba Kuti temple at Sravasti.

It was about the year A.D. 800 that there arose the great Brahmanical revival, which has prevailed in India up to the present day, but Buddhism left its influence: the great sacrifices of antiquity have never been revived; the Homa and Payasa, or ghi and food sacrifices, are exclusively offered by the Vaishnava sectarians, even by most of the Saivava; and the sacrificing of buffaloes, goats, and fowls is chiefly practised amongst the uneducated Sudra and non-Aryan races, to Durga, Kali, or the earth, under the form of the various local deities. The Vaishnava, who look for the coming of a tenth avatar, had been inclined to regard Sakya as the prophesied incarnation; but when Buddhism was seated on the throne of Magadha, and the old Vaishnava sect was persecuted, they fell away from Buddhism, and have ever since been apart, even more tender of animal life than any Buddhist, but in other doctrines dissimilar.

Amongst the *Singhalese* Buddhists, the term Buddha is understood to indicate beings who appear in the world at intervals, and are able to teach men the way to attain nirvana (Hardy), and they recognise Anomadassa as a Buddha prior to Gautama.—*Hardy*, p. 433.

In Ceylon, this faith has not been subjected to much persecution. In the 16th century, the Tamil invaders made every effort to destroy the Buddhist books; but the priests subsequently sent a mission to Siam, and properly ordained priests were imported from Amarapura in Burma. By the 18th century, Buddhism had regained its ascendency. In the 19th century, the priests have been actively diffusing a knowledge of their creed. They have printing presses, from which tracts, pamphlets, and serials issue in great numbers. They present some new arguments and inferences; but the defiant and blasphemous expressions which they contain against the sacred name of Jehovah, are probably the most awful ever framed in human language. In Ceylon, on Adam's Peak, is a footmark which has been the object of pilgrimage for ages, which Buddhists ascribe to Buddha, but Mahomedans to Adam. There are models of feet in different parts of the island.—*Yule*, ii. 359, 368. The tooth of Buddha, Dalada, SINGH., Dhata Dhata, HIND., is greatly reverenced. There are, in Ceylon, statues of Buddha of great height. One near Mehintala is 70 feet high, and one of Gautama Raja at Carculla is 38 feet. At Anarajpura, in Ceylon, are several Buddhist dahgopas or dhagobas, the heights of which vary. They were built at from B.C. 307 to A.D. 276.

A shoot from the pipal tree at Buddha Gaya, known as the Bo Tree, has been cherished at Anarajpura for twenty centuries; and in the courtyard of every vihara and temple of Ceylon, pipal trees are preserved as objects of veneration. A system of caste was introduced by king Vijaio amongst the Ceylon Buddhists, which still prevails there, though directly opposed to Buddhist doctrines, and not existing in any similar form in other Buddhist countries.

Buddhism has been examined by Prinsep, Hodgson, A. Cunningham, Yule, Csoma Korosi, Rajendra Lala, Sykes, and Bird in India; by Pallas, Schmidt, Burnouf, Müller, Bunsen, Barth, Fergusson, St. Hilaire, Benfey, E. Edkins, Stanisla Julien, Lassen, Abel Remusat, Tennent, Wilson, and Wassiljew of Europe; by Turnour, Gogerly; and Spence Hardy of Ceylon; by Phayre, Mason, Lowe, Bigandet, and Bastian of Burma; and by Legge of China; and there has been much discussion as to the nature of the doctrines which Sakya preached. There is no doubt that he was an ascetic, for he left his wife and family, and preached and inculcated asceticism; and however greatly his followers may now vary in their belief, it is a fundamental doctrine with all of them, that existence is an evil, for birth originates sorrow, pain, decay, and death. Whether he believed in a Supreme Being is questioned. Mr. Hodgson describes his belief as 'monastic asceticism in morals, and philosophical scepticism in religion.' Bunsen considers that Sakya, the ascetic, of all founders of religions, at once stands the nearest to, and the farthest from, Jesus of Nazareth, the Christ. The farthest, inasmuch as he renounces in despair the actual world which Jesus purposes to raise to Godlike purity; but the nearest, by virtue of the width and humanity of his conceptions of God, and the wide diffusion which they have obtained. But this view was not held by many of his own day, who styled him An-Iswara, the lordless one, meaning that he taught an absolutely atheistic nihilism; and Burnouf considered the doctrine of Buddha to be atheistic and materialistic in his teaching that existence is a burden, and that annihilation is the highest happiness which the soul can strive after. Barth says (p. 110) Buddha's doctrine is absolutely atheistic. The great truth of the Fatherhood of God is lacking in Buddha's teaching. According to Bunsen (God in Hist. p. 345), his creed introduced or revived civilisation, and softened manners amongst millions. At present the Buddhists are in two great sects, those of the Mahayana, and those of the Hinayana. The Mahayana is represented in the literature of the northern Buddhists of Tibet, Nepal, China, and Japan; and the Hinayana in that of Ceylon, Burma, Siam,

and Cambodia, and Anam? The Buddhism of Mongolia is an offshoot from Tibet, and that of Corea, Japan, and Cochin-China is from China.

In China and Mongolia, according to MM. Huc and Gabet, there are theistic Buddhists, who acknowledge an Adi-Buddha, or eternal Buddha, whom they consider to be God over all.—*Yule*, i. 242.

Sakya Muni discountenanced the philosophic views of the Brahmans, but did not deny the authority of the Vedas. But he was not followed in this by subsequent professing Buddhists.—*T.*

Three marches from Jeypore, on the road to Dehli, the town of Babra has one of the edicts of Asoka on a block of stone or rock on a hill, in old Pali, and of date B.C. 309. It is in the oldest Lat character. It differs somewhat in style and language from the pillar and rock edicts. The subject is the Buddhist commandment, forbidding the sacrifice of four-footed animals. The Vedas are alluded to, but though not named, are condemned as 'mean and false in their doctrine, and not to be obeyed.' The scriptures of the Muni (which must be the Vedas) are spoken of as directing blood-offerings and the sacrifice of animals. Priests and priestesses, religious men and religious women, amongst the Buddhists, are commanded to obey the edict, and bear it in their hearts (vol. ix. p. 617).

The sacred canon of the Buddhists now extant is called the Tripitaka, *i.e.* the three baskets. The first basket contains all that has reference to Vinaya, or morality or discipline; the second contains the Sutra, or discourses of Buddha; the third, Abhidharma, includes all works treating of dogmatic philosophy or metaphysics. The first and second each contain five separate works. The second is generally known by the name of Dharma, or law; and it has become usual to apply to the third basket, which contains seven separate works, the term Abhidharma or bye-law. The Sutra are ascribed to Sakya Muni; they consist of ethical and philosophical dialogues by Sakya; and a writer in the Calcutta Review states they make mention of the gods Narayan, Jonardhan, Shib, Brahma, Petomah, Borun (Vorun), and Songkar. Other names are Kabir, Sokr or Vasob, and Vissoo Kormo.—*Cal. Rev.*

Professor Max Müller, in 1881, translated the Dhammapada, a collection of verses; the Sutta Nipata, a collection of discourses, was translated by V. Frausböll; and Rhys Davids issued the Buddhist Sutras.

Buddhist writings have been preserved in two comparatively original redactions, but neither of them in the Magadhi dialects, the primitive language of their creed. The Buddhists of Nepal, Tibet, and China have their books in Sanskrit, or have translations immediately from the Sanskrit. The Sanskrit writings were made known about 1840, by Mr. B. H. Hodgson.

The literature of the Buddhists of Ceylon, Burma, and Siam, is in Pali; and the Dipavansa contains a history of Buddhism in that island, which breaks off with the death of Mahasena, A.D. 302. The Mahawansa was compiled by Mahawana, who lived about A.D. 500; it has been brought down to the 18th century by successive writers, and was translated by the Honourable G. Turnour of the Ceylon Civil Service.

Their relative age and authority is not yet decided, though that of the Pali has been known since the 5th century by the commentaries of Buddha ghosha.

Analyses of this literature have been made in Spence Hardy's Eastern Monachism; Childer's Pali Dictionary; Rhys David's Buddhism; B. H. Hodgson's Memoirs in Asiatic Researches and the reprint of his Collected Essays, Csoma of Koros in Bengal As. Soc. Journal and Asiatic Researches.

The Chinese collection has been described in Beal's Buddhist Tripitaka as it is known in China and Japan, and W. Wassiljew's Der Buddhismus.

Up to the present time, all that has been found of the Abhidharma is in extracts and fragments.

Some of the Sutras have been translated by E. Burnouf, Max Müller, and Cecil Bendall, and in the Journal of the R. As. Society. The Vinaya Pitakam in the Pali has been published by H. Oldenberg, the Mahavagga in 1879, and the Cullavaga in 1881.—*Barth, Rel. of India.*

Mahendra, son of Asoka, is supposed to have brought the Attha-katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Buddha ghosa, about A.D. 430, re-translated into Pali. According to another account, the doctrines were first reduced to writing by the Ceylon priests during the reign of king Vartagamani, 88–76 B.C., and by a synod assembled 10–40 A.D., by the Turushka king Kanishka. For the former the language used was the vernacular, from which in the 5th century it was translated into Pali; for the latter, Sanskrit.

The Buddhist religious works of Tibet brought to notice by Alexander Csoma de Koros, are the Tanjur, which consists in its different editions of 100, 102, and 108 folio volumes, and comprises 1083 distinct works. The Tanjur consists of 225 volumes folio, each weighing from 4 to 5 lbs., in the edition of Pekin; but editions have also been published at Lhassa, and other places. Of these, De Koros gave an analysis in the 20th volume of the Asiatic Researches, and died soon after.

In the Tibetan creed, the doctrine of transmigration is shown, and final absorption into Buddha, as the reward of a virtuous life. It therefore follows that Buddha, with the Tibetans, is the divine Being who created all, and to whom all return, and that for the good there is no separate existence in a future world. There has been some misapprehension regarding the Buddhas and Budhisatwas of the Tibetans, the regeneration of the Grand Lama being considered as an exceptional case of a Buddha returning amongst mankind. Mr. Hodgson (pp. 137, 138) truly calls the 'divine Lamas' of Tibet, Arhantas; but he believes 'that a very gross superstition has wrested the just notion of the character to its own use,' and so created the 'immortal mortals, or present palpable divinities of Tibet.' In the Nouv. Jour. Asiat. t. xiv. p. 408, ii., Fra Orazio says that 'Lama sempre sara coll' istessa anima del medesime Ciang-c'iub, oppure in altri corpi.' Remusat was not aware of this fact when he stated, 'Les Lamos du Tibet se considérent euxmêmes comme autant de divinités (Bouddhas) incarnées pour le salut des hommes.' But the explanation which Major Cunningham received in Ladakh, which is the same as that obtained by Fra Orazio in Lassa, is simple and convincing. The Grand Lama is only a regenerated Budhisatwa, who refrains from

accepting Buddhahood, that he may continue to be born again and again for the benefit of mankind. For a Buddha cannot possibly be regenerated, and hence the famous epithets of Sathagatha, 'thus gone,' and Sugata, 'well gone,' or 'gone for ever.' The valley of Le or Ladakh proper, Zanskar, Hembaks or Dras, Suru, Purik, Spiti, Nubra, Janskee, and Rong, are all Buddhist (*The Bilsa Topes, by Major Cunningham*, pp. 1–67).

In Tibet, the Buddhist practical creed is thus briefly stated by Csoma de Koros:—1st, To take refuge only with Budh. 2d, To form in the mind the resolution to aim at the highest degree of perfection, and so to be united with the Supreme Intelligence. 3d, To humble oneself before Budh, and to adore him. 4th, To make offerings of things pleasing to the six senses. 5th, To glorify Budh by music, and by hymns, and by praise of his person, doctrine, and love of mankind, of his perfections or attributes, and of his acts for the benefit of animated beings. 6th, To confess one's sins with a contrite heart, to ask forgiveness of them, and to repent truly, with a resolution not to commit such afterwards. 7th, To rejoice in the moral merit and perfection of animated beings, and to wish that they may obtain beatitude. 8th, To pray and exhort existing holy men to turn the wheel of religion, that the world may long benefit by their teaching (*Prinsep's Tibet, Tartary, and Mongolia*, p. 167).

One of the established points in Tibetan Buddhism is the belief in metempsychosis, or the migration of the souls of animated beings; and the Tibetans believe in six forms in which a living being may be re-born, viz. lha, TIB.; deva, SANSK., spirits or gods; mi, or men; lha mayin, or evil spirits; dudo or johsong, brute beasts; yidaga, imaginary monsters; and inmates of nyalba, or naraka, or hell.

To cease to exist is the prevailing hope with all Buddhists. The Buddhist longing for annihilation is an exaggeration of the craving for rest which has been felt by many races, and by the followers of many creeds. The universal cry of the overworked and sorrowing children of men has ever been that of the lotus-eaters:

'There is no joy but calm.'

The universal refrain of humanity is one implying trouble, anxiety, and never-ceasing toil, and its aspiration is that of repose. A holiday is a cessation of labour; and the highest hope of many Christians has ever been, to reach that bourne where the wicked cease from troubling, and the weary are at rest. Nirvana is as a blown-out candle. It is essentially in theory a non-active faith—a faith of negatives. Their ten commandments, according to Max Müller, are:—Do not kill; do not steal; do not commit adultery; do not lie; do not get intoxicated; abstain from unsuitable words; abstain from public spectacles; abstain from excess in dress; do not have a large bed; do not receive silver or gold. Ten obligations or precepts, dasa sil, are repeated when a Burmese enters a kyoung as a novice (*Fytche*, ii. 192).

In carrying out the ascetic views of Sakya Muni, pious Buddhists of all these countries, both men and women, have, from the first enunciation of his doctrines, been accustomed to withdraw from public life into monasteries and convents. We have distinct evidence of the existence of institutions of this kind established at dates long antecedent to the Christian era. They were in the form of vihara, or cells and caves, or buildings erected for the convenience of those who sought so to spiritualize themselves by separation from the world. Only the ruins of such buildings exist in peninsular India, but in Tibet and Tartary they still are like those left by the Indian Sramanas or Lamas, ten and twenty centuries anterior to the present, and varying very little from what is reported of the monasteries of the earlier Christians; there are also, according to M. Huc, both at Koon-boom and in Tibet, the types of the devotees who practised penances, and sat as pillars, like Simeon Stilites. In Burma, every Buddhist lad, for a period, must enter a monastery.

Pythagorean institutions are described as very monastic in their character, in that respect resembling closely the vihara of the Buddhists of India. The doctrines of Pythagoras were widely spread over Greece, over Italy and Asia Minor, for centuries after his decease, and under the name of Mithraic the teachings of Budh had also a wide extension (*Prinsep's Tibet*, pp. 140, 161).

To a Buddhist ascetic, continence is essential to purity, but even contact is unlawful. Nevertheless convents for women are very characteristically Buddhist institutions; they existed in the Burman empire till of late years, and are still to be met with in Nepal, Tibet, and China (*Toy Cart*, p. 142).

Burma.—Dr. Mason says the philosophy of Buddhism, in Burma, is the religion of Buddhism. To be a Buddhist is to believe in the philosophy of Being. The Buddhists propound as an axiom, that all things are unreal, and on it all their philosophy is based. Some Buddhists recognise idols, a few wholly reject the worship of idols; but these are equally Buddhists, who believe that true happiness is not found in any state of body or mind; that existence is a calamity; and that the only desirable object is the extinction of being, or nirvan, where there is deliverance from ideas and consciousness. To be a pious Buddhist is to remain unaffected by surrounding objects, to deny oneself of everything beyond the bare necessaries of life, and to cry out, day and night, all things are transitory, productive of unhappiness, and unreal. A change of heart and implicit faith are essentials of salvation. Burmese Buddhists believe in good and evil spirits, and in the scheme of transmigration, and, for the good, final absorption; and the Burmese Buddhist prays that he may, in his transmigrations, meet with a Buddha to convert him. Woman takes a humble position in Burmese Buddhism, and she longs to become a man in her next transmigration. Their views as to the desirableness for release from this life are evinced in modes painful to European feelings. The Rev. Mr. Marks, when in Moulmein, had a sick pupil whom he went to see. On entering the house, and inquiring for the lad, the mother in a glad manner repeated he was well, and jauntily led to another room, where he was pained to find the young boy lying dead, and still more pained by the mother continuing to repeat that he was well.

In Burma, in some temples, four past terrestrial Buddhas occupy the four sides of the temples (*Yule, Cathay*, i. 242).

In Burma, there is a great belief in spirits, both good and bad,—amongst others, the nat and the

bilu. An attempt to reform Buddhism was made in 1863, by some of the chief phoungyes of Kemmendine. Like the Protestants of Christianity and the Brahmoists of Hinduism, the reformers seem to go back to their oldest books, or bedagat, the three series of which minutely describe the duties of priests and laity, and define the objects of faith. They condemned the lax practices of this degenerate age, such as priests wearing sandals, carrying umbrellas, and visiting religious theatrical shows. At the bottom of their reforms, insignificant as they appear, there was doubtless much puritan earnestness. They called themselves 'Soolay Gandee,' Soolay meaning the great spirit to whom the pagoda in the centre of Rangoon is dedicated. The Buddhists of Burma are liberal almsgivers; but the act of making the offering is the final individual merit, and the utilization of the gift is not regarded.

In Burma, the Buddhist priesthood is open to every orthodox believer. All that it enjoins is a life of purity, temperance, and truth. The h'poongyee is the priest. Every Burma boy becomes a hierophant, and during the most receptive years of his life, remains under the discipline and control of the village h'poongyee, to whom the family authority is temporarily delegated. He is housed, clothed, and fed in the kyoung or monastery, and the parents are put to no trouble or expense throughout the whole period of his tuition. The h'poongyee is the master. As a rule, he is strict and peremptory, yet sufficiently attentive to the moral and physical well-being of his pupils as to earn their continuous attachment and esteem. His teaching has a strong religious tinge, but it teaches discipline, diligence, and habits of punctual attendance. The h'poongyee have ceased to be propagandists, and have undertaken the work of national instruction, and have all the elementary education in their power.

Tibet.—The Buddhist priests or Lamas of Tibet, Mongolia, and Manchuria acknowledge the Grand Lama of Tibet as their spiritual head. He is the spiritual and political ruler of Tibet, and is subordinate to the Emperor of China only. The Lama are chosen from all classes of society; and in Mongolia, when there are two or three sons in a family, one of them must be dedicated to the service of Lamaism. They reside in monasteries, and are celibates, shave their heads, and wear a yellow robe. Their religious services resemble those of the Christian cathedrals. A human thigh-bone is hollowed out, and made into a musical pipe. The Lamas in the towns of Lamamiau and Ye-hole are about 10,000 in number. Many of them are wanderers on the vast plains of Mongolia. Lama temples are very imposing (*Gray*, p. 134).

Siam.—Between the Buddhists of Siam and Ceylon there has been much intercourse, and it is probable that almost identical doctrines are held in the two countries. During the efforts made by the Buddhist monks of Ceylon in the defence of their religion, and in their attacks on Christianity and on Jehovah, the king of Siam and one of the native chiefs of Kandy contributed largely towards the publication of the numerous tracts, pamphlets, and serials that were sent forth from the Buddhist printing presses of Ceylon. When Siam was visited by Sir John Bowring, a king was reigning, who in early life, when a late king had usurped the throne, had withdrawn from political squabbles to the safety and sanctity of the religious profession, and was residing in a Buddhist temple, whence he was brought forth to occupy the throne, after the seclusion of a quarter of a century.

Cambodia.—It is stated by a writer in the Journal of the Indian Archipelago (No. xi. Nov. 1852, p. 606), that, in Cambodia, Buddha is not regarded as the first cause, the creator of all things; but there prevails amongst them a pantheism, in which all nature is deified, but above all they place Buddha, and worship him daily.

Laos.—Similarly, for instance, De Carne relates (p. 113) that Buddhists of Laos offer parts of their bodies at the image of Buddha, in the pagoda at Phnom in Upper Laos. The interpreter to the French mission made an offering of his forefinger up to the half of the upper joint. It was chopped off with a chopper by the attendants of the pagoda.

In *China*, monks try themselves with great severities. Buddhism has never taken a high place amongst the philosophies and religions of the country, though recognised as a state religion from A.D. 65, under the emperor Ming-ti. Buddhist missionaries had entered China in the third century before Christ. A missionary is mentioned in the Chinese annals, in the year 217 B.C.; and about the year 120 B.C., a Chinese general, after defeating the barbarous tribes north of the desert of Gobi, brought back as a trophy a golden statue of Buddha (*Müller's Lectures*, p. 139). There was much intercouse between the Buddhists of India and China for some centuries after the introduction of Buddhism into China; but in the 10th century, after A.D. 975, the religious visitors to China became greatly more numerous. Chinese pilgrims also had passed years in India studying their religion, and they wrote narratives of their travels. Of these, there have been published the travels of Fa Hian, A.D. 399–414; of Hiwen Thsang, A.D. 628–645; and of Hoei Singh, who set out A.D. 518. A later traveller, Khi-Nie, who journeyed A.D. 964–976, was sent by the emperor of China, at the head of 300 monks, to seek relics of Buddha, and to collect palm books. Such pilgrimages continue; and Colonel Yule met men at Hardwar who had crossed the Himalaya from Mah-Chin, to visit the holy flame at Jawalamukhi in the Panjab (*Yule*, ii. 411). The Chinese Buddhist invocation is, Oh me to Fo! Oh me to Fo! In China and Mongolia, according to MM. Huc and Gabet, theistic Buddhists acknowledge an Adi-Buddha, or eternal Buddha, whom they consider to be God over all. In Ceylon and Indo-Chinese countries there is no such belief (*Yule*, i. 242). Chinese Buddhists are in different sects or schools, on account of differences in opinion on matters of philosophy. But though the religion is one of the recognised State creeds, Buddhists are not allowed to hold office.

Amongst the *Japanese*, the religion of Buddha and the Sintu religion have equal precedence. Their Buddhist priests use the Chinese language in their worship, except in their poetry, which is in Japanese. Bishop Smith of Victoria says there were in Japan, at his visit, eight sects or orders of Buddhist priests,—Tendai, Shinngong, Dzen, Oobaku, Jiodo, Hokki, Ikko,—whose priests are allowed to marry, and Nichiren. Shiu, Shu, or Ju is placed after the proper name, designating each

sect. At Dyboots, in Japan, is a bronze figure of Buddha, 53 feet high.

The Loo-Choo islands Buddhism is less perfect than that of the Japanese.

The *Korean* Buddhists and Buddhism were made known to Mexico by Chinese priests in the 5th century A.D., and had followers in that country until the 13th century, when the conquering Aztecs put an end to it.

Perhaps no religion equals the Buddhist in its injunctions as to tenderness for animal life; yet the Chinese, amongst whom are many Buddhists, and the Burmese, all of whom are Buddhists, are, as races, amongst the least merciful of mankind; are cruel, revengeful, and remorseless shedders of the blood of their fellow-man. The Burman Buddhist will not kill a quadruped animal for food, but he eats with readiness all animals that have died of disease, or that have been killed by others; and fish and the shrimp tribe, which their rivers and seas produce, are eaten in quantities greater than by any other known race.

Much of the costume of Buddhist priests and of the ritual has a similarity to those of Christians of the Romish and Greek forms; and De Guignes, De Gama, Clavijo, Anthony Jenkinson, all notice statements regarding the Greek Church, the Chinese, and the Burmans, indicative of a belief in the identity of the form of worship. When Dr. Richardson and Captain MacLeod, in their exploration of the countries east of Burma, fell in with Chinese traders, these generally claimed them as of their own religion. In the Chinese temples are a number of images not unlike the Christian representations of Mary and of some of the saints, lamps and wax lights are on the Buddhist altar, the Buddhist priests are robed in the sacred vestments called pluvials in Christian ritual books, processions of suppliants occur as with Christians, and chanting is in a style almost exactly like the Gregorian chants of Christian churches. Early Christian missionaries to China believed these to have been introduced among them by the devil clumsily imitating holy things, and grasping at the honours due to God (*Yule*, ii. 551).

In India, Buddhist caves exist in Kattyawar, in a hill near Setana; in another near Khadia, south of Junaghar; at Hinglaj near Pattan, between the villages of Khadati Khan and Khamardand, in the Bardas; in the Salemal hill, North Bhabra; at Mewarda in the hill of Kakanda; at Diveswar in the hill of Mandava, near Chotila; at Devagarhi, near the village of Bhadali, south of Palyad; at Bhoeragarh, N.E. of Jasdan; in the Jogi near Kanamatra village; in the Palitana hill; and at Dwarka. There are Buddhist caves also in Orissa.

The caves of Junnar, Bhaja, Bedsa, Talaja hill, Sana, are remarkably devoid of figure ornament or imagery. In this respect they contrast strongly with Ajunta, Ellora, Karla, the second and last few caves at Nasik, and many in Salsette. At Ajunta and other places are images of Buddha, in the sanctuaries and on the façades. They are entirely absent at Bhaja, and in the older and middle series of about ten caves at Nasik, and at Junnar. The Tulja Lena group of caves in a hill about 1½ miles west from Junnar, are so named because one of them has been appropriated to Tuljâ Devi by the modern Brahmans.

Nidana indicates twelve conditions of existence, viz. ignorance, karmam or acts, consciousness, individuality, sensibility, objects of sense, sensation, desire or thirst, clinging to existence, birth, old age, and death.

The *Buddhist triad* or tri-ratna (three jewels) consist of Buddha, Dharma, and Sangha.

The *Buddhist wheel* is a prominent object in the Buddhist sculptures of India. It is supposed to be an emblem of the perpetual succession and eternity of matter; and it has served likewise another purpose in the corruptions of Buddhism. Prayers were pasted on it by the priests, who then put the wheel into rapid revolution. Each turn had the efficacy of an oral repetition; and the faster it revolved, the more rapidly was the devotee approaching the ultimate bliss of nirvana.

Buddha-Pasaka is a Buddhist salutation. It means worshipper of Buddha. Upasaka is another salutation.—*Professor Max Müller's Lectures*, p. 139, *and Chips from a German Workshop; Bunsen's God in History*, i. pp. 341, 211; *Wheeler's History of India*, p. 159; *Tennent's Ceylon*, i. pp. 343, 527, ii. p. 614; *Tennent's Christianity in Ceylon*, pp. 206, 207, 264; *Hardy's Eastern Monachism; Calcutta Review; Frazer's Magazine*, June 1868; *Rangoon Times; Saturday Review; Bengal As. Gaz.*

BUDDHIST ARCHITECTURAL REMAINS are the only vestiges of the prevalence in British India of the doctrines taught by Sakya Sinha and his disciples, but they afford valuable illustrations of the alterations introduced into that great teacher's doctrines. It is known that the final disappearance of Buddhism from continental and peninsular India was violent,—their priests were slain and their temples burned,—and there can be no doubt that the Brahmanical priesthood were the immediate actors in the scenes, but whether these were of the Vaishnava or Saiva sect there is no information. The Buddhist remains now existing may be divided into four distinct classes: *First*, cave temples, containing topes, sculptures, paintings, and numerous inscriptions. *Second*, vihara, or monasteries; *Third*, inscriptions on rocks and pillars; *Fourth*, topes, or religious edifices.

The vihara or monasteries are of two kinds: *First*, cave viharas, of which several magnificent specimens have been published by Mr. Fergusson; and *second*, structural viharas, of which some specimens still remain at Sanchi, but in a very ruinous condition.

(*a*) The cave vihara consists of (1) natural caverns slightly improved by art. These are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack. The next kind have (2) a verandah opening behind

BUDDHIST ARCHITECTURAL REMAINS.

into cells for the abode of priests, as in Cuttack and in the oldest vihara at Ajunta. The third (3) has an enlarged hall supported on pillars. The most splendid of these are at Ajunta; though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Junnar.

(*b*) Buddhist chaitya caves form the second class. These are the temples or churches of the series, and one or more of them is attached to every set of caves in Western India, though none exist on the eastern side. Unlike the vihara, all these caves have the same plan and arrangement. All consist of an external porch or music gallery, an internal gallery over the entrance, a central aisle, which may be called a nave, roofed by a plain waggon vault, and a semi-dome terminating the nave, under the centre of which always stands a dahgopa or chaitya. In the oldest temples, the dahgopa consists of a plain central drum, surmounted by a hemispherical dome crowned by a Tee, which supported the umbrella of state, of wood or stone. These two clasess comprehend all the Buddhist caves in India.

The *third* class of religious architectural remains in India consists of Brahmanical caves, properly so called. The finest specimens are at Ellora and Elephanta, though some good ones exist also on the island of Salsette and at Mahabalipur. In form many of them are copies of, and a good deal resemble, the Buddhist vihara. But they have not been appropriated from the Buddhists, as the arrangement of the pillars and position of the sanctuary are different. They are never surrounded by cells, as all viharas are, and their walls are invariably covered or meant to be covered with sculpture, while the viharas are almost as invariably decorated by paintings, except the sanctuary. The subjects of the sculpture of course always set the question at rest.

The *fourth* class consists of rock-cut models of structural Brahmanical temples. To this class belong the far-famed Kailas at Ellora; the Saivite temple at Dhumnar, and the Ruths at Mahabalipur. The last are cut out of isolated blocks of granite, but the rest stand in pits.

The Indra Subba group at Ellora should perhaps form a fifth, but whether they are Brahmanical or Jaina is undecided.

The *fifth* or true Jaina caves occur at Khandagiri in Cuttack and in the southern parts of India, but are few and insignificant. In the rock of Gwalior fort, there are cut in the rock a number of rude colossal Jaina figures some 30 to 40 feet high, of some of their thirtankara, some sitting, some standing.

The *Behar* caves are in the neighbourhood of Rajagriha. The Milkmaid's cave and Brahman Girl's cave have inscriptions in the Lath character. They date about 200 B.C., and are the most ancient caves of India. The Nagarjuni cave and Haft Khaneh or Satghar group are situated in the southern arm of the hill, at some little distance from the Brahman Girl and Milkmaid's cave. Another group is the neighbouring Karna Chapara and Lomas Rishi caves.

The caves of *Udyagiri* and *Khandagiri* hills, about 20 miles from Cuttack and five from Boban Eswara, are next in antiquity to those of Behar. They are built on the hills of Udyagiri and Khandagiri; the former are Buddhist and the older, the latter probably Jaina. Many of the inscriptions are in the Lath character, and this gives their age as anterior to the Christian era. The frieze sculpture in the Ganesgompha is superior to any in India, and resembles that of the Sanchi tope at Bhilsa. In it there are no gods, no figures of different sizes, nor any extravagance. In the Buddhist caves here, there are no figures of Buddha, nor any images. In a Jaina cave near, on Khandagiri, the 24 thirtankara with their female energies are sculptured.

The *Ajunta* are the most complete series of Buddhist caves in India, without any mixture of Brahmanism, and contain types of all the rest. They are in a ravine or narrow valley in the ghat south of the Tapti.

At *Baug*, in a ravine or small valley in the ghat on the north side of the valley of the Tapti, are three ancient Buddhist caves.

The *Karli* caves are close to the high road from Poona to Bombay, about half-way down on the right-hand side of the valley as you proceed towards the sea. They are not so extensive as those of Ajunta, but they are purely Buddhist. The largest and most splendid chaitya cave temple in India which could be selected for reproduction by art, is the principal excavation at Karli, and it is also interesting as the oldest Indian work of the kind known to exist. Karli has numerous inscriptions in the caves in the Pali language.

The *Salsette* or *Kenheri* caves, in the island of Salsette, are purely Buddhist, but inferior to those of Ajunta or Karli. They are excavated in a hill in the midst of an immense tract of forest country, and Mr. Fergusson supposes their date to be about the 9th or 10th century of the Christian era.

Dhumnar, about 40 miles S.E. from Nemuch, but close to Chundivassa, contains Buddhist caves, with a Brahmanical rock temple behind. Those of Dhumnar, like the caves of Ellora, contain a strong admixture of Brahmanism.

The *Ellora* caves are excavated in a porphyritic greenstone, and are largely Brahmanical. They are in the face of the mountain overlooking the valley of the Godavery, close to Roza, the burial-place of Dowlatabad, and where Aurangzeb, Alamgir I., is interred.

Those of *Elephanta* are entirely Brahmanical, though perhaps of the same age as those of Ellora. The caves of Elephanta overlook the harbour of Bombay. They are cut in a harder rock than those at Ellora. These caves are in the island of Gharipuri, called by Europeans Elephanta, an island in Bombay harbour. Among the hundreds of figures there sculptured, every principal deity is found. Buddha is evidently, from his size and situation, a principal personage there.

Mahabalipuram, or the Seven Pagodas, between Covelong and Sadras, south of Madras, has been described by Dr. Babbington in vol. ii. Trans. R. A. S., p. 258; and by Messrs. Chambers and Goldingham in A. R. vol. i. p. 145, and v. p. 69; and by Mr. Charles Gubbins in Bengal As. Soc. Journal. The Mahabalipur caves are entirely Brahmanical, and have been excavated after all the other series were formed (*Fergusson's Rock-cut Temples of India*).

The inscriptions of king Asoka consist of edicts and proclamations. King Asoka carved his edicts on the rocks at Dhauli in Cuttack, also at Girnar in Gujerat, at Kapurdagiri, near Pesha-

wur, and on pillars erected in different parts of the country. In the thirteenth edict of the rock-cut inscriptions, he mentions having, about B.C. 258, formed treaties of alliance with Ptolemy Philadelphos, Antiochus Theos, Antigonus Gonatus, Magas of Cyrene, and Alexander, the king of Epirus and Macedonia, mentioned by Justin, for the protection or aid of his co-religionists in their dominions. They have been deciphered successively by J. Prinsep, Norris, Dowson; and elucidated by the works of Burnouf, Lassen, Wilson, Kern, Buhler, General A. Cunningham, Corpus Inscriptionum, and E. Senart in Journal Asiatique.

BUDGEROW. ANGLO-HIND. A boat in use on the Ganges. See Boat.

BUDH, in Hindu astronomy, the planet Mercury, and Hindus deem it fortunate to be born under this planet. Budh presides over Wednesday, Budhwar, dies Mercurii. In one of the zodiacs, he is represented seated on a carpet, holding in his hands a sceptre and a lotus; in another he is shown riding on an eagle; and elsewhere he is described as sitting in a car drawn by lions; and by Ward as sitting on a lion.

BUDH, an ancestor of a branch of the great Hindu people of a time prior to authentic history. He is traced by them up to Brahma, from whom he descends through Atri, Samudra, Chandra, or Soma, and Vrihashpati. Budh is said to have married Ila, daughter of Ikshwaku; and the descendants of this union were, in succession, Pururava, Ayu or Yaou, Nohas or Nohus, and Yayat. Ayu or Yaou is claimed by the Tartar and Chinese genealogists as their great progenitor; and from Yayat sprang three great lines, the Yadu, Puru, and Oora or Oorvasa, from each of whom came many dynasties ruling on the Indus, in Hindustan, Assam, Ava, and China. The great Hya was a branch of the Yadu; and five members of it formed Panchalika or Panchaldesa, and the seed of Bajaswa occupied all the countries on the Indus. Of the three lines, the Yadu, Puru, and Oora, the Yadu became the most illustrious. The descendants of Budh and Ila were known as the Chandravansa, Somavansa, or Induvansa, all of these meaning the Lunar race; but the fame of the Yadu eclipsed the prior designations, and throughout India the Lunar race came to be styled Yaduvansa. The Yadu held territories in Hindustan about Allahabad, but seemingly in small republican states, some of which were staked and lost at play. The relatives then fought for dominion, for eighteen days, on the field of Kuru Khet. There was no battle of armies, but a series of single combats, with treacherous, cruel surprises, during which nearly all the Yadu fell, and at the close, several of those remaining emigrated, amongst whom Krishna was one. The story is told in the Mahabharata. After the combats, the Yadu seem to have left the Ganges, and to have been expelled from Dwarica, to have crossed the Indus, passed Zabulisthan, and founded Gajni and Samarcand, but to have swept back on the Indus into Gujerat and the Indian desert, from which they expelled the Langaha, Johya, Mohila, etc., and founded successfully Tannote, Derrawul, and Jeysulmir. They are now known as the Bhatti of Jeysulmir, the Jharijah of Cutch Bhooj, the tribes occupying Kerrowlee and Subbulghur on the Chambal, and the Sumaitcha on the Chambal. The great Tuar tribe are also said to have been of Yadu origin. The Hya also was a branch of the Yadu, some of whom formed Panchaldesa or Panchalika, and the seed of Bajeswa at one time occupied all the countries on the Indus. The Bhatti and Jharijah thus trace their descent from Budh and Krishna, and they may be said to occupy the Indian desert from the Sutlej to the ocean. Budh seems to have been the first emigrant from Sakadwipa or Scythia, into Hindustan, viz. about B.C. 2400. Between Budh and Krishna was a period of 1200 years. But his descendants had deified Budh; and in Hindu mythology he is described as the son of Soma or Chandra or Indu, the moon, by Rohini. The date of the apotheosis of Budh is not known. Prior to the deification of Krishna, Budh was worshipped by all the Yadu as the great ancestor (Pitriswara) of the Lunar race. The principal shrine of Budh was at Dwarica, where he still receives adoration as Budha Trivikrama. But by the deification of Krishna, whose emblem was the eagle, Krishna's mysteries superseded the simpler worship of Budh. The worship of Bal, or the sun, as Balnath, and of the moon as that of Budh, seem to have co-existed, and an amalgamation had occurred, as the serpent was made to twine round the lingam, as at the shrine of Eklinga. Colonel Tod is of opinion that the original worship of Budh was monotheistic, and that prior to the rise of Vishnuism, the three idolatrous classes of Hindustan were the adorers of Surya and the descendants of Budh, who preserved the serpent sign of their race, and Krishna's followers, who adopted the eagle. There seem to have been 56 clans of the Indu, who were distinguished by names of animals,—takshac, the serpent; aswa, the horse; sassu, the hare; lomri or nomri, the fox, etc. etc.—*Tod's Rajasthan*, i. pp. 533–536.

BUDHA-BASARA. SANSK. Budha-kakara, TEL. Cardiospermum halicacabum. Popular superstition asserts that by eating its seeds, the understanding is enlightened, and the memory rendered miraculously retentive.—*Ell. Fl. And.*

BUDHA DAS, father of Upatisso, who built hospitals for cripples, for pregnant women, for the blind and diseased.

BUDHA GANGA, also Burha Ganga, the old bed of the Ganges, from which the stream has shifted. It is traceable below Hastinapur, and also below Soron and Kumpil. The change of bed seems to have occurred since the time of Akbar.—*Elliot.*

BUDHA GHOSHA or Budha Ghosa, a Brahman, a native of Buddha Gaya, who became a convert to Buddhism. He lived in the early part of the 5th century A.D., nearly 1000 years after Sakya Muni (ob. B.C. 543). He went to Ceylon A.D. 430, and there compiled his great work, the Visuddhi Magga, or Path of Holiness, a cyclopædia of Buddhist doctrine. He was subsequently employed to re-write in Pali the commentaries, which had been handed down in Singhalese. Mahendra, son of Asoka, is supposed to have brought the Attha Katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Budha Ghosha, about A.D. 430, re-translated into Pali. His great eloquence obtained for him his titular name, meaning Voice of Buddha.—*Hardy's Eastern Monachism.*

BUDHA GUPTA, a king who governed the country between the Jumna and the Nerbadda, about the eighth century.

BUDH-ASHTAMI. SANSK. A Hindu holiday, from Budha, Mercury, and Ashtami, the eighth lunar day.

BUDHAYANA, a Hindu philosopher, who lived in Ilavratu, the country which surrounds Sumeru. He taught that God alone is unchangeable. He is said to have been the author of a law treatise, and to have arranged some parts of the Vedas into chapters.—*Ward*, iv. p. 30.

BUDH'S BEGGING POT, the Kasgal-i-Ali, is a circular bowl, 4 feet wide and 2 feet deep in the centre; the sides are 4 inches thick. It is of black porphyry. It is in a corner of the enclosure of the tomb of Sultan Wais, at Kandahar.

BUDHWAR, Wednesday, sacred to Budh, and named after him. Amongst Hindus it is a day propitious to any new undertaking.

BUDI. HIND. Among Hindus, the period of the month from full to new moon, called the dark half of the month.—*Elliot.*

BUDI-BUDAKI. CAN. A class of religious mendicants in Mysore.

BUDIDE. TEL. Ashes.

Budide Chatta, Heliotropium coromandelianum.

Budide Gummadi, Benincasa cerifera, *Savi*, referring to the white powder covering the fruit.

Budide Pannu, a fee for permission to bury a corpse.

BUDIL. HIND. Picea Webbiana, P. Pindrow.

BUDKHES. HIND. Cordalis Govaniana.

BUDLA, or Buddali. KARN. A leather bottle.

BUDLEYUN. GREEK. The mooql of the Arabians and Googal of India, names of bdellium, also of the Commiphora Madagascarensis tree.

BUDRANJA BOYA. HIND. A small species of Melissa, found about Ajmir, where it is considered heating, and is used to cleanse the blood; one seer sells for two rupees.—*Gen. Med. Top.*

BUDRI. BENG. Zizyphus jujuba.

BUDSHUR. HIND. Ephedra Gerardiana.

BUDU. HIND. Viscum attenuatum.

BUDUMURU. TEL. Sponia orientalis, *Planch.*

BUFF.

Peau passées en buffles, FR.	Bufalo; Cuojo di
Peau de buffle; Buffle, ,,	Bufalo, ... IT.
Buffelhaute, . . . GER.	

A kind of leather prepared from the skins of thick-hided animals, buffaloes, oxen, and the deer tribe.—*M'Culloch; Faulkner.*

BUFFALO.

Bubalus Buffelus, *Blum.*	Bos bubalus, *Briss.*
Bhains (male), . HIND.	Karbo; Karbou, MALAY.
Mhains (female), . ,,	Moonding, . . SUNDAN.

The buffalo inhabits Tibet, but is domesticated in India, the Indian Archipelago, and southern Europe. It is the only indigenous ruminant of Ceylon. They are frequently albinos, with pink eyes. The finest of the domesticated buffaloes of India are reared in the Hyderabad Dominions, west of Nirmul. Some naturalists are inclined to the opinion that there are two species. They are large, ungainly-looking animals, with great horns; but a domesticated breed, to the west of Nirmul, are of enormous size, almost like small elephants, and give a great quantity of milk. They are kept as milch kine, but are also employed as beasts of burden and draft; also to carry sacks on their backs, to plough with, to drag carts. They have little or no hair, and their hides look like polished leather. They require to be in a moist climate, or to be immersed in water daily. They love to wallow in water or slimy mud, and often roll themselves to get a coating of it. A large male buffalo is more than a match for a tiger. It has large flat horns, some curved and some long (spirocerus and macrocerus). Its ribs are large, flat, and white. It is the buffalo, buffle, and büffel of the French and Germans. In the Hambangtotte country, in Ceylon, the villagers are much annoyed by the wild ones, that mingle with the tame when sent out to the woods to pasture, and it constantly happens that a savage stranger, placing himself at the head of the tame herd, resists the attempts of the owners to drive them homewards at sunset. Being an animal to which water birds are accustomed, the Singhalese train the buffalo to sport, and, concealed behind the animal, browsing listlessly along, they guide it by ropes attached to its horns, and thus creep undiscovered within shot of the flock. In the northern parts of India, they are similarly trained to assist the sportsman in approaching deer. One of these sporting buffaloes sells for a considerable sum. Between 1851 and 1855, Liverpool imported from India, annually, about 30,000 of its hides and 600 tons of horns. The male buffalo is frequently sacrificed by non-Aryan races, sometimes in considerable numbers; and only in 1859, the Government of Madras ordered the magistrate of the Krishna Division to forbid the cruel rite of Ammavaru, wherein bullocks are impaled alive to appease the goddess Devi, and avert cholera. On that occasion, in a small village, from twelve to twenty-four bullocks were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of men. There are two generally recognised wild species of buffaloes in Africa,—the Cape buffalo (B. caffer), and the short-horned buffalo (Bos brachyceros).—*Bikmore, Travels; Stat. of Commerce; Tennent's Ceylon.*

BUFFALO THORN, Acacia latronum.

BUFONIA, a section of the 2d sub-class of reptiles, Batrachia, and order Batrachia salienta. The section Bufonia includes the families Rhinodermatidæ and Bufonidæ. Bufo scabra, the Bengal and Java toad, abounds in the marshes in the Lachen valley, adjoining Tibet. This is a remarkable instance of wide geographical distribution for a batrachian, which is common at the level of the sea under the tropics.—*Hooker, Jour.*

BUG, an insect belonging to the family Hemiptera, several genera of which occur in India. Amongst others are Cantuo ocellatus, Leptoscelis marginalis, Callidea Stockerius, etc. etc. Of the aquatic species, the gigantic Belostoma Indicum attains a size of nearly three inches. Some of them are most attractive in colour; a green one is often seen on leaves, and is quite inoffensive if unmolested, but if irritated exhales an offensive odour.—*Tennent's Ceylon.*

BUG. Insects known as coffee bugs have, in recent years, occasioned anxiety and losses to the coffee planters. In Ceylon, the first regularly worked estate was opened in 1825, but the bug does not seem to have appeared in large quantities till 1845, when, however, it began to spread with such rapidity, that in 1847 a very general alarm was taken by the planters, about the same time

that the potato, vine, and olive diseases began to create alarm in Europe. The coffee bug seems, however, to be indigenous in Ceylon, for the white bug has been found on orange, guava, and other trees, as also on beet-root and other vegetables, and the brown bug attacks the guava, hibiscus, Ixora, Justicia, and orange trees—indeed, every plant and tree, and even the weeds, on a coffee estate, particularly such as are in gardens.

When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, whilst the fungus, which never fails to attend on the bug, prevents restoration by closing the stomates through which the tree breathes and respires. Bug, Mr. Nietner tells us, existed on the estates to an incalculable extent; none were believed to be quite free from it. Whole estates are seen black with bugs, *i.e.* with the fungus; and he asks, 'Am I wrong in saying that if there was no bug in Ceylon, it would at a rough guess produce 50,000 cwts. of coffee more than it actually does?' The value of this quantity on the spot being about £125,000, this sum represents the aggregate of the annual loss by bug sustained by the Ceylon planters.

Mr. Nietner's observations had been more particularly confined to the group of districts around Peacock Hill, but his list of the enemies of the coffee tree holds good in general for the entire coffee region of Ceylon. He tells us, however, that the brown and white bug and the black and white grub are the only universal and important enemies of the coffee tree, and that the destruction caused by Arhines, Limacodes, Zeuzera, Phymatea, Strachia, and the coffee rat, appear to be of a more local and occasional nature, and are therefore of less importance. There are three pests which are chief,—the white bug, the brown bug, and the black bug.

The appearance and disappearance of the coffee bug, he tells us, is most capricious. It comes and goes,—now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands; here leaving an estate in the course of a twelvemonth, there remaining permanently. Sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown, damp localities, the latter being found more plentiful in close ravines and amongst heavy rotting timbers than on open hillsides, and it is probably to this predilection that the shifting of the insect is attributable. The bug of course seeks out the softest and most sheltered parts of the tree, the young shoots, the under sides of the leaves, and the clusters of berries. The injury done by the white bug seems more severe than that from the brown, but, not being so plentiful as the latter, it is of less general importance. The white bug is especially fond of congregating amongst the clusters of berries, which drop off from the injury they receive, and trees often lose their entire crop in this manner. The injury produced by the brown bug is the weakening of the tree, and is thus more general, but the crop does not drop off altogether nor so suddenly. With white bugs on an estate, the crop can hardly be estimated; with brown bugs it can.

The *White* or *Mealy Bug* is the Pseudococcus adonidum. The male insect is of a dirty brownish colour, and slightly hairy. It is very minute (very much smaller than the female, only about half a line long), and resembles certain small Ephemeridæ or May-flies. The female is oval, brownish-purple, covered with a white mealy powder, which forms a stiff fringe at the margin and at the extremity of the abdomen two setæ. The larvæ and pupæ are active, and move about. The insects, in all stages of development, are found in Ceylon all the year round, chiefly in dry and hot localities, on the branches of trees, and on the roots to one foot under ground. Mr. Nietner says it is identical with the species naturalized in the conservatories of Europe. It is preyed upon by the Scymnus rotundatus, a minute beetle of the ladybird tribe, of the size of a pin's head, black and pubescent; also, the yellow-coloured and common Encyrtus Nietneri and the black-coloured scarce Chartococcus musciformis, two minute Hymenoptera (wasps), only $\frac{1}{2}'''$ long, and the minute whitish mite, Acarus translucens. Of the members of this family of insects, the Coccidæ, some, as the cochineal and lac insects, are of great economical importance, but others, as the sugar-cane blight of the Mauritius, the Aspidiotus, and the coffee bug, are excessively baneful to the gardener and agriculturist.

The male of the *Brown* or *Scaly Bug*, Lecanium coffeæ, is of a clear light pinkish-brown colour, slightly hairy, and very pretty. It is more delicate than the male Pseudococcus. The females when young are yellowish, marked with grey or light brown; and old individuals are light brown, with a dark margin. It affects cold, damp, and close localities 3000 feet in height, and the propagation, as in the white bug, is continuous. The brown bug is much infected with parasites, amongst which the most common are eight minute Hymenoptera (wasps) with brilliant colours; but a mite, the Acarus translucens, and the larva of the Chilocorus circumdatus, a kind of ladybird, also feed on the bug. In the larva state, the male and female brown bug are not distinguishable. The number of eggs produced by a female brown bug is about 700. Those of the white bug are not so numerous, but their propagation in Ceylon is continuous throughout the year, and this explains their great abundance compared with cold countries, where the produce is one generation of young annually. The brown bug, particularly the full-grown female, is dreadfully infested with parasites, which thus greatly help the planter. Indeed, it is a question whether coffee-planting could be carried on without their aid in the destruction of the bug.

The *Black Bug* is Lecanium nigrum, but the female only is known. In colour it is from yellowish-grey to deep brown, and almost black in age, and of a shield-like shape. It occurs alone, but also intermixed with the brown bug, but it is much less abundant, and therefore not demanding the planter's attention. Its occupation of a coffee or any other tree gives rise to the appearance of a glutinous saccharine substance, which has received the name of honey-dew. This is either a secretion of the bug, or the extravasated sap which flows from the wounded tree, or probably a combination of both. A fungus, or two fungi, the Syncladium Nietneri and Triposporium Gardneri, seem to depend on this for vegetation, as the honey-dew and the fungus disappear with the bug.

Another bug, the *Strachia geometrica*, of a yellowish colour, but marked with grey and orange on the upper side, was found at Badulla. It feeds upon the juice of the young berries, three per cent. or more of which were said to have suffered from it. It is allied to the green or fœtid bug; but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

One of the Aphidæ, Aphis coffeæ, the coffee louse, is found in small communities on the young shoots and on the under side of the leaves of the cocoanut tree, but the injuries it occasions are insignificant.

Several caterpillars, the Aloa lactinea, the Orgyia Ceylanica, Euproctis virgunculà, the Trichia exigua, Narosa conspersa, the Limacodes graciosa, and a species of Drepana, are found on the coffee trees, but they do not cause much injury. Another caterpillar, however, though fortunately not abundant, the Zeuzera coffeæ, destroys many trees, both young and old, by eating out the heart. It resembles the caterpillar of the goat-moth of England, and is as thick as a goose quill. It generally enters the tree 6″ or 12″ from the ground, ascending upwards. The sickly drooping of the tree marks its presence.

Black Grub.—The larva of the moth called Agrostis segetum is the very destructive black grub. This pest is about an inch long, and is most abundant from August to October. The caterpillar lives in the ground, but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers, and are very destructive to gardens and in the field, as they eat everything that is artificially raised, despising grass and weeds. They generally appear only on certain fields, and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and in Europe, where it injures the grain and beet-root crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off, and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated, when it is mentioned that Mr. Nietner lost through them in one season, in certain fields, as many as 25 per cent. of the young trees he had put down.

The larva of a little moth, the Galleriomorpha lichenoides, and three caterpillars of the Boarmia leucostigmaria, B. Ceylanica, and Empithecia coffearia, are found on coffee trees and other plants from September to December.

The larva of the Gracillaria coffeifoliella mines the coffee leaves; it is very common, but of no importance to the planter.

The ravages of the large, well-known, beautiful locust, the *Phymatea punctata*, with its scarlet abdomen and yellow and bronze above, are not continuous in the coffee tree, but are occasionally very annoying. A swarm settled on a field of one-year-old coffee and gnawed the bark off the stems, causing them to throw out many shoots, and permanently disfigured five per cent. of the trees. They do not touch the Illuk grass, Saccharum Konigii, *Retz*, but seem only to attack cultivated plants and trees. At Tangalle they destroyed tobacco plantations, and at Matillee in Kandy the native grain crops were injured by these locusts. The larvæ and pupæ are as destructive as the perfect insects; but this seems, fortunately, the only species of locust that does any real injury in Ceylon, and this injury is in importance not to be compared with that done by other species in other countries.

White Grub.—Under this name are included the larvæ of various Melolonthidæ, the cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack; and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand fine old coffee trees. Mr. Gordon used to dig up the soil at the foot of the trees, and take out such grubs as he could find.

Weevils.—The family of the weevils is one of the most extensive amongst the beetles; and in Ceylon, as in Europe, many of its members do much injury to agricultural produce. Mr. Nietner had seen nearly the whole sweet potato (Batatas edulis) crop of the Negombo district destroyed by one of them, the Cylas sturcipennis. The common rice weevils Sitophilys oryzæ, is another instance; and one of the cocoanut tree destroyers of the Ceylon low country, the Sphænophorus planipennis, belongs also to this family. The Arhines? destructor, a beautiful green weevil, Mr. Nietner had not found do any injury to coffee trees; but Mr. J. Rose of Matturattee, writing to him, says, 'The mischief they do is plentiful, and if they were as plentiful as the bug, they would be the planter's worst enemies. Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. One year they appeared upon a neighbouring estate in great force, and ran over at least forty acres. The same thing occurred on three other estates.'

The *Acarus coffeæ*, or coffee mite, is so small as to be hardly perceptible to the naked eye. It is closely allied to the red spider of the hothouses of Europe. Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves, giving them a brownish sunburnt appearance. Individual trees suffer from its attacks, but the aggregate damage from it is not great.

The coffee rat of Ceylon, the *Golunda Elliotti*, occasionally commits much damage, seemingly to get the bark, for they do not seem to eat the berries. With their long sharp incisors they bite off with great smoothness the smaller and younger branches, generally an inch from the stem; and should the plants be quite young, just taken from the nursery, they bite them right off a few inches from the ground, and carry them to their nests in hollow trees. They appear irregularly at intervals from the jungles, and there is hardly an estate that does not now and then receive a visit from them. The natives of Ceylon say that their food in the jungles is a species of Strobilanthus, called Nilu in Singhalese, and that the rats only issue from their forest residence and attack the coffee estates when their forest food fails.

The injuries from other animals are not serious. A squirrel, the Sciurus Layardi, which eats the coffee berries, is common on estates; the pulp alone is digestible, and the coffee beans are dropped on logs of wood and on the ground. Jackals and monkeys occasionally do the same; this is called parchment coffee. A deer will now and then come from the forest and nibble the tops of the young trees.

Mantis tricolor, *Nietner*, the Mantis of the coffee tree, is green, lower wings reddish, with large blackish spot at the posterior margin. The female is 1 inch long, with 1½ inch of an expanse of wings. The male is considerably smaller. The eggs are deposited upon coffee leaves, in cocoon-like masses of ⅝ of an inch in length, but drawn out further at each end. As to the remedies to all these plagues, Mr. Nietner tells us that several means of checking the extension of the bug have been proposed and tried. Amongst these, the introduction of the red ant; but their bites are so fierce and painful, that the coolies refuse to go amongst the trees while the ants are there. Rubbing off the bug by hand has been tried, but it can only be attempted upon young trees without crop; Mr. Nietner, although allowing that an immense quantity of bug is thus destroyed, is nevertheless of opinion that the effect is but trifling. He thinks that the application of tar to the roots is a good suggestion, although he is obliged to admit that hitherto no important results have been achieved by it. He adds that high cultivation seems to have the effect of throwing it off. But as the bug seems to depend on locality, Mr. Nietner does not look for any beneficial result so long as the physical aspect is unchanged. He thinks that if the open, warm, airy pattenas were cultivated, which the experiments on a large scale, tried at Passelawa, show that they can be, the brown bug, which is the great destroyer, would not find the conditions favourable to its existence; or perhaps, if estates as a rule were made smaller than they generally are, if the reduction in acreage were counterbalanced by a higher system of cultivation, universally carried out, the bug would not be so numerous as it now is (Mr. Nietner). In the Peninsula of India, *borer* is a name given to the larva of certain coleopterous beetles, which injure coffee trees. There are two, the white and red borer, and the chief of these is the Xylotrechus quadripes of Chevrolat. The large and rapid introduction of coffee-growing into Ceylon and India has shown that the plant is liable to be attacked by many enemies, and ignorance of that has been the cause of much loss. Coffee trees in Coorg have also been injured by the rot, a disease resulting from improper pruning. The rot attacks and decays the centre of the stem. In Coorg, when the tree is attacked by the borer, the leaves become yellow and droop. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the females near the root of the tree, and the pupa borers tunnel up the heart of the plant.—*Nietner; Dr. Bidie on Coffee Planting.* See Coffee.

BUG of Miana. See Argas.

BUGGLECONDA, a steep basaltic hill rising about 1200 feet above the plain near Innaconda, in the Guntur collectorate of the Madras Presidency, and remarkable for the frequent earthquakes which occur at it. No crater has been observed, but it has three peaks, the central one being the highest. The name, meaning the charcoal hill, has been given to it from the black colour of its rocks. About the year 1840 earthquakes occurred several times in one month, and large stones rolled from the hill to the plains. Heynes says (Tracts, pp. 108–117) the Chicota hill has frequent earthquakes, and that the Ongole hill seemed to affect the compass.

BU-GHYEE-PHYOO. Burm. Clerodendron viscosum, *Vent.*

BUGIO, in Japan, a civil officer who exercises controlling powers over collectors, interpreters, and other inferior officers. See Japan.

BUGIS or Bugi, a bold, self-reliant, maritime people of Celebes, of which they occupy the northern part, and are known, in consequence, as Macassar men. The Bugis, originally from the same stock as the Malay, are superior to all other natives of the Archipelago in their spirit of adventure. They are a brave, active, haughty, fierce, and vigorous race. They love justice, and are faithful to their bonds, but seldom forgive injuries. Under the name of Macassars, they form the flower of the colonial troops in the Dutch service. Macassar was the most notorious place in the Eastern Archipelago for the Bugis people to run amok. On the average, one or two occurred in the month. It was in fact the national mode of committing suicide amongst the natives of Celebes, and was therefore the fashionable mode of escaping difficulties. Ten or twenty persons were sometimes killed and wounded at one of the amok. Stabbing and killing at all he meets, the amok runner is at last overpowered, and dies in all the excitement of battle. It is a delirious intoxication, a temporary madness, absorbing every thought and action (Wallace, i. p. 174). Although they bear some personal resemblance to the Malays, arising probably from a common origin, in every quality but courage they are essentially different. Exposed to the same temptations, and most skilful and adventurous navigators, they have never adopted the occupation of piracy, but abhor and resist it, and defend themselves against the Malay prahus with the most heroic and desperate valour whenever they are attacked, proceeding, if overpowered, to blow up their vessels rather than submit. The poorest of these hardy islanders is as impatient of a blow as a European gentleman; and it is permitted to any one to avenge an affront by the death of the person who offers it. A more than Spartan training is bestowed on children. The males at the age of five or six are removed from their parents, lest they should be made effeminate by indulgence, and they are not restored to their family until they are of an age to marry. They are the Phœnicians of the Indian Archipelago; and there is not a coast, from the northern shores of the Australian continent to the Malay Peninsula, where their ships are not habitually seen. They leave their country in the beginning of the eastern monsoon on a trading voyage, and proceed westward until they reach Singapore. With vessels of peculiar build, of from forty to fifty tons burden, they conduct almost the whole carrying trade of the

Archipelago. They own at least 1000 ships, the outward cargoes consisting of cotton cloths, gold dust, edible birds' nests, tortoiseshell, trepang or sea-slugs for Chinese epicures, scented woods, coffee, and rice; and in spite of the jealous and restrictive policy of the Dutch, they have greatly contributed to diffuse British manufactures throughout the islands of the eastern seas.

In the beginning of the western monsoon, they go in great numbers to the Aru islands, which is the principal rendezvous for the people of Ceram, Goram, the Ki islands, Tenimber, Baba, and the adjacent coast of New Guinea, a distance from Macassar of upwards of 1000 miles. They carry English calicoes, cotton goods of their own manufacture, Chinese gongs, and arrack; and the return cargoes are tortoiseshell, mother-of-pearl shell, pearls, birds of paradise, and trepang, the Malay term for all the kinds of holothuriæ or sea-cucumbers. Of trepang alone about 14,000 pikuls are yearly shipped from Macassar, of a value of 600,000 dollars, or £150,000. It is estimated that the annual value of goods carried by the Bugis to the Aru islands from Macassar alone is 80,000 dollars, or 200,000 guilders; and of those taken to the Aru group from other places, 20,000 dollars, or 50,000 guilders. Bugis are subdivided into many nations, — united, however, by the common ties of similar language and similar institutions. There is but one of their tribes distinguished for maritime enterprise and commercial spirit, the Wajo or Tu-wajo people. Their original site is in the interior of Celebes, on the northern banks of an extensive fresh-water lake, 24 miles in breadth, from which a river issues, to fall into the Gulf of Boni. Their voyages extend from Siam to N. Guinea, and from Manilla to Acheen. They are the great carriers of the Archipelago. In the year 1825 they had 786 trading prahus. Amongst the Bugis traders to the east, Kilwara is their metropolis. It is a mere sandbank, lying between Ceram Laut and Kissa, and offers good anchorage in both monsoons. Horses are bought at Gorontoto in Celebes.— *Quarterly Review*, No. 222, p. 502; *Bikmore*, 101; *Oriental Herald*, vii. p. 140.

BUGLAR, a tree of Chutia Nagpur; its bark, powdered, is used as a substitute for glue.

BUGLI. HIND. Spiræa Lindleyana.

BUGO, of the Philippines, Chavica seriboo, *Miq.*

BUGRA. HIND. Gynandropsis pentaphylla.

BUGRI. HIND. Cleome ruta.

BUGTI, a wild Baluch tribe on the western bank of the Indus, near Shikarpur, in the hills east of Lehrat. They are one of the great Rhind tribes. Some of them are serving in the Panjab cavalry, and many were in the Sind service. They are subjects of the khan of Kalat. The Bugti and Murree occupy the mountain district which extends eastward to the south of Sind and Kutchi.

BUG-TRORA. MAHR. Tecoma undulata.

BUHIRA. BENG. Terminalia rubrica.

BUHOOARI. BENG. Cordia myxa, C. latifolia, Terminalia bellerica, T. Moluccana.

BUHOW, a tribe lying south of Kashmir, little reclaimed from barbarism.

BUI, HIND., seemingly from Bhoom, land, uncultivated land. The name of several plants,— the Crotalaria burhia; Agathotes, *sp.*; Francœuria crispa; Ballota limbata; Plectranthus rugosus; Ærua bovii; Panderia pilosa.

Bui Champa, Kæmpferia rotunda.

Bui-Choti, Anabasis multiflora.

Bui Madaran, Achillea millifolium, Artemisia Indica, Artem. vestita, *Wall.*

Bui-Mung, and Bui-Singh, Arachis hypogæa.

Buin Aonlah, Phyllanthus niruri.

Buin Kaviti, Feronia elephantum.

BUILDING MATERIALS. In the Peninsula of India, all the most ancient buildings are of stone, while the edifices of the past five hundred years, comprising some of the most stupendous piles, are of brick. The great religious institutions of Sri Sailam in Cuddapah, at Conjeveram, Chellambram, Srirangam, the temples at Tanjore, Gangondaram, and Tribhuwanam, the ruins at Bijanagar, Bijapur, Gogi, and Kulburga, the pagoda at Leepichi in the Bellary, and that at Tarpatri in the Cuddapah district, monuments of ancient Hindu and Mahomedan art, are of stone. Those connected with architecture, sculpture, and painting, called into being by the exigencies of religion, always the best stimulus to works of design, have suffered more from sectarian zeal than the ravages of time, and they are widely scattered over the length and breadth of the land. Sculptured stones, fortifications, temples, and works of irrigation are found in every direction, and not only impart a knowledge of the state of science and civilisation at various periods, but throw a valuable light on other subjects of inquiry. The recent advent of the British nation into India, the efforts needed to obtain a standing-place, and the duty devolving on them of introducing useful public works, have all hitherto prevented them from engaging in ornamental architecture. The cupola of the Presbyterian church at Madras, built by Colonel de Haviland, is good, and there are a few ornamental buildings in Calcutta and Bombay. But works such as the Ganges Canal, the Southern Coast Canals, already extending almost from the Brahmaputra and the Ganges to the western coast, the great dams across the Godavery and the Kistna, the tunnelling of the Ganges and Indus, the roads everywhere, from Cape Comorin to Tibet, the railroads with their stupendous bridges, and the irrigation canals, already in vastness and in public usefulness, surpass all that Aryan, Hindu, Buddhist, Pathan, Moghul, or Arab rulers had done during their previous 3000 years of occupation. The Moghul dynasties of India, besides palaces and tombs, porticos and mosques, left a few useful sarai and bridges, but many of these were erected by private persons.

In the northern part of the Peninsula, from the Central Provinces to the Godavery, is a great greenstone area, the trap flowing over and covering sedimentary rocks; and in the east, in the province of Hyderabad, is a vast Plutonic outburst of granite. On the south of this granitic and volcanic rock there had been an estuary, extending from north of Madras to the Kistna, and from the Bay of Bengal up the Kistna and Pennar to the sources of the Gutpurba and Malpurba, and it is now filled with distorted, broken, upraised limestone, blue slate, and sandstones, from near Curcumbarry, through Tarpatri, Cuddapah, Kurnool, to Kaladgi and Belgaum. To the south of that narrow gulf is the great granitic tract of Bellary and Mysore, succeeded further south, about Trichinopoly and Madura, with other

limestone beds, both fossiliferous and non-fossiliferous; and from these volcanic, metamorphic, and aqueous-formed rocks, building stones are drawn.

Laterite rock is a clay iron ore peculiar to India; it is widely diffused, and has been largely used in India. The Arcade Inquisition at Goa is built of it; also St. Mary's Church, Madras, and the old fortress at Malacca.

Trap-Tuffa, sometimes white, sometimes greenish or purple, resembles laterite in the quality of being easily cut when raised, afterwards hardening on exposure to the air. It is used as a building stone, and suits well for basins, troughs, and aqueducts; it is not very extensively employed.

Littoral Concrete is invariably found close by the sea-shore, and is so named from its resemblance to the artificial stone formed by the cementation of sand, gravel, or other coarse material, by lime or mortar. It is composed of the material prevailing on the shores,—of shells, sand, gravel, and pebbles,—and varies in its character with the rocks in the neighbourhood, being micaceous towards Cochin and Tellicherry, from the quantity of sand and other nodules from the granite and gneiss; gravelly to the north of Bombay; and around it, composed almost entirely of fragments of shells. Along the shores of Sind, Arabia, and the Red Sea, though the material composing it is abundant in a position similar to that in which it exists on the Malabar coast, but it is nowhere cemented into stone. Even in Bombay the cementation is far from invariable. The principal quarries are at Versova, about twenty miles to the north of Bombay, where the shore is sheltered by a vast dyke of basalt, formerly submerged.

The sand is first removed, and the rock is smoothed on the surface. A space about twelve feet each way is next divided into slabs one foot square, the grooves between them being cut with a light, flat-pointed, single-bladed pick. These are raised successively by a tool something between an adze and a mattock, a single stroke of which is in general sufficient for the detachment of each from its bed. The blocks thus cut out and raised being laid aside, the bed is once more smoothed, and the operation resumed, till the pit reaches the depth of six or eight feet. This variety of building material is brought in vast quantities to Bombay, where a large portion of the native houses are built of it. It is not very strong, but, with the admirable cement employed, it makes a good and economical wall.

Trap.—In the Dekhan, the most massive structures are raised and carved on trap with delicacy and correctness. The favourite material for the over-ground Mahomedan tombstone is basalt, and, after many hundred years, the Arabic letters, carved in relief, are as sharp as on the day they were first cut. The vaults and domes of tombs and temples are commonly bolted with iron from top to bottom; and in many cases, instead of scaffolding, the structure is surrounded with a rough wall, ten or twenty feet off, the interval between being filled up with earth; a long inclined plane serves for raising the stones. A magnificent structure of this sort, the tomb of one of the Gwalior princes, has stood half-finished near Poona since the early part of the 19th century, and here native architecture may be seen in perfection in all stages of advancement.

BUILDING MATERIALS.

The only other building material at the Bombay Presidency consists of a fine-grained variety of nummulite, like Bath oolite, called, from the name of the place whence it comes, Porebunder stone.

All over India, bricks, laterite, and clay are largely used; in the Mauritius, stone and slabs of coral rock. In many parts of Bengal, wattle-work is in use for houses.

Since Indian railroads were commenced, with their great spanning bridges, the rocks of all their neighbourhoods have been largely utilized; and buildings formed of the greenstones, granites, limestones, clayslate, and sandstones are everywhere to be seen. Throughout the great volcanic district of the Dekhan, the various kinds of greenstone are largely used. On the blue slate formation, along the valleys of the Kistna and Tumbudra, and on the compact limestone formation on each side of these rivers, houses have ever been formed from these materials; but the favourite rock for ornamental purposes in the Buddhist and Hindu temples of peninsular India, is the dark basaltic greenstone, often, from its high polish, called black marble. In an ancient underground temple at Bijapur this basalt is alone employed. The Brahmanical and Buddhist caves of Ellora and Ajunta, and the smaller caves at Mominabad, are excavated out of the greenstone and greenstone amygdaloid. At Ellora they are about twenty in number, in the face of the mountain, almost scarped as it falls into the valley of the Godavery; a similar number are at Ajunta, in a ravine near the scarped ghats overlooking Kandesh. Those on the right bank of the Irawadi, near Prome, look on the river. In Madras and Calcutta, and in Indian towns generally, brick is the ordinary building material. In the whole of Burma and the Tenasserim Provinces, the houses are on posts, and built of wooden planks with shingled roofs.

Of the rocks of aqueous origin, the sandstones, slates, and limestones, the whole of the valley of the Kistna, and great parts of the valleys of its affluents, the Gutpurba, Malpurba, Bhima, Tunga, Bhudra, and Tumbudra, and much of the valley of the Godavery and of the valleys of its northern affluents, have limestone, clayslate, and sandstone rocks, and the houses and more extensive buildings are all built of these. The compact limestone of Kurnool, westward to the Bhima, is an excellent building material.

The whole of the Kymore range in Shahabad is described as of mountain limestone, which also shows itself in the valley of the river Sone as far at least as Mungeysur peak in Mirzapur; and it crops up at Rhotas, forming a sloping base to the precipitous sandstone rock. Below the mountain limestone is one of a plush grey colour, mixed with occasional crystals of calc spar; this, like the Kurnool stone, is admirably suited for lithography. Below the latter, in Kymore, is a limestone of a hard, tenacious, almost indestructible composition, admirably suited for building.

The sandstones of the Kymore range have a high commercial value at Chunar and Mirzapur, being used as flagstones and for ornamental purposes, the proximity of the Ganges affording an easy river carriage; otherwise they are the worst and most destructible description of stone in the range. The millstones of Chynepore, Sasseram, and Tilowthoo (perhaps also Akbarpur), are famous, but must always be dear in a distant

market, for want of river carriage. The Sone causeway and the Koylwan railway bridge are built of the dense sandstone of Sasseram; little quantities are found in the higher portions of the range towards Rhotas. The best stone, while easily workable, is almost as hard as granite, and may be had of any colour, white, crystalline, blue, grey, and all shades to a dark red.

Flexible sandstone is found at Ulwar, Jhend, and Jubbulpur.

At the Panjab Exhibition held at Lahore, there was a good collection of building materials from Sahi Balabgarh in the Dehli district, including the red, the spotted, and the light-coloured sandstone so much used in the large buildings of Upper Hindustan; and from the same place were polished blocks of white marble, and a pretty dappled grey marble, called Narnaul marble, from the Hissar district. From the Kangra district there was sent grey limestone, sandstone of two sorts, both good for building, and granite. Some nice workable sandstone sent from Madhopore must come from the hills above that place. From Kashmir there was some black marble, and some polished slabs of serpentine, which is found at Tashgaon in Little Tibet. The Salt Range, Jhelum, and Shahpur districts possess good building stones, sandstone, and calcareous sandstone; from Jhelum were specimens of marble which might become useful for building, with gypsum or alabaster of the same hills. See Architecture.

BUIST, DR. GEORGE, LL.D., a voluminous writer on general and scientific subjects relating to India, viz.: Manual of Physical Research, Report of Meteorological Observations at Bombay in 1842 and 1844; On the Saltness of the Red Sea, Bom. Geo. Trans. ix. p. 39; Catalogue of Remarkable Hailstorms in India, ibid. p. 184, Rep. Brit. Ass., 1850; Notice of Remarkable Meteors in India, Bom. Geo. Trans. ix. p. 197, Rep. Brit. Ass., 1849 and 1852; Outline of the Operations of the British Troops in Sind and Afghanistan, Bombay 1843; Annals of India for 1848–49; On Woods in India in 1849, Edin. Phil. Jl. (Jameson's), 1851, ii. p. 52; On the Evidence of the General Upheaval and Depression around the Sea-shores of India and Northern Europe, ibid. 1851, Edin. Ph. Jl. 1851, Bom. Geo. Trans. Reports, 1850–51, Rep. Brit. Ass., 1851; On the Visible Appearance of the Seasons in Western India, without reference to Instrumental Observation, Rep. Brit. Ass., 1851; Desultory Remarks on the Oriental Sculptures or the Runic Stones of Scotland, Bom. Ass. Trans. ii. p. 43, Bl. Ass. Trans. 1851; On a Cheap Form of a Thrashing Mill employed in England, and well suited for India, Bom. Agri. Trans., 1842; On the Various Forms of Windmills in use in Europe and Egypt, with Water-raising Machines made use of in the East, with numerous illustrations, Bombay 1848, folio; On the Connection betwixt Oriental and Scandinavian Antiquities, Bl. Ass. Trans., 1852; On the Volcanoes, Volcanic Phenomena, Hot Springs, etc., betwixt the line and 32° N., Bom. Geo. Trans., 1852, x.; On the Geology of Bombay and the Adjoining Islands, ibid.

He accepted employ under the Government of India at Allahabad, but became ill, and returned to Calcutta, where he died. He was one of the most distinguished students of physical science in India, and one of the veterans of the Indian press.—*Dr. Buist's Catalogue.*

BUJI BABBAR. HIND. Eriophorum comosum.

BUJLO. HIND. Oreoseris lanuginosa.

BUJOOR. BENG. Corypha elata.

BUJRA. HIND. Cleome ruta.

BUJRA, a large, commodious, but generally cumbrous and sluggish boat, having more pretensions to comfort than speed, used for journeys up the Ganges. See Boat.

BUK or Buka. BENG. Agati grandiflora.

BUK. HIND. Land recovered by the recession of a river. Bukara, land left by a river, but rendered useless by a covering of sand.

BU'KALAMUN. ARAB. Chameleon.

BUKAN. HIND. Eclipta erecta, Lippia nodiflora.

BUKAYUN. PERS. Melia sempervirens.

BUKBUR. ARAB. Fruit of Cassia fistula.

BUKCHI. HIND. Conyza anthelmintica.

BUKEPHALA, a city built on the scene of Alexander's battle with Porus. Strabo says it was on the left bank, where Alexander had crossed; Plutarch says it was near the Hydaspes, where Bucephalus, Alexander's horse, which was killed here, was buried; Arrian, Diodorus, Curtius, and Justin say it was opposite to Nikæa. According as we follow Strabo or Arrian, it was at Dilawar or at Jalalpur, each of them 6 miles from Mong, the battlefield of Nikæa.—*Cunningham*, p. 177.

BUKHARA, the capital of a khanate in Central Asia, the chief point of Central Asiatic trade. Its name has been supposed to be derived from Vihara, a Buddhist monastery, but Mahomedan authors say that Bukhar meant Majma-i-ilm, *i.e.* a place for the collection of knowledge, that is, a college or school. Turks pronounce the word Bukhara, while the Persians say Bokhara.—*Vambery, Bokhara*, p. 14.

BUKHARIA, also called Little Bukharia, also Eastern Turkestan, bounded on the north by Mongolia, on the east by the Shami or Kobi desert, on the west by Kokhand and Badakhshan, and on the south by the Tsung Lung or Korakoram range of hills, which separates Little Bukharia from Little Tibet. The inhabitants of Little Bukharia speak Turki, and profess the Mahomedan religion. The Uigour Hoei-hou, called simply Hoei-hoei, under the Mongol dynasty of Yuan, were Mahomedans, and this name is applied by the Chinese to all those of the same religion. The inhabitants of the towns of Little Bukharia are in part descendants of the ancient Uigour or Hoei-hou, and consequently Turk; in part Sarti or Bukharians, who are scattered as merchants all over Central Asia, and who are Iranians. There are many of them at Pekin, Hang-chu-fu, Canton, and other commercial cities of China. Their mother tongue is Persian; but they also speak the oriental Turki, which is the general language of Turkestan, and the most diffused in Little Bukharia. The Uigour writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the old Syriac character through the Nestorians. The modern Tartar characters are written (and, it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. What Uigour meant with Mongol authors is doubt-

ful, but the people and language so called by the western Asiatics were Turk. Captain Valikhanoff speaks of the language now in use at Kashgar as being Uigour, but it is not clear whether he means that this term is known to the natives.—*Russians in Central Asia*, p. 67; *Yule, Cathay*, i. p. 206; *Timkowski's Journey to Pekin*, i. pp. 6,378–79.

BUKHO, the Karen priest and physician.

BUKHUR. ARAB. Incense or fumigation.

BUKI. HIND. Equisetum debile.

BUKIT. MALAY. A hill. Bukit gadong, a locality in the Malacca district occupied by the Jakun race.

BUKIYANI, an industrious cultivating tribe of Mahomedans in the Multan division of the Panjab. They were Chauhan Rajputs, and about the 16th century became converts to Islam.

BUKKAPU. TEL. Cæsalpinia sappan.

BUKKAR-ul-WASH. ARAB. The wild cow.

BUKKUR, a fortified island in the Indus river. It is in the centre of the stream, nearly opposite the town of Rori; and on the western bank is Sikkur, now called Victoria on the Indus. Bukkur is in lat. 27° 42′ 45″ N., and long. 68° 56′ 30″ E. It is a limestone rock 2400 feet long, 900 broad, and 25 in height. On its north is the holy islet of Khaja Khizr or Jind Pir, and on its south is that of Sadh Bela. It has been held successively since the 14th century by the Summa Rajputs, the Dehli, Kalhora, Afghan, and Talpur rulers, and was ceded to the British in 1839.—*Burton; Postans; Imp. Gaz.* See Bakkar.

BUL. SANSK. Force, strength; pronounced Bal, also Bil.—*Ell.*

Bul-Arati, a name of Indra as the destroyer of the giants.

Bul-Bhog. HIND. Taking forcible possession of property; from Bul, force, and Bhog, wealth.

Bul-Kut, rent taken in advance.—*Elliot, Glossary.* See Bal.

BULA. BENG. Paritium tortuosum.

BULAHUR, HIND., also Buladhur, from bullana, to call; a village servant in Allahabad district serving as a guide or messenger.—*Ell.*

BULAK, said by Niebuhr (i. p. 63) to be the Latopolis of the ancient Greeks. Bulak has been for centuries the river port of Cairo, although originally a mile distant from it, and it has now become incorporated with that city. The Museum of Egyptian Antiquities, a magnificent collection, entirely unrivalled of its kind, was established at Boulac by Ismail, Khedive of Egypt.

BULANDSHAHR, a town often called Baran, in the N.W. Provinces, on the west side of the Kali Nadi. It gives its name to a district in the Doab between the Ganges and the Jumna, between lat. 28° 3′ 30″ and 28° 42′ 45″ N., and long. 77° 20′ and 78° 31′ 45″ E.; area, 1910 square miles, and population, 936,667. It is said to have formed part of the great Pandava kingdom ruled over from Hastinapur, a city which was cut away by the Ganges. Bulandshahr was approached by Mahmud A.D. 1018, and its people embraced Mahomedanism. A.D. 1193, Kutub ud Din captured it from the Dor raja by the treachery of his cousin Ajaypal, who accepted Mahomedanism, and whose descendants still hold lands there. Rajputs since, for a time, occupied the district, expelling the Meo. It has been under the Dehli and Mahratta rule, and in 1803 became British territory. During the mutiny the Gujar and others held the district from the 21st May to the 4th October. The people are Hindus, Rajputs, Mahomedans, with Chamar, 146,149; Jat, 56,453; Lodha, 51,513; Gujar, 48,786; Khakrob, 29,501. Coins of Alexander the Great and of the Indo-Bactrian kings are being found at Baran to the present day.

BULAQ. HIND. A jewel worn in the septum cartilage of the nose.

BULAT. BENG. Phaseolus mungo, *Linn.*

BULAT-WÆLA. SINGH. Chavica seriboo.

BULBASSI, a Kurd race, composed of—1. Kabaiz, the reigning family; 2. Manzoor; 3. Mamash; 4. Piran; 5. Rummook; 6. Sinn and Taafah, who together make one tribe. They are all predatory. The chiefs of tribes are called Muzzin. The price of blood among the Bulbassi is 22 oxen; but it may be made up in other effects, to which often a nominal value is attached, more than twice the real amount, when the affair is to be compounded amicably. The crimes punished with death are adultery, seduction, and such like. The Bulbassi are endogamic. They have courtship among them, and carrying off a girl by the lover is common. When a chief dies, if his eldest son is incapable, the best of the brothers succeeds. In their own country the Bulbassi do not willingly acknowledge any superior, either Turkish or Persian, but when they descend into the regions of Karatchook they pay a tribute of sheep to the Bey. Most of the principal people among them possess a complete suit of mail. For curing wounds they sew the wounded man in the skin of a bullock fresh stripped off the animal, leaving only his head out.—*Rich, Kurdistan*, i. p. 133.

BULBUL. PERS. A term employed among the various Mahomedan nations of Southern Asia, to designate birds belonging to several generic divisions of a natural family. The Persian bulbul is a species of true nightingale; it is the Luscinia major (or Sylvia philomela of Temminck), and is known as the Bulbul-i-bostan in India, where it is frequently imported as a cage-bird. In Persia it is often called the Bulbul-i-hazar dastan, the bulbul of a thousand notes; and its genus, Luscinia, is very closely allied to the small thrushes of America. The Persians delight to speak of this favourite song-bird, which Moore has made widely known:

'There's a bower of roses by Bendemeer's stream,
And the nightingale sings round it all the day long:
In the time of my childhood 'twas like a sweet dream
To sit in the roses and hear the birds' song.
That bower and its music I never forget;
But oft, when alone in the bloom of the year,
I think, Is the nightingale singing there yet?
Are the roses still bright by the calm Bendemeer?'

It is migratory there, making its appearance with the roses in April, and disappearing with the rose at the end of summer. According to Zakary bin Mahomed-al-Kaswini, the Persians say the bulbul has a passion for the rose, and laments and cries when he sees it pulled. The English nightingale, Luscinia philomela (Philomela luscinia), is migratory through Europe, N. Africa, and Asia Minor, but is not known in India or Persia. Indeed, there is no true nightingale, wild, in British India; but the shama, Cercotrichas macrourus, undoubtedly the finest song-bird of British India, is not unfrequently designated the

Indian nightingale. It is common to India and the Malay countries; and there is a second species (C. luzoniensis) in the Philippines, and a third (C. erythropterus) in Africa. The esteemed Indian songster is le merle tricolor de longue queue of Levaillant (Oiseaux d'Afrique, pl. 114). We may remark that the Orocetes cinclorhyncha is also termed shama in the Madras Presidency. The bulbul of Southern India is not even a song-bird, the term being applied to the Bulbul-i-gul-dum, Hæmatornis cafer, which is a common cage-bird, and, like quails and cocks, trained to fight; and when pitted against an antagonist, it will sink from exhaustion rather than release its hold. The Husaini bulbul, also called the Shah bulbul, is of another sub-family, the Myagrinæ, and is known also as the Paradise fly-catcher. It is of a chestnut colour for many months, but becomes white in the breeding season. It is a very graceful bird, with very long tail feathers, and it is a pretty sight to see it flitting from tree to tree. How the birds prevent the long tail feathers from becoming entangled in the thorny trees, is very curious. In Ceylon, the chestnut bird is called the fire thief, and the white bird the cotton thief. Its colouring is chaste, and its movements in flight graceful. Mr. Layard has often watched them, when seeking their insect prey, turn suddenly on their perch and whisk their long tails with a jerk over the bough, as if to protect the feathers from injury.

In the Madras Presidency, the three-coloured thrush, Geocichla cyanotus, is sometimes called a bulbul; and the hill bulbul of Matheran is the Otocompsa jocosa. It has crimson ear-tufts.

Dr. Jerdon arranges the Brachypodidæ into four sub-families, — the Pycnonotinæ or true bulbuls, the Phyllornithinæ or green bulbuls, the Ireninæ or blue-birds, and the Oriolinæ or orioles. He names—

Hypsipetes psaroides, *Vig.* Himalayan black bulbul.
H. Neilgherriensis, *Jerdon.* Neilgherry black bulbul.
H. Ganeesa, *Sykes.* Ghat black bulbul.
H. M'Clellandi, *Horsf.* Rufous-bellied bulbul.
Hemixos flavala, *Hodgson.* Brown-eared bulbul.
Alcurus striatus, *Blyth.* Striated green bulbul.
Criniger ictericus, *Strickland.* Yellow-browed bulbul.
C. flaveolus, *Gould.* White-throated bulbul.
Ixos luteolus, *Less.* White-browed bush bulbul.
I. xantholæmus, *Jerdon.* Yellow-throated bush do.
Kelaartia penicillata, *Blyth.* Yellow-eared bulbul.
Rubigula gularis, *Gould.* Ruby-throated bulbul.
R. flaviventris, *Tickell.* Black-crested yellow bulbul.
Brachypodius poiocephalus, *Jerdon.* Grey-headed do.
Otocompsa leucogenys, *Gray.* White-cheeked crested bulbul.
O. leucotis, *Gould.* White-cheeked eared bulbul.
O. jocosa, *Linn.* Red-whiskered bulbul.
Pycnonotus pygœus, *Hodgson.* Common Bengal do.
P. pygœus hæmorhous, *Gmelin.* Common Madras do.
Phyllornis Jerdoni, *Blyth.* Common green bulbul.
P. Malabaricus, *Lthm.* Malabar green bulbul.
P. aurifrons, *Temm.* Gold-fronted bulbul.
P. Hardwickii, *Jard.* and *Selb.* Blue-winged bulbul.
Iora Zeylonica, *Gmelin.* Black-headed bulbul.
I. typhia, *Linn.* White-winged green bulbul.
I. scapularis of the Archipelago.
I. Lafresnayii of Arakan.

—*Jerdon, Birds of India; Layard's Nat. Hist. of Ceylon; Cal. Rev.* See Birds.

BULBUL CHASM. Pers. Literally, bulbul eye. A pattern produced in weaving.

BULCHA, a pass in Kamaon, in lat. 30° 28′ N. and long. 88° 14′ E., over a high ridge, extending E. and W.

BULD. Hind. Horned cattle. Buldea, a cowherd.—*Ell.*

BUL-DAN. Amongst the ancient Hindus, the sacrifice of a bull to Balnath, the lord Bal, the sun. Balnath was the deity worshipped by the Saura races in Gujerat, and was identical with the Syrian Bal. That ancient sacrifice has long ceased. Four altars were erected for offering the flesh to the four gods, Lakshmi-Narayana, Umia-Maheswar, Brimha, and Ananta. The nine planets, and Prithu, or the earth, with her ten guardian deities, were worshipped. Five Vilwa, five Khudiru, five Pulashu, and five Udumburu posts had to be erected, and a bull was tied to each post. Clarified butter was burnt on the altar, and pieces of the flesh of the slaughtered animals placed thereon. Another description says that a covered altar had to be prepared. Sixteen posts had then to be erected of various woods; a golden image of a man, and an iron one of a goat, with golden images of Vishnu and Lakshmi, a silver one of Siva, with a golden bull, and a silver one of Garuda, the eagle, were placed upon the altar. Animals, as goats, sheep, etc., were tied to the posts; and to one post, made of the wood of the mimosa, was to be tied the human victim. Fire was to be kindled by means of a burning-glass. The sacrificing priest, hota, strewed the grass called d'hub, or immortal, round the sacred fire. Then followed the burnt sacrifice to the ten guardian deities of the earth,—to the nine planets and the Hindu triad, to each of whom clarified butter was poured on the sacred fire one thousand times. Another burnt-sacrifice, to the 64 inferior gods, followed, which was succeeded by the sacrifice and offering of all the other animals tied to the posts. The human sacrifice concluded, and the sacrificing priest offered pieces of the flesh of the victim to each god as he circumambulated the altar.

At the present day the bull is often devoted by Hindus to the gods, on the 11th day of mourning for a near relative. In this a marriage ceremony is performed, called brikhotsarg, or abandoning of a bull. Brik means a bull, and also the zodiacal sign Taurus. The brikhotsarg marriage ceremony is performed in the name of the bull, after which the animal is set free to roam; and in some Hindu towns of India these devoted cattle infest the streets and roads, and are very numerous and very troublesome. In several Mahratta towns they were often let loose. In Benares they are still in numbers; and whatever they may do or wherever they may lie down, they may be patted, spoken to, or even shouted at, but never struck. They are called Bijar, Saur, Brahmany bull. A similar marriage ceremony is performed with a well and orchard.—*Ward on the Religion of the Hindoos*, ii. p. 263; *Elliot*, 260. See Banotsarg; Bull; Jalotsarg.

BULDANA, a small walled town on a plateau in the Berar Assigned Territories. It is the chief town of a district of 2807 square miles, and a population of 404,042 souls, three-fourths Hindus, composed of several plateaux, with small fertile valleys intervening. Since 1318 it has been under Mahomedan rulers; but prior to that a Jaina dynasty seems to have held sway, and remains of their temples are to be seen at Deolghat, on the Penganga, at Mehkar, at Sindhked, Pimpelgaon, and at Lona. Besides the Mahomedans, in 1867—

Brahmans,	10,500	Dher,	38,928
Kunbis,	158,289	And,	7,444
Brinjara,	11,590	Gond,	309
Mali,	11,424	Koli,	2,607
Marwari,	2,819	Bhil,	416
Bania,	4,745	Lar,	1,777
Rajput,	3,468		

BULDEO, in Vrij, is a shrine of Buldeo, who is supposed to be the Hercules of the east and west, his club a ploughshare, and his covering a lion's skin. The complexion of Buldeo is depicted white, and that of Krishna black or azure. See Baldeva.

BUL-DHOON, the valley of Sookeytmundi in the Kohistan of Jullundhur, but also called Kangra Bhawan, also Pallam Pattiar. Natives of the Bul-dhoon and Kulu have sallow complexions, and seem of the same race as the natives of Bushair. The men are tall and strong, but few of them are handsome. Many of the young women are pretty, but at the age of 20 or 25 they become coarse and stout. It was the practice for the women, gaily dressed, to assemble and greet a stranger with songs as he entered each village, for which honour he was expected to give a rupee to each knot. The men and women dress almost similarly.—*Masson's Journeys.*

BULESUR, a subdivision of the Gujar race.

BULGAR. HIND. Boletus igniarius.

BULGARIAN. The wild people who dwelt or wandered in the plains of Russia, Lithuania, and Poland, in the age of Justinian might be reduced under the two great families of the Bulgarian and Sclavonian. Those of the former nation, who touched the Euxine Sea and the Mæotis, derived from the Huns their name or descent. The evidence of language attests the descent of the Bulgarian from the original stock of the Sclavonian, or more properly Slavonian race; and the kindred bands of Servian, Bosnian, Rascian, Croatian, Wallachian, etc., followed the standard or example of the leading tribe. The first king of Bulgaria, in its present extent, was in A.D. 640, and their empire continued until 1017, when they were ruled by a lieutenant of the Greek empire.—*Chatfield's Hindustan*, p. 289.

BULGHAR, a town in Russia, where Russia leather is made; also Russia leather, corrupted into Bulkhal or Bhulkhal. In Persia, a kind of bottle, to hold nearly three quarts, is made of bulghar, to be used by horsemen travelling. It has a wooden stopper, and hangs from the saddle or girth, and swings under the horse. It is called matahrah or matarah.—*Ouseley's Travels*, i. p. 247; *Fraser's Khorasan*, p. 69.

BULI. BENG., HIND. Sterculia urens, *Roxb.*

BULJA-WANLU. TEL. A Sudra race of Telingana. See Balja.

BULKOKRA. BENG. Adelia castanicarpa.

BULL.

Al-Taur; Saur,	ARAB.	Taurus,	LAT.
Taureau; Bulle,	FR.	Nandi; Bail,	HIND.
Stier,	GER.	Nar-gao,	PERS.
Shur,	HEB.	Mar,	TAM.
Foro,	IT., SP.	Eddu; Basava,	TEL.

The bull has always held a prominent place in the religious systems of Asia. The sacred bull of the Assyrians, the Apis of the Egyptians, and the bull Nandi of the Hindus, are evidently identical types. The golden calf of the Israelites will not be forgotten. And for the use of the figure of the bull as a sacred ornament by the Jews, the brazen sea in the temple of Solomon may be cited (1 Kings vii. 25; 2 Chron. iv. 4, 5; and Jeremiah lii. 20). In Assyria, Baal, or the supreme deity, was worshipped under the form of a bull or heifer, as may be inferred from Tobit i. 5: 'Now all the tribes which together revolted, and the house of my father Nephthali, sacrificed unto the heifer Baal;' but the reading is doubtful.

In the English Scriptures, the word 'bull' is the translation of several Hebrew words; shor, a cow, theo, a wild bull; abbire, tor. A calf was in Hebrew ogel, in Arabic, ajel. Jeremiah xxxiv. 18 and 19 tells of a sacrificial rite of splitting a calf in two, and men passing between the parts; and bull-worship is noted in 1 Kings xii. 28, 29, 30, the images being of gold. In ancient Western Asia, Bal and the brazen calf were specially worshipped on the fifteenth of the month (see 1 Kings xii. 32); and at present, in India, the sacred day of Bal-Eswar, with his Vahan bull Nandi, is the amavasa, the moonless fifteenth day of the month. The bull was offered to Mithras by the Persians; and, opposed as it now appears to Hindu faith, he formerly bled on the altars of the sun-god, on which not only the Buldan offering of the bull was made, but human sacrifices.—*Layard, Nineveh*, ii. pp. 474-5. See Bul-dan.

Apis, the sacred bull of Egypt, was chosen by the priests of Memphis for its black and white spots; and Mnevis, the sacred bull of Heliopolis, had nearly the same marks; but the Hebrews, in preparing their water of purification, were ordered (in Numbers xix. 2) to kill a red heifer without a spot. Amongst the Egyptians, the solemnities at the burial of Apis were entirely Bacchic. The priests did not wear the nebris or deer skin, but they wore the panther skin, and carried thyrsus staves. The brazen calf mentioned in Scripture as an object of worship by the Hebrews, is still worshipped by Hindus in India, frequently of brass, but oftener of stone. Some of the Hindu images of the bull are of colossal size. One, supposed to be the largest in the south of India, is to be seen at the Charmandi hill in Mysore. It is carved out of a solid rock at the side of the hill, and is approached by ascending 660 stone steps. There is also a magnificent temple of Siva at Tanjore, with a great bull in front. Siva, under the name of Mahadeva or Eswara, is the tutelary divinity of the Rajputs in Mewar; and, from the early annals of the dynasty, he appears to have been, with his consort Isani, the sole object of the Gehlot Rajput's adoration. Eswara is there adored under the epithet of Eklinga, and is either worshipped in his monolithic symbol, or as Eswara Chao-mûkhi, the quadriform divinity, represented by a bust with four faces. The sacred bull Nandi has his altar attached to all the shrines of Eswara in India, as was that of Mneves or Apis to those of the Egyptian Osiris. Nandi has occasionally his separate shrines, and there is one in the valley of Udaipur which has the reputation of being oracular as regards the seasons. The bull was the steed of Eswara, and carried him in battle; he is often represented upon it, with his consort Isa, at full speed. In Ceylon, to every herd of cattle there is a sacred bull, who is supposed to exert an influence over the prosperity of the flocks; his horns are ornamented with tufts of feathers, and

frequently with small bells, and he invariably leads the great herd to pasture. On starting in the early morning from the cattle kraal, the natives address the bull, telling him 'to watch over the herd; to keep the cows from straying, and to lead them to the sweetest pastures, so that they shall give abundance of milk,' etc.—*Bunsen*, i. p. 432; *Tod's Rajasthan*, i. pp. 222, 514; *Tennent's Ceylon; Vossius de Idololatria; Bryant, Analysis; Hancarvelle, Recherches sur les Arts de la Grèce; Ouseley's Travels*, i. 280; *Ward's View*, ii. 143. See Bul-dan.

BULLA. DUK. Terminalia bellerica. SANSK., Pavonia odorata.

BULLA, the polo game of the Dard.

BULLAIN-LENA. HIND. A ceremony amongst Mahomedan and Hindu women in India, in which the woman sweeps her hands down from the head to the feet, and then raises them to her own head, supposed to take the other's evils on herself.

BULLAR, HIND., Lablab vulgare, L. cultratum.

BULL-FROG of Malabar, Rana Malabarica.

BULLY TREE. Achras sapota.

BULOOSITOON ROOMANI, Buloositoon Yunani; Punica granatum.

BULPAM. TAM. Bulpamu, TEL. Soapstone.

BULRUSHES, Typhaceæ.

Jonc, ...	FR.	Pun, ...	SIND.
Goma, ...	HEB.	Booree; Putera, riri, ,,	
Giunco, ...	IT.	Junco, ...	SP.

Bulrushes, so conspicuous in the marshes of Europe, extend to similar situations in most parts of India. The leaves are in some parts of Europe employed in making mats and winter coverings for plants, as well as for stuffing chairs, putting between the staves of barrels. The leaves of putera and riri (Typha elephantina and T. angustifolia) are employed in making mats in North-West India. In Sind the former is called pun, and its leaves employed for making mats and baskets. The pollen, like that of Lycopodium, is inflammable, and used as a substitute for it as in Europe. It is also collected in Sind, and there called booree. Elephants are fond of T. elephantina. It is a valuable sand-binding plant, and it is tied into bundles as a swimming float.—*Royle, Fib. Pl.* p. 35.

BULSUN. A Native State, originally a feudatory of Sirmoor, but a separate sunnud was granted to it in September 1815. Its tribute payment is Rs. 1080. Its chief is of Rajput origin. Thakur Jograj was created a rana in 1858, for services rendered during the mutiny. The revenue of the state is Rs. 6000, and the population 4892.

BULTI extends from the confines of Ladakh westward to the great bend of the Indus. It has Dras and Hasora on its south, and the Kouen Lun or Mustagh on the north. The bed of the Indus at Tolti is 7500 feet; at Iskardo, the capital, 7000; at Rondu, 6200; and at the great bend, about 5000.—*H. f. et T.* 224, 225.

BUL TUL, or Shur-ji-la, a pass leading to Kashmir, in lat. 34° 10′ N., long. 70° 15′ E. The crest is 10,500 feet.

BULUH. MALAY. A bamboo. Buluh perindu, the plaintive bamboo, also called Buluh-ribat, the storm-bamboo. In the forests of the Malay Peninsula, Sumatra, and Java, the natives make holes in the forest bamboos, and plaintive sounds issue when the wind blows. It is a sort of Æolian pipe. See Bamboo.

BULUN. SINDI. The water hog, a porpoise? in the rivers Indus, Ganges, Irawadi.

BULUNG. JAV. Plocaria candida, *Nees*; Eucheuma spinosa; Agar-agar; Gracillaria tenax.

BULUT TAGH is that part of the Kouen Lun chain which is east of Samarcand and south of Khokand. Bulut Tagh means the cloud mountain; but the Kouen Lun chain is also called the Belur Tagh, which, according to Cunningham, is synonymous with the Balti mountain. Other names for the chain are Mustagh, Karakoram, Hindu Kush, and Tsung lung or Onion mountains, from the prevalence on it of a species of Allium. Its continuation forms the Pamir range west of Yarkand. The Kouen Lun chain is not less elevated than the Himalaya, and is covered throughout a great part of its length with perpetual snow. Its axis has not been crossed by any traveller, but has been reached by Dr. Thomson, who visited the Karakoram pass, elevated 18,300 feet. In Western Tibet, the axis of the chain is in general distant about 150 miles from the Himalaya, and the country between the two consists of a complication of ranges of lofty and rugged mountains, separated from one another by stony valleys, which at the higher parts of the courses of the rivers expand at intervals into alluvial plains.—*H. f. et Th.*

BUMAY-ZA. BURM. Albizzia stipulata.

BUMBA, a race inhabiting the hills westward from Kashmir to the Indus.

BUM BUKLESIR. See Hot Springs.

BUMBUL. HIND. Rubus biflorus.

BUMEE. SINGH. Tetranthera Roxburghii.

BUMMALO, a small fish, salted and dried; also called Bombay duck, but found on all the coasts of Southern Asia. See Bombay Duck.

BUMTELE, name of a Rajput tribe on the eastern parts of the Central Doab.—*Ell.*

BUN or Boon. ARAB. Coffee, coffee berries.

BUNA of Kaghan. Albizzia odoratissima.

BUNA. HIND. Edwardsia mollis, Platanus orientalis.

BUNAFUR, a tribe of Yadubansi Rajputs in Oudh, Allahabad, Benares, Gurra Mundla, and Bundelkhand.—*Ell.*

BUNBHOOAY. BURM. Careya arborea.

BUNCHONG BULU, a red dye-wood of the Celebes.

BUNCOGA. SINGH. Urostigma Mysorense, *Miq.*

BUND. HIND., PERS. (Bănd.) A slip of an account. Band-behri, also Band-phantah, a statement of a village account; an embankment, a dam.—*Ell.*

BUND, Boond. HIND. A dark blue silk with many spots, largely made at Benares. Bund mumi, a kind of stiff waxed spotted silk.

BUNDA. HIND. A sort of earring (pundela); a ring used by ear-borers.

BUNDAHISH, or Original Creation, a sacred book of the Parsees; it is in the Pehlavi. It gives the Parsee cosmogony; and one version was written about A.D. 880.

BUNDALA, or Boondala, an agricultural race in the Maiker district.

BUNDARE, a Kandh village in the Madras district of Vizagapatam. Until 1849, three human beings were here annually sacrificed, two to the

sun in the east and west of the village, and one in the centre. The head was left attached to the sacrificial post till devoured by birds.—*Imp. Gaz.*

BUNDELA, a tribe who claim to be Rajputs. They give a name to the province of Bundelkhand (corruptly Bundelcund). They are descended from the Garhwars of Kantit and Khairagarh, and first settled in Bundelkhand in the 13th or 14th century. There are few genuine Bundelas in the British portion of the province, except in the pargana of Panwari. The province of Bundelkhand is a mountainous hilly tract of country lying between lat. 23° 52′ to 26° 26′ N., and long. 77° 53′ to 81° 39′ E., between the rivers Jumna and the Chambal on the N. and N.W., the Jubbulpur and Saugor divisions on the south, and Rewa and Baghelcund and the Mirzapur hills on the S. and E. Within these bounds are five British districts; it encloses the three Treaty States of Orcha or Tehri, Datia, and Samthar, and the states of 26 chiefs who have sunnud or Ikrarnamah from the British Government. Iron and copper are obtained, and diamonds from Panna. It seems to have been occupied successively by Gonds and Rajputs; and to the latter are due the forts of Ajyegarh and Kalinjar, the temples at Khajuraka and Mahoba, and the Hamirpur irrigation works. A vast portion of Bundelkhand is hilly and unproductive, forming the northern slope of the table-land of the Vindhya. Bundelkhand has, in the past three centuries, been fifteen times desolated by famine. The Bundela became dominant in the 14th century. Towards the middle of the 18th century, the aid of the Mahrattas was called in against the Dehli forces. On the fall of the Peshwa in 1818, all his sovereign rights were ceded to the British. Under the Bundelkhand Agency are Sohawal, Jignee, Ajyegarh, Baonee, Beronda, Bijawar, Chirkary, Chutterpore, Duttia, Kotee, Myhere, Nagode, Orcha, Punna, Rewa, and Sumpthur. Of the principal states, Gwalior, Indore, Bhopal, Dhar, Dewas, Bhopal, and Jowra are under Mahomedan rulers, and the rest Mahratta. The petty states hold under the immediate guarantee of the British Government, but have feudal relations with one or other of the larger states, and occasionally with more than one.—*Imp. Gaz.; Treaties, etc.*, iv. p. 195.

BUNDER or Bandar. PERS. A seaport, a harbour; prefixed to many seaports along the coasts of the Arabian Sea. Shah-Bunder is a harbourmaster, a governor; the British sailors' market boat is the Bunder boat.

BUNDER ABBAS, formerly called Gambroon, in lat. 27° 10′ N., at the entrance of the Persian Gulf, is 5 miles north of Kishm island. It is in the south of the province of Kirman, and is about eighteen days' march from the town of Kirman.—*Horsburgh.*

BUNDESH, a religious book of the Parsee Zoroastrians. See Bandahish.

BUNDI, a tributary state in Rajputana, lying between lat. 24° 58′ and 25° 55′ N., and long. 75° 23′ and 76° 30′ E. Population in 1875 was 224,000, paying a tribute of one lakh of rupees. The ruling family belong to the Hara tribe of Rajputs. Omeda Raja gave most efficient assistance to Colonel Monson's army in its retreat before Holkar; he died in 1804, after a rule of upwards of fifty years, and was succeeded by his infant son, Bishen Singh. During the Mahratta supremacy, this state suffered much at the hands of Sindia and Holkar, who virtually assumed the management of the revenues. The territory of Bundi was so situated as to be of great importance during the war in 1817 in cutting off the flight of the Pindari. Maha Rao Bishen Singh early accepted the British alliance, and a treaty was concluded with him on 10th February 1818. By this, the tribute paid to Holkar and the lands in Bundi held by Holkar were relinquished to the raja, who engaged to pay to the British Government the share of tribute he had hitherto paid to Sindia. In its earlier fortunes, this state became so connected with the imperial court of Dehli, that, like Jeypore, the princes adopted several court customs. The Purthan, or premier, was entitled Diwan and Moosahib; and he had the entire management of the territory and finances. The Foujdar or Killadar is the governor of the castle, the Maire de Palais, who at Bundi is never a Rajput, but some Dha-bhae or foster-brother identified with the family, who likewise heads the feudal quotas or the mercenaries, and has lands assigned for their support. The Bakhshi controls generally all accounts; the Rassala those of the household expenditure. Bundi has a beautiful palace. During the mutiny and rebellion of 1857, the raja was less forward. Its military force is 700 horse, 1575 infantry, and 88 guns.—*Tod's Rajasthan*, ii. p. 504; *Treaties, Engagements, and Sunnuds*, iv. p. 63.

BUNDI. HIND. A kind of sweetmeat, in grains or drops. Būnd, a drop.

BUND-i-Kaisar, a dyke or bund near the town of Shuster in Southern Persia, thrown across the river Karen. Sir Henry Rawlinson says that it was constructed by Ardeshir Babekan or his son Shahpur; and the canal constructed is called Nahr-i-Dariyan, which waters the fields to the south in the Miandab.—*De Bode.*

BUNDU MALLI. TEL. Jasminum sambac, *Ait.*

BUNER, a democratic State between Afghanistan and India, N.W. from Peshawur, beyond the Judoon country on the north-west. It is a rugged country, extending from the lower range of the Hindu Kush downwards to hills which command the Chumla valley and the central plain of Yusufzai. On its western frontier, again, lies the Swat territory. The Buner people could muster a force of some thousands. They have generally abstained from molesting British subjects. Near them are the Swat, Ranizai, and Lower Osman Khel tribes, the two latter being subordinate to the former.

BUNGA. PUKHTO. Ransom.

BUNGA, a temple of the Akali sect of the Sikhs.

BUNGA-BUA-PALA. MALAY. Also Bunga pala, mace. Bunga Chanki, also Bunga-lawang, cloves; Caryophillus aromaticus. Bunga pukul ampat, Mirabilis jalapa. Bunga chappa, Blumea balsamifera.

BUNGARI. HIND. Vangueria spinosa.

BUNGAROO. TEL. Gold.

BUNGARUS CÆRULEUS, B. tropidonotus, B. Ceylonicus, are three poisonous serpents of Burma and Ceylon, of the family Elapidæ. B. cæruleus occurs in most parts of India and in Burma; B. fasciatus, common in Burma, is rare on the eastern coast of the Peninsula; B. semifasciata occurs in China. These snakes are from 4 to 6 feet long.

BUNGA SURSON. HIND. Sinapis juncea.

BUN-GHI. HIND. Corchorus olitorius.

BUNGKA, HIND., also called Kutooa, an aquatic beetle which cuts rice plants. It is said to make a leaf boat, which it paddles from plant to plant.—*Ell.*

BUNGLA. HIND. Bungalow, a one-storeyed house.

BUNG-MAI-ZA. BURM. Inga bijemina, *Willde.*

BUNGOMA, ? Emyda granosa.

BUNGRAH. HIND. Acorus calamus aromaticus.

BUNGREE. HIND. Glass bracelets.

BUNG-TA-LAI. CHIN.

Tung-ta-hai, . .	CHIN.	Yang-kwo, . . .	CHIN.
Ta-hai-tsz, . . .	,,	Boa-tam pai jam, .	,,
Pung-ta-rai, . .	,,		

A tree of Siam; its fruit makes good jelly.—*Smith*, p. 44.

BUNGUSH, a Pathan tribe who inhabit the enclosed plain of Meranzai, and also the Kuram valley within the Afghan limits. In the Kohat district, the principal tribe are the Bungush. They can muster 15,000 fighting men, and are fairly good soldiers. In 1851 they petitioned the British to include them in Kohat. This request was acceded to. They offered to guard the Kothul; and while arrangements were progressing, the Gullee Afridi suddenly attacked the Bungush people on the Kothul, and seized that post. Several Bungush chiefs were killed in the encounter, and Major Coke, who was present, was slightly wounded. Upon this check, the Bungush people obtained the alliance of two small though warlike tribes, named Buzoti and Sipah. These were independent, and dwelt in the hills near the pass.

BUNI. HIND. A muslin made at Dacca.

BUNIJ, the Thug designation of a victim.

BUNJ. ARAB. Hyosciamus sniger.

BUNJAR or Banjar. HIND. Waste land, land lying fallow; also indifferent soil.

BUNJIN. HIND. A weed which grows in the kharif crops; much sought after by fakirs who practise alchemy.—*Elliot.* Qu. ban jan, Wild Man.

BUNKITA BARRING, obtained from an undescribed plant in Borneo, produces a dark purple or black dye.

BUNNAS, a river which rises in a cluster of summits in the Aravalli range, lat. 24° 47′ N., long. 73° 28′ E., south-west into Runn of Cutch by several small channels. Length, 180 miles. About 17,000 square miles drained.

BUNNI. HIND. Payment in kind; hence Bunnihar, a ploughman paid in kind.

BUNNI, a timber of Jullundur; resembles the 'Ban,' except that it is smaller, and the wood is of a white colour, but it is applied to the same purposes as the 'Ban.'—*Comr. Jullr.*

BUNNU, a district in the Derajat division of the Panjab, situated S.W. of the Kala or Salt Range, with its centre in lat. 22° 40′ N., and long. 70° 30′ E. Its population, 288,000. The Bunnu valley is south of and is accessible by the Sūrduk and the Koonh-i-gao passes. The lands are chiefly rich and fertile, intersected by the Kuram, and irrigated by water-cuts. The only uncultivated portion is the 'thul,' or pasturage ground at the base of the hills. During the winter months the Waziri pasture their flocks and herds, and erect patriarchal huts of skins with wooden framework. In the summer months they retire to the cool mountain heights, taking their cattle and dwellings with them. The Bunnuchi are mixed races, who dwell in walled villages. They are undersized and sallow-skinned. They are quiet, orderly, and regular in revenue matters, but immoral, capable of reckless perjury and deliberate assassination. They cultivate with some industry. Iron is imported in quantities from the Waziri hills, and is worked up at Kalabagh into agricultural implements, caldrons, cooking utensils, grates and fire-irons, ladles, pegs, locks, horse-shoes and chains. The Waziri bring it down on bullocks and mules chiefly through the Kurum pass to the Bunnu fair, where it is bought up by carriers from Kalabagh. The spade in use in Bunnu, called in Pushtu 'erm,' is very peculiar. Tobacco is imported in large quantities from the Waziri hills. Much cattle is brought to the Bunnu fair from Dour and the Waziri hills; also numbers of goats and sheep. The Doomba is much prized, and is reared in the district as well as beyond the border.—*Records of the Govt. of India*, No. 11.

BUNNUR, an Afghan tribe adjoining the Peshawur district.

BUN-OTSURG. HIND. Also written Ban-otsarg, from Ban, a forest, Ootsarg, abandoning. A Hindu marriage ceremony performed in honour of a newly planted orchard, without which it is not proper to partake of its fruit. A man holding a Saligramma personates the bridegroom. Another, holding the sacred tulsi, personates the bride. After a homa or fire sacrifice, the officiating Brahman puts the usual questions to the couple. The bride then makes three circuits of a spot in the orchard, moving from the south to the west, followed by the bridegroom holding an end of the personating bride's garment. The bridegroom then takes precedence, and circumambulates similarly.—*Elliot.*

BUNSEN, KARL CHRISTIAN, born 1791, at Corbach in Waldeck. He was the son of a soldier; was long employed in Italy and England as ambassador; and was the author of Egypt's Place in Universal History; Description of Rome; Hippolytus and his Times; Signs of the Times; Church of the Future; God in History.—*Fraser's Magazine*, June 1868.

BUNT are the chief people in Canara.—*C.* 134.

BUNT. HIND. Smut balls, or pepper brand. The fungus which occasions this disease, Uredo caries, *Dec.*, U. fœtida, *Bauer*, has hitherto been met with only in the grains of wheat, when its presence is readily recognised by the peculiarly disgusting odour of the infected ear. When this disease prevails, it greatly deteriorates the value of the sample; and, from imparting its disgusting odour to the flour, makes it less fit for bread.—*Russell.*

BUNT. HIND. Unripe pulse of Cicer arietinum.

BUNTA-JAMUDU. TEL. The Euphorbia antiquorum.

BUNTAKI. HIND. Solanum melongena.

BUNTING. Several species of these birds occur in India. The grey-capped bunting is Emberiza caniceps. The black-throated bunting is E. cioides. The grey-capped bunting is E. Stewarti.

BUNTURIA, a class of wood-rangers in the northern parts of Gorakhpur. They are now cultivators.—*Ell.*

BUNUCH. BENG. Morinda exserta, *Roxb.*

BUNUGA-GASS. SINGH. Urostigma mysorense, *Mig.*

BUNUN. HIND. Fragaria vesca.

BUNYA-BUNYA, a tree, Araucaria Bidwelli, of Australia, with cones as large as a child's head. It grows from 100 to 150 feet high, with a remarkably stout trunk, which scarcely tapers for one-half of its height from the base. The unripe seed is greedily eaten raw by the natives at all times, and when ripe, roasted and pounded into cakes. Each tribe of aborigines has its own group of trees; and of these each family has a certain number allotted, which pass from generation to generation, and is the only hereditary property which any of the aborigines are known to possess.—*Mr. Bidwell; Dr. Bennett, Australasia.*

BUN-ZU. See Bom-zu.

BUPLEURUM MARGINATUM. *Wall.*

Kali Zewari, . . HIND. | Zira, Sipal, . . HIND.

This and allied species are abundant in many parts of the Panjab Himalaya from 2500 to 11,500 feet. In Kanawar the root is stated to be eaten raw, and the seeds to be exported as Zira.—*J. L. Stewart, M.D.* See Carum.

BUPLEURUM OCTORADIATUM. *Smith.*

Tsz-hu, ... CHIN. | Ts-ai-hu, ... CHIN.

This plant is said to grow in Yen-ngan-fu and in Shen-si, its root is employed in thoracic and abdominal inflammations.—*Smith*, p. 45.

BUPRESTIS, a genus of beetles with bright wing-covers, largely used in the arts. See Beetles; Coleoptera; Insects.

BUQ. PERS. A goat's horn. Buq-i-Hamam, the horn summoning to the bath.

BUQR-EED, or Eed oos Zoha, held on the 9th day of the twelfth month Baq-reed. On this occasion, Mahomedans of India proceed to the Eed-gah in great state, when the khootbah is read in the name of the ruling sovereign.

BUR, also Buri or Boratu. SIND. The pollen of the Typha elephantina, *Roxb.*, made up with water into cakes, and much eaten. It is inflammable like that of Lycopodium, and is used as a substitute for it in Sind.—*Royle*, p. 35.

BUR, a wandering tribe in the N.W. Provinces.

BUR. HIND. Tamarix orientalis, Oreosersis lanuginosa, Cymbopogon iwarancusa.

BURA, Buri, Burha, Budha. HIND. Old. Many towns, rivers, etc., are so designated.

BURA. HIND. Chopped straw.

BURA-AL. HIND. Morinda citrifolia.

BURA-BUHOOARI. BENG. Cordia latifolia.

BURABUR hills are isolated rocks of sienitic granite rising abruptly from the plain about 15 miles north of the city of Gaya, by the left bank of the Phulgo or Mahanadi. The highest is called Burabur, also Sidheswar, from a temple to Mahadeva that once crowned its heights. The next in height is the Kowa Dol, which is near a mile to the south-west. A third is called Nagarjuni, and is the easternmost of the great cluster. A fourth, and the smallest, called Durhawut, is at the northern extremity; others also have names, but the above alone contain objects of notice. The Kowa Dol is an almost entirely bare rock, having nearly a perpendicular scarp on its northern face, and sloping at an angle of 45° more or less on the opposite or southern side; east and west, it is disjointed and inaccessible; huge stratified masses are piled one over the other, decreasing in length at each end. The whole is surmounted by single blocks like pillars, the centre one of which towers above the rest, and is conical. It is said that formerly there was a huge block balanced on the top of this cone, which, from its being moved by birds alighting on it, obtained the name of Kowa Dol, or crow-moved, or the crow swing; about the eighteenth century, this rocking stone fell down to where it may still be seen. The caves of Burabur are seven in number,—four in one hill, three in another; but the name Satgarba, commonly understood to mean seven chambers, is applied to two only.

In the hollow or recess on the east side are the remains of a once splendid Buddhist temple, of which many pillars are still standing; also a gigantic figure of Buddha seated. The Sinhasun or throne is very handsome: there are the usual supporters, the Sinha or lions rampant, trampling on elephants couchant, and ridden by amazons armed with shields and swords. 60 or 80 figures are rudely cut in the huge detached masses of rock at the foot of the hill. There is one block hewn into the shape of a small temple, with niches and images on the four sides. First niche, from proper right, male figure erect with a spear; 2d, female figure, Pudmavati or Maya devi; 3d, Buddha seated; 4th, Mahadeva and Parvati, commonly called Gouri Sunkur, Parvati seated on Mahadeva's knee, with the bull Nandi at his feet, and the Sinha or lion at hers; 5th, male figure erect with four arms; 6th, male figure carried on the shoulders of another; 7th, the Lingam and Yoni; 8th, male half figure, Aruna? 9th, Mahadeva and Parvati repeated; 10th, male figure erect holding a lotus in each hand, probably Surya; 11th, Ganesha; 12th, female figure with four arms, attended by Nandi and Sinha; 13th, male figure standing on a prostrate figure. After these, nine niches have what appears to be Durga slaying Mahesh-Asur with her trident; she has one foot on the buffalo's neck, and holds it by the hind leg. This subject is repeated on many detached rocks. The Linga is of as frequent occurrence. There is one very large four-faced Linga, called the Choumūrti Mahadeva, such as may be seen in the caves of Ellora; it is of common occurrence in this district. The inscriptions are in Pali, in the old Pali character.—*Capt. Kittoe, Beng. As. Soc. Jo.*, clxxviii., 1847.

BURA-CHOOLI. HIND. Villarsia Indica.

BURAD. HIND. Filings, raspings, chips.

BURAGA. TEL. The gum and wood obtained from Bombax Malabaricum.

BURA-JANWAR. HIND. The hog; literally, bad beast.

BURAK and Sarmu rivers run in valleys of the Assam chain. The Naga, Mikir, Cachari, Garo, and Kassya are the five races in whose possession chiefly are the broad highlands of that chain, extending from the N.E. near the head of the Kynduayn and Namrup, on one side along the valley of the Brahmaputra to its southern bend round the western extremity of the chain, and on the other side south-westerly along the valley of the Burak and Surmu.

BURAQ, steed on which Mahomed rode to the seven heavens. The angel Gabriel seated him on it.

BURAT. HIND. Assignment. ARAB., the night of record, a Mahomedan ritual.

BURATY or Pulati, a Mongol nomade tribe near the Baikal lake.

BURAYA. HIND. Rucervus duvaucelli.

BURBUTI. BENG. Dolichos Sinensis.

BURCKHARDT, JOHAN LUDWIG, a native of Denmark, who travelled in Egypt and Arabia, author of Notes on the Bedouins, 1831, and Wahabis; also of Travels in Arabia, 1829, and Travels in Syria, 1822. He visited Mecca A.D. 1814, under the name Shaikh Ibrahim. He is buried near Cairo, in the large cemetery outside the Bab-un-Nasr.—*Playfair; Burton's Pilgrimage to Mecca*, i. p. 168.

BURDA is one of the five northern districts of Kattyawar. Burda hills end in the south in the Alich range and in the Oshum.

BURDEH. ARAB. A thick striped woollen stuff, in use by the Arabs as a cloak or blanket. Akhda-burdeh is a grey or brown, and Ahmar-burdeh a red one. That of Mahomed was 7½ feet long and 4½ feet broad.

BUR DEWALI, a lofty tower in Jaganath, about 180 feet in height and about 28 feet square inside, in which the idol and his brother and sister Subahdra are lodged. See Jaganath.

BURDI, a wild Baluch tribe on the western banks of the Indus, near Shikarpur.

BURDU GUMADU. TEL. Cucurbita hispida.

BURDUR. —? a tree of Cuttack, an excellent wood for carriage poles, shafts, and wheels, and in all coachbuilders' work; sp. gr. 1·00.—*Cal. Cat. Ex.* 1862.

BURENDA, also written Borenda, properly Bruang, a pass in the Himalaya, in lat. 31° 23′ N., long. 79° 12′ E.; the length of the crest is 50 paces, and the crest is 15,171 feet above the level of the sea. The most elevated part is a narrow glen, very steep. The pass leads from Kunawar through the outer Himalaya, and is the easiest and most frequented in the neighbourhood. It is open for seven or eight months; during the rainy season almost all the snow dissolves.

BURGEE, a Hindu race in Woon.

BURGH. HIND. Phytolacca decandra.

BURGHER, in Ceylon, is applicable only to white persons of pure Dutch descent, of whom there are now but very few in Ceylon; but the name has, by courtesy, been given to all those who in India are styled Indo-Britons, Eurasians, East Indians, Anglo-Indians, or more commonly 'half castes,' namely, the descendants of Europeans by native women. In the Moluccas, also, the term is applied to the Christian descendants of the Dutch. The Amboyna burghers, who usually crowd the jetty spending their time in angling for small fish, will refuse to carry even a light burden; but this kind of manual labour is the peculiar province of slaves, and the Vrij Burghers, poor enough as they usually are, but priding themselves in professing the same religion with the Europeans, will not lower themselves by performing a description of labour which even Chinese and free Mahomedans would disdain.

BURGHER, a name given by Europeans to the Badaga or Marves race on the Neilgherry Hills.

BURGUNDY PITCH is a product probably of the Abies excelsa; it is of light yellow colour, often adulterated with dammer or ganda baroza.

BURHA or Budha. HIND. Lit. an old man; in the Kamaon Himalaya, the superintendent or headman of a village, or of a set of villages. The term is equivalent to Kumin, Syana, and Thokdar, and is chiefly used in the eastern parganas of Kamaon. The tenure connected with it is called Burha Chari and Kumin Chari.

BURHA GANGA, an old bed of the Ganges, traceable below Hastinapur, and Soron and Kampil.

BURHAL. HIND. A light yellowish-coloured wood, not strong; plentiful in the Santal jungles. Used for doors, venetians, furniture, etc., by the natives.—*Cal. Engineer's Journal*, 1860.

BURHANPUR, town in lat. 21° 18′ N., and long. 76° 16′ 26″ E., is on the N. bank of the river Tapti, and distant 41 miles S. by W. from Khandwa, the headquarters of Nimar. Population in 1877 was 29,303. It was founded about A.D. 1400 by Nasir Khan, the first independent prince of the Faruki dynasty of Kandesh, and called by him after the famous Shaikh, Burhan-ud-Din of Dowlatabad. It was held by eleven princes of this dynasty for two hundred years, till A.D. 1600, when the kingdom of the Faruki was annexed by the emperor Akbar. In 1614, Sir Thomas Roe, ambassador from James I. of England to the Great Moghul, describes his visit here to Prince Parviz, son of Jahangir. Tavernier passed through Burhanpur (or, as he wrote it, Brampour) in 1641, and again in 1658. It was plundered in A.D. 1685, by the Marhattas. It was taken by General Wellesley on the 13th October 1803.

BURHAPATRA, a pargana in the Gonda district in Oudh, area 77¾ square miles or 49,688 acres, and population in 1865 was 20,451. The Ahir and Chamar are the most numerous castes. The aboriginal Bhar here are following a kind of Kumari cultivation, wandering from jungle to jungle.

BURHA PENN, a deity of the Kandh race.

BURHEL, Ovis nahura. See Bovidæ.

BURHOLIA, HIND., a branch of the Bhrigubansi Rajputs settled at Burhoul, near Benares.—*Ell.*

BURI or Buli, a Philippine palm; probably Corypha gebanga, the gabang of the Malays and Javanese. The Philippine islanders from the leaves make mats, from the sap both sugar and a distilled spirit, from the pith a sago, from the seeds rosaries, and the spines, boiled in water, yield a thread from which a coarse cloth is woven, called sagoron.—*Crawfurd, Dic.* p. 77.

BURI. HIND. Vitis Indica; Symplocos spicata.

BURIAL CUSTOMS. In the south and east of Asia, the modes of disposing of their dead are almost as varied as are the races themselves. It has been remarked that the mode of disposing of the dead has from the earliest times been symbolomatic of the opinions as to the worth of the deceased while he was amongst them, or indicative of their views as to the future condition of the departed. In general there has been little display over the remains of women; but whether with men or women, the prevailing habit has been to convey the remains to some quiet resting-place with a decorous solemnity, and there erect some lasting memorial over them. With some races, however, even to the present day, the departure of a friend or relative is regarded joyfully, and the procession to the place of final disposal is mirthful; while other races even cast out their dead, and allow the remains to be treated with indignity. But the anxiety of the generality of nations has been to perpetuate the memory of the departed; and everywhere are to be seen sepulchral monuments raised with that object. Many of these exist from prehistoric times, and often form the sole remaining history of the races who erected them. At the present day, monuments erected

with brick or stone, and in the form of pillars or upright or horizontal slabs of stone, or cupolas, or domes, or sarcophagi, beneath which the remains are laid, are usual modes of marking the deceased's resting-place. But in more primitive times, the cairn or heap of stones, the monolith, the cromlech, the circle, the heaped-up barrow of the Celtic tribes, the tumulus, as the Romans called it, were usually resorted to, and many of these are to be seen in the south and east of Asia.

The *cairn* was formed of stones gathered from the vicinity, and set round about the resting-place of the dead and piled over them; and this is all that is given to the Mahomedan pilgrim who falls in the desert. The *monolith* or single stone was usually placed perpendicularly near the spot. The *cromlech*, consisting of two, three, or more upright stones, with a flat stone placed over them, formed a sepulchral chamber, and was the earliest approach to the cupola or dome. The *circle*, or enclosure of upright stones set singly at varying spaces apart, are found surrounding the cromlech or cairn. The *barrow*, or tumulus, often raised to a considerable height, and covering a large area, is the most noble, and has been the most enduring; and with these the bodies of the departed were not interred in graves sunk below the surface, but were placed on the surface of the ground, and then the earth was heaped up. The barrows, many of which have been opened, are found sometimes to contain skeletons, in other cases urns only, while occasionally both urns and skeletons, or urns and ashes, appear together. The urns are often found to contain burnt bones and relics; but in the earliest barrows are war weapons, such as stone hatchets and hammers, celts of the same material, both arrow-heads and spear-heads of flint, with beads of various substances, and torques or collars and armlets of gold or bronze. Somewhat later, the celts and weapons are of bronze, and the sword is found to have been broken, indicative that the warrior's race had been run. The ornaments remain the same, and coins are found.

The methods adopted for the disposal of the dead from the most ancient times have been interment, burning, embalming, launching into rivers, and exposure. Of all these the first seems to have been the most general and primitive. Cremation is undoubtedly very ancient, for king Saul was burnt, and his bones afterwards buried; and Asa was burnt in the bed which he made for himself, filled with sweet odours and various kinds of spices. In Egypt the practice of embalming obtained from their earliest history, but the practice was confined to that country, and arose from its people holding it unlawful to expose the remains to fire or animals, or to permit them to become a prey to worms. The vast catacombs still remaining on the banks of the Nile were the common receptacle for the general population who could not afford a separate tomb.

Over the ruins at Nimrud, Mr. Layard discovered ancient tombs, of a race unknown, and of which he could not assign any date. Many of the vases, necklaces, and ornaments obtained there have a resemblance to those of the Egyptian tombs. Two or three purely Assyrian cylinders were also discovered in the tombs. Mr. Layard considers that the mode of burial which is there evidenced, more nearly resembles that adopted by the early Persians. Cyrus and Darius were buried in sarcophagi in troughs. The Egyptian alabaster πιελος, or tub, in which Darius was buried, is mentioned by Theophrastus. The Assyrians, like the early Persians, may have buried their dead entire, and preserved the bodies in honey or wax (Herod. lib. i. c. 140, Arian de Bello, Alex. Theoph. de Lapid. c. xv.). According to Ælian, when Xerxes opened the tomb of Belus, he found the body in a coffin filled nearly to the brim with oil. Mr. Layard infers that these tombs belonged to an intermediate people or race who occupied Assyria after the building of the most ancient palaces, and before the foundation of the most recent.

In British India, and in all the south and east of Asia, interment, cremation, and exposure are all practised by one or other of the races occupying it. Java, in the Archipelago, seems to have been peopled from the continent of Asia, and its people have three modes of disposing of the body of a deceased person. By fire, termed obong; by water, termed larung; or by exposing it upright against a tree in a forest, where it is left to decay, termed setra. When the body of a chief or person of consequence is burnt, it is usual to preserve the ashes, and to deposit them in a chandi or tomb.

The Ninevites, in all their various monuments, have left us no trace of their ideas concerning the dead, while the sepulchral urns obtained in Babylonia contain the remains of the dead, with jars and utensils for food and water made of baked clay, and with remains of date stones, the head of the dead reverently laid on a sun-dried brick as a pillow. Amongst the urns found on the plain of Bushire each had a pointed end, and at its mouth a bowl or basin without bottom; not united to the main part by means of agglutination, but very closely fitted, and supported in its place by the general bed of earth. These urns lay horizontally, not parallel with each other, but on a straight line, and in the direction of east and west. In one urn was a quantity of sand, with the bones of a full-grown person, completely filled, and very heavy. The skull was placed about the middle or widest part, not in the basin, which contained only sand. Of this urn the greatest circumference was 2 feet 9 inches, its length 3 feet 4 inches, including the bowl or basin, which separately was near 8 inches. The urns, made of clay, are about 1-3d of an inch thick, and solid at the pointed end, but the bowls without bottoms. The insides had evidently been coated with some bituminous substance; but the urns nowhere exhibited inscriptions nor any other mark by which their degrees of antiquity might be ascertained.

The ancient coffins of the Chaldæans were of clay, some of them shaped like a dish cover, the head being placed on a pillow of sun-dried brick, and jars and utensils for food and water. There were also jar coffins, and they seem to have been interred in artificial mounds.

Their ancient tombs, rare in Assyria and Upper Babylonia, are chiefly in Chaldæa proper; and the Rev. G. Rawlinson (i. 107) suggests that the dead may have been conveyed to the sacred land of Chaldæa, similarly as the Persians even now send their dead to Karbila and Meshid Ali, and as the Hindus from remote India send the bones, or the entire bodies, to the Ganges at

Benares. There, Chagda or Chackrada, near Sooksagur, is an abyss said to have been made by the chariot wheel of Bhagirath. The place is a great Golgotha, where the dead and dying are brought from a great way off to be burnt and consigned to the Ganges. The deceased is seldom conveyed by any of his relations, unless from a short distance. Poor people generally send forward their dead for incremation in charge of bearers, who never betray the trust reposed in them.

The Romans generally burned, but they sometimes buried their dead; and children who died in infancy were interred in the immediate neighbourhood of their former homes. Their sepulchral urns, with the ashes of the dead, were commonly buried about two feet below the surface, and their memorial stones were often inscribed. They used the sarcophagus, or massive stone-coffin, and also the tumulus or barrow. They bore their dead with much lamentation to the funeral pile, on which, after being lighted, they cast the robes and arms of the deceased, as well as the slaughtered bodies of his favourite animals.

The ancient Greeks, in laying out their dead, always placed an obulus or Greek coin in the mouth, to pay Charon's fare across the rivers Styx and Acheron, and a cake made of flour and honey to appease Cerberus. Amongst them men cut off their hair when they attained the age of puberty, and dedicated it to some deity. Theseus is said to have repaired to Delphi to perform this ceremony, and to have consecrated his shorn locks to Apollo. After this it was again allowed to grow long, and only cut off as a sign of mourning. Thus at the funeral of Patroclus (Iliad, xxiii.) the friends of Achilles cut off their hair, and

'On the corse their scattered locks they throw.'

In some parts of Greece, however, it was customary to wear the hair short, and to allow it (Cassandr. 973) to grow long when in mourning.

'Neglected hair shall now luxurious grow,
And by its length their bitter passion show.'

In Luristan, the female relatives, on the death of their male relatives, cut off their hair, and hang the locks around the tomb. The young women and young men of the island of Delos cut off a lock of hair before marriage, and place it near the tomb of the virgins from the Hyperboreans.

Barrows or mounds of earth have been largely used by the nations of Central Asia, from the Mediterranean to the Pacific Ocean, both in ancient times and now. The king of Ai, slain by Joshua (Josh. vii. 26, viii. 29), was placed at the entrance of the city, and over his body was raised a great heap of stones. Herodotus mentions that the barrow of Alyattes, king of Lydia, was 1300 feet broad, and nearly a mile in circumference, and it has been identified by modern travellers. Barrows were the favourite memorial of the Teutonic race, some of them very large; but the Saxons used also cists or stone coffins. The custom of raising tumuli over the remains of the mighty dead, seems to have been prevalent in the Central Asiatic region from the most ancient times and been taken into Scandinavia. Ezekiel, xxxii. 27, describes the practice of slaying persons and interring them with their dead chief. Herodotus also describes the barrow burial of the Scythians; and to the present day, in the region of the Kar Karella, and in many other parts of the steppe occupied by the Kirghiz, are to be seen numerous tumuli of great size. Herodotus tells us that when a king died, his corpse, embalmed and covered with wax, was conveyed in a chariot in solemn state to the place of sepulture; a large quadrangular pit was dug; in this they placed the royal corpse on a mattress of straw; on each side of this they planted spears, and covered it with wood, and roofed it over with hurdles of willow. In the remaining part of the pit they interred one of the late king's women, strangled for the purpose, together with his cupbearer, his cook, his groom, his minister, his courier, his horses, as well as some articles of every kind, including several goblets of gold, that he might be supposed to need in his journey to the other world. This done, the people eagerly contended with each other in the work of heaping over the whole a mound of earth as vast as possible. The proceedings did not here terminate; for the year following, fifty of the late king's confidential attendants, and fifty of his horses, were slain, and placed, the men on the horses, around his sepulchre.—*Melp.* 71, 72. When Chengiz Khan died, his remains were covered with a lofty mound, and extensive forests were planted to exclude the footsteps of man. Colonel Tod tells us that the tumulus, the cairn, or the pillar, are still raised over the Rajput who falls in battle; and throughout Rajwara sacrificial monuments are found, on which are seen, carved in relief, the warrior on his steed, armed at all points; his faithful wife (sati) beside him, denoting a sacrifice; and the sun and moon on either side, emblematic of never-dying fame.—*Tod's Rajasthan*, i. p. 74. In Saurashtra, also amidst the Cathi, Comani, Balla, and others of Scythic descent, numbers of palia or joojar (sacrificial pillars) are conspicuous under the walls of every town, in lines, irregular groups, and circles. On each is displayed in rude relief the warrior, with the manner of his death, lance in hand, generally on horseback, though sometimes in his car; and on the coast the pirates of Budha are depicted boarding from the shrouds.

In the Panjab, near Bamian, in Afghanistan, and near Kābul, the sepulchral monuments remaining of ancient times are topes. They consist of a mound, on which is erected a cupola, supported by walls of masonry, more or less in a Grecian style of architecture. One near Manikyala is 80 feet high and 320 feet in circumference. In its centre were found vessels of gold, silver, and copper, with coins of Rome and the Bactrian Greeks. In a chamber 60 feet deep was a copper box containing animal remains. It is one of many topes or stupas.

Many cairns are found in different parts of Southern India, and, prior to the stupas or topes, this seems to have been a common mode of covering the dead. Indeed, as Colonel Cunningham remarks, the tope is only a cairn regularly built. On the Neilgherry hills are found remains of cairns, cromlechs, kistvaens, and circles of upright loose stones, which are nearly identical with those found in Europe in the ancient seats of the Celts. In these cairns are found vases, cinerary urns, and other vessels of glazed pottery, which sometimes contain human bones, more or less charred, and mixed with ashes; sometimes a little

animal charcoal alone. They are met with in various districts in the Presidency of Bombay, in almost every part of the Dekhan and peninsular India, from Nagpur to Madura, in immense numbers on the Animally hills, a range on the south side of the great Coimbatore gap, which forms the commencement and northern face of the Southern Ghats, those on the Animally being of a more advanced order and a better condition than the Neilgherry tombs. Similar remains are found in Circassia and Russia, and circles of stones surrounding ancient graves are found on the south Arabian coast and in the Somali country in Africa. Major Congreve directed much attention to those on the Neilgherry Hills; and Captain Meadows Taylor discovered and examined a large number of these remains at Rajan Kooloor, in Sorapur, and also at Siwarji, near Firozabad, on the Bhima, and devoted much attention to the comparison of them with similar remains found in England. He calls them Scytho-Celtic or Scytho-Druidical. Neither the hill people, the Toda and Kurubar, nor any Hindu, knows anything about the race to which these sepulchral remains belonged; and neither in Sanskrit literature nor in that of the Dravidian languages is there any tradition on the subject. The Tamil people generally call these cairns Pandu-kuri. Kuri means a pit or grave, and Pandu may refer to the Pandu or Pandava brothers, to whom so much of Hindu mythology relates. The race who raised these cairns were probably dwellers in the country prior to the advent of the present Dravidian occupants, and were expelled by or ultimately became absorbed in the latter; or they may have been a nomade shepherd race, who had wandered into India after it was peopled and settled, and then wandered out again, or became absorbed amongst the people of the country. But the remarkable fact connected with the people whose religious rites and usages of sepulture gave rise to these cairns, is that they have everywhere disappeared from Southern India, and not even a tradition of their existence survives.

In the centre of peninsular India, around Hyderabad, in the Dekhan, and at Bolarum, and at Secunderabad, there are many burial-places of that race, of whose existence nothing is known; and about 20 miles S.E. of Secunderabad is one great resting-place of the dead, a vast burial-ground extending over miles, which must have been the place of interment of a huge number of people, or used through many centuries. The mode of interment in all these has been to select a large stone, beneath which a winding tunnel or way had been excavated; and the remains of bones and urns, with weapons, are found deposited in a central cavity, a circle of large loose stones being drawn around, the circumference of some of these circles being between one and two hundred yards. The people whose tombs are thus represented were undoubtedly nomades dwelling in tents, for not far off are the remains of a great nomade city, consisting solely of walls, within which the tents must have been erected, for no stone nor earth heap nor mound remains within the same enclosure to indicate the former existence within of any building. The remains found within these cairns also leave the impression that, as with the barrow burials, the wives and servants were slain and interred along with the chief person; and the Hindu and Rajput practice of suttee (sati) would therefore seem to be merely a continuation of the ancient Scythic sepulchral rite of immolating the favourite wife, the servant, and the horse to accompany their master and serve him in the next world.

The Christian treatment of the dead is various; and in Europe, to this day, the indifference, not to say levity, of the Italians, in all relating to their dead, contrasts strangely with the tenderness and sentiment of the Germans, both Romanist and Protestant, as displayed in their cemeteries. In Naples, where are two cemeteries, with a pit for each day of the year, the humbler dead are stripped, and after a priest has read prayers over the bodies, they are all thrown into a hole by the cemetery assistants, amidst oaths and jocularity and laughter. The richer dead are stripped, placed in dry sand to be shrivelled up, and when dry they are dressed in their usual clothes, ticketed, and placed in a glass case. The German race, on the other hand, reverently dispose of their dead, and preserve in neatness the grounds and tombs of their cemetery, which they call Gott's Aker, God's field, but after a few years the ground is re-ploughed to be refilled.

In Ceylon, formerly, after burning the bodies of the deceased kings of Kandy, their ashes were carried by a man in a black mask to the Mahawelli Ganga, where he embarked in a canoe. At the deepest part of the river he clove the vase with a sword, scattered the ashes on the stream, and, plunging headlong after them, dived, arose near the opposite bank, whence he fled to the forest, and was presumed to be never more seen. The canoe was allowed to drift away, the horse and elephants that accompanied the procession were set at liberty in the woods, and the women who had strewed rice over the remains were transported across the river and forbidden to return.

Several of the Hindu customs resemble practices mentioned in the Old Testament, as in Jeremiah xvi. 6: 'Neither shall men lament for them, nor cut themselves.' For the Hindus, on the death of a relation, express their grief by loud lamentations, and not unfrequently, in an agony of grief, bruise themselves with whatever they can lay hold of. Ezekiel xliv. 25: 'They shall come at no dead person to defile themselves;' and touching the dead defiles a Hindu, who must bathe to become clean again. Job xxvii. 19: 'The rich man shall lie down, but shall not be gathered,' *i.e.*, his soul shall be left in a wandering state; and Hindus believe that persons for whom funeral rites have not been performed, wander as ghosts and find no rest. Jeremiah xxxiv. 5: 'So shall they burn odours for thee.' Scented wood and other odoriferous substances are placed upon the funeral pile of a rich Hindu, and burnt with the body. Matthew ii. 18: 'Rachel weeping for her children, and would not be comforted, because they are not.' The lamentations of a Hindu mother for her child are very loud and piercing; it is, indeed, almost impossible to conceive of a scene more truly heartrending than that of a whole town of such mothers wailing over their massacred children. 'In Rama was there a voice heard, lamentation, and weeping, and great mourning.'

Rajendra Lal Mitra, writing on the funeral ceremonies of the ancient Hindus, says the first ceremony was the removal of the dead from the

house to the burning ground, and this was done on a cart, drawn by two bullocks, or by aged slaves. The procession was headed by the eldest of the party, and included an old black cow. The animal was sacrificed at the burning ground, and its fat, flesh, and organs were placed on the corpse, which was subsequently enveloped in the raw hide of the animal. The wife of the dead was made to lie by the corpse, and was thence removed by a younger brother, a fellow-disciple, or a servant of the dead, who offered to marry her. The ceremony of burying the bones was performed on the 3d, 5th, or 7th day; and on the 10th day the mourners assembled together, and, after certain oblations, offerings, and prayers, raised a circle of stones, and then retired to the house of the chief mourner to feast on kid's flesh and barley.

As a rule now, the dead of Vaishnava Hindus are burned. As death draws near, a lamp is lit at the bed-head, and a 'homa' sacrifice performed with camphor and cocoanut; and as life dies out, the five elements of the cow are dropped into the mouth of the moribund from a tulsi leaf. Within two or three hours the body is lifted, and this is done early, as none of the household nor any of the neighbours can partake of food until the remains be disposed of. The pile of wood or cow-dung cakes used is about two feet high, and on it are placed some tulsi leaves, a little sandal-wood, and the deceased is laid with his feet to the north. When laid on the pile, a cloth is placed over the face, and raw rice is placed on it over the mouth. The heir of the deceased places a charred bit of sandal-wood or a tulsi branch at each corner of the pile, and a Vityan sets fire to the mat, using fire taken from the sacred fire lit at the bedside of the dying man. On the following day the heir and friends visit the pile, remove the skull and the bones, on which he and all with him pour water and wash them,—wash them with the sikai, anoint them with oil and honey, and clean them with milk, and place them all on plantain leaves anointed with butter. A young cocoanut shoot is then placed on the skull, and the whole put into an unburned earthen pot, and taken or sent to a river or to the sea; the person who conveyed it returning to the temple, where he pronounces aloud the deceased's name, and adds, 'Pray for him.' Often they are sent to a holy river, even to the Ganges at Benares. The men relatives shave. The hair of the Brahman widow's head is shaved. The body is not always carried through the doorway of the house. If it be an inauspicious day, or if the house door be so placed that the courtyard has to be crossed, then the remains are carried through an opening broken in the wall. Captain Butler, writing of the Hindus of Assam (Travels, p. 228), says if a man die inside a house, no Hindu can eat in it afterwards, or reside in it, as it has become impure; it is generally pulled down and burned, and a new house erected on the same spot. All Assamese, when dying, are therefore invariably brought out to die in the open air on the bare ground, that the building may be preserved, and also to ensure the happier liberation of the spirit from the body. The remains of Hindus are unclothed for the last rites.

Children under eight years of age and unmarried girls are buried, as also are all who die of smallpox, as the belief is that this ailment is a manifestation of the presence of the goddess Ammun, Mariatha, Mariamma, or Kali, and the anger of the goddess would revert on the family if burned. The dead from cholera are similarly buried.

In the mode of disposing of the dead, the wish expressed by the deceased is attended to. Vedantists all bury; also all the Gosai, all the Lingaet or Vira Saiva, the five artisan castes, the Kansala, goldsmith, carpenter, ironsmith, brazier, and stone-cutter, all the Byragi and Sanyasi, and the gurus of the sects, the Pandarums, the Kashai, likewise all the non-Aryan races and tribes not admitted into Hinduism. The dead of the Vedantist sect, and those of the Lingaet and artisans, are placed seated, the last in a grave five feet square, with a ledge on the south.

As the artisan's life becomes extinct, the body is made to assume the attitude to be preserved in the procession and in the grave. It is placed against a wall, the legs are crossed underneath in the usual sitting attitude, and the head is fastened to a nail driven into the wall, and so retained till rigidity ensue. They are borne to the grave in a car, on the shoulders of relatives or friends. On reaching the burial-place, the Oodwan reads prayers, and the body is seated on the side ledge with its face looking northwards; salt and ashes of cow-dung are placed on the head.

Amongst the Aryan Hindu, the great bulk believe in spirits and worship them; their worship of ancestors, 'pitri,' is continuous; they also believe in demons and evil spirits; transmigration through clean and unclean animals is a point of faith, and a great majority regard the soul as an emanation from the Deity, and look to re-absorption and annihilation as the point of attainment for the good. Many of these are Buddhist views.

Hindus of Sind are not allowed to die in bed, otherwise one of the males of the family who has attended upon the deceased becomes in a state of impurity, and must visit some well-known place of pilgrimage, as the Dhara Tirth, the Narayan-Sar in Kutch, etc. When near death, the sick person is placed on a spot smeared with cow-dung (Chanko, Lepan, or Poto), and when in the last agony, the five sacred elements are poured into the dying person's mouth.

The Mahomedan, when about to die, has his spirit calmed by the 'Yasin' chapter of the Koran being read to him, and is either washed (Ghassal) at his own house, or taken, within a few hours, to a Ghassalkhana, specially built for the purpose, near the cemetery, and where men or women washers perform the duty, and then put on burial clothes and apply camphor and antimony. The body is conveyed in a box with much solemnity, with wreaths of flowers and perfumes laid over the covering; the coffin is carried on men's shoulders, and from time to time is heard the Ty-eb part of the Mahomedan creed: 'There is no deity but God, and Mahomed is the prophet of God;' and on reaching the grave, funeral service is read, consisting of the four portions of their creed (takbir), and a blessing (dua) is asked, which all present repeat. After the Fatiha, the body is lifted from the coffin and gently lowered into the grave, laid with the head to the north and feet to the south, and turned on its side with the face towards Mecca. Each person then takes a little earth, and, repeating the words in chap. 112 of the Koran, 'We created you of earth and

we return you to earth, and we shall raise you out of the earth on the day of resurrection,' he puts the earth gently into the grave. The body is then protected with wood and covered in. The Fatiha is again repeated, and again at the door of the cemetery, and at this juncture two angels, Moonkir and Nikir, approach the dead, make him sit up, and inquire who his God and prophet are, and what his religion is. If he has been a good man, his answers are satisfactory, and odours from paradise are diffused around the departed; but if bad, he is bewildered, and these angels torture him. They believe that the dead continue in a conscious state, and dogs and horses or other polluting animals are not allowed within the cemetery; women, also, do not enter, lest the repose of the dead be disturbed. Mahomedans do not speak of a person as dead,—they say he has passed away, has taken his departure; and the living all believe in, and hope for, resurrection in a future state: 'They who believe and do that which is right, shall enjoy blessedness, and partake of a happy resurrection. . . . Paradise . . . . is watered by rivers; its food is perpetual, and its shade also; this shall be the reward of those who fear God' (Koran, ch. xiii.). 'Therein are rivers of uncorruptible water; the rivers of milk, the taste whereof changeth not; and rivers of wine pleasant unto those who drink; and rivers of clarified honey; and therein shall they have plenty of all kinds of fruits; and pardon from their Lord' (ch. xlvii.). 'There shall be gardens with shady trees; with fountains flowing, couches of silk interwoven with gold; beauteous damsels with black eyes lying on green cushions, and beautiful carpets, fruits, palm trees and pomegranates' (ch. lv.).

The monuments over Mahomedan tombs have usually been of earth, or of unbaked brick; but every material, and of the most enduring kind, is employed, and the names are sometimes engraved on the tombstones. The tombstone of a man is distinguished by a raised part in the centre, and that of a woman by a depression. In Turkey, a pillar with the carved figure of a turban distinguishes the grave of a man. The prevalent form in India of Mahomedan tombstones of the rich is a dark or black tombstone, with verses of the Koran engraved on it, and covered by a cupola. Some of these domes are very magnificent. Those of the Adal Shahi dynasty at Bijapur and Gogi have attracted much attention, as also have those of the Bahmani dynasty at Kulburga and Kutub Shahi dynasty at Golconda. The cupolas at Roza where Aurangzeb is buried have not any display, and that of Aurangzeb is the least ostentatious. His daughter's tomb at Aurangabad is large, and many of the tombs at Dehli and Agra are great structures. That of Mumtaz Begum, known as the Taj Mahal, is particularly remarkable. Reformers amongst the Mahomedans consider that unbaked brick or earth should alone be used.

The Christian doctrine that man, in all that he can do of good, is still without merit, is not shared in by any of the Mahomedan, Buddhist, or Hindu sects, who all consider that a personal merit is gained by their good doing; and a Mahomedan passing a funeral of a Mahomedan, turns with it a short way, and lends his shoulder to convey the body to the grave, to bring a merit on himself.

The Parsee or Zoroastrian race are to be found scattered from Hong-Kong in the east to Great Britain in the west, a small but intellectual remnant of the once great Median nation. A considerable body of them dwell in Bombay, in Gujerat, and the western towns of India. Their sick are never allowed to expire on a bed. When the moment of passing away is near, the sick person is removed to the ground, and bathed and washed. The reasons alleged for this removal are various; but the one ordinarily accepted amongst them is that a dead body is an unclean thing, necessitating that all who touch it shall destroy their clothes, and whatever is touched by it must be destroyed. For these reasons, the dead, in Bombay, are carried by a class of Parsees called 'Nessus salar,'—Nessus meaning unclean (Najis, PERS.). These men, clothed in white, carry the remains to the Dokhma, or tower of silence, and lay the body on its raised upper floor. The Dokhma is without any roof covering; is open to the sky, so that birds of prey, vultures, kites, have the freest approach. The raised floor has a deep well, surrounded by a raised platform, with channels converging to a well. The corpse is laid on a partition of the platform, and the decomposing matters flow along the channels into the well. When the well is full, the bones are removed and buried outside the Dokhma. The fire-priests are paid to pray for the dead, monthly, for a year, and thereafter on every anniversary of the demise. After the demise, and before the removal of the body, a dog is brought near to gaze on the departed. This is the 'Sag-did' or dog-gaze, and, by one account, is said to be had recourse to with the object of ascertaining, from the dog's movements, the state of the soul of the departed; by another account, it is practised from the belief that the dog is a naturally chaste animal, and the view of the chaste dog falling on the dead will expedite the translation of the soul to heaven across the Chigvan bridge. See Bridge.

The *non-Aryan* and non-Hindu races of British India are estimated at about 20 million souls, but, except the great Gond nation, and the Kol, the Bhil, and the southern Shanars, most of them are in small tribes, and many are occupying forests and mountain fastnesses, or are dwelling on the outskirts of towns. They in general bury their dead.

The *Sowrah* of the hill ranges of the Circars, mostly those hills near Chicacole, near Kalahanda, and southwards as far as Bradachellum, bury their dead with their weapons.

The *Chenchwar* race, farther south, in the forests of the Nalla-Mallai, bury their dead and sometimes burn, and, like the Tartar races, they carry the deceased's weapons to the grave.

The *Kuki* race of Assam, up to the middle of the 19th century, continued to make inroads on the plains, not for plunder, but to secure heads, and they have been known to carry off fifty heads in a night. On the death of a chief, the body is smoke-dried, and kept for two months with the family. If a raja fall in battle, they immediately proceed on a head-hunting expedition, and bring in the heads of those they kill, hold feastings and dancings, and, after cutting the heads into pieces, send a portion to each village. This is considered in the light of a sacrifice to the manes of the deceased.

The *Khassya* hill race, 4000 to 6000 feet above

the level of the sea, inter their dead on the undulatory eminences of the country. These are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude piers. Menhir are there; one of them seen was 30 feet out of the ground, 6 feet broad, and 2½ feet thick, and in front of each is a dolmen or cromlech of proportionately gigantic pieces of rock.

In *Tibet* there are four modes of disposing of the dead, viz. incremation, throwing into the rivers and lakes, exposure on the summits of mountains, and cutting the dead bodies and giving them to the dogs to eat, which is the most flattering of all. The dogs of the environs devour the poor, but for the rich there are establishments with dogs for this purpose.—*R. A. S. J.*, vi., 1872–3.

In Tibet, the sovereign Lamas are deposited entire in shrines prepared for their remains, which are ever afterwards regarded as sacred, and visited with religious awe. The bodies of the inferior Lamas are usually burnt, and their ashes preserved in little metallic idols, to which places are assigned in their sacred cabinets. Ordinary persons are treated with less ceremony. Some are carried to lofty eminences, where they are left to be devoured by ravens, kites, and other carnivorous animals. But they also have places surrounded by walls where the dead are placed.

Mongols sometimes bury their dead; often they leave them exposed in their coffins, or cover them with stones, paying regard to the sign under which the deceased was born, his age, the day and hour of his death, which determine the mode in which he is to be interred. For this purpose they consult some books, which are explained to them by the Lamas. Sometimes they burn the corpse, or leave it exposed to the birds and wild beasts. Children who die suddenly are left by their parents on the road.—*Timkowski's Pekin*, ii. p. 312.

In *Spiti*, in the N.W. Himalaya, when a person dies, the body is sometimes buried, or burnt, or thrown into the river, or cut into small pieces and burnt. Admonitions are made over the body to the departed spirit, such as, 'Do not trouble yourself, you cannot enter it (meaning the dead body); in summer it quickly becomes corrupt, in winter it freezes and is too cold for you.'

Amongst the Buddhist Burmese, whose religion teaches them to look on death as a release from the cares and troubles of the world, as a possible cessation of transmigrations and the longed-for arrival of annihilation, the cremation of the remains of friends, relatives, and teachers, are not seasons of grief; the spectators are often able to look on them with joy. The Rev. Mr. Marks went to see a sick pupil, whose mother met him at the door. To Mr. Marks' inquiry as to her child's state, she replied, 'He is well, he is well,' and skipping, half joyfully, half hysterically, before him, led him to an inner room, where the pupil lay dead, but the bereaved mother, full of faith, was still able to say, 'He is well.' The remains of holy men, the phoungye, are not soon removed. Their bodies are placed in honey, sometimes for a year or more. One at a phoungye house in Kemmendine, adjoining the editor's dwelling-house, was kept in honey for a year, and then removed. In the process of embalming, the body is placed in honey for a few weeks, the intestines are then removed, and replaced by spices, and the body is encased in a sheathing of wax, which is coated with lac, and this gilded with gold-leaf. The body is then left to dry on a staging, under a white umbrella, and finally the coffin is placed on a model of a kneeling elephant, made of wood and paper. On the day appointed for the funeral of the priest, a great crowd assembled, and, with two ropes attached to the car, one part of the multitude pulled it towards the place of cremation, another pulled against them, and, with shouting and laughter, drumming and uproar, the remains at length reached the burning place and were burned. Looking quietly at the opposing multitudes, their antagonism seemed a representation of some ancient idea of good and bad spirits battling for the dead. But the object of this struggling to draw the car onwards and to retard it is unknown.

In September 1870, the remains of the queen-mother of Burma were burned between the inner and outer walls of the palace, to the north of the main entrance. A large space was enclosed by a fence or yazamat, in the centre of which the burning took place. Inside and outside of this, numerous temporary sheds were run up for the princes, queens, ministers, etc. Above, where the fire was to be placed, a lofty structure of bamboos was erected; this was covered with white cloth. The body of the late queen-mother was laid out in state in one of the pavilions to the south side of the palace, the gardens being for the time open to all. The troops were under arms in the great square and other parts of the palace open to the public, a large space in front of the enclosure being kept clear for the king and his retinue. About 10 A.M., the first of the procession accompanying the coffin appeared at the inner gate of the palace, and slowly marched towards the pyre, all taking up their respective positions with order and regularity. Save the troops, all taking part were in white; but the numerous gilded palanquins, gold umbrellas, together with the splendid bier, with the white umbrellas joined to the green coats, red and gilt headpieces of the troops, with the numerous elephants, gaudily trapped, placed here and there, made the scene barbarously splendid. Following or preceding the bier were the princes and princesses, the queens with the Pakan Meng, the late king. He and the first queen, whose mother the deceased was, walked in front of the bier. About a quarter to eleven the great inner gates were again thrown open for the exit of the king and retinue. The king was seated in a large gilded palanquin, borne on the shoulders of some 40 or 50 men, and was accompanied by four of his daughters and one son, all young. He, like all the others, was dressed entirely in white. Advancing up to about ten yards from the front of the enclosure, the palanquin was halted, the retinue and guards filing off right and left, and forming a large hollow square. Prayers were said by several phoungye, the king gave directions as to the exact minute at which the cremation was to commence, the bearers turned round, the procession was re-formed, and moved inside the great gates, which were again partially closed, while drums, tom-toms, and cymbals were beaten, and trumpets (?) sounded, amidst a tumultuous noise. The queen, princes, Pakan Meng, etc. etc., returned to the palace, shortly after the cremation was completed, in the same order as they came out. The coffin was

overlaid with gold to the extent of 7½ viss, which was afterwards distributed among the phoungye, or to be applied to the building of a pagoda. Charcoal was employed at the burning of the body, and was kept at a red heat by numerous bellows placed all round. The whole of the body with the exception of a small part of the back of the skull was reduced to ashes, or at least consumed on the fire. This small piece, little bigger than a rupee, was placed in a gold cup closed by a lid studded with rubies, while the remains of the charcoal and ashes were placed in earthenware vessels to be carried to the river. The gold cup was confided to an official, who took his place in the hearse. Having arrived at the river bank, those deputed for the purpose entered two gilded boats lashed together, but a little apart, which were rowed out into the centre of the stream. Here a halt was made. The bearer of the gold cup, with it rolled up in his putzoe, jumped into the water, and while he was underneath let it go. At the same time the jars of ashes had their contents poured into the stream, the man was picked up, and there was an end of the ceremony.

On the death of a Burmese, the body is washed, the two thumbs are tied together, a piece of gold or silver money is put in the mouth, as Kadoakah or ferry toll, and after a day or two placed in a coffin on a bier, which the young men carry to the burying-ground, halting from time to time to sing and dance, keeping time to the song. The tsandala or gravediggers place the coffin on the funeral pile. Persons dying of cholera, smallpox, and the young under 15 years of age are buried; 7 days after the funeral, the leip-bya or soul of the deceased is released from the house by the house Nat.

Karen relatives, after burning the body, collect the bones, and, at an annual festival, the bones of all who have died are carried and interred in a consecrated Ago toung or hill of bones.

In *Siam*, the poor are buried or exposed to beasts of prey; if above the lowest class, the deceased, after the bowels have been extracted, is laid in a wooden coffin, externally lacquered and gilt, and this is placed for some days on a high table. In the meantime the priests light up tapers, burn perfumes under the coffin, and chant funeral hymns at night. A procession of relatives and friends dressed in white and covered with white veils follow the corpse. Beside it are borne figures of various animals or singularly-shaped monsters carved out of bamboo, and the accompanying talapoins exclaim, 'We must all die, we are all mortal.' The mourners attest their sorrow by their tears, and often hire women for the express purpose. The body is then taken from the coffin and placed naked on the pile, which is set fire to, and the remains are scorched. The body is then replaced in the coffin and deposited under one of the pyramids erected about the temple. Graves are held sacred among the Siamese, and their violation is considered as a heinous offence. They refuse the honour of burning to persons killed by accident, by lightning, to the still-born, to those who die in child-birth or from smallpox, and to suicides. The remains of such are either thrown into the water, or exposed to beasts of prey.

With the *Chinese*, when life has departed, the dead body is arrayed in robes of state, or in most costly apparel; ablutions are not performed, nor any unnecessary handling of the body suffered. White is the sign of mourning. The Chinese worship the spirits of the dead, and, amongst that nation, the desire to have a good coffin is universal. Many purchase for themselves that last tenement, and keep it by them, and it is usually substantial, of metal or wood. In Burma, where many Chinese are settled, the best block of teak is selected, and the upper portion being sawn off to form a lid, the block is hollowed and ornamented. These may be seen in Moulmein in every carpenter's shop. In China, the coffin-makers' shops have a very gay instead of a lugubrious appearance, as the coffins are usually painted red, or some equally bright colour, and the more expensive ones are decorated profusely with gilding; these coffins are placed on shelves one above the other, and the prices vary from one dollar up to four or five hundred. The funeral customs of China vary in the different districts. In Fo-Kien, the body is placed in a coffin soon after death, a fan is placed in the hand, a piece of silver in the mouth, and an opening is sometimes made in the roof for the spirit to effect its exit. The tombs are on the hillsides, where lucky spots are chosen by geomancers. Paper images of clothes, horses, and other luxuries are cast into the grave, and a sacrifice of cooked provisions is offered on the day of the funeral. Every year, in the month of April, the whole population visit the tombs and worship the manes of ancestors, sacrifice at the tombs of their relatives, weeping near the graves, and burning fictitious paper money, making offerings of meat, fruit, cakes. Sackcloth is the material for mourning.

Most of the Chinese cemeteries have a sacrificial temple, to which are attached extensive suites of rooms for the reception of the coffins of the richer members, pending transmission to their native districts, for Chinamen prize the privilege of being interred near their forefathers. The Chinese coffin is of good wood, and ponderous. The lid is morticed on, and carefully closed, all joints cemented so as to prevent all entrance or exit of air. Only a small aperture is drilled through the lid over the face, so as to allow the entrance or exit of the spirit at its option. Sometimes a humble family will keep the coffin for many months in their house till able to purchase a tomb, but the very poor are buried *en masse* within enclosed buildings. The rite of respectful burial is however so revered, that burial clubs exist in all the large cities. The monumental tombs are small raised truncated cylinders. The tombs of opulent Chinese are decorated with statues of men and horses. They run into excess in mourning for the death of near relations. Every part of the ceremonial is exactly regulated; even the period, manner, and degree of the mourner's grief being duly prescribed. The corpse being dressed in warm clothes, and deposited in a substantial coffin, is kept for several days above ground, whilst the survivors express their measured grief by gesture, dishevelled hair, sackcloth, and mournful silence. When a lucky spot has been selected for the grave, the corpse is consigned to the earth. Building a tomb in the form of a horse-shoe, they inscribe thereon the name of the deceased, erect a tablet to his memory in the hall of his ancestors, and repair annually to the grave, in order to prostrate themselves before the manes,

and to offer victuals to the spirits. In the temples, divine honours are paid to their memory. To supply their full wants in the other world, they burn gilt paper, paper chariots and houses, with every necessary article of furniture, which are supposed to be changed in the other world into real utensils, whilst the gilt paper, when burnt to ashes, becomes so much ready money. The greater the personage, the more protracted is the mourning. The emperor mourns three years for his parent, and every good subject follows his august example. Mandarins resign their offices during this period of affliction, literati avoid entering for the examinations, and working people abstain for some time from their labour. Chinese sutti prevailed to a considerable extent up to the middle of the 18th century. It does not appear, however, to have been regarded as a compulsory rite, but was generally the widow's own choice, to show her extreme fidelity, or to escape the hardships of widowhood, or, in the case of dutiful sons, to save the life of a parent. Fire was never used, but opium, poison, or starvation were the means of suicide employed. Yiun Chang was the first emperor who discountenanced those practices, which his immediate predecessors had encouraged; and he forbade honorary tablets to be erected to self-immolating victims. In 1792 a memorial was presented to the emperor, praying for the dedication of a tablet to a most dutiful son, who had cut out his liver in order to cure his mother's sickness. The Imperial Board of Rites, after mature deliberation, respectfully observed that the practice of cutting out the liver is that of the ignorant, showing a contempt for their lives, and after all but foolish devotion, and a decree was issued discountenancing the custom. The Chinese, like Christians and Mahomedans, plant trees in their cemeteries and around the tombs. The cypress is a favourite with all these religionists, and in northern Europe the yew is much planted.

The *Japanese* have a great respect for the dead. They place the remains inside a kind of square tube, and in a sitting posture. To obtain this position, they are said to use the Dosio powder, which, placed within the mouth of the corpse, is said to have the effect of relaxing all the muscles. The hollow square is carried in a chair or norimon by four men into the yard of the Tera, escorted by a few women dressed up in bright colours, wearing a veil of white crape on the head. They are here met by the Ochaushan and a number of minor canons, who chant to the sounds of the tom-tom, the whole company awhile moving with the body around the temple, into which they at length rush with a great noise. Prayers are then read over the body, and it is removed to be burned. If the deceased has been a person of rank, the ashes are deposited in an urn, and buried within the sacred precincts of the Tera. In the procession there is very little affectation of sorrow; they seem to regard it as a joyful occasion, and the whole ends with a feast at the house of the deceased.—*Boutell's Manual of British Archæology*, London 1868, p. 100; *Raffles' Hist. of Java*, i. p. 327; *Travels of a Hindu*, i. p. 18; *Edinburgh Phil. Journ.*, July 1867; *Madden's Sepulchres*, i. pp. 368–457: *Picard; The Bible; Homer's Iliad; Baron De Bode's Travels in Luristan*, ii. pp. 218, 219; *Englishwoman's Domestic Magazine*, No. 49; *Tod's Rajasthan*, i. p. 47; *Dr. Caldwell's Comparative Grammar; The Koran; Madras Journal of Literature and Science; Timkowski's Journey to Pekin*, ii. p. 212; *Burton's Scinde; Butler's Travels; Forbes*, 277; *Rawlinson.*

BURIGOPAN. BENG. Dipteracanthus dejectus.

BURI MAE. HIND. Tamarix Indica.

BURJ. PERS. A bastion, a fort. Buruj, the plural, is applied to the signs of the zodiac, in order, as Masudi says, to mark the position of the stars with reference to these fixed objects. The word burj is widely diffused. In Gothic Bairgan, and Saxon Beorgan, to fortify; Thracian Bria, a city (Strabo, vii.); German Burg, a city; and English Borough, Burgh, and Bury, so frequently the affix of the names of towns. All places in Britain that in the old time had the name of Bourroughs, were places one way or other fenced or fortified. The Greek Purg-os is evidently the same word, signifying a tower, and hence applied also to a dice-box,—Mitteret in pyrgum talos (Hor. Sat. ii. 7, 17). It enters commonly into the name of fortified towns,—one in Mysia (Anabasis, vii. 8, 8); in Thrace (Herod. vii. 112).—*Elliot, Supplemental Glossary; Restitution of Decayed Intelligence*, ch. vii.

BURJ. HIND. Betula bhojputra, B. Jacquemontii, *Spach.*

BURJA. TEL. Hymenodyction excelsum.

BURKA. ARAB. A veil, a woman's face veil; also a door curtain, and the curtain which is suspended over the entrance of the Kaba.

BURKUK, Khubani, Mishmish, Bakur-Khanee, HIND., vars. of Armeniaca vulgaris; the apricot.

BURMA, as now known to Europe, was formerly the site of four kingdoms, viz. Arakan, Tha-htun, Martaban, and Pegu. It is still subject to two dominions, being partly a British province and partly under a Burmese ruler, the two portions being designated respectively British Burma and Independent Burma.

British Burma comprises territories conquered in the two wars of 1824–26 and 1852–53. The features of the country are of a varied character. The Yoma mountains and the Tenasserim range stand prominently to the view. On the Arakan coast is the Naf estuary; and there also are the Mru and Koladyn or Arakan rivers. In the Pegu district are the Irawadi, the Hlaing or Rangoon rivers, the Pegu, Sitang, and Bhileng; in Tenasserim the Salwin and the river of Tavoy.

The British portion consists of the long strip of land lying between lat. 9° 55′ and 20° 50′ N., and long. 92° and 99° E., an area of 88,556 square miles, with a population in 1881 of 3,707,646. *Arakan.*—Males, 384,045; females, 257,963; total, 562,008, against a total of 484,363 in 1872, thus showing an increase of 77,645, or 16 per cent. *Pegu.*—Males, 1,249,346; females, 1,081,061; total, 2,330,407, as against 1,662,658 in 1872, or an increase of 668,349, or 40·2 per cent. *Tenasserim.*—Males, 431,270; females, 380,548; total, 811,818, as against 600,727 in 1872, or an increase of 211,091, or 34 per cent. The totals for the entire province are—males, 1,984,661; females, 1,719,572; total, 3,707,606, as against 2,747,148 in 1872, showing an increase of 957,085, or 34·8 per cent. Rangoon in 1872 contained a population of 98,745; it now contains 132,004, showing an increase of 33,259, or 36·6 per cent. In 1872 the population of Moulmein was returned at 46,472.

In 1881 it was returned at 53,080, or an increase of 14 per cent.

A treaty is said to have been entered into in 1757 between the Indian and Burmese Governments, and in 1795 Captain Michael Symes was sent as envoy to Ava; but from 1797 disputes regarding Arakan began, and fugitives into Chittagong were in 1798 demanded from the British. On this Colonel Symes returned to Rangoon, where he was not treated with ordinary civility by the governor, and he left for Bengal in January 1803. After this, Captain Canning was sent on two occasions, the latter in 1809. On the first he was treated discourteously, but on the second with civility. In 1811 the Arakanese rebelled, and invaded Burmese territory; and in 1811 Captain Canning was again sent to mediate. Subsequently to that year the Burmese officers in Arakan more than once made demands for the surrender of Arakanese refugees, and even made pretensions to the sovereignty of Bengal as far as the city of Murshidabad, as territory pertaining to the kingdom of Arakan. In 1819 they interfered in Assam, and in 1824 they invaded Cachar. War was declared against Burma on the 5th March 1824, and, after two campaigns under Sir A. Campbell, a treaty of peace was signed at Yandaboo on the 24th February 1826, on which occasion parts of Assam, Arakan, and Tenasserim were ceded to the British. Subsequently, in 1851, in consequence of the Burmese refusing redress to a British shipowner whom they had injured at Rangoon, war was again declared, and was conducted successfully by General Godwin. Rangoon fell to a combined naval and military force on the 14th April 1852, and when peace was declared, all Pegu and Arakan were retained by the British.

British Burma may be geographically divided into five portions, viz., (1) *Arakan*, stretching from the Naf estuary, which separates the province from Chittagong, to Cape Negrais, and consisting of a comparatively narrow strip of country between the sea and a high mountain chain; (2) *Pegu*, the valley of the Irawadi, which, divided from the Sitang valley by the Pegu Yoma range, unites with it in its southern portion; to the eastward is the chain of hills which forms the watershed between the Sitang and the Salwin rivers, and on the west the Anouk-pek-toung-myeng, literally, the high western range of mountains, sometimes called the Arakan Yoma range; (3) the *valley of the Salwin;* and (4) *Tenasserim*, a narrow strip, like Arakan, reaching down to the Pakchan stream in 9° 2′ N. lat., and separated from Siam by a lofty chain of hills running from north to south nearly parallel to the coast, at a distance of from 30 to 40 miles inland, but approaching nearer to the sea at its southern extremity; (5) The numerous islands off the Tenasserim coast, known as the Mergui Archipelago.

For administrative functions it is arranged as the Commissionerships of Arakan, Pegu, and Tenasserim, all under a Chief Commissioner since the 31st January 1862. The principal towns are, —Rangoon, Moulmein, Prome, Bassein, Akyab, Henzada, and Tavoy, with the military cantonments of Thayat-myo and Tounghoo. Some of the districts have a very scanty population; in 1872 only 6 to the square mile in the Mergui and Salwin districts, 7 in that of Ramree, 10, 14, 15, and 16 in those of Tavoy, Tounghoo, Sandoway, and Amherst respectively, and in Myan Oung, the most populous, 115. Of the entire population, 2,447,831 were of the Buddhist religion, 99,846 Mahomedans, 52,299 Christians, and 36,658 Hindus.

The country has long been known to the people of India as one of the Savarna Bhumi, which Europeans render the Golden Chersonese, and applied to the delta of the Irawadi. The *Irawadi* and Sitang valleys unite towards their mouth to form an extensive plain, stretching from Cape Negrais to Martaban. It is annually inundated, but is the most productive part of the whole province, and a canal connects the Pegu and Sitang rivers. The Irawadi is navigable for river steamers as far as Bhamo, 600 miles from the coast. The *Hlaing* or *Rangoon* river rises close to Prome, and, when passing Rangoon, it is joined by the Pegu and the Pu-zwon-doung rivers coming from the N.E. and the E. The two latter rivers rise close together in the Yoma range, about 58 miles above the town of Pegu, and they communicate by several channels with the principal delta branch of the Irawadi. The *Salwin* is a great river, but, owing to numerous rapids and rocks, it is only navigable by boats for 100 miles from its two mouths. Between Talifu and Momien, 600 miles due north of its mouth, it flows a rolling current in a shingle bed 140 yards wide. The *Sitang* river rises far north of British territory, and in the dry season is with difficulty navigated by any boats. Below Shwe-gyeng it receives the river of that name, and finally disembogues into the Gulf of Martaban.

The more prominent and dominant races have been the *Myama* or *Burmese*, the *Ra-kheng* or Arakanese, and the *Mon*, Mun, or Taleng. The native name, Ma-ran-ma, M'ran-ma, whence the softened modern M'yan-ma, M'ya-ma, is the source of the European corruption Burma. The Arakan people are of the same race as the Burmese, and the territory was long under the Burmese rule. In the 16th century, Arakanese dominion extended to Chittagong and the Megna river, and the 17th century saw there several adventurers from Europe. Sebastian Gonzales established himself at Sandiva (Sandwip), and was for years a terror to the country, till crushed with the help of the Dutch. The Ramana or Ramaniya territory was held by the Mon, Mun, or Taleng, whose districts were Tha-htun, Pegu, and Martaban. It was founded several hundred years B.C. by emigrants from Coromandel. Tha-htun is now ten miles from the sea-shore. It was the Sobana Emporium of Ptolemy. Pegu city was founded by emigrants from Tha-htun, A.D. 573, and Martaban three years later.

In Arakan and in the basin of the Irawadi are other tribes of the same stock with the Burman, and their languages are in their present form so much akin to it, that they may be almost considered as forming, with Burman, dialects of one tongue. The Burmese is monosyllabic, and has no letter corresponding to f or v, and no hissing sibilant s. The Burmese language is spoken in Arakan, in the valleys of the Irawadi and Sitang, and in Tenasserim to the south of Tavoy.

The Burman people occupy the lower part of the basin of the Irawadi above Pegu, with the southern parts of the upper basin and the valley

BURMA.

of the river beyond, as far as Ba-mo. They are also found in the delta, but their progress there has been comparatively recent, and the prior inhabitants still form the greater majority.

Burma has the Tai or Shan on the east, the Malay on the south, Hindu and Mahomedan races on the west, and the Tartar and Chinese on the north. Within these boundaries are many tribes, with several synonyms, but nearly all may be referred to four great families,—the Mon or Talaing, the Burman, the Karen, and the Shan.

A. *Mon.*
B. *Burman,* viz. Burman, Rakhui, Mug, Kanyan, Tounghuer, Tavoyer, Yau or Yo, Yebain, Pyu, Kado, Danu.
C. *Karen*—
  a. Sgau tribes, viz. Sgau, Mau-ne-pgha, Paku, We-wa.
  b. Bghai tribes, viz. Tunin, Bghai, Pant Bghai, Lay-May, Manu or Manau, Karen-ni or Red Karen.
  c. Pwo tribes, viz. Pwo, Shoung, Ka or Kay, Ta-ru or Ku-ta, Mo-pgha, Ha-shwie, Toungthu, Khyin.
  d. Shan Karen, viz. Yen or Yein, Yen-seik, Ying-baw, Pandung, Toung-yo, Black Karen.
  e. Miscellaneous tribes, viz. Ka-khyen or Ka-ku, Ka-mi or Ku-mi, Kyau, Kun, Sak, Mru, Shendu, Selung.
D. *Shan Tribes,* viz. Shan or Tai, Lao or Lau, or Lawa or Wa, Paloung or Paloa, and Phwon or Mwoon.

There are numerous Shan states far to the north-east, but they generally owe fealty to the Burmese monarch.

Burmans march on the north with rude tribes of their own family, collectively termed *Singpho,* who occupy the Upper Irawadi. On the extreme north, the linguistic boundaries of the Singpho are unknown.

Lau, a wild tribe only known under the generic *Lau,* termed Kha-nung, occupy the mountains to the north-east of the Kham-ti, apparently in the upper part of the Mi-li or Nam-Kiu. They are interspersed between the Kham-ti and the Mung-fan. the latter appearing to belong to the Tibetan family (Si-fan or Kham-pa). The Kha-nung may form a link between the Kham-pa and the Singpho or Burman families.

Shendu, Shindu or Shandu, occupy all the country watered by the Koladyn and Mee, as far down as the Sulla Kheoung, but north of the Sulla Kheoung they are not tributary to the British.

Khon villages are spread from below the Sulla Kheoung to Teinway; their villages are few, and they also pay no tribute to the British.

Kumi or Khwa-mi occupy all the country watered by the Koladyn as far down as the Koladyn Thannah, also both banks of the Mee and Samee Kheoung, and both banks of the Pee and the Yeo as far as Khoong-choo, east and north-east of Koladyn, and the country watered by the Pee and Yeo west of the Koladyn.

Mru occupy from Koladyn Thannah as far as Ralla, and eastward to Mahamonie and Old Arakan south-east, and both banks of Myoo from Rasudong northwards. They do not exclusively occupy the whole of that tract of country, their villages being interspersed with those of the Arakanese; they are, correctly speaking, wild people rather than hill-people. Some families live with the Kumi on the lower part of the Mee and Pee streams, and also on the Yeo. They also inhabit the hills on both banks of the Myoo river in the western part of the district from Rasudong northwards to Sugarloaf hill. In this extreme north-west part of the district, there are some wild people called *Mroong,* living among the Mru, but there is no appreciable difference in their manners, customs, and appearance, from those of the Mru.

The *Mroong* in the upper basin of the Mayu, and towards the hill frontier of Chittagong, are a colony imported from the Bodo country by the kings of Arakan, at the period when their conquests extended far up Eastern Bengal.

Kyen occupy the whole of the large hilly tract of country east of the river Semru, in fact, all the hills east of the district, and dividing it from Independent Burma and Khyouk Phyo. They are the most numerous of the hill tribes. Some of their nearer villages pay tribute, but those more remote are independent. All the Kyen women tattoo their faces.

Anoo is a small hill tribe of four villages, living on the Paroon Kheoung, a little above Tulukmee. They differ little from the Kumi. All the tribes have separate clans, at constant warfare with each other.

Burma, Siam, and Tonkin received their first culture from India, along with Buddhism; and their ancient buildings all bear the stamp of Indian origin and Indian taste of a post-Christian age. Siam has in recent times added Chinese methods of improvement to the Indian ones, and Tonkin owes mainly from China.

About five-sixths of the population are Buddhists, the remainder Christians, Mahomedans, Hindus. Every Buddhist Burmese must once in his life enter a kyoung or monastery, even if only for a few days, as a monk. The procession to the monastery is gay, and he there undertakes the ten negation commandments, not to kill or steal or indulge in unlawful passion, nor speak falsely, nor drink intoxicating liquors, nor eat after mid-day, dance, sing, or play instrument, paint the face, stand in high places, or touch gold or silver.

The Burmese are of the Himayana sect of the followers of Buddha, whom they call Godama, and they have great figures of Godama in every pagoda. They believe in the presence of a spirit 'La' in every animal, plant, or thing, and they adhere to a Lent, Wa, from the full moon (wa-tso) of July to that of (tha-ding-ynot) October, and they have a rosary of 108 beads. The Leip-bya, literally 'butterfly,' is the soul, the psyche of the Greeks, the life, the perceptive principle. They have spirits of kinds called Nat, and demons called Beloo; have witch-finders; and believe in astrology, the evil eye, and philtres. Every *Mon* village has a Nat; and a Burmese king dying is said to ascend to the Nat village (Nat yua-tsan-thee). With all the dead, a piece of gold is put into the mouth as ferry toll, ka-dō-akāh. The great Shwe-Dagong Po-yah pagoda was erected B.C. 585. Its height is 372 feet.

Besides the Wa or Lent, their religious annual festivals are the Ko-daw-ba, or Beg-pardon day; the Ta-wa-dein-tha, relating to the life of Buddha; and the Water Festival, Shin-oo-pa-ga, when little saucer-shaped lamps are consigned to the river at night. Their favourite religious story is the Way-than-da-ra, on the former existence of Buddha. Their everyday amusements are the pooey drama, the puppet or marionettes, 2 to 3 feet high, music,

boat and horse racing, football, boxing, wrestling, gambling, cock-fighting. The country is wealthy, and their aversion to regular labour is extreme. Notwithstanding this, the total trade in 1870 amounted to £10,263,000, increased in 1880 to £22,222,000. The incidence of taxation on the population of 3,736,771 is Rs. 6·3 per head. So little is this felt, that every family in Burma on the average spends £12 yearly on jewellery and imported luxuries. Bullion to the extent of a million and a half annually is absorbed in the province, in addition to the great amount spent in charity and amusements.

Their courting time is after 9 P.M., and is called Loo-byo-tay, thee-achyrin, the time for young men to go about. Polygamy is legal, but is only practised by the wealthy. Living as man and wife, or eating out of the same dish, is a legal marriage. The bridegroom provides a dower. The king has four legitimate wives. Few women have had education. They can hold property, and can divorce themselves from their husbands. The Burman woman's lower garment, Ta-mein, is a narrow cloth of various colours of a pleasing contrast, which descends generally from the waist or from below the arm to the feet. It is made to overlap, and in front is tucked in, but it is so narrow that as the wearer walks the thigh is more or less shown at each step. Women transact the most important business. The filagree work necklace 'Bayet' is a great ornament with the Burmese women. As in Buddhist countries, Burmese women are more nearly the companions and not the slaves of the men. But the Tibeto-Burmans and the cognate Indonesian tribes permit great licence to both sexes prior to marriage, when chastity is not required.

The Burmese tattoo themselves, and, after certain Turks, are perhaps the most civilised men and women who do so. They tattoo their bodies with figures of lions, tigers, beloo or demons, and dragons, also red squares, cabalistic signs or words on their breasts, arms, or backs. The Burmese, Mon, or Ta-laing also tattoo from below the navel to below the knee; the Shan from the navel to the ankle. The Karen-ni have a rising sun on their back as a clan badge, as a mark of manhood. The Kyen tattoo the whole of the face of their women. The inflammation is severe, and death occasionally follows the operations.

The Burmese have no surname. Their single name is prefixed with Moung, meaning brother, or Nga, Koh, and Poh. They and the Karen have the custom of brother-making, called by them Doh, also Thway-thouk. In salutation, the Burmese bend the head three times to the ground, but the Karen, the Shan, and wild tribes of Arakan sniff their relatives. Burmese are skilled workers in metals. A bell at Mengoon is 12 feet high. At Amarapura is a sitting figure of Gaudama, 12 feet high. It was formerly the tutelary saint of Arakan, and was carried off A.D. 1784 by the king of Burma. Amongst the Karen, the Kyee-zee, a large one-headed metal drum, is the standard of wealth. They use as bellows the double-formed forcing air-pump of the Malays. Hla-pet, or pickled tea, prepared from the leaves of the Elæodendron Persicum, forms a part of every Burman ceremony. They brew a rice beer called 'koung.'

The Karen races continue the destructive form of temporary clearings for cultivation, called Toung-ya, meaning hill clearing or hill garden. Rats, at long intervals of 40 or 50 years, invade the Karen lands in myriads, crossing streams, so that the water is black with them, and devouring every edible thing. From 1870 to 1874 the hill country east of the Sitang was devastated by them, and Government expended £10,000 in relieving the Karens.

The adult dead are burned; those under 15, also such as have died of cholera or smallpox, are buried. Leip-bya, or spirit or soul of the deceased, is believed to dwell in the house until released on the seventh day from the house by the house Nat. The Karen, after cremation, and at an annual festival, collect the unburnt bones, and carry them to the consecrated Ayo-toung, or hill of bones. This is a practice of other tribes.

Independent Burma has the British districts of Assam, Arakan, and Pegu, with the Tipera and Manipur states on the N. and W. and S., with Chinese territory and the Shan states on the E. It extends from lat. 19° 30′ to 28° 15′ N., and from long. 93° 2′ to 100° 40′ E., and its area has been estimated at 192,000 square miles; this includes the tributary Shan states. Its rivers are the Irawadi, Kyeng-dweng, which unite in lat. 21° 50′ N., the Sitang or Paung-laung (Poungloung), the Salwin, and the Myit-nge. Crawfurd estimated its population at 22 to the square mile, which would give about 3,090,000; Colonel Yule's estimate in 1855 was 1,200,000; Count Bethlenen in 1874, excluding the Shan tribes, reduced it to 700,000; Dr. Hunter in the Imperial Gazetteer, including the Shan, supposed the number to be 4,000,000.

The Burmese seem to have been an intruding race, conquering from north to south, and the boundaries of their kingdom have greatly varied. On their first advance from Arakan, they appear to have conquered the northern part of the ancient kingdom of the Mon, for their capital was for 395 years at Prome. In the era of their greatest stability and prosperity, their capital was at Pagan (probably the place of that name above Ava), from the second to the middle of the 14th century A.D. It was not till the middle of the 16th century A.D. that they succeeded in annexing Pegu. But in the middle of the 18th the Mon threw off the yoke, and in their turn subjugated all Burma for a short period. The Burma capital had moved up the river from Prome to Pagan, from Pagan to Panya, from Panya to Ava, from Ava to Amarapura, and thence, in 1822, to Mandalay, where it now is.

In the Burmese chronological table translated in Crawfurd's Embassy, are the following events:—

B.C.		
691		Sacred Epoch.—The grand epoch established by An-ja-na, the grandfather of Gautama.
628		Gautama born; 608 began to reign.
589		Gautama became a Buddha.
544		Gautama died, and obtained Nib'han (annihilation).
543	1	The sacred epoch established by king Ajatasat.
94	450	The communications of Gautama reduced to writing in Ceylon.
A.D.		
76	1	The Prome epoch established by king Sumundri.
639	1	The Vulgar epoch established by Puppa-Chan-ra-han.
1364	726	Uch-cha-na-praung, in Chitkaing. But this year Sa-to-mang-bya founded

B.C.		
		Angwa (Ava), and began to reign; and Chitkaing and Panya were destroyed.
1752	1114	Alaung b'hura (Alompra) began to reign at Mut-cho-bo (Monchabo).
1781	1143	His cousin Paing-ka-cha, commonly called Maung-mang, son of U-pa-ra-ja at Ava, succeeded the same year by his uncle Pa-dem-mang, or Man-ta-ri-kri, son of Alaung-b'hura, and founder of Ama-ra-pura.
1822	1184	Ava re-built and made the capital.

Independent Burma is ruled by a king, with a chief council, the Hlut-dan, composed of four Meng-gyi, four At-ween-wun, and four Wan-da-lay. Burmans differ from the Anamese in being stouter and darker, and in the head being Daya-Polynesian or Turanian oval, and not obtusely ovoid. The head varies greatly, and the coarser forms show a tendency to the Binua contraction of the forehead, rendering the lateral expansion of the forehead very marked. The normal or non-Indianized Burman head appears in many respects to resemble the coarse Sumatran, Javan, Borneon, and Polynesian. This softened Turanian type is decidedly allied to the oblong square and oval Chinese type, and not to the ovoid and orbicular type of the Tibetan, some of the Himalaya-Gangetic, the Anam, and the Celebesian tribes. The Burmans on the west more often resemble the handsome Asianesian tribes found in Borneo, some parts of East Indonesia, and Polynesia. Burmans and Malays are somewhat stouter than the Siamese, the average height being probably about 5 feet 2 inches.

The royal family have customs partly Scythic, partly Aryan. They claim descent from the Solar king of Kapilawasta (which was the capital of Suddhodana), and one of the royal titles is 'Ne dwet bhu-yeng,' sun-descended monarch. A peacock is borne on the royal standard, and the figures of a peacock and a hare are painted on the king's throne. The Abeit theik or Water Libation is offered on the accession of a new sovereign. In the royal family, the custom is continued of marriage between half brothers and sisters, and the king's eldest daughter remains unmarried.

Burma has a rich soil, producing in abundance all the cereals, millets, pulses, and oil-seeds, valuable timbers, fibres, cotton, indigo, catechu, lac, caoutchouc, tea, coffee, tobacco, mustard, sugars from the cane, palmyra, betel, yam, sweet potato, and the potato. A tea plant also, supposed to be the Elæodendron Persicum, which furnishes the chief ingredient in the Hla-pet or pickled tea. Amongst its mineral products may be named gold, silver, iron, tin, lead, antimony, copper, bismuth. Quarries of marble are worked near Amarapura. Coal has been discovered on the Irawadi. Ruby mines are very productive; sapphires occur, and garnets; earth-oil is largely obtained from wells. A binoxide of tin occurs in abundance in the streams of the Tavoy and Mergui districts. Lodes have been struck, but they have been found to fine away. Once-washed stream tin yields 70 per cent., and twice-washed 75 per cent., of pure metal. The mercantile products are rice, timber, silk, lacquer ware; and the people are famed for their gold and silver work, and for their wood-carving; rice, of which the yearly product is a million tons, employs, with other articles of produce, 1,200,000 tons of shipping, of which 1,000,000 tons are British. Of teak wood, 150,000 tons are exported in the year,—86,000 tons to India, and 64,000 tons to Europe, chiefly to Britain. The approximate value of the whole is £1,000,000 sterling. Rice cultivation is chiefly in the valleys and the delta. The amount of the rainfall varies greatly,—in Prome about 43 inches, and at Sandoway 230 inches.

Caoutchouc trees are abundant in the Bhamo and Mogoung districts, estimated at nearly half a million. The galena of Bandwen and Tounghoo mountains is highly argentiferous; precious serpentine also occurs, and the gems of Capelan (Kyat Pen) are famed. The larger wild animals are, elephants, rhinoceros, unicorn and bicornis, hog, tiger, leopard, bear, deer, bovidæ, porpoises.—*Forbes' Burmah; Mason's Burmah; Crawfurd; Yule's Embassy; Oldham* in do., p. 335; *Prinsep's Antiquities; Peschel; Aitcheson's Treaties; Bishop Bigandet; Imp. Gaz.*

BURMALA. HIND. A marriage garland.

BURMANN, author of the Thesaurus Zeylanicus, published in Holland, which he wrote from the collections made in Ceylon by Dr. Paul Hermann, a medical man in Ceylon. The same collection served Linnæus to write his Flora Zeylanica, and it is now in the British Museum. Subsequent to this, in the year 1768, Professor Nicholas Laur. Burmann of Amsterdam, son of the author of the Flora Zeylanica, published his Flora Indica, with 67 plates, containing figures of 178 plants tolerably executed, but much inferior to those in the Flora Zeylanica.—*Wight's Prod. Fl. I.* p. 10, quoted in *Hook. et Th.*

BURMAR. HIND. Artemisia parviflora.

BURN, MAJOR-GENERAL, an officer of the Bengal army; while of the rank of major, when Dehli was besieged by the Mahratta army 20,000 strong, under Holkar, with a full train of artillery of 130 guns, kept in constant activity, though the walls were 10 miles in circumference, and much decayed, with a small force he defended it successfully, until the siege was raised by the approach of the grand army. Sir D. Ouchterlony, then Resident, remarked that it cannot but reflect the greatest honour on the discipline, courage, and fortitude of British troops in the eyes of all Hindustan, to observe that with a small force they sustained a siege of nine days, repelled an assault, and defended a city 10 miles in circumference, which had ever before been given up at the first appearance of an enemy at its gates. It is commemorated by one of the bastions being named Burn's bastion.—*Oriental Herald*, vol. v.

BURNELL, A. C., of the Madras civil service, who devoted much labour to the elucidation of the history of ancient India; an eminent Sanskrit scholar, a voluminous writer on Hindu law and Sanskrit literature. The Strasburg University honoured him with the title of Doctor.

BURNES. Three brothers of this name served together in India. Sir Alexander Burnes wrote Travels in Bokhara and History of Cabul, at which place, along with their youngest brother Charles, he fell on the 2d November 1841. They were natives of Montrose in Scotland, sons of James Burnes, provost of the town, and relatives of the poet Burns.

Sir Alexander entered the Bombay army in 1822; travelled from Bombay through Sind, the

Panjab, and Bokhara to the Caspian Sea, returning by the Persian Gulf, betwixt 1831 and 1833; was despatched on a mission to Kābul in 1837; Assistant to the Envoy from 1838 to1842; Author of Notice of Hospital for Animals at Surat, Jl. i. p. 96; On the Colossal Images in Bamian, Bl. As. Trans. 1833, ii. p. 563; Travels into Bokhara, Lond. 1834, 3 vols.; On Female Infanticide in Cutch, Lond. A. S. Trans. 1834, i. p. 193; Cabool, 1837 and 1838, Lond. 1842, 1 vol.; Notice of Sind, Lond. G. S. Trans. 1837, viii. p. 2; Observations on the Maritime Communications of India, as carried on by the Natives, ibid. 1836, vi. p. 2; On the Ruins of Puttun Somnath, Lon. A. S. Trans. v. p. 104; Account of the Reg Rawan; On the Descendants of Alexander in the Valley of the Oxus; On a Fair for the Indus Trade; On Herat and the Surrounding Countries; Coal Localities near the Indus; Navigation of the Indus; On the State of Turkestan. He also wrote articles on Commerce in Sind and Afghanistan; On the Persian Faction in Kabul; On the Political Power of the Sikhs; On the Political State of Kabul in 1837; On Russia in Central Asia; On the Siah Posh; On the Wool of Kabul and Bokhara. A memoir of his life appeared in the Bombay Times, December 1841, As. Jl. 1842.

James Burnes, K.H., the elder brother, a medical officer of the Bombay army, author of A Visit to the Court of Sind.—*Dr. Buist's Narrative of Afghanistan*, Bombay, 1843.

BURNOUF, EUGENE, a learned native of France, who devoted much of his life to oriental investigations. As a Sanskrit scholar, in 1840–47 he edited and translated part of the Bhagavata Purana. He published in 1844 his Introduction à l'Histoire du Buddhisme. He died in 1851. He was Professor of Sanskrit in the College de France in 1826, in conjunction with Lassen. He wrote the Essai sur le Pali. He did for Zend and Achæmenian Persian what Jacob Grimm had done for the Teutonic languages. His labours have been continued by Lassen, Haug, Spiegel, Justi, and others. He published a memoir on the cuneiform inscriptions of Hamadan.— *Oriental Linguistic Studies*, p. 176; *Sayce*, i. p. 52.

BURNUS, Ar., also written Būrnoos, a hooded cloak, generally made of white woollen stuff, and mostly worn by the people of northern Africa.

BURO. Beng. In Hindi, Bara, large.

Buro-bel, Jasminum plenum.
Buro-bet, Calamus fasciculatus.
Buro-buhooari, Cordia latifolia.
Buro-chali, Guatteria suberosa.
Buro-chhooncha, Cyperus Iria.
Buro-chuna, Vicia sativa.
Buro-elachi, Amomum grana paradisi.
Buro-gachh, Ficus religiosa.
Buro-gothoobi, Mariscus cyperinus.
Buro-hulkusa, Leucas cephalotes.
Buro-jalgantee, Panicum setigerum.
Buro-jhauji, Utricularia stellaris.
Buro-joan, Ptychotis ajowan.
Buro-jubanee, Trichelostylis miliacea.
Buro-kanoor, Crinum toxicarium.
Buro-kerui, Euphorbia hirta.
Buro-keshuriya, Hymenochæte grossa.
Buro-keshuti, Adenostemma biocarpum.
Buro-kokshim, Blumea lacera.
Buro-koondo, Jasminum arborescens.
Buro-kookoor-chita, Tetranthera monopetala.
Buro-kulpa, Trichodesma Zeylanicum.
Buro-kungi, Abutilon graveolens.
Buro-kut, Sagittaria obtusifolia.
Buro-looniya, Portulaca oleracea.
Buro-makal, Trichosanthes bracteata.
Buro-methi, Trigonella fœnum-Græcum.
Buro-munda, Loranthus longiflorus.
Buro-musoor, Ervum lens.
Buro-neelpudmo, Nymphæa major.
Buro-panchoo-lee, Villarsia Indica.
Buro-panee-murich, Polygonum pilosum.
Buro-pani-nuti, Poa Chinensis.
Buro-phootika, Melastoma Malabathricum.
Buro-rai, Sinapis ramosa.
Buro-ritha, Sapindus emarginatus.
Buro-ruktu-kumbul, Nymphæa rubra.
Buro-sada-ma-khumshim, Canavalia leucosperma.
Buro-shalook, Nymphæa pubescens.
Buro-shalpanee, Flemingia congesta.
Buro-shama, Panicum hispidulum.
Buro-shialkanta, Argemone Mexicana.
Buro-shoonthee, Rottbolla exaltata.
Buro-shoung, Bergera Königii.
Buro-tugur, Tabernæmontana plena.

BURO-BHOOA and Bhooa. Hind. Species of Bombyx which feed on the castor-oil plant and Cocculus acuminatus. They are shaggy-haired, imitating each other. The former is innocuous, but the hairs of the Bhooa are brittle, and cause intolerable itching, provoking dangerous and even fatal results. If swallowed by goats or buffaloes, it is followed by swelling and inflammation of the bowels. The bhooa is shunned by mynas and other insect-eating birds.

BUROOD, a race in Berar. In 1865 there were 955 of this people in the Oomraoti district.

BUROONDI. Sansk. Celosia argentea.

BURR or BARR. Wherever Arabs are met with in tents, they denominate their place of encampment 'Burr,' or wilderness,—the term Sahara, or desert, being more particularly applied to the wilderness of Africa.

BURR. Arab. Triticum æstivum, wheat.

BURRAR, Hind., in Rajputana is an indefinite term for taxation, and is connected with the thing taxed, as ghaneem burrar, war tax; garh ginti-burrar, house tax; hal-burrar, plough tax; neauta-burrar, marriage tax, and others, both of old and new standing. The burrar is well understood in Mewar, and is levied on many occasions for the necessities of the prince or the head of a clan.—*Rajasthan*, i. pp. 143, 160.

BURRI. Hind. Wedding gifts; also hand-sowing of seed, also dibbling grain. Gurri, Gulli, and Si are all similarly applied.—*W.*

BURRICK, a fabric manufactured by the Jaguri Hazara from the wool of the Dumba sheep. Qu. Bārik, Pers., fine.

BURRO. Hind. Reed pens.

BURSENAPATI, the title of the chief of the Muttuk branch of the Singpho group, and the people are called Muttuk, Moamerria or Mowameria. Their country is a short distance from where the Brahmaputra river enters the Assam valley, and they dwell close to the banks, and principally on the southern side.

BURSERACEÆ, a natural order of plants, nearly all natives of tropical climates. About 24 species have been found in S.E. Asia, of the genera Balsamodendron, Boswellia, Canarium, Garuga, Icica, and Protium. They all have an abundance of fragrant resinous juice. Boswellia serrata yields olibanum. Canarium Bengalense, of this tribe, according to Dr. Roxburgh, exudes an excellent clear amber-coloured resin, not unlike copal. In America, several valuable resins, as elemi, carana, chibow, and two or three kinds

of tacamahaca, are afforded by plants of this tribe. —*Royle's Ill. Him. Bot.* p. 177; *Voigt*, p. 149.

BURSINOPETALUM ARBOREUM, *Wight*, var. macrophyllum. A large tree of the forests of the Central Provinces of Ceylon, growing at an elevation of 4000 to 7000 feet. B. tetrandrum, *Wight*, is another large tree of Ceylon.—*Thw. Zeyl.* i. p. 42.

BURSUNGA. HIND. The leaves of Bergera Konigii, used medicinally.

BURTON, R. F., an officer of the Bombay army, in which he rose to the rank of captain, one of the most varied linguists of his day. In 1853, under the name of Haji Abdullah, he visited Medina and Mecca. He led an expedition into Central Africa, and discovered Lake Tanganyika. He visited the Mormons at the Salt Lake. He entered the civil service of Great Britain, and was successively consul of Damascus, at British Guiana, at Cape Coast, and at Trieste. He went on a mission to the king of Dahomey. He made an examination of the land of Midian. He wrote—Goa and the Blue Mountains; Description of Sind, or the Unhappy Valley; Sind and the Races that inhabit the Valley of the Indus; Journey to Mecca; Travels in the Somali Country; The City of the Saints; The Nile Basin; Abeokuta, Zanzibar; Unexplored Syria; The Highlands of Brazil; Battlefields of Paraguay; Ultima Thule; Two Trips to Gorilla Land; Mission to Dahomey.

BURU, a large island in the Eastern Archipelago, being about 200 miles in circumference. The bulk of the inhabitants are a comparatively fair people, very closely resembling the natives of Amboyna; and the only tribe that is likely to be Papuan, is a small community which resides in the neighbourhood of a mountain lake near the centre of the island. This lake was visited by parties from the garrison in 1668, and again in 1710, and their observations are recorded at some length by Valentyn, in his Beschryvinge Van Oost India.—*Earl's Papuans*, p. 185.

BURUCH. SINGH. Chloroxylon Swietenia, *R.*

BURUD. MAHR. A caste whose occupation is mat-making, sometimes enumerated among the village servants.

BURUGA. TEL. Eriodendron anfractuosum.

BURUNG. MALAY. Any bird.

BURUNGEE. DUKH. Siphonanthus Indica; HIND., Quercus flexuosa.

BURUT are distinguished from the Kalmuk only by their language. The Mongol, the Kalmuk, and the Burut are a very phlegmatic, good-humoured people; they have all accepted Buddhism, but practise many shaman rites.

BURYA. PERS. Mats.

BURZAL. HIND. Betula bhojputra.

BURZUD. PERS. Galbanum.

BUSA-KARELLA. HIND. Momordica charantia.

BUSHAN, of Upper Chenab, Salix alba.

BUSHIA, a town in the Himalaya, with horses, yaks, sheep, provisions, etc. The people, half nomadic Tartars, inhabit caves fitted up like houses in the cold season, and dwell in tents during the rest of the year. The height of Bushia is 9200.—*Rep. Proceed. Mag. Surv. India*, p. 3.

BUSHIRE or Abu-Shahr, in lat. 29° 0′ 15″ N., and long. 50° 51′ 30″ E., a port on the coast of the Persian province of Fars, 225 miles W.S.W. of Shiraz. It is situated at the N. extremity of a low sandy peninsula, about 11 miles long and 3½ broad. It has a population of about 12,000 souls. Treaties were made with the king of Persia in 1763 and 1841, and the British have a Resident there. The value of the trade amounts to about a million sterling. Its population are mixed Arabs and Persians, with about 100 Armenian merchants. The tribes around Bushire are the bravest on the Persian seaboard, and opposed the British in the war with Persia in 1856. It was captured by the British on the 10th December 1856. Bushire is probably the result of the silting up of a still more ancient harbour about 6 miles from it, where bricks with cuneiform inscriptions are found. Out of the plain near Bushire many vases have been taken, formed of ill-baked clay, and filled with seeds of the tulah plant or mallows, which soon decay when affected by the fresh air. Earthen urns, containing the remains of human bodies, are said to abound on the plain of Bushire. —*MacGregor*, pp. 80–102; *Ouseley's Travels*, i. p. 216; *Treaties*, vii. 99, 137.

BUSH-KURD district is looked upon by the natives as a part of the Kohistan, and the Kurds who inhabit it are never spoken of by the term Makrani, or people of Makran; but it is south of the Kohistan, and unquestionably in Makran. It is one uninterrupted and rugged mass of mountains, that afford pasturage for the cattle of the Kurd Baluchi, who depend on the lower countries for grain and other supplies. These people are a tribe of Kurds that have advanced out of Luristan. —*Pottinger's Travels*, pp. 305–6.

BUSH QUAIL. Lowa, HIND. Quails of the genus Perdicula.

BUSI. TEL. Vitex arborea.

BUSSAHIR or Bashahr, a hill state in the upper course of the Sutlej river, recognised 6th November 1815, at the close of the Nepal war, and in 1862 granted the right of adoption. The inhabitants suffer from goitre, but not so much as in the valleys of the Pabur and Tons; the people in the higher valleys do not suffer so much as those in low situations. The natives of Bussahir, Sookeyt Mundee, and Kooloo have sallow complexions, and seem all of the same race.

BUSSI KHEL, a tribe on the N.W. borders of British India. The Afridi lie between Peshawur and Kohat; they are fierce, factious, and strong, and, with the Bungush, the Jewaki, Bari, Bussi Khel, and Busti Khel, as also the Sipah and Buzoti, are more or less independent.

BUSSO. JAP. A Buddhist priest or talapoin.

BUSSY, an eminent commander of the French in India, from A.D. 1751. He threw all his influence in support of the Nizam of the Dekhan, was present at the battle of Ambur, which the French gained and Anwar-ud-Din fell, and he attacked Gingee successfully. He was attached to Muzaffar Jung, but after his death he appointed Salabut Jung to be subahdar of the Dekhan, and accompanied him to Aurangabad. He subsequently defeated the Peshwa, and was able to obtain for Dupleix the title of Nawab of the Carnatic. He subsequently obtained the cession of four provinces near Aurangabad, then of the four Circars. He was afterwards dismissed the Hyderabad service. He then returned to the Dekhan, and joined Lally at Arcot, and was taken prisoner at the battle of Wandiwash.—*Malleson, French in India.*

BUSTAR, a district and dependency in Central

India, surrounded by the Teling in the south, Khond and Mari Gond on the east, and Hindus to the north. It lies westward of the state of Jeypore, and has the Godavery for its southern boundary. In length it is about 170 miles, and in breadth about 120, with an area of 13,000 square miles. It is a country of plains and plateaux, lofty mountains and fertile valleys, rivers and forests, with a population of about 200,000.

The raja claims to be a Rajput, and the family add Singh to their name. The chief town is Jugdulpur. Till past the middle of the 19th century, human sacrifices to Deoteshwari Devi were of frequent occurrence, and at certain festivals as many as a thousand sheep and buffaloes would be sacrificed to two goddesses. The races consist of the hunting and fishing *Tugara* or *Purja*, who will eat anything, from beef and mutton down to rats and snakes. The *Gudwa*, who subsist by cultivation chiefly, seem much given to dancing and amusement. On holidays, men and women join in dancing to the music of a fife and drum. A ring is formed by all joining hands; the company circles round and round, relieved now and then by mighty hops to the centre and back. This finished, a man steps forward, singles out one of the other sex, and banters her about her ugliness, and so forth, and the woman retorts. The *Soondee* deal extensively in mahwa arrack. The *Maria* are numerous; inhabit the densest jungles, avoid all contact with strangers, and are so timid that they flee to the hills on the least alarm. They are strong and agile, very expert in the use of the bow, and are a cheerful, light-hearted race. The women tattoo themselves from head to foot. The clothing of the Maria decreases in quantity in direct proportion to the increase of the distance of their abodes from civilisation. They are very inquisitive, sharp observers, apt to learn, and remarkable for their truthfulness and honesty. The savage race in the Beila hills have leaf aprons.

BUSTARD. European and Indian bustard.

Beet-miaka, . CAN., TEL.	Jangli kaboot, . . HIND.
Ostarde, Outarde, Houtarde, Bistarde, . FR.	Starda commune, . . IT.
	Cowdun, Ahu-buru, PERS.
Trapp, Trappe, Trapgans, ... GER.	Jars, ... ,,

Ackentrappe, . . ,,	Abu-tarda, ... SP.
Der Grosse Trappe, ,,	Nil-Naray, . . . TAM.

It is the Otis tarda, the great bustard of Europe, to which the English name bustard is usually given; but in the classifications of zoologists the family Otididæ has three genera, the Houbara, Eupodotis, and Sypheotides, some species of the last being usually termed florikin.

Eupodotis Edwardsii, *Gray*. Indian bustard.

Otis nigriceps, *Vig.*	Otis lucionensis, *Vieill.*?
Tokdar, Burra, . HIND.	Gurrayin of Hurriana.
Sohun Gugunbher, ,,	Bat-myaka, . . . TEL.

This noble bird is 4½ to 5 feet long, and extent 8 feet. It weighs 26 to 28 lbs. It is not known in Bengal, Behar, or the Malabar coast, but seeks the open grassy plains of India. It is becoming very scarce in the cultivated country, but is said to be still abundant in Rajputana. Their usual food are insects, but they eat reptiles and fruits. They are polygamous, and at the breeding season the male struts about on some eminence, puffing out the feathers of the neck and throat.

O. lucionensis of China may be a distinct species. Other species are E. nubra, *Ruppell;* E. Ludwigi, *Rupp.*; E. Caffra, *Licht;* E. Denhami, *Children;* E. Arabs, *L.;* and E. Kori, *Burchell.* A species very closely allied to E. Elwardsii is the Otis Australis, *Gray*, the wild turkey of Australia.

Houbara Macqueenii, *Gray*, Houbara bustard.

Otis marmorata, *Gray.*

Dugdoor, ... AFGH.	Tilaor, ... HIND.
Hurriana florikin, . ENG.	Obarra, . . W. PANJ.

This bird has a beautifully crested head, is 25 to 30 inches long, and extended is 4 feet. It weighs 3¼ to 3½ lbs. It is supposed that both the male and the female assume the ruff in the breeding season. It is found throughout the plains of the Panjab and Upper Sind, where it is much hawked with the cherrug falcon, Falco sacer. It also occurs from Dehli to Afghanistan, in Mesopotamia, in Europe, and England. It occasionally baffles the hawk by ejecting on it a horribly stinking fluid, which besmears and soils the hawk's plumage. Houbara undulata occurs in N. Africa and Arabia, and visits Spain.

Sypheotides Bengalensis, *Gmelin.*

Otis deliciosa, *Gray.*	Otis Himalayana, *Vigors.*
Charas, charaj, charaz, H.	Dabar of Nepal Terai.

The Bengal florikin is about 24 to 27 inches long, and 44 to 47 inches extended. In the breeding dress of the male, the whole head, which is crested, also the neck, breast, and lower parts, with the thigh coverts, are deep glossy black. It is found from Lower Bengal to all along the foot of the Himalaya. The sexes live apart, at no great distance from each other. They eat insects and sprouts of plants. It is shy and wary.

Sypheotides auritus, *Latham*, lesser florikin.

Otis fulva, *Sykes.*

Khar titr of Bhils.	Likh, ... HIND.
Kan-noul, . . . CAN.	Tan-mohr, . . MAHR.
Charaz, charas, . DUKH.	Warragu Koli, . . TAM.
Chulla charras, . . ,,	Niala-nimili, . . . TEL.

The Canarese, Mahratta, and Telugu names mean 'ground peafowl.' In breeding plumage, the male, in head, neck, ear-tufts, medial wing covers, and the whole lower plumage, is deep black; the chin alone is white. It is 18 or 19 inches long, and weighs 16 or 18 oz. Dr. Jerdon considers the black and common grey florikin to be identical, but in the plumage of different seasons; it is found throughout India, from the Himalaya to the south. It eats insects and beetles. It is hawked by the baz, the laggar, the shahin, and wokhab.

Otis tetrax, *L.*, the Tetrax campestris, the small bustard of Europe, is said to have been found in the Peshawur valley, and occurs in Central and Western Asia and North Africa.

The following are bustards of Africa, some of which spread into Arabia, viz. O. rhaad, *Shaw;* O. cærulescens, *Vieill.;* O. scolopacea, *Temm.;* O. afra, *L.;* O. afroides, *S.;* O. Senegalensis, *Vieill.;* O. melanogaster, *Rupp.*

The Australian bustard is the O. Australis; in the pairing season, the attitudinizing of the male is extremely singular.—*Ainslie, Mat. Med.; Eng. Cyc.; Jerdon, Birds.* See Birds.

BUSTI KHEL, an Afghan tribe. See Bussi.

BUT, a manner of pronouncing and writing the name of Buddha, also the Bhot or Bot race.

BUT. PERS. An idol. In the Hindi and

several Indian tongues, Bu or But is a spirit, generally an evil spirit.

But-Faroshi, a tax or fine levied to defray the cost of celebrating the worship of the village deity.

But-Khana, a temple, an idol-house; by some supposed to be the origin of the English word pagoda, also supposed to be from pai-guda.

BUT, also Butkalay. BENG. Cicer arietinum.

BUTA. HIND. Head of the Indian corn, the Zea mays. Buta-dar, a diaper fabric. Also any shrub or plant; Crotalaria burhia; Cheti-buta, Abelia triflora. Buta kara-mee, TEL., Nauclea parvifolia.

BUTAI-MISWAK, HIND., Astragalus multiceps.

BUTAIRI, or Ailri, HIND., Rhus semialata.

BUTALLA-POTAKA. TEL. Senna.

BUTALLI MARAM. TAM. Givottia rottleriformis.

BUTANA. HIND. Common pea.

BUTANI, a clan of the Baluch Maghazzi tribe, which has been located in Kachi for a long time. The Maghazzi are subdivided into four principal families or clans, of which the Butani of Jell are the most illustrious, and give the chief or sirdar to the whole. They boast of being able to muster 2000 fighting men, and between them and the Rind a blood-feud long existed. The Maghazzi and Rind are alike addicted to the use of ardent spirits, opium, and bhang. The Butani dwelling in the Dehra Ismail Khan district, were a robber tribe until they became British subjects.

BUTAN KOOSHUM. SANSK. Anisomeles Malabarica.

BUTASHA. HIND. Sugar cakes.

BUTAYAT. BURM. Ægyceras fragrans, *Kon.*

BUTCHER ISLAND, $3\frac{3}{4}$ miles from the shore in Bombay harbour. Its Hindu name is Depadevi, or the island of the gods, Holy Island.

		Kimsukamu, . .	,,

This tree grows in most parts of British India and Ceylon. It covered the battlefield on which Clive defeated Suraj-ud-Dowla, which in history is known as the battle of Plassey. When left to nature it attains a good size, but it is much cut for firewood, and its roots cut for fibre to make ropes with, and it is generally seen gnarled and bushy. In April its large clusters of deep orange-coloured flowers, called teso, also kisu, attract attention. An infusion of the flowers of this and also of B. superba, dye cotton, previously prepared with alum, a bright yellow, which may be changed by an alkali into deep reddish orange. The lac insect is frequently found on the smaller branches. Its wood resembles teak in appearance, and is used for gunpowder charcoal, well curbs, and for building purposes. The leaves are sold to shopkeepers in the bazars for the purpose of wrapping small articles in them instead of paper. From the bark of the root a very strong fibre is prepared. The root is cut into lengths of from two to four feet, and the bark peeled off, dried, and beaten by handfuls with a wooden mallet. It is used for caulking boats, and making ropes and cables for anchoring boats. The flowers are offered by the Ho to their god Desauli Bonga. Its gum, of a deep red colour, is known in commerce as the Butea kino and Indian kino, the Palas gond or Dhak ka gond.

BUTEA SUPERBA. *Roxb.* iii. 267.

Tige moduga, . .	TEL.	Baranki chettu, .	TEL.
Tivva moduga, . .	,,		

An immense creeper with flowers resembling those of B. frondosa. It grows on the mountains of Coromandel, in the Circars, the Kheri jungle, and in the Dehra Doon, and is not uncommon in the provinces of Tavoy and Mergui. It yields the same kind of gum as B. frondosa.

BUTEONINÆ, the buzzard sub-family of birds of the order Raptores, or birds of prey, comprises Archibuteo hemiptilopus of Tibet and the Himalaya; Buteo pygmæus of Tenasserim; B. rufinus of India and N. Africa, and B. vulgaris, the common buzzard of Europe, N. Africa, Asia Minor, higher mountains of India, common in the W. Himalaya, rare in the Neilgherries, and replaced on the plains by B. canescens; rare, and to the northward and far west only, in America; mostly migratory in Scandinavia. B. Bacha, *Franklin*, and B. Melanotis, *Jerd.*, are synonyms of Spilornis cheela, *Daud.*

BUTHUS AFER, *Linn.*, the great black scorpion of Ceylon; is as large as a little crayfish; its sting occasions a little inflammation.

BUTI. HIND. A vegetable; flower.

Awani buti, Ballota limbata.
Buti ka mockka, Boletus ignarius.
Baggi buti, Stachys parviflora.
Dandi buti, Cleome ruta.
Farid buti, Farsetia Edgeworthii.
Ganda buti, Euphorbia helioscopia.
Gandi buti, Glinus latoides.
Kauri buti, Trichodesma Indica; Solanum gracilipes.
Khare buti, Oreoseris lanuginosa.
Mundi buti, Sphæranthus hirtus.
Pili buti, Abutilon Indicum.
Pipat buti, Heliotropium ramosissimum.
Popat buti, H. Europæum.
Resham buti, Berthelotia lanceolata.
San buti, Cassia obovata.
Tappal buti, Crozophora tinctoria.
Wadi buti, Ajuga bracteata.

BUTIA, a name comprising the Little Tibetans, the natives of Ladakh, the Tibetans of Tibet proper, and the people of Bhutan. See Bhot Bhutan; Bulti; Ladakh; Tibet.

BUTIRSACHA. MALAY. Glass beads.

BUTKUS. MAL. Elæodendron Roxburghii.

BUT MOOGRA. DUKH. Jasminum sambac.

BUTOCERA RUBUS, the Curuminga of the Singhalese. A beetle which penetrates the trunk of the cocoanut tree near the ground, and there deposits its eggs; and its grubs, when hatched, eat their way upwards through the centre of the tree to the top, where they pierce the young leaf-buds and do incredible damage.—*Tennent's Ceylon.*

BUTOMUS, a genus of plants of the ord. Butomaceæ. Roxburgh (ii. 315) describes B. lanceolatus of India. B. umbellatus, the Kiai-tsau of the Chinese, is a waterside plant of China and Europe. Its rhizomes, formerly eaten, are now used medicinally.

BUT PESH. HIND. Aplotaxis gossypina.

BUT SHUR. HIND. Ephedra Gerardiana.

BUT-SU-DA-NA. JAPAN. A Buddhist altar-shelf.

BUTTER.

Niu-nai-yu; Su-yu,	CHIN.	Manik sapi; Man-

Butter is one of the components of milk, the others being curd or casein, a kind of sugar, and certain salts. The lighter matters suspended in milk, when it is allowed to stand, separate in the form of cream, which can be further separated, by churning, into butter and butter milk. The yield of cream is increased by dropping into the milk a small piece of zinc. Butter is naturally of a yellow colour, which is deepened when the cows feed in rich pastures, but it is often artificially heightened by arnotto and safflower. Karra, or fresh butter, is seldom used by the natives of India. It is generally kept till it turns rancid, and then clarified by repeated boiling. This is called roughan in Persia, and ghi in India. The ordinary drink of the Tartars is kumys, a spirit made of mares' milk. They pour the milk into a large leathern vessel, and, when they have got a considerable quantity, beat it till it begins to ferment like new wine. When it becomes quite sour, they beat it again violently, and then draw off the buttery part. The fermented whey makes a brisk sort of liquor, with an agreeable almond flavour, very intoxicating to those not much accustomed to it. The Tartars also make from goats' milk a kind of butter, which they boil and keep for winter use in goats' skins, and though they put no salt in it, it never spoils. It is seemingly ghi. After they have taken off the butter, they boil the curd again to make cheese, which they dry in the sun, and which is as hard as iron. These cheeses they put into sacks for the winter store, and when the supply of milk becomes scanty, they put this hard, sour curd into a leathern vessel, pour hot water upon it, and beat it till it liquefies; and with this acid drink they have to content themselves during the time of year so severely felt by pastoral nations. The Tartars live chiefly on their flocks and the produce of the chase. In China the milk of every domesticated animal has been employed for making cream and butter. The milk from the wild cow is said to be the best. Ghi, or clarified butter, is called T'i-hu.—*Smith*, 45; *Huc's Christianity*, i. p. 209; *Toml.*; *M'Cull.*

BUTTER, DR. D., a Bengal medical officer who wrote on the Topography and Statistics of Oudh, Calcutta, 1839; On Public Health in India; Planting of Trees along the Himalayas, Bl. Med. and Phys. Trans., Calcutta Government Gazette, and As. Jl., 1829, xxvii.; On the Preparation of Opium for the Chinese Market in the Behar and Benares Agencies, Bl. As. Trans., 1836, v. 165.

BUTTERFLY.

Let-pya, . . .	BURM.	Parwana, . . .	HIND.
Papillon, ...	FR.	Farfalla, ...	IT.
Schmetterling, . .	GER.	Mariposa, ...	SP.

Butterflies are very numerous in the S. and E. of Asia, and many of them very beautiful. They are classed by entomologists in the insect order Lepidoptera. The largest and most gaudy of Ceylon is the great black and yellow butterfly, the Ornithoptera darsius, *Gray*. Its upper wings, which often measure six inches across, are of a deep velvet black. Its caterpillar feeds on the Aristolochia and betel leaf, but the butterfly on the heliotrope. Papilio polymnestor, the black and blue butterfly, feeds on the ruddy flowers of the hibiscus or the dark-green foliage of the citrus. Papilio Hector has crimson spots on the black velvet of the inferior wings. When examining the Lachen valley, Dr. Hooker found the caterpillar of the swallow-tail butterfly (Papilio machaon) common, feeding on umbelliferous plants, as in England; and a sphynx (like S. euphorbiæ) was devouring the euphorbias; the English Cynthia cardui (painted-lady butterfly) was common, as were sulphurs, marbles, Pontia (whites), blues, and Thecla, of British aspect but foreign species. Amongst these, tropical forms were rare, except one fine black swallow-tail. Kallima inachis of India and K. paralekta of the Malay Archipelago furnish wonderful examples of protective resemblance to dead or decaying leaves, every one of them being some shade of ash or brown or ochre. The Ornithoptera paseidon of the Aru Islands, is the bird-winged butterfly. In the western districts of Java are the calliper butterfly, Charaxes kadeni; of birds, the elegant green and yellow trogon, Harpictes Reinwardti; the gorgeous little minivet fly-catcher, Pericrocotus miniatus, which looks like a flame of fire among the bushes; and the rare black and crimson oriole, Analcipus sanguinolentus. The Papilio arjuna has its wings covered with grains of golden green.—*Wallace*, p. 118.

BUTTER MILK.

Dhai, ...	HIND.	Salla, also Majiga, .	TEL.
Moroo, ...	TAM.		

Butter milk forms an ingredient in many native recipes; it is used by chucklers for softening leather.—*Rohde, MSS.*

BUTTER-NUTS. See Caryocar.

BUTTERS, VEGETABLE. This name is given to the concrete oil of certain vegetables, from its resemblance to the butter obtained from the milk of animals. The term is also occasionally, but improperly, applied to some vegetable products which are entirely of a waxy nature, such as the wax of Myrica cerifera. The name is likewise bestowed in Siberia on certain algæ, species of the genus Nostoe, such as N. pruniforme. The most important vegetable butters are produced by species of Bassia and certain palms.

Butter of Cacao, from Theobroma cacao. 1000 parts of the seed yield 300 parts of a concrete oil or butter, of a most agreeable flavour.

Butter of Cinnamon, from Cinnamomum verum, or C. Zeylanicum. By strong decoction the fruit yields a concrete oil, also called cinnamon wax, used for candles, and which exhales while burning a most fragrant odour.

Butter of Nutmeg, from Myristica moschata, is brought from the Moluccas, of two kinds, and is obtained by bruising the nutmegs into a paste, which is compressed in bags between hot metallic plates.

Butter of Cocoanut, from the Cocos nucifera, is prepared by rasping the pulp of fresh ripe cocoanut, adding a little hot water, squeezing and boiling the milky juice until the water has evaporated, and filtering through paper. This oil separates into two portions, the one fluid and limpid, the other a solid concrete substance of a pure white

colour, which, in the shade, remains unliquidated at all temperatures.

Butter of Palm-oil, from Elæis Guineensis, a native of Africa and America. It is much esteemed in Europe for unguents, and has been lately recommended for culinary purposes.

Butter and Tallow Tree, the Pentadesma butyracea, *Br.*, of Sierra Leone, is so named from the yellow, greasy juice which copiously flows from it when cut. It is mixed by the Negroes with their food.

Kawan Solid Oil, of Java and Singapore, is obtained from an undetermined species of Bassia.

Shea Butter is from the seeds of Bassia Parkii, *Don*, growing in W. Africa; likely to become valuable for the manufacture of candles and soap.

Galam Butter, from Bassia butyracea, Fulwa or Phulwara, also Choorie, of Nepal, Almora, and Kamaon in Northern India. In the province of Dotee this is so abundant, that the oil is cheaper than, and is used to adulterate, ghi. It is white and solid, fusible at 120°, and exhibits little tendency to become rancid when kept.

Bassia latifolia Oil separates into two portions,—one on the surface, fluid, and of a pistacio green colour; the other of a brownish green, and almost solid.

Bassia longifolia or Illupu Oil. One sample separated into two portions,—the upper, fluid, of a pale oil-green in colour, and the lower greenish white, and of the consistence of ghi. Another separated into three portions, the uppermost a golden yellow, and fluid; the middle, yellowish white, solid, and floating in the upper; and the lowest, solid, and brown in colour. A third was of the consistence of ordinary ghi. A specimen, almost solid, from Tanjore, was of a light golden-yellow colour.

Chinese Vegetable Butter from Stillingia sebifera is much in use in China. The number of these trees in the province of Che-kiang is immense.

Indian Vegetable Butter, Piney Butter, or Doopada Solid Oil, is from the Vateria Indica of the western coast of India. It is white or yellowish white, of the consistence of hard salt butter, and in the shade remains always solid. It is used for lamps principally, but is very suitable for soaps and candles. It is prepared by cleaning the seeds, then roasting and grinding them into a mass. To five seers of seed add twelve seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected, and the process repeated.

Carap or Carab Vegetable Butter, from Carapa Guianensis, a large tree in Trinidad and British Guiana.

Butter of the Great Macaw Tree, from Acrcomia fusiformis.

Japan Wax is from Rhus succedaneum.

Almond Butter, from Amygdalus communis.

Cocum Butter, from Garcinia purpurea seeds, which produce solid oil.

Gamboge Butter, Mukke Tylum, TAM., Arasana Ghoorghy yennai, CAN., is a product of the Garcinia pictoria, *Roxb.*, which grows abundantly in Mysore and the western jungles. Gamboge butters are solid, and of a deep leek-green colour. The oil is procured by pounding the seed in a stone mortar, and boiling the mass until the butter or oil rise to the surface. 2½ measures of seed yield one seer of butter; it is sold at the rate of 1¼ annas per seer of Rs. 24, in the Nuggur division of Mysore, and is used as a lamp oil and as ghi.

Sterculia fœtida Oil, Coodiray yennai, or Coodira pusjan yennai, TAM., is thick at all seasons of the year, and is obtainable probably in large quantities in the Nalla Malla and Yella Malla forests of the Peninsula of India.

Butter of Laurel, Laurus nobilis.

Solid Oils are obtained from some Dipterocarpi in the Indian Archipelago.

Solid Oil of the Horse-eyes and Cacoons of Jamaica, Fevillea scandens, is white and hard.

Mijo or Japan Butter, from Dolichos soja.

Solid Oil, from Myristica (Virola) sebifera of British Guiana.

Solid Oil from the Demerara butter tree, Saouari, Pekea tuberculosa.

Solid Oil of Bombay, from Salvadora Persica, or Vernonia anthelmintica?

Broonga Malagum Oil, of Masulipatam, separates into three portions,—the uppermost, fluid, resembling brown sherry; the middle, of the consistence of ghi, and brownish yellow; and the lowest almost solid, and of a hair-brown colour.

Mooroogana Butter, of Canara, is used for medicinal purposes, and as an ointment for the wounds of cattle injured by tigers. It is said to be produced from a forest tree growing in the Canara jungles. It is dark brown, and is the most solid of the solid oils.

Odul or Adul Oil, of Travancore, separates into two portions,—the upper, fluid, of the colour of golden sherry; the lower, reddish white, of the consistence of ordinary hard salt butter.

Shacotty Oil, of Canara, used for cutaneous eruptions, separates into two portions,—the upper, yellowish and fluid, and the lower brownish-red, and of the consistence of hard ghi.

Hibavania, a solid oil of Canara, from the Sampajoy district, of a clove-brown colour.

Camujuy Tree Oil; a small bottle, priced Rs. 2¼, from the same district, was a dark gelatinous mass, of the consistence of blanc-mange.

Oil of Hydnocarpus inebrians, the thortay oil of Canara, used for sores, is a very valuable vegetable solid oil, of the consistence of ordinary hard salt butter.

Terminalia bellerica, Tani-kai yennay, separates into two portions,—the one fluid, of a pale oil-green colour, and the other white, floccular, and of the consistence of ghi.—*Madras Museum Report, Simmonds*, pp. 510–514.

BUTTON.

Boutons,	FR.	Kanching,	MALAY.
Knopfe,	GER.	Botoens,	PORT.
Buttoun,	GUJ.	Pogowizu,	RUS.
Gundi,	HIND.	Botones,	SP.
Bottoni,	IT.	Battan,	TAM.
Bahru,	MALAY.	Buttasulu,	TEL.

Buttons are made from every possible material. Those of metal are often gilt; and five grains of gold, and sometimes 2½ grains, are made to cover 144 one-inch buttons, so great is the divisibility of that precious metal. A round ball or button is used in China to mark the rank of their wearers. The members of the first rank, or highest order, wear on the apex of their caps a dark-red coral ball or button; the second class have one of a

light red; third class, light blue; fourth, dark blue; fifth class has a crystal ball; and the sixth class a ball of mother-of-pearl. Members of the seventh and eighth class have a golden ball, and the ninth and lowest rank, one of silver. Each officer may be further distinguished by the decoration of a peacock's feather. This is attached to the base of the ball or button on the apex of his hat, and slopes downwards; it is worn at the back.—*Gray*, 27.

BUTTOO-PASSALEI KIRAI. TAM. Basella cordifolia, *Lam.*, B. alba, *Linn.*

BUTUM. ARAB. Pistacia terebinthus, turpentine.

BUTUNTI, a name given to the Tartars by the people of Lower Kunawar. They also call the Tartars Zhad, also Bhotia, and their country is called Bhot and Bootunt. These Tartars differ greatly in appearance from the people of Lower Kunawar.

BUVUSHIRUM. SANSK. Phyllanthus niruri.

BUWAYA. MALAY. Crocodile.

BUXAR, a town, lat. 25° 32′ N., long. 84° E. It gives its name to a district which is a subdivision of Shahabad. The town is built on the bank of the Ganges, and is largely inhabited by Mahomedans. A battle fought and won here by the British, 22d October 1764, under Sir Hector Munro, against Mir Kasim, the last independent Nawab of Murshidabad, placed Bengal and Behar in their possession.

BUXUS, a genus of plants, the species of which afford the valuable boxwood. B. sempervirens is the common box, and forms a large evergreen bush or small tree, common all over the S. of Europe, from Spain to the N. of Persia and into the N.W. Himalaya. The Himalaya boxwood is known as Pabur Lakri. Mr. Dunlop saw a jungle of this plant at Sem Kharrak, beyond Ramnee, the trees as tall as English firs, and some of them as thick round as a man's body. The chief supply of boxwood for Europe is derived from the southern parts of Europe, and from Asia Minor. European boxwood is more curly, softer, and paler than the Turkey. The Karens furnished Dr. Mason with specimens of a wood not light, but scarcely to be distinguished from the boxwood of Europe. Dr. Wallich found Nauclea cordifolia on the banks of the Irawadi, with wood coloured like that of the box tree, but much lighter, and at the same time very close-grained. One Tavoy tree, he says, has a strong, tough wood, in grain like box. B. Chinensis, *Lam.*, is the China box tree. Buxus emarginatus, *Wallich*, was introduced into Britain from the Himalaya. The wood is found to be softer than the common kinds, though like them in other respects. Woodcuts have been engraved upon this wood, which has the advantage of being of considerable size and thickness.—*Eng. Cyc.; Royle, Him. Bot.* p. 327; *Mason; Voigt.*

BUXUS SEMPERVIRENS. *Linn.*

B. Nepalensis.

Samshad, Shumaj; Safed dhawi, . . BEAS.	Chiki, ... JHELUM.
Paprang, . . . ,,	Papri, Papar, SUT., RAVI.
Hwang-yang-muh, CHIN.	Shanda, Lag-hune, . . TR.-INDUS.

This grows in northern Persia, also in China in the provinces of Kiung-Chau-fu, Hainan island, and in T'ung-jin-fu in the Kwei Chau province; it is abundant near Manikaran in the N.W. Himalaya. From being lopped, it is generally seen as a shrub, but at times grows to a tree of some girth, locally only, on the Sutlej and Beas, upon the Rattan Pir, near Panch, above Rawul Pindi, in the Salt Range, and Trans-Indus. The wood is carried to Umritsur and other places in the plains to be made into combs, but the supply is probably getting exhausted. This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 feet. Wood hard, heavy, and nearly as compact as the boxwoods of Europe. Used in the schools of art throughout India for wood engraving, and used for plugs for rifle bullets. The leaves of the box are poisonous to the camel.—*Cleghorn, Panjab Report*, p. 63; *Powell's Handbook; Dr. J. L. Stewart, M.D.*

BUYO of the Philippines, betel leaf, the sirih of the Malays, and Piper betel of botanists.

BUYUR. BENG. Jujube, Zizyphus jujuba.

BUZ. PERS. A kind of antelope, or long-horned mountain goat, called Tish by the Arabs.

BUZA. HIND. Hordeum hexastichum.

BUZGUND. HIND. Gulpista; Pistachio nut.

BUZLI. HIND. Oreoseris lanuginosa.

BUZOOR-BUTU of Bombay, Cycas circinalis.

BUZOTI and Sipah are small but very brave Pathan tribes, the Buzoti numbering 500, and the Sipah 300 fighting men. They live in tolerably close connection with their more powerful neighbours the Afridi, and manage to hold their own. After the British acquisition of the Panjab, they acted up to their engagements in regard to the Khaibar pass, and generally behaved well.

BUZRUK. ARAB. Linseed.

Buzr-kaluna, Plantago ispaghula.

Buzr-ul-Bunj, henbane seed.

Buzr-ul-Bunj-Ahmar, seeds of Cleome viscosa.

Buzr-u-Shibet, dill seeds.

BWÆ. BURM. Careya arborea, *Roxb.*

BWAI-JIN. BURM. Bauhinia anguina; B. racemosa.

BYA-JAINTI. HIND. Sesbania Ægyptiaca.

BYAKED, also Byakoor. BENG. Indian night-shade, Solanum Indicum.

BYANA or Byara. KARN. A piece of pasture land attached to a village, and assigned as a perquisite to the headman, who lets it out for the grazing of cattle at a charge per head.—*W.*

BYANS, a pass in Garhwal, in which are 9 villages and 184 houses. The people who occupy four of the Garhwal passes are Bhot; those in the Darma pass are said to be Mongols left by Timur. The Bhotia in Byans speak a dialect of Hindi.

BYANS RISHI is a mythical holy man, who is supposed by the people of Byans in the N.W. Himalaya to be dwelling on the top of the Kelirong mountain. He appears to be the rishi Vyasa.

BYAT, a powerful tribe which came originally from Tartary with Chengiz Khan. They were long settled in Asia Minor; and a number of them fought in the army of Bajazet against Timur. After his defeat, many of the families of this tribe were sent by the conqueror to the province of Diarbekir, but, having quarrelled with its ruler, they went to the territories of Baghdad, where they lived till the time of Shah Tamasp, who brought them into Persia. One half was settled at Souj Bulagh, a district of Teheran, and the remainder at Ashraff, in Mazenderan. They remained on these lands till Abbas II. transplanted a number of them to Khorasan. The

Byat are still more numerous in Turkey than in Persia; but in the latter country, in the reign of the Suffavean monarchs, they were registered at forty thousand families.—*Malcolm's Persia*, ii. p. 218.

BY-IT-ZIN. BURM. Antidesma paniculata.

BYLTÆ of Ptolemy, are the Balti people of Little Tibet. They have on the east the Khor country, which is inhabited by a people supposed to be the Chaurandi Scythæ of Ptolemy.—*Cunningham.*

BYNEE ARRACK is from Caryota urens.

BYNSA, one of the seven branches of the Bazigar race.

BYRAGI. ANGLO-HIND. For Viragi (vi, privative, raga, passion), Hindu Vaishnava ascetics. The followers of Ramanand and Kabir form their principal subdivisions. The Byraga, or Zafartakia, is a small crooked stick or piece of iron which the Byragi devotee places under his armpit, to lean upon as he sits. See Vairagi.

BYRD, amongst the Rajput races, the blessing of a bard to a ruler. Whenever a Suktawut chief enters the court of his sovereign, or takes his seat among his brother chiefs, the bards still salute him with the dying words of Ballo—'Doonah datar, Chaogoonah joojar; Khorasan, Mooltan-ka-aggul,' meaning 'Double gifts, fourfold sacrifice;' that is to say, with increase of their prince's favour the sacrifice of their lives would progress; and which, for the sake of euphony probably, preceded the byrd won by the founder, 'The barrier to Khorasan and Multan.' The byrd of the Chondawut is 'Dos sehes Mewar ka bur kewar,' 'The portal of the ten thousand [towns] of Mewar.' It is related that Sukta, jealous of so sweeping a byrd, complained that nothing was left for him, when the master bard replied, he was 'Kewar-ka-Aggul,' the bar which secures the door, 'Kewar.'—*Tod's Rajasthan*, i. p. 358.

BYSSUS, a long, delicate, lustrous, and silky fasciculus of filaments, by which some of the conchiferous molluscs, for example the Mytilacea, mussels, and Malleacea, hammer oysters, are moored to rocks, etc. It is an assemblage of muscular fibres, dried up in one part of their extent, but still contractile and in a living state at their origin. The tendinous foot of Byssoarca and Tridacna seems to be a step towards the organization of a true byssus. The byssus of the great Pinna of the Mediterranean is in a fleshy sac or sheath at the base of the foot, which is attached towards the middle of the abdominal mass of the animal. In Italy it is manufactured into various articles; and there are few museums without a glove or a stocking woven out of this substance. The pearl oyster, by a byssus, secures itself to the rocks. The animal's foot is composed of muscular fibres, and is 2½ inches long when distended. On the lower side there is a groove lined by a secreting membrane, which is an exact mould for the formation of the byssus. When the animal desires to attach itself to the rock, its foot is protruded, and, after seeking out a suitable spot with the tip for some minutes, is again retracted into the shell. A strong fibre, of the form of the groove in the foot, is thus left, attached to the base of the foot at one end, and to the rock at the other. The process is again and again repeated, until a strong cable is formed; and it was one of the most important results of the careful investigations of Dr. Kelaart in Ceylon, that the power of the animal to cast off its byssus at pleasure was ascertained. It leaves it behind to make another in a more convenient place. From this ability to shift its berth, it follows that the pearl oyster might safely be taken from its native beds and made to colonize other parts of the sea, and also that it would move of its own accord if the surrounding water should become impure or sandy, or when there is an influx of fresh water. The animal can reform the byssus at pleasure, if in good health and condition.

BYTTNERIACEÆ, the Byttneria tribe of plants, by some botanists considered a distinct natural order, by others reduced to a section of Sterculiaceæ.

BYTURNI river rises near Lohardugga, in lat. 23° 29′ N., long. 84° 55′ E., runs S., S.W., S.E., E., into the Bay of Bengal, by Dhumrah river; length, 345 miles. It receives the Sunk, 95 miles. About 26,000 square miles are drained by the Brahminy and Byturni. It is the Styx of Hindu mythology, and is sacred, more especially at its source. There is a legend that Rama, when marching to Ceylon to rescue his wife Sita from her captor Ravana, halted at the river-side, on the borders of Keunjhur, and numbers of Hindus visit the river every January. It is also written Baitarani.

BYZANTIUM of Ptolemy is supposed to be the Balabhi of Gujerat.

C

C, in the English alphabet, has no power of its own, but takes that of k before a and u, and of s before e and i. Its use for foreign words is therefore apt to mislead; for instance, in the Persian and Urdu word circar, a government, an authority, and in common use, there is one letter for two sounds, and two sounds for one letter,—a breach of all system. Even the form of ch has two sounds, as in character and charter. To get rid of this inconsistency, the tendency has been growing amongst scientific men, to substitute ka and ku for ca and cu, and to write Cabul and Cashmir as Kābul and Kāshmīr, and Cutch and Cudapah as Kach and Kadapah, and also to use k for the hard ch. The Italians have the soft English ch in cio and ce; and the French and Germans use the letters tch and tsch to meet the equivalent letters in all the cultivated languages of Southern India in which the sounds produced by the English compounds of ch, as in child, have single letters with corresponding powers in all those tongues, and, in all but Tamil, ch'h also has equivalents modified in compound letters, but there is no letter which has two sounds of ch, as in character, child. With entirely similar sounds for ca, cu, and ka, ku, some duplication is unavoidable. See Ch.

CABA. ARAB. A quadrangular building in Mecca, towards which all Mahomedans turn in prayer; the Black Stone, Hajar-us-siah, is built into its wall. It was a lingam of the god Mahadeva or Siva.

CABAB-CHINI. HIND. Cubebs.

CABAN, in the Philippine Islands, a measure of capacity.

CABBAGE, Brassica oleracea.

Peh-tsai,	CHIN.	Kobi,	HIND.
Chou,	FR.	Cavolo,	IT.
Kohl,	GER.		

The word is derived from the Latin, caput, a head, through the French cabus. The opinion is generally entertained by naturalists, that the white and red cabbage, savoy, borecoles, cauliflower, and broccoli have all originally sprung from the wild cabbage of the sea-coast. The cabbage, horse-radish, cress, mustard, turnip, etc., all belong to the natural order of Cruciferæ. The varieties cultivated are, red, rose, and white; also the hundred-leaved cabbage. Cabbage is largely eaten by the Chinese. From the seeds of a variety cultivated on the continent of Europe, the colza oil used in lamps is expressed.

CABBAGE, a term applied to the new leaf-shoots at the tops of palm trees; they are cooked and eaten as vegetables. That of the Alsophila excelsa of Flinders island, Australia, is in substance like a Swedish turnip, but is too astringent in taste to be agreeable, and it is not much improved by cooking.

CABINETS of silver are worn by all the Jangam sect of Hindus, each containing the conical emblem of Siva, the lingam of the Hindus, the phallus of the Greeks, and the priapus of the Romans. The tabernacle of Moloch, mentioned in Acts vii. 43, was doubtless a cabinet in which the object was enclosed; and the shrines of Diana were most probably of the same construction, and for the same purpose. A medal, with a figure of Diana's shrine, shows pointed cones and a semi-lune. Bacchus brought his thyrsus from the east when he returned from his Indian expedition. It was said to have been surmounted by a fir cone or pine, but a recent writer in the Edinburgh Review thinks it was the date. This fruit, according to Pliny, was consecrated to the worship of almost every heathen divinity. The date palm is the scriptural emblem of all that is dignified, beautiful, and good, and entered largely into the ornamentation of temples.—*Edinburgh Review; Milner's Seven Churches of Asia*, p. 130.

Gomena,	IT.		

In Southern Asia some cables for ships are made of coir, the requisite quantity being laid out at full length along the beach or other convenient spot; they are made up in strands, and twisted in a very simple machine, viz. a strong wooden frame in a strong board, across which three or four pins are placed, and turned, like the screws of a carpenter's bench, by as many men; the further end of the cable is fixed to a large revolving pin, which is turned round in a similar manner. As the strands are twisted, the horse in which this is fixed is drawn nearer to the other. It is evident that cable strands thus laid are very unequally strained, the outer lines being tight, while the inner ones are slack. By laying the strand and twisting it as each yarn leaves its separate reel, a strand is formed of which each yarn bears its due proportion of the strain. Huddart's patent rope was laid on this principle; the necessary apparatus for winding off the yarn might be readily made. Cables for the Shakespear bridges were formed of the country rattan. In the Red Sea, cables formed of the coating of the branches of the date tree are used; and the same material, with a proportion of fibre of the Kaldera bush, the Pandanus odoratissimus, is used by fishermen in forming drag ropes for their nets at Oopada. In the Eastern Archipelago rattan cables are largely used.—*Mr. Rohde, MSS.*

CABO NEGRO, Spanish, of the Philippines, is obtained from the gomuti palm, Arenga saccharifera, and resembles black horse-hair. It is found between the trunk and branches, in a matted form, interspersed with black twigs. When separated from the latter, it is manufactured into a cheap and durable cordage, chiefly used for cables and standing rigging. A single palm in its lifetime yields two crops of this material, each amounting to about 9 lbs. The twigs are used as writing pens, and also as arrows. Under the hair-like material a soft substance is besides collected, used as oakum for caulkings, and as such exported to China.—*Walton's State*, p. 119. See Gomuto.

CABOOK. SINGH. Lateritious deposit, said to be the product of decomposed gneiss.

CABOOL. See Kābul.

CABRAL. Alvarez Cabral, the Portuguese commander in the second expedition sent to India by the Portuguese. It consisted of 13 ships and 1200 soldiers, and sailed from the Tagus in March 1500. In his route he discovered Brazil, A.D. 1500, and took possession of it, and then sailed to Calicut. He lost four ships, in one of which Bartholomew Diaz perished. He entered into treaties with the chiefs at Cochin, Cannanore, Onore (Honore or Honawar), and Quilon, and built fortresses at their principal towns. The Zamorin at first was cordial, but, being instigated by the Mahomedans, attacked their fort, and killed all the Europeans. Cabral retaliated by destroying ten Mahomedan ships, and then returned to Lisbon in July 1501.

CACALIA COCCINEA, a flowering plant, mostly found in waste places.

Cacalia Kleinia, *Wight.* Hart's ear.

Lisan ul saur,	ARAB.	Yenna putu nalikel,	TEL.
Gao zaban,	PERS.	Jimmudu,	,,
Ermina-Kullie,	TAM.		

The leaves resemble the tongue of the buffalo; the stalks are prickly, and covered with white spots. While fresh, the leaves have a strong smell like hemlock; they are given in decoction in rhumatism, syphilis, and lepra. For the class of cases in which sarsaparilla is usually employed by European practitioners, they seem to be highly esteemed by Mahomedan and Hindu practitioners. A water distilled from the leaves is kept for use.—*O'Sh.* p. 420; *Honigberger*, p. 246.

Cacalia sonchifolia, *Linn.*

Emilia sonchifolia, *D. C.*		E. purpurea, *Cass.*	
Shudimudi,	BENG.	Udiram panum,	SANSK.
Pella camudi,	MALAY.		

A decoction of this plant is deemed antifebrile on the Malabar coast.—*O'Sh.* p. 420.

CACA-MULLU. TAM. Pedalium murex. Cacapalam, Lagenaria vulgaris.

CACATUINA or Cocatoo, a sub-family of birds of the family Psittacidæ, of the order Scansores. See Birds.

CACAY tree is the greatest ornament of the woods of Karnata. The foliage is a fine shining green; and the pendulous strings of flowers surpass those of the laburnum, not only in beauty,

but in length and number. In the cool of the morning they diffuse a most agreeable perfume. The plant is sacred to Ganesh, the god addressed by all Hindus about to commence any undertaking. The people worship him under the form of his favourite tree. The cultivators of every village place a stake of the Cacay on the ground, level a circular place round it, and purify this area with cow-dung. On this spot they assemble before the commencement of seed-time, burn some incense before the stake, make offerings of rice, milk, and the like, and pray for the success of their crops. The ceremony concludes with a rural feast. It seems to be the Cathartocarpus fistula.

CACHALOT, the Physeter macrocephalus, or sperm whale. The male ranges in length from 38 to 76 feet, is about 60 feet in the average. The female does not exceed 30 or 35 feet. The cachalot is without symmetry, of a prevailing dull black colour, occasionally marked with white, especially on the abdomen and tail. They propel themselves round by striking and pulling against the water with the flashes of their tails. The lower jaw is diminutive, slender, and in form not unlike the mandible of a bird; the teeth of the upper jaw, wholly ivory, in aged males are of great solidity, and weigh from 2 to 4 lbs. each. It spouts a thick watery mist from its nostrils at intervals of ten or fifteen minutes. The valuable sperm is chiefly situated in the head. It is a solid mass of soft, yellow, oily fat, weighing between 2 and 3 tons, in a hollow of the head, bared on the upper jaw, and forming the front and lower part of the snout. The cavity, called case, is situated to the right and beneath the spouting canal, and corresponds to nearly the entire length of that tube. It is filled with a very delicate well of cellular tissue, containing in large cells the limpid and oily fluid, which is liberated on the slightest force. The quantity, chiefly spermaceti, contained in this singular receptacle is often very considerable, and nearly 500 gallons have been obtained from the case of one whale. It has been noticed in the Mediterranean, and a stray individual in the Thames.—*Hartwig.*

CACHAR, a district in Assam, in the upper portion of the valley of the Barak, extending from lat. 24° 13′ to 25° 50′ N., and from long. 92° 26′ to 93° 29′ E. Its area, 3750 square miles. Its population in 1872 was 205,027, in the area of 1285 square miles, to which the census was confined. They consist of Manipuri, Cachari, Lushai or Kuki, Naga, Mikir, and Khassya. The Burmese invaded it, but were again expelled during the first Burmese war, when the legitimate raja, Govind Chandra, was restored by a treaty. On the southern frontier of Cachar lies the territory of the Lushai or Kuki, a most warlike tribe, who in 1848–49 drove up the Kuki from the south into Cachar; but Colonel Lister, by a judicious employment of the Kuki as soldiers, exerted a salutary influence over the Lushai. The Lushai, however, have in their turn been pressed up northwards by another tribe still more powerful than themselves, called the Poi, who approached from the south-east. The hilly tract lying between Cachar and Chittagong is inhabited by the Lushai, who claim and hold all the tract of country to the south of the parallel of the latitude of Chatterchoora hill, and east of Hill Tiperah to the Tepai river is the Burmese frontier. The Cachari dynasty ended on the assassination of Govind Chandra, without heirs, in 1830, and in 1854, Tularam Senapati of N. Cachar also died without heirs. The Cachari people must at one time have had an extensive sway in the valley of the Brahmaputra. The people adopted Hinduism about the beginning of the 18th century, and about half the number profess that faith. It yields rice, petroleum, salt from salt wells, and several valuable timbers, tea, caoutchouc from the Ficus elastica. The elephant, rhinoceros, buffalo, metna or wild cow, gavæus gaurus, tiger, black bear, and deer occur, with the sambur and the barah-sinha. The Manipuri women weave excellent cotton cloth, and a fine net for mosquito curtains. The agriculturists band themselves together as guilds or khel.—*Imp. Gaz.; Aitcheson's Treaties*, p. 77; *Ann. Ind. Adm.* xii. p. 86.

CACHARI. HIND. Cucumis pubescens.

CACHAR KALANG. TAM. Dioscorea alata.

CACHU. HIND. Colocasia antiquorum.

CACHUR. HIND. Curcuma zedoaria.

CACODOXUS ARGUS. *Linn.* A fish eaten by the natives, though many reject it on account of its reputed disgusting habits. In several examined in the estuaries of the Ganges and at Penang, the stomach contained remains of small fishes and crustacea. According to Bennet, it is in Ceylon angled on hooks baited with a kind of sea-weed ('Pendah'), of which this fish appears to be particularly fond.

CACRI. HIND. Cucumis utilissimus.

CACSHA, in the astronomy of the Hindus, the orbit of a planet, or the circle which ancient astronomers called the deferent; for the Cacsha carries epycycles (Paridhi), like the deferent.—*Warren.*

CACTACEÆ or Cacteæ, the Indian fig tribe of exogenous plants; many genera and species are found in S.E. Asia. Some species are the food of the cochineal insect. Of these the Opuntia tuna seems the most employed in Peru; O. Hernandezii is the most celebrated in Mexico; and O. cochenillifera, the native province of which is somewhat doubtful. The Old Man cactus, Cereus senilis, *Salm*, is so called from the hoary aspect of the columnar stems. The cactuses are natives, almost exclusively, of the new world, from whence the prickly pear (Opuntia Ficus Indica), now abundantly naturalized in the Atlantic islands, and generally on the shores of the Mediterranean, where it serves to form impenetrable fences, was originally introduced.—*Engl. Cyc.* p. 710; *Voigt*, p. 60.

CACTUS INDICUS. *Roxb.*

Opuntia Dillenii, *Haw.*

Nag-phunee, . .	BENG.	Kabuli-tsui, Gangi-sho, Kangi-chii, .	PANJ.
Naga-kali, . . .	TAM.		

Dr. Roxburgh supposed this plant to be a native of India, grounding his opinion on its general distribution and its native names. Dr. J. S. Stewart mentions it as a plant of the Panjab, on which the wild cochineal insect feeds. In the Panjab, it is grown as a hedge up to 4000 and 5000 feet, near the Jhelum. Dr. Roxburgh also mentions C. Chinensis, with its synonym Fabricia bracteata.—*Roxb.; Dr. Stewart; Voigt.*

A straggling shrub, flowers in terminal racemes, of a dingy white, nearly throughout the year; very common about Musalman burial-grounds. C. Indica, *Lam.*, and C. trifoliata, *W. and A.*, are plants of Coromandel.—*Riddell.*

CADAGA SALEH. TAM. Rungia repens.

CADALACCA. MALEAL. Cadalay, TAM. Cicer arietinum.

CADALI. SANSK. Musa paradisiaca.

CADALI PUA. TAM. Lagerstrœmia reginæ.

CADAM. HIND. Nauclea parvifolia.

CADAPILAVA. MALEAL. Morinda citrifolia.

CADASSUM. TAM. Barringtonia racemosa.

CADDIS-WORM insects are found in all tropical Asia. They belong to the family Leptoceridæ, and the genus Setodes contains several of them; they are enclosed in cases with projecting shields.—*Hartwig.*

CADELARI. MALEAL. Achyranthes aspera.

CADESIA. The battle on the plains of Cadesia, on the border of the Euphrates, fought in A.D. 632, sealed decisively the fate of Iran. This battle lasted for three days; was fought during the khalifat of Omar, by his general Saad, against Rustum, the general of Yezdejird III., the last of the Sassanian race. The Arabs are said to have lost about 8000 men, while the loss on the Persian side amounted to nearly 100,000.

CADJAN. ANGLO-MALAY.

Jowli, ... HIND. | Tennam olé, . . . TAM.
Cajan, ... MALAY. | Tati aku; Cobaré aku, TEL.
Pannam olé, . . . TAM.

A commercial word, used by the British in India for the dried leaves of the cocoanut and palmyra palms; they are largely used as a thatch, which resists the rain better than tiles; but roofs made of them should be relaid before the commencement of the rainy season; 149,500 were imported into Bombay in the year 1850–51. Books of palm leaves, called kavile in Telugu, are prepared from the palmyra and the fan or cocoanut palm, and are written on with an iron style.

Kajan, MALAY, are mats made from the leaf of the Mang-kwang. See Cocoanut Palm; Fan Palm; Ola; Palmyra.

CADJU. MALAY. Anacardium occidentale.

CADU. HIND. Lagenaria vulgaris.

CADUMBAH. MALEAL. Barringtonia racemosa.

CÆLODEPAS CALYCONUM. *Bedd.* A plant which grows at Paupanassum, at the foot of the Tinnevelly hills, and called kotpira. Its wood is very hard.—*Bedd. Fl. Sylv.*

CÆSALPINIA. Some of the species of this genus are useful trees or shrubs. C. bonducella and C. digyna are of the climbing plants, the seeds and oils of which are used in medicine. The pods of C. coriaria, or sumach, a small tree, are used as a tanning material; C. paniculata is a magnificent climber of the Himalayas; and C. sappan yields one of the Brazil woods of commerce. The fleshy pods of a Cæsalpinia are largely used as soap in all parts of China, and may be bought in every market town. C. bimas grows in the Eastern Archipelago. C. Braziliensis of S. America, province of Pernambuco, might be introduced into India; its wood yields a red dye; it is the Brazil wood of commerce.

CÆSALPINIA CORIARIA. *Willde.*

Poinciania coriaria, *Jacq.*

Libi-libi, Divi-divi, Dibi-dibi, . . . ENG. | American sumach, . ENG.

This small tree is now growing plentifully about Singapore, Salem, Bangalore, Hunsur, and Chicacole. It is a native of S. America, but in 1842 was introduced by Dr. Wallich into the Botanical Gardens at Calcutta. The seed-pods, for tanning leather, are considered superior to all the Indian astringents, and leather tanned with them is considered equal to that of the best of Europe manufacture. The pods are oblong, compressed, somewhat obtuse, curved laterally, the inner side being concave and the other convex. It is to the curved pod that the commercial term of divi-divi or libi-libi is given. The average produce of pods from a full-grown tree has been estimated at 100 lbs. weight, one-fourth of which consists of seeds or refuse, leaving about 75 lbs. of marketable matter. The divi-divi pods are of a dark brown colour externally, when ripe, and $\frac{3}{4}$ths of an inch wide. Underneath the outer skin of the pods, and separated from the seeds by a layer of woody fibre, is a considerable thickness of astringent matter of a light yellow colour, almost pure tannin, slightly darker in colour than that manufactured from galls, about 60 or 65 per cent. of the whole pod (excluding seeds). At an interval of six feet apart, an acre of ground will contain 1210 trees, yielding an average of 810 cwts., and 30 lbs. of divi-divi, or above $20\frac{1}{2}$ tons of marketable matter, worth, at only £5 per ton, £200. The quantity of mucilage it contains precludes it from the use of dyers. One part of divi-divi is sufficient for tanning as much leather as four parts of bark, and the process occupies only one-third of the time. The selling price ranges from £8 to £13 per ton. The imports into the United Kingdom in 1844 were 3900 tons; in 1845 and 1846, about 1400 tons each year; during the subsequent three years the imports were merely nominal; but in 1850 a renewed demand seems to have sprung up, for 2770 tons were imported into Liverpool, and a few tons into London. —*Voigt; M. E. J. R.; Dr. Cleghorn's Reports; Markham*, p. 353; *Simmonds' Comm. Products*, p. 503; *Indian Annals*, No. vii. p. 120; *Jurors' Report, Madras Exhibition*, 1855.

CÆSALPINIA DIGYNA. *Rott.*

This tree, the Verzina of Cæsar Frederick, grows widely over S.E. Asia. Its wood is a very important article of commerce. In 1842 as much as

78,000 cwts. were shipped from Ceylon, but the export from thence has decreased. A large quantity is exported from Siam and the Philippine Islands; as much as 200,000 pikuls annually from the former, and 23,000 pikuls from Manilla. 3524 pikuls were shipped from Singapore in 1851, and 4074 pikuls in 1852. 3670 tons of wood were imported into England in 1852, at £7 to £12 the ton. Fée considers Cæsalpinia sappan to be one of the Brazil woods of the merchants. But it is probable that it is the produce of more than one genus. The best Brazil wood is said to come from Pernambuco, where it is called Pao da Rainha, or Queen's Wood, on account of its being a royal monopoly. C. sappan grows in the N. Arcot forests, in the Nalla Mallai of Cuddapah in the Kotah jungles; is a native of Malabar, Ceylon, Bengal, Burma, Tenasserim, Siam, and Amboyna; is found in the immediate vicinity of Prome, growing on the small hills of the place, and near Thoung-zai, in the northern part of the Rangoon district, where it is also seen in small quantity. It is cultivated in Palghaut for dying the straw used in mat-making, and from its high price for this purpose, it is not used for carpentry. It grows with great luxuriance in South Malabar, where it is cultivated rather extensively by the Moplahs, who plant a number of the seeds at the birth of a daughter. The trees require fourteen or fifteen years to come to maturity, and then become the girl's dowry. Dr. Cleghorn thinks the dye-wood is damaged by being allowed to float in salt water. In the Bombay forests it grows freely in their cultivated places without any care, but the heart-wood is dingy, and wants that fine pinkish red which the wood of the southern forest has. The heart-wood being cut into chips, steeped for a considerable time in water, and then boiled, is used for dyeing. The cloth or thread is repeatedly dipped in this liquid, and hung to dry between each wetting, till it is brought to the shade required. To fix the colour, alum is added. The powder commonly used at the Holee festival is extracted from the wood of this tree. The reddish-brown tint so frequently met with in the clothes of the poorer Chinese, is produced from this wood. The seeds are used for colouring milk. The chips are used like logwood, and medicinally.—*Marsden's Sumatra*, p. 95; *Voigt; Captain Macdonald; Drs. Wight, M'Clelland, Gibson, and Cleghorn.*

CÆSALPINIA SEPIARIA. *Roxb.* Mysore thorn.

Reichardia decapetala, *Rottl.*

Grows in Kamaon, Nepal, Bengal, Ava, Tavoy, Mysore, Ajmir, and in all the Himalayas under 5000 feet. It is a scandent, strong-armed shrub, used to fence around fields, and forming a splendid impenetrable hedge, covered with bright green leaves and large yellow spikes of flower. Hyder Ali surrounded fortified places with it.—*Voigt; Irvine; Chow-Chow; Thompson; Stewart.*

CÆSAR, the Arabic, Greek, and German Kaisar, a title of the emperors of Rome, which was applied to the Byzantine emperor, until the title was transferred to the Turkish sultan.

CÆSAREA ruins stand by the seaside, and from the summit of a tower that is washed by the waves, a view is obtained of the whole coast of Palestine, from Cape Blanco to Jaffa. When Colonel Skinner passed through, the area of this once proud city was used for a burial-ground.—*Skinner's Overland Journey*, i. p. 155.

CÆSAR FREDERICKE, a Portuguese jeweller who wandered from Bussora to Kurachee, and thence to Goa and Vijayanagar.

CAFFER BREAD, of the Cape of Good Hope, is from the Encephalartos caffer. The stem, when stripped of its leaves, resembles a large pine-apple. It is also called the Hottentot bread-fruit. The Kafir people bury it for some months in the ground, then pound it, and extract a farinaceous matter of the nature of sago.—*Captain Carmichael.*

CAFFER TEA, the leaves of Helichrysum nudifolium, common in the Cape Colony, and used medicinally.

CAFFREE CHILLEY, Capsicum grossum.

CAFIR, also Kafir, a term employed in India to designate the African race, usually the large-featured, curly-haired variety. La Bourdonnais enlisted many into his army, but the British in India have never enlisted them. They are employed in the city of Hyderabad. A small number were employed in the Ceylon Rifle Corps; comparatively few of their children grew up, usually falling victims to pulmonary complaints. Cafir also is a term to designate the idol-worshipping race in the N.W. Himalaya, known as the Siah Posh Cafir, because of their black-coloured clothes. Also a general term of abuse by Mahomedans to any non-believer in Mahomed. It is from the Arabic, meaning a denier, an infidel.

CAGGAR, the ancient Drishadvati, a river of the Rajputana desert, also known as the Hakra, but absorbed by the desert sands many centuries ago. The stream took a westerly direction by Phoolra, where it is still to be traced, and fell into the Indus below Cutch. Its absorption occurred during the reign of Rao Hamir, prince of Dhat, and caused great physical and political changes in the country. There are vestiges of large towns buried in the sands; amongst them is the Rung Mahal, west of Bhatnair, with subterranean apartments still in good preservation. The tradition is that it belonged to a Powar prince in the time of Alexander the Great, Sikandar Roomi. The absorption of the Caggar river is named as one of the causes of the comparative depopulation of the northern desert of India.—*Tod's Rajasthan*, ii. pp. 213, 214. See Saraswati.

CAHAMILILE. SINGH. A very hard, fine, close, even-grained heavy Ceylon wood.

CAHUA. HIND. Pentaptera arjuna.

CAILLEA CINEREA. *G. and P.*

Dichrostachys cinerea, *W.*	Desmanthus cinereus, *W.*
Mimosa cinerea, *Linn.*	Acacia dalea, *D.C.*
Mavalinga maram, TAM.	Venuturu, . . . TEL.

This small tree grows in Ceylon, in the Madras Presidency, and is common on sterile plains of the Dekhan, Dehli, Patna, and Paghamew.—*Voigt.*

CAIN, according to Bunsen (iv. 426), Qayin, is the type of the dwellers in towns. He was the progenitor of the city-building Aryan, as also of the vast Turanian wanderers, who move about all but cut off from the rest of mankind. Cain is called Kabil by Mahomedans, and is fabled by them to rest under Jab'l Shamshan, the highest wall of the crater at Aden, where he and his

progeny, tempted by Iblis, erected the first fire temple. See Abu Kubays.

CAIRN.

Ganj, ... HIND. | Birah, ... MAHR.

A heap of stones or tumulus piled over the resting-place of the ancient dead, in different parts of S. India. Prior to the Buddhist stupas or topes, this seems to have been a common mode of covering the dead; indeed, the tope is only a cairn regularly built. On the Neilgherry hills are found remains of cairns, barrows, cromlechs, kistvaens, and circles of upright loose stones. In the cairns or barrows, vases, cinerary urns, and other vessels of glazed pottery, are often found, which sometimes contain human bones, more or less charred, and mixed with ashes; sometimes a little animal charcoal alone. They are met with in almost every part of peninsular India, from Nagpur to Madura, in immense numbers on the Animally hills, a range on the south side of the great Coimbatore gap, which forms the commencement and northern face of the Southern Ghats, those on the Animally being of a more advanced order and in better condition than the Neilgherry barrows. Similar remains are found in Circassia and Russia; and circles of stones surrounding ancient graves, are found on the southern Arabian coast, and in the Somali country in Africa. All around Hyderabad and Secunderabad, in the Dekhan, are great numbers of cairns; and many of these remains are at Rajan Kooloor, in Zorapur, and also at Siwarji, near Ferozabad, on the Bhima. Neither the hill people, the Toda and Kurubara, nor any Hindus, know anything about the race to which these remains belonged; and neither in Sanskrit literature, nor in that of the Dravidian languages, is there any tradition on the subject. The Tamil people generally call these cairns pandukuri; kuri means a pit or grave, and pandu refers to the Pandu or Pandava brothers, to whom so much of Hindu mythology relates. The resemblance of the barrows and their contents (with the cromlechs, etc.) to the remains which are discovered in the ancient seats of the Celtic race in Europe, is exact (Dr. Caldwell's Grammar). In India, the topes or tumuli of Kraku-chanda, Kanaka, and Kasyapa existed before the preaching of Sakya; and the ancient elemental deities of the Vedas preceded the worship of Dharma or concrete nature.

Kodi Kul, or umbrella stone, Topi Kul, cap or covering stone, and Pandu Kul or Pandu stones, are other names by which the cromlechs of Southern India are known to the people. The Topi Kul is a large mushroom-shaped stone placed on the ground. Underneath it are urns of baked pottery, containing portions of human bones mixed with charcoal, and a fine powder or sand, in which also the urns had been placed. And whether with the Kodi Kul, the Topi Kul, the kistvaen or cairns, a foreign earth, *i.e.* an earth not belonging to the locality, is used to cover in the funeral urns. Mr. Babington was the first to notice them, about the year 1820. Underneath the Topi Kul he found a flat stone, and beneath it an urn or urns, resting in a shell corresponding to its shape, filled in with fine sand; and on ledges near the urn, were remains of iron implements and weapons, with heads of various kinds, an iron tripod, a lamp, etc. In 1831 Captain Harkness found groups of cairns on the Saroni hill at Ootacamund. They are low mounds of earth rising to the centre, surrounded by circular walls of dry stone, about 3 feet high, and about 6 to 8 feet in diameter. Underneath the surface earth was a pavement of large flat stones, resting on smaller stones, beneath which was a layer of fine brownish-black mould, 2 feet in depth, intermixed with broken pottery, charcoal, broken clay, images of buffaloes, and with other soil of a blacker and finer kind. Below the covering flags were numerous urns filled with black earth, bone, and charcoal, some perfect, some broken.

Captain H. Congreve, 1847, also described these, and he claimed for them a Scytho-Celtic or Druidic origin, and identity with similar European remains. He found at Ootacamund and in the Neilgherries generally, cairns with single and double rows of stones round them, disposed in circles; open temples of large rocks set on end, as at Abury in Wiltshire, and Rowldrich in Oxfordshire; single rocks as altars, surrounded by rough circular walls and rings of stones; barrows environed with a trench and mound; and single stones 5 to 10 feet high, etc. Beneath the flagstones, remains were found as described by Captain Harkness. Captain Congreve found cromlechs at Acheny, near Kotagherry, in which the people said pigmies not a foot high had been buried. At Adi Raer Cottay, he found a group of the kistvaen, or closed cromlech; and he said that there is not a relic of Druidism existing in England, the type of which he had not found on the Neilgherry hills.

Captain Meadows Taylor, between 1850 and 1860, discovered and described cromlechs, kistvaens, and cairns, in Zorapur in the Dekhan. The cromlechs were closed on three sides, and the south-west front left open. The kistvaens were closed on all four sides; and both were covered at top with a single slab of large size. Some of them had a round hole, of 6 to 9 inches in diameter, in the centre of the south side or south-west side. The kistvaens were partially filled with fine black or grey earth, intermixed with broken pottery, partly calcined bones, and pieces of charcoal. The cromlechs contained nothing. Both cromlechs and kistvaens were formed of sandstone and limestone rock, altered by the intrusion of granite. Some of the cromlechs and kistvaens were of large size,—the cromlechs up to $15\frac{1}{4}$ feet long by 9 feet broad, and $2\frac{3}{4}$ feet thick; the kistvaens up to 12 feet by $10\frac{1}{2}$ feet, and up to a foot thick, and the side slabs $12\frac{1}{2}$ by 8 feet. Those at Rajan Koolloor, at Haggeritgi, and elsewhere, are identical with those of the Neilgherries, with the kistvaen called Kitscoty House near Aylesford in Kent, with those in Wales and other European localities, and in Circassia, as described by Mr. Bell. The people call them Mori, Mohori, or Muni houses.

The remains near Hyderabad consist of single, double, and treble rows of large stones. In some places the space within the circle has been paved with large pebbles beaten down with clay; in others the circle stones have been simply placed around the covering earth, which has a heaped-up mound form, and contains only earth and small stones. They vary up to 50 feet in diameter. At various depths below, but chiefly about 9 to 14 feet deep, is a great block of rock, beneath which is a space enclosed by slabs, and also a passage or entrance. The grave-pits underneath are from 9

to 15 feet. The floor of the pit is flagged with stone slabs, on which is a cist, formed by slabs on edge, with a covering slab. Around the head of each cist were found circular vases, urns of red and black pottery, glazed and unglazed, spear heads, arrow heads, fragments of swords, of bill hooks, iron lamps, iron tripods. In one compartment of a cist Captain Taylor found a perfect male skeleton; in others, one, two, or three smaller skeletons, evidently of women, some with the skulls separate from the bodies, and the skeletons lying on their bellies; and between the upper flagstone and the cist, intermixed with the earth, were skeletons and portions of skeletons in every possible position, the skulls of many being separated from the bodies. These he considered to be the remains of persons who had been sacrificed and thrown into the grave-pit of the cairn. The slabs above, the guiding entrance below, and the cists, lay invariably N.E. and S.E.

In the circles near Hyatnuggur, and other places around Hyderabad, southwards to Zorapur, bells, iron weapons, and pottery have been found. The weapons consisted of arrow heads, a javelin rod like that used by the Binjari race of the present day, lance and spear heads, bronze bells and cups. In a Hyatnuggur cairn, also, were found chank shells (Turbinella pyrum), some of them intended to be used as conchs, others as ornaments, necklaces, etc. The pottery articles were cups, and an hour-glass-shaped drum, also human and other bones.

All around in the cantonment of Secunderabad and Bolarum are numerous remains, many of which have been opened, and some very perfect skulls obtained.

There are many cairns on the Masulipatam road, noticed by Captain (now General) Doria. Also at Goor Muktul, between Zorapur and Hyderabad; many near Dewarconda, about 40 miles S.E. from Hyderabad; also at Narkaelpilly. A return from Mr. Pelly showed 2129 cromlechs and kistvaens in the Bellary district, which the people believe to have been the dwellings of a diminutive race called Mohori. Cairns, cromlechs, and kistvaens are also to be seen in all the Raichore Doab; in the district lying between the Krishna and Tumbudra, on the Yemmee Gooda hills.

At Vibuthalli Captain Taylor discovered a great group of natural rocks or tors, surrounded by circles of stones. One at Vibuthalli consists of a square of 22 rocks on each side. It is partly incomplete, and the area measures 360 by 340 feet. At Shahpur is a parallelogram, where 56 huge rocks enclose a space and tumulus 400 feet by 260. Some of the masses exceed 200 tons in weight, one of them 267 tons, and it is difficult to imagine how such masses were moved from the granite hills at Shahpur, three miles distant. It had been a place of cremation on a large scale, and the tumulus consisted of human ashes, charcoal, and pieces of bone; and the remains of each body had been covered over with white earth.

The Zorapore graves are of two kinds, one in which the dead were buried, accompanied by human sacrifices; the other burned their dead, and placed their ashes in cairns, or collected and placed them in kistvaens.

Captain Congreve regarded these Neilgherry remains to be those of Scythic races. Captain (Colonel) Taylor discusses the question whether of Scythic races, Aryan or Turanian. Over vast wildernesses in the northern regions of Asia, along the banks of the Irtish, and beyond the remote Yenisei, innumerable tumuli are scattered, containing the remains of ancient art and long extinct races of men. Implements of silver, gold, and copper, girdles of the precious metals, bracelets decked with pearls, fragments of porcelain, have surprised the travellers who have seen a few of the tumuli opened. Similar tumuli are spread over the north of Europe. Esehricht, Nilsson, and Retzius, in Sweden and Denmark, Dr. Willde in Ireland, and MM. Robert and Serres in France, have attempted to identify in these relics the remains of different races supposed to have inhabited successively the north of Europe in early times. In the opinion of the Swedes, the sepulchral remains of northern Europe may be referred to three successive eras. They display different physical types and different stages of advancement in civilisation. The oldest are the relics of a people with round heads, having the transverse diameter of the cranium large in proportion to the longitudinal. The implements and ornaments which are found in the tombs of this race, indicate the greatest rudeness. They consist of tools and the heads of arrows and lances made of stone and bone, but nothing indicating a knowledge of the use of metals. It seems to be the opinion of Retzius and that of Nilsson (Scandinaviska Nordens Urinvanare, af S. Nilsson, Lund. 1838–43), that they were the burial-places of a people much older than the Celts. Similar remains, discovered in France, have been supposed by MM. Robert and Serres to be referable in like manner to different eras.

In the Alford district of Aberdeenshire are many cairns of enormous size. Some people think they have been beacons to give warning in time of danger; but many of them are situated in low places, and they are supposed to be tombs of some great men. It is a common saying among the people of that country to this day, when any person makes them a gift, 'God I wat, gin I live ahint you, I'se add a stane to your cairn.' The old Celtic is, 'Curri mi clach er do cuirn,' 'I will add a stone to your cairn;' *i.e.* I will do homage to your memory when you are dead. And to this day many old people never pass by any of these cairns without throwing a stone to it.

The Gond races in the Vindhya place great stones over the graves. Doorgawati, queen regent of Gurha Mundela, was killed in action against the troops of Akbar, under Asaf Khan, as an inscription of her family asserts (As. Res. xv. p. 437). She was interred at the place where she fell (Ben. As. Soc. Journal, vi. 628), and to this day the passing stranger places, as a votive offering, one of the fairest he can find of those beautiful specimens of white crystal in which the hills in this quarter abound. Two rocks lie by her side, which are supposed by the people to be her drums converted into stone; and strange stories are told of their being still occasionally heard to sound in the stillness of the night by the people of the nearest villages. The very ancient custom of casting a stone upon untimely graves is still observed throughout Spain, accompanied by a silent prayer for the dead.

In the Upper Godavery, British side, and Kistna

district south of Jaggiapetta, tombs and cairns are found in groups, particularly in the Kistna district, where there are hundreds on one hill alone,—four stone slabs on edge, and slab at bottom, and one on top; then round the tomb a ring of small stones, some 12 feet in diameter, and small stones within that heaped over the grave. The grave is sunk from 2 to 4 feet in the ground, according to the breadth of the side slabs. The sizes of the graves are from 1 foot 6 inches long by 1 foot broad, to 6 feet long by 2 feet broad. In the Kistna district the slabs are limestone; in the Upper Godavery, trap, hypogene rock and sandstone. In several of these graves has been found a skeleton. The body had been laid on the right side, head resting on right arm, head always north, feet south. The bones crumbled almost at a touch. The size of the upper slabs on the tombs vary in size from 4 feet by 3 feet to 8 feet by 6 feet; some of the smaller tombs have no slabs on them on top, but only small stones piled up as a cairn.

In the Upper Godavery, also, are tombs without cairns, no slabs at bottom, only four forming the sides. They are generally 4 feet by 3 feet square; some immense slabs on top measured 14 by 5 feet. The graves are filled up with small earthen pots, filled with burnt bones and clay. Beads, apparently made of ivory, and some small glass ones of red and green colour, in the pot that contains the charred remains of the skull. There is a splendid tomb of sandstone on the Nizam's side of the river opposite Lingala; the slab on top is 9 feet square, the tomb surrounded with eight rings of stone (sunk in the ground) some 7 feet in diameter; it is evidently a chief's grave. In another grave, with smaller slabs and fewer rings round, were the usual pots with bones and beads; the rings contained a skeleton with feet in towards the tomb, the skull placed between the knees. These were the skeletons of slaves that had been sacrificed on the death of a chief, number according to rank. Herodotus describes this ceremony. Mr. Rivett Carnae, in the beginning of 1847, brought to notice the existence of barrows, a little further northward, at the village of Junapani, near Nagpur, in which were found articles of pottery, spear and arrow heads, battleaxes, a horse snaffle bit, stirrup-irons, and a small iron model of a bow and arrow.

In the Bengal Asiatic Journal, xiii. p. 618, for 1844, is Colonel Yule's description of the Khassya people of East Bengal, an Indo-Chinese race, who keep cattle but drink no milk, and the sister's son inherits property and rank. They habitually erect dolmens, menhirs, cists, and cromlechs, almost as gigantic in their proportions, and very similar in appearance and construction, to the so-called Druidical remains of western Europe. The undulatory eminences of the country, some 4000 feet to 6000 feet above the level of the sea, are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude piers. In one spot, buried in a sand grove, were found a nearly complete circle of menhir, the tallest of which was 30 feet out of the ground, 6 feet broad, and 2 feet 8 inches thick; and in front of each was a dolmen or cromlech of proportionately gigantic pieces of rock, while the largest slab hitherto measured is 32 feet high, 15 feet broad, and 2 feet thick. Several had been very recently erected. The method of obtaining the blocks, is by cutting grooves, along which fires are lighted, and into which, when heated, cold water is run, which causes the rock to fissure along the groove. The lever and rope are the only mechanical aids used in transporting and erecting the blocks. The objects of their erection are various, — sepulture, marking spots where public events had occurred, etc. The Khassya word for a stone, 'mau,' as commonly occurs in the names of their villages and places, as that of man, maen, and men does in those of Brittany, Wales, Cornwall, etc. Thus Mausmai signifies in Khassya the stone of oath; Mauloo, the stone of salt; Mauflong, the grassy stone, etc.; just as in Wales, Penmaen Mawr signifies the hill of the big stone; and in Brittany a menhir is a standing, and a dolmen a table stone, etc. A cairn of considerable size, on the roadside at the top of the Ajunta ghat, seems to have been a thankoffering for the ascent of the ghat. We added, like the rest of our camp, one stone to the heap.—*Ras Mala, Hindoo Annals*, ii. p. 387; *Dr. Pritchard, Rep. Brit. Ass.* 1847, p. 236; *Colonel Meadows Taylor in J. E. Soc.* 1869; *Dr. Caldwell's Grammar; As. Res.* v. xv.; *Capts. Harkness and Congreve in M.L.S.J.; Captain Yule; Beng. As. Soc. Journ.* xiii. p. 619. See Cheda; Cromlech; Ghorband; Tsalai.

CAIRO, the capital of Egypt, in lat. 30° 6′ N., and long. 31° 26′ E., a very ancient city in the valley of the Nile, and known to the people as Misr. After the conquest of Egypt by Cambyses (B.C. 525), the Babylonians are said to have founded New Babylon, on the site now occupied by old Cairo. That city, during the Roman occupation, was the headquarters of one of the three legions stationed in Egypt. In A.D. 638 New Babylon was captured by the Arabs, and a new city gradually arose beyond it, which received the name of 'Fastat,' from its having grown up around the tent (fastat) of the Arab general. The modern city was built adjacent to Fastat, in the 12th century A.D., a portion of the stone used in the construction having been obtained from the ancient city of Memphis.

In A.D. 973, the new city, under the title of Misr (al Kahirah, *i.e.* the Victorious), was constituted the capital of Egypt. The citadel was built in 1116 by the famous Saladin (Salah-ud-Din), who also erected the beautiful aqueduct seen from its walls. Within the walls are the Pasha's palace, the arsenal, mint, and public offices, a mosque, and a well 260 feet deep, known as Joseph's Well. It was not, however, Joseph the son of Jacob who sank it, but a ruler of that name, about A.D. 1100. Under the successors of Salah-ud-Din, Cairo was greatly extended; its magnificence culminated about 1340 A.D.

On the 26th January 1517, the Osmanli sultan, Selim I., entered the city as its conqueror, and thenceforward its history is a blank down to the 22d July 1798, when it was occupied by the French army under Bonaparte. In 1801 the French garrison capitulated to the Turkish army. On the 3d August 1805, Muhammad Ali Pasha took possession of the citadel, which witnessed the massacre, 1st March 1811, of 400 Mameluke Beys, by his orders. Amir Bey alone escaped by leaping the wall. The population is estimated at 400,000, Egyptians, Mahomedans, Copts, Jews, Europeans, and other strangers from the principal

oriental states, but the mass of the population consists of Egypto-Arabian townspeople, of a much more mixed origin than the fellaheen or agricultural population.

CAJAN. MALAY. Fronds of the palmyra and cocoanut palms.

CAJANUS INDICUS. *Spreng.* Pigeon-pea. Of this there are two varieties, which differ only in the colour of the vexillum.

Var. α, with vexillum of a uniform yellow colour on both sides.

Cajanus flavus, *De Can.*	Cytisus cajan, *Linn.*
Dhal, Arhar, . . BENG.	Shakhull, . . . PERS.
Pai yen khyung, . BURM.	Adaki, ... SANSK.

Dhingra Kundi of Kangra.	Potu Kondalu, . ,,

This is a very valuable pulse.

Var. β, vexillum purplish and veined on the outside, yellow on the inside.

Cajanus bicolor, *D. C.*	Cytisus pseudo-cajan, *Jacq.*
Burry Tur, . . DUKH.	Main Tovarai, . . TAM.
Two-coloured Dhal, ENG.	Malay Tovarai, . . ,,
Hill Doll, ... ,,	Konda Kandulu, . TEL.

An excellent pulse, makes a pudding little inferior to that made of peas, and is a particular favourite. When husked and split, it constitutes the kind of dhal which most commonly enters into the formation of the vegetable curry of the Hindu,—moisture, 12·0; nitrogenous matter, 20·1; starchy matter, 63·1; fatty or oily matter, 1·5; mineral constituents (ash), 3·2. This is sown in fields at the commencement of the rains in June, and sometimes much later; it is ripe in December. The seeds are sometimes ground into flour, or split like dry peas; for the latter they are an excellent substitute. It is one of the plants employed in the Bengal Powder-works at Eshapore, in the manufacture of gunpowder charcoal. It might probably be employed in the manufacture of pyroligneous acetic acid. The green pods are cooked in curries. The seeds are separated from the dried pods by beating, and to give a bright colour are mixed with red earth and steeped in water until they germinate. They are then removed, and dried in the sun for two days, and bruised in a mill to break up the seeds, when it is freed from the testa. The cotyledons are now called dhal, which is cooked for curries; also sweet cakes are made from it. Dhal sells at 18 to 24 lbs. for a shilling. The dry leaves and stalks are given to cattle, and the stalks used as thatch.—*Beng. Phar.* p. 235.

CAJAPUTI OIL, Kayaputi, Cajaputi oleum. This oil is obtained from the leaves of the Melaleuca cajaputi of Maton and Roxburgh; and it has been said, also from M. leucodendron, which is the species known to the people as the kayuputi, literally white wood. Rumphius described two trees, Arbor alba major and Arbor alba minor, and in 1798, Mr. Smith, of the Calcutta Botanic Garden, was sent to the Molucca islands to obtain the true sort of cajaputi plant. He obtained several of each of the trees, and they were distributed over India. Specimens sent to England, were ascertained by Dr. Maton to be those of the Melaleuca cajaputi, *Roxb.*, a small tree with an erect but crooked stem, covered with thick, rather soft, light-coloured bark; branches scattered, with slender twigs which droop like those of the weeping willow. A native of the Molucca islands, especially of Boeroe, Manipe, and of the S. of Borneo. It is called daunkitsjil, but also cajaputi. The leaves are collected on a warm dry day in autumn, and placed in dry sacks, in which they nevertheless become heated and moist. They are then cut in pieces, macerated in water for a night, and then distilled. Two sackfuls of the leaves yield only about three drachms of the oil. This is clear and limpid, of a light green colour, very volatile, diffusing a powerful odour, having a warm aromatic taste, something resembling that of camphor, followed by a sense of coolness. Sp. gr. 0·914 to 0·927; soluble in alcohol. It boils at 343°. — *Crawfurd's Dict.; O'Sh.; Royle; Mason.* See Melaleuca cajaputi.

CAJU. GUJ., HIND. Casearia elliptica? also HIND., Anacardium occidentale. Cashew-nut tree. Caju ka tel, the oil from the apple.

CAJUR. HIND. Phœnix dactylifera, the date-palm, properly Khajur.

CAKAY. CAN. Cathartocarpus fistula.

CALA. SANSK. Time in its natural acceptation; a term applied to a variety of mathematical and astronomical subjects. Cala, in Hindu astronomy, an arc of one minute of a degree; also the phases of the moon, of which the Hindus count 16. Maha Cala, the conjunction or opposition of the sun and moon. See Kala; Yug.

CALABAR SKINS.

Petitgris, ... FR.	Vaor, ... IT.
Grauwerk, ... GER.	Bjelka, ... RUS.
Vajo, ... IT.	Gris pequeno, . . SP.

Siberian squirrel skins, of various colours, used in making muffs, tippets, etc.—*M'Culloch; Faulk.*

CALABASH, Cucurbita lagenaria, *Linn.*

Hurrea kuddoo, . HIND.	Chooray kai, . . . TAM.
Laboo Ambon, . MALAY.	Anapa kaya, . . . TEL.

This is the Lagenaria vulgaris, *Ser.* It is of two kinds, the long or Ceylon, and the round; they are good vegetables when young, and are useful when dry as vessels, also as fakirs' bottles, as the sounding drum for the sitar, and as a buoy for swimming across rivers. The New World calabash is the shell of the fruit of Crescentia cujete, *L.*, a tree of the West Indies and South America, applied to various domestic purposes, and often carefully carved or painted.—*Rohde, MSS.*

CALABASH NUTMEG, Monodora myristica, var., of tropical West Africa, bearing globular fruits, 4 to 6 inches in diameter, filled with aromatic seeds. These might, with advantage, be brought to India.

CALABA TREE, Calophyllum calaba, *Linn.*

CALACUTA, in Hindu mythology, a poison produced from the churning of the ocean.

CALADANA. HIND. Pharbitis nil.

CALADIUM ESCULENTUM. *Willde.*

Colocasia esculenta, *Schott.*	Ervi, ... HIND.

A small bulbous root, sown from March to July in rows of beds, mostly along a watercourse where ginger is planted. It requires much water, and takes from six to seven months to ripen. When boiled and then roasted, it is very wholesome, and somewhat resembles a yam in taste; the natives also put it into curries. It is not liked by Europeans.

CALADIUM XANTHORIZUM. *Smith.*

Kwei-kui, . . . CHIN.	Tuh-kioh-lien, . . CHIN.

This Chinese arum has a round irregular bulb, used medicinally.—*Smith.*

CALAH, one of the three cities mentioned in Genesis x. 11, 12 as having been restored by Asshur, son of Shem. B.C. 746, Calah revolted, and Tiglath-Pileser became ruler of Assyria. It has been identified as the modern Nimrud, q.v.

CALA JIRA. HIND. Fennel flower seed.

CALAMANDER WOOD.

Koulou-midrie, . SINGH.	Kalumederiye, . SINGH.
Koulmidrie, . . ,,	Calamander maram? TAM.

A commercial term applied to the woods of two or three species of Dalbergia growing in Ceylon, one of them the D. quæsita, *Thw.* It is scarce even in Ceylon; it is probably the most beautiful of all fancy woods. The figure is between that of rosewood and zebra-wood; the colour of the ground is usually a rich hazel brown, described as chocolate brown with black stripes. It is hard, and turns well. Mr. Rohde (*MSS.*) met with variegated ebony of rich lustre in logs of ebony cut in the Northern Circar hills, but whether this was owing to the wood being young, or whether the wood was from a distinct tree, he did not know; but there seems no doubt that very many trees yield an ebony.—*Ains. Mat. Med.* p. 211; *M'Culloch; Rohde, MSS.; Holtzapfel; Mendis; Fergusson; Thwaites.* See Dalbergia.

CALAMARIDÆ, the family of dwarf snakes. See Reptiles.

CALAMARIES, or Squids, are molluscous animals, of the family Teuthidæ, section Decapoda. Most of the genera are fossil; but Loligo or Teuthis has twenty-one recent species, and one of them is luminous at night. See Mollusca.

CALAMBAC, Chin-hiang, CHIN., also Calambeg, called aloes-wood, is the agallochum of the ancients, and the agila or eagle-wood of the moderns. It is produced in Siam and Sylhet by Aquilaria agallocha.—*Royle, Illustr.* p. 171.

CALAMBUCO, one of the best timber trees of the Philippines. The wood is largely employed in the fabrication of domestic utensils and agricultural implements.—*Crawfurd, Dic.* p. 79.

CALA MEEN. TAM. Polynemus Indicus.

CALAMINE.

Shih-sui-yuen, . . CHIN.	Calamina, . . . LAT.
Carbonate of zinc, ENG.	Zinci carbonas, . . ,,

Rough calamine is prepared for medicinal use by burning; prepared article, usually called oxide of zinc, is often adulterated with sulph. baryta, carbonate of lime, etc.—*Royle.*

CALAMUS. This genus of palm trees is indigenous to Southern Asia, and Dr. Griffiths enumerated 58 species. They abound in the Madras territories, along the foot of the Himalaya from Dehra Doon to Sylhet, in Assam, Chittagong, in the Malay Peninsula, Siam, Cochin-China, Sumatra, and in the Eastern Archipelago. The species are mostly spreading shrubs or small trees, erect, or climbing to a considerable height, or trailing their weak stems several hundred feet along. They furnish the dragon's blood, Malacca canes, and rattans of commerce, some being formed into walking-sticks; some, as the C. rotang and others, form the canes or rattans of commerce, of which the people of the Khassya hills make bridges 300 feet long, and those of the Animally hills are formed into long looped ladders. The hard flinty coating of the cane stems are readily split into strips, from which the bottoms of chairs and similar articles are manufactured. It is not, however, possible to say from what particular species the canes of the shops are obtained, it being probable that many are gathered indiscriminately; C. rotang has, however, been said to furnish the stouter, and C. scipionum the more slender sorts. But the C. tenuis of Assam, C. gracilis, C. extensus, and others, all furnish the canes of commerce. The stem of Calamus verus is described as being 100 feet long, that of C. oblongus 300 to 400 feet, of C. rudentum upwards of 500 feet, and of C. extensus as much as 600 feet. Rumphius even states (vol. v. 100) that one kind attains the extraordinary length of 1200 feet. The cane stem is closely covered over by the tubular bases of the leaves, through which it is drawn by the cane-gatherers when green; afterwards it is dried in the sun, and then is ready for the market. The ground rattan is distinguished by its straight head and altogether straight and stiff character, as well as by its pale colour, some of them are at least an inch in diameter, and others not half that thickness. Some are distinguished by a hard, and others by a soft bark. It is not known whether the slender are of the same species as the thicker kinds, only growing in different situations, or from roots of different ages; but Rhapis flabelliformis is said to yield the ground rattan. Another kind of rattan is called dragon cane. This, both light and dark coloured, is thicker than the last, has long internodes and a hard bark, less flexible than the common rattans, but strong, springy, and much valued. A variety, with soft bark, is called Manilla dragon cane. Other kinds of canes, imported from China, are known, one with stiff stems and large knots, by the name of Jambee, another as Whangee. This has a pale, hard bark, and flexible stems, with internodes of about an inch and a half or two inches, and a number of little holes at the knots. Some of the canes of commerce, however, are produced by species of bambusa, saccharum, and other grasses. The flesh that surrounds the seeds of this genus is a delicate article of food; limpid water flows from the stems when cut through; and the young shoots of some of them, while still tender, are fritted or boiled, chopped small, and, being fried with pepper and gravy, are said to furnish a very delicate dish. One of the kinds of dragon's blood or jurnang is the produce of species of calamus; and those which chiefly yield it are the C. petræus, *Lour.*, C. rudentum, *Lour.*, C. verus, *Lour.*, and C. draco, *Willd.*, of which the last three were by Linnæus reckoned mere varieties of C. rotang. Mr. Gamble names 39 species.

Calamus arborescens, *Griff.*, is an arboreous species of rattan common in the Burma jungles. Griffith justly terms it 'a very elegant palm.'

Calamus draco, *Willde.*

Dam-ul-Akhwain, ARAB.	Rotan-jarnang, . MALAY.
Ky-eing-ni, . . BURM.	Kanda-murga-rattam,
Tu-tang, Koh-liu, . CHIN.	TAM.

This grows in Burma, the Malay Peninsula, Sumatra, and the Eastern Archipelago, and is said to be the species which, as a natural secretion of its fruit, yields the best d'jurnang or dragon's blood, an article of commerce from the earliest times, and still in demand. In the forest of Tenasserim, the natives call it 'red rattan,' as it produces a red exudation like dragon's blood. It is little known in the Peninsula of India. The plants when young are elegant, and resemble small palm trees, after which they become scandent,

and overrun any neighbouring trees. The fruits are fleshy, red, and astringent. Dragon's blood is of more importance in the arts than in medicine, being chiefly used as an ingredient in varnishes and paints. In commerce it occurs in powder, grains, masses, drops the size of an olive, and in sticks, enveloped in the leaf of the talipot palm.

Calamus erectus, *Roxb.* Its seeds are used as a substitute for betel-nut.

Calamus extensus, *Roxb.*, Nela poka, TEL. Its seeds are used for betel-nut. See Canes.

Calamus fasciculatus, *Roxb.* Rattan cane.

Buro-bet, . . .	BENG.	Parambu, . . .	TAM.
Perambu, . .	MALEAL.	Amla Vetasawmu,	TEL.

This cane is a native of Bengal, used for walking-sticks.

Calamus inermis, *T. And.*, furnishes the finest alpenstocks.

Calamus latifolius, *Roxb.*, of Chittagong, Burma, and the Andamans, is used for tying timber rafts, and to make cables.

Calamus montanus, *T. And.*, of Sikhim and Bhutan, is the best cane for suspension bridges and for dragging logs.

Calamus rotang, *Linn.* Rattan cane.
C. Roxburghii, *Griff.*, *Royle.*

Bet, Beta, . . .	BENG.	Betamu, Bettapu,	TEL.
Rotan, ...	MALAY.	Niru Prabba, Pemu,	,,
Bed, ...	PERS.	Pepu, ...	,,
Perambu, . . .	TAM.		

This species of calamus is said to furnish the stouter of the rattan canes of commerce, which are readily split into strips, are extensively used for the caning in the backs and bottoms of chairs, sofas, and light carriages; are made into matting, seats, sofas, baskets, and cabinets; and throughout the Archipelago vessels are furnished with cables formed of cane twisted or plaited. They are likewise formed into ropes by the people of the forests, to drag heavy weights and to bind wild elephants. The kinds employed for caning chairs, etc., are known in commerce by the name of rattan cane, and are yielded by long trailing species which abound wherever the genus is found. The most northern one, Calamus Royleanus, no doubt yields the rattans collected in the Dehra Doon, while C. Roxburghii doubtless yields those collected in more southern latitudes. Dragon cane is thick, both light and dark coloured, with long internodes and a hard bark, less flexible than the common rattans, but strong, springy, and much valued. C. Royleanus, C. rotang, common in Bengal and on the Coromandel coast, are used for all the ordinary purposes of cane; as also are C. tenuis of Assam, gracilis, extensus, and others. Canes form a considerable article of commerce. Between four and five millions of them have been exported from the East Indies. Dampier says: 'Here we made two new cables of rattans, each of them four inches about. Our captain bought the rattans, and hired a Chinese to work them, who was very expert in making such wooden cables. These cables I found serviceable enough after, in mooring the vessel with either of them; for when I carried out the anchor, the cable, being thrown out after me, swam like cork in the sea, so that I could see when it was tight, which we cannot so well discern in our hemp cables, whose weight sinks them down, nor can we carry them out but by placing two or three boats at some distance asunder, to buoy up the cable, while the long boat rows out the anchor.' The tow-ropes mentioned by Marco Polo as used by the Chinese for tracking their vessels on their numerous rivers and canals, seem also to have been made of cane, and not of bamboo, as sometimes stated, as they were split in their whole length of about thirty feet, and then twisted together into strong ropes some hundred feet in length. In Java, Sumatra, and throughout the eastern islands, vessels are furnished with cables formed of cane twisted or plaited. This sort of cable was very extensively manufactured at Malacca.

Mr. G. Bennet says (Wanderings, ii. p. 121) that near Macao the rattans are split longitudinally, soaked, and attached to a wheel, which one person keeps in motion, whilst another binds the split rattans together, adding others to the length from a quantity carried around his waist, until the required length of the rope is completed.

Calamus Royleanus, *Griff.*, the most northern of the canes, being found in the Dehra Doon, where it abounds. Plentiful in the eastern Kamaon forests, and used in all cane-work.

Calamus rudentum, *Loureiro*, grows on the Mahabaleshwar hills and Dekhan, also in Cochin-China and the Moluccas. Loureiro describes this large species as being twisted into ropes in the eastern regions, and employed, among other purposes, for dragging great weights, and for binding untamed elephants.

Calamus scipionem, *Loureiro.* Griffith considered this to be the species which yields the Malacca cane, but the plant does not appear about Malacca. He was, however, informed that the canes are imported from Siak, on the opposite coast of Sumatra. Some of these are simply mottled or clouded, others of a brown colour, in consequence, it is said, of their having been smoked. The more slender specimens with the longest internodes are those most highly valued.

Calamus viminalis, *Ainslie.*

Bet, ...	DUKH.	Perupum, ...	TAM.
Vetra, ...	SANSK.	Betta, ...	TEL.

It grows in the woods, and its fruit is eaten by the common people.—*Roxb.; Griffith; Seeman; Voigt; Royle, Fib. Pl.; Mason; O'Sh.; Bennet; Thompson; Ainslie*, p. 231; *Gamble.*

CALANDRA GRANARIA.

Ch'heda, Ghun, .	HIND.	Makora, . . .	HIND.

A weevil very destructive to grain. It is one of the insects styled goon by the people. See Insects.

CALANOS, a Brahman who accompanied Alexander the Great into Western Asia. He was an old man upwards of 80, and went along with Alexander through Gedrosia, the modern Makran. But at Pasargada, in Persia, he fell sick, and ended his life by immolating himself on a pile. According to Plutarch, his real name was Sphones. His native country was on the banks of the river Camala.—*Cal. Rev.* See Zarmano Chegas.

CALAPA. MALAY. Cocoanut palm. From this is derived the old word for the cocoanut, calaper, still usual amongst sailors.

CALAPNATH. HIND. Andrographis paniculata.

CALASTRI or Kalahasti is a zamindari estate in the Madras district of North Arcot, Madras. The town, in lat. 13° 45′ N., and long. 79° 44′ E., is the principal town of a Hindu chief known as the raja of Calastri.

CALCAREOUS SPAR. Calc-spar.

Ying-shwui-shih, .	CHIN.	Han-shwui-shih, .	CHIN.
Peh-shwui-shih, .	,,	Safed surma, . .	HIND.

The varieties of this mineral are calc-spar, Iceland spar, satin spar, chalk, rock milk, calcareous tufa, stalactite, stalagmite, limestone, oolite, pisolite, argentine, Fontainebleau limestone, white and clouded marbles, statuary marble, compact limestone, stinkstone, anthraconite, plumbo calcite, mineral agaric. Calcareous spar is used in India medicinally, and they call it white antimony, probably from its rhombohedral fracture resembling that of galena, which is usually employed in lieu of antimony; and natives use this also for the eyes, just as they do sulphide of antimony. At Sankerydroog, 25 miles S.W. of Salem, a great quantity of calcareous spar is burnt and sent to Salem and other parts, for eating with betel, as betel-eaters hold it in esteem. It requires a much greater heat than the ordinary kinds of limestone, and is generally burnt in small circular kilns with a jungle shrub, which gives out a great heat. When burnt it is much whiter than ordinary chunam, takes a most beautiful polish, and is much used for the last coat of plaster in houses, etc., giving the appearance of the whitest marble when polished. It occurs also at Masulipatam and in Travancore; rhomb spar at Nellore, and satin spar, or fibrous carbonate of lime, in the Hyderabad territory. Calcium is estimated to constitute one-fourth part, by weight, of the materials of which the earth consists. The importance of the uses of the compounds corresponds with the abundance of the element itself. But for the use of calcium in separating iron from ore, iron would not occupy the important position it does. Its compounds form ranges of mountains, coral islands, and chalk cliffs. There are few industries which do not depend in some way upon it in the form of carbonate of lime, as limestone, chalk, marble, calc-spar, and shells.

Calcined shells, Poh-fen and Hai-koh-fen of the Chinese, when finely powdered, are used in China as a face powder, or for dusting sores. The famed polished wall plaster of the Madras houses is made of lime prepared from calcined shells dredged from the neighbouring Pulicat lake. See Chunam.

Calcis carbonas, Chalk, Carbonate of lime.

Kils,	ARAB.	Karrimatti,	HIND.
H'toung h'pyu,	BURM.	Kapur ingris,	MALAY.
Craie,	FR.	Gil safed,	PERS.
Kohlensaurer kalk,	GER.	Simi chunambu,	TAM.
Valaiti chuna,	HIND.		

Chalk is only seen as an article of import into India. The Hindustani, Malay, and Tamil names describe it as foreign lime. It is used in households; but the bones of vertebrata, a large part of the shells of testaceous mollusca, of crustacea, corals, oyster shells, crab's claws, crab's eyes, as they are called, are all employed in eastern countries medicinally, as also the lapis judaicus, which is the spine of fossil echinus. All consist of pure carbonate of lime, with some animal matter intimately intermixed.—*Royle.*

CALCULUS CYSTICUS, bezoar.

Hajr-ul-Bakir,	ARAB.	Gauzereh,	PERS.
Gairun,	DUKH.	Gorochana,	SANSK.
Biliary calculus,	ENG.	Koroshanam,	TAM.

Biliary concretions occasionally found in the gall bladders of horned cattle in India. They are generally contained in a little bag, which holds two or three small calculi, each about the size of a tamarind stone, or one large one as big as a marble. They are of a bright yellow colour, and are considered by native practitioners as highly valuable in certain indispositions of young children, owing to their cordial and alexipharmic qualities. A piece about the bigness of a mustard seed is commonly given for a dose to a babe of two months old, in conjunction with an infusion of omum or siragum. This substance is also used, together with kadukai and machakai, in preparing a mixture for cleansing the inside of the mouths of new-born infants. The Vyteans prescribe a solution of it in warm ghi, to be poured up the nose in cases of nervous headache; and they administer it, too, in doshum (typhus fever), made into a draught with woman's milk.—*Ains. Mat. Med.* p. 85. See Bezoar; Gall Stones.

CALCUTTA, in lat. 22° 34′ 2″ N., long. 88° 23′ 59″ E., at the cistern of the barometer at the Surveyor-General's office, is 18 feet (G. T. S.) above the sea. It is the capital of British India, built on the left or eastern bank of the Hoogly river. It is a place of great trade, and has a mint, a cathedral, a governor's house, a fortress, a town hall, great hospitals, schools and colleges, a botanical garden, custom office, high court, and public monuments to Sir David Ouchterlony, Warren Hastings, Wellesley, Cornwallis, Outram, and others. The name is from Kalika (Kali, and ăt), to move, also said to be from Kali Kota, and it was the first concession to the British in that part of India. It was, when they obtained it, only a miserable village known also as Kali Ghat, of which also some believe its present name is a corruption. It is about 80 miles from the Bay of Bengal. On the 18th June 1756, it was taken by Suraj-ud-Dowla. Messrs. Drake and Minchin had made their escape along with the women and children, but Mr. Holwell held out for forty-eight hours longer, and he and 146 of the people were then imprisoned in a small guard-room, about 20 feet square, and on the following morning only twenty-three issued alive. The guard-room was thenceforward known as the Black Hole of Calcutta. In January 1757 it was recovered by a detachment from Madras under Admirals Watson and Clive, and the treaty of Calcutta was agreed to on the 9th February 1757. The population greatly increased:—

1710,		10,000 to 12,000
1752.	Mr. Holwell's estimate,	409,056

1872.	In the Census of Lower Bengal,	429,535
1881,		684,658

In 1686 the English merchants quited Hugli and occupied the three river-side hamlets, Sutanati, Kalikata, and Govindpur, where in 1696 they erected the original Fort William, and in 1700 they formally purchased the site from prince Azim, son or grandson of Alamgir I. Between 1752 and 1773, the present fortress was constructed, at a cost of two kror, and the natives gathered around it. After the battle of Plassey, a mint was established, and the first coin was issued on the 19th August 1757. In 1797 it was declared a presidency. The town has a European and a native portion; and until the latter half of the 19th century, its insanatory condition was con-

stantly exposed. There are now several colleges, medical schools, and hospitals. In 1873 the death-rate was 25·82 per 1000. It has several times suffered from cyclones; those of 5th October 1864 and 2d November 1867 caused great damage to the houses and to the shipping.

Calcutta municipality exercises jurisdiction over seven square miles. The Mahratta Ditch, around Calcutta, was excavated by the natives in the middle of the 18th century, as a protection against Mahratta inroads. Calcutta has been the nurse of many able statesmen, learned men, and philosophers,—Warren Hastings, Sir John Shore, Sir William Jones, Drs. John Borthwick Gilchrist, Horace Hayman Wilson, Francis Balfour, N. Wallich, Sir W. O'Shaughnessy, Buchanan, Lord Dalhousie, and Lord Canning, Mr. Carey, Mr. Marshman, and James Prinsep.—*Imp. Gaz.*

CALDANI, a body of Christians in Kurdistan who use the Syrian language in their liturgy.—*De Bode.* See Kuldi.

CALDERA BUSH, Screw pine.

Talam, ... Tam. | Mogili, ... Tel.

This is the Pandanus odoratissimus, *Linn.*, which was brought into India from the Mauritius. Its leaves are valuable for making soft matting; the droops from the stem are a mass of tolerably fine fibres, and the ends, beaten out, are used by plasterers for brushes; the fibre is used for lines and cordage; and the plant itself makes good fences near the sea, but it soon becomes straggling. —*Rohde, MSS.*

CALDOORTY, in Travancore, 700 feet above the sea, has a rainfall of 150 to 200 inches. Tea is grown there.

CALDWELL, The Rev. Dr. R., during the latter half of the 19th century a missionary for Christianity in the south of peninsular India; author of the Comparative Grammar of the Dravidian Languages, and On the Shanar Race. His success in conversions was great, and he was created a bishop of the English Church.

CALEMBERI. Singh. Coromandel or calamander wood.

CALENDAR. Nations have adopted different divisions of time, from which history has presented difficulties and contradictions. That of the Chaldæans was seen by Callisthenes, the favourite of Alexander. It commenced B.C. 2234. The Chinese calendar was reformed under the Han dynasty, B.C. 1991.

The Romans called the first day of each month Calend, from a word which signified 'called,' because the pontiffs on those days summoned the people together, to apprise them of the days of festival in that month. The Roman calendar is stated to have been introduced by Romulus, the founder of Rome. He divided the year into ten months only,—Mars, Aprilis, Maius, Junius, Quintilis (afterwards called Julius), Sextilis (afterwards called Augustus), September, October, November, and December. Mars, Maius, Quintilis, and October contained 31 days, and each of the six other months 30 days, so that the ten months comprised 304 days. The year of Romulus was therefore of 50 days' less duration than the lunar year, and of 61 days less than the solar year.

Numa Pompilius placed two months, Januarius and Februarius, before Mars. Julius Cæsar consulted the astronomers of his time, and fixed the solar year as 365 days 6 hours, comprising, as they thought, the period from one vernal equinox to another. The six hours were set aside, and at the end of four years forming a day, the fourth year was made to consist of 366 days. The day thus added was called intercalary, and was added to the month of February, by doubling the 24th of that month, or, according to their way of reckoning, the sixth of the calends of March. Hence the year was called bissextile. This almost perfect arrangement, which was denominated the Julian style, prevailed generally throughout the Christian world till the time of Pope Gregory XIII. The calendar of Julius Cæsar was defective in this particular, that the solar year, consisting of 365 days 5 hours and 49 minutes, and not of 365 days 6 hours, as was supposed in the time of Julius Cæsar, there was a difference between the apparent year and the real year of 11 minutes. This difference at the time of Gregory XIII. had amounted to ten entire days, the vernal equinox falling on the 11th instead of the 21st of March, at which period it fell correctly at the time of the Council of Nice in the year 325. To obviate this inconvenience, Gregory, in 1582, ordained that the 15th of October should be counted instead of the 5th for the future.

The solar, *i.e.* really the sidereal year, called the Shuboor Sun, or vulgarly the Soor Sun, that is, the year of (Arabic) months, was apparently introduced into the Dekhan by Taghalaq Shah, between A.C. 1341 and 1344, and it is still used by the Mahrattas in all their more important documents, the dates being inserted in Arabic words written in Mahratti characters. The Fasli or 'harvest' year of other parts of India was not introduced until the reign of Akbar and Shah Jahan, and they mostly continue to this day to be used even by the British in revenue accounts. —*History of the Sikhs; Captain Cunningham*, p. 34; *Bunsen*, ii. pp. 402, 442; *T. of Ind. Cal.* See Era.

CALENDERING. Mora, Tel. A term said to be corrupted from cylindering, cotton or linen goods being passed between cylinders or rollers, and made of a level and uniform surface. In India, an appearance similar to that produced by calendering is given to goods, particularly to such chintzes as were intended for the Persian market, by beating them, and then rubbing them on a board with a shell slightly waxed. The texture is no doubt injured by it. The coarse cloths formerly largely exported, were beaten with a heavy block on a log of wood, before being made up in bales.—*Rohde, MSS.*

CALENDRELLA BRACHYDACTYLA, the Alauda brachydactyla, or short-toed lark of S. Europe, N. Africa; rare in Britain; extremely common in India, where it is currently known to Europeans as the ortolan.

CALF. As the Basava and Nandi of the Hindus, the brazen calf mentioned in Scripture as an object of worship by the Hebrews is still worshipped by Hindus in India. It is rarely if ever of wood, is often of brass, but oftener of stone. See Bull, Lingam; Nandi.

CALI, the Diana Taurica of Greece. See Kali.

CALI, in Hinduism, the expected tenth incarnation of Vishnu in the shape of a white horse with a human head. See Kali.

CALICHI-KAI. Tam. Bonduc nut; Cæsalpinia bonducella.

CALICO.

Bombagina; Tela, .	IT.	Tuni, ...	TAM.
Kayin-Kapas, .	MALAY.	Gud'da, ...	TEL.
Bawelnika, . . .	POL.		

Cotton cloth, originally manufactured at Calicut on the Malabar coast, still largely made in India, but much of that used is brought from Britain. Arrian (i. 539) speaks of the beautiful white linens of India, probably the same with the modern calicoes. These formed, as they do at present, a great part of the people's clothing.

CALICOIL, a stronghold of the raja of the Kollari race, now ruled by the Puducottah raja.

CALICO PRINTING. This art was common to the Egyptians and the Hindus, and is still largely practised by the latter, with a skill which produces much to be admired, even in the midst of the productions of the world, and after so many attempts have been made to improve this art, certainly imported from the East. Pliny was acquainted with the wonderful art by which cloths, though immersed in a heated dyeing liquor of one uniform colour, came out tinged with different colours, which afterwards could not be discharged by washing. The people of India apply the mordants both by pencils and by engraved blocks. The cloth-printers at Dacca stamp the figures on cloth which is to be embroidered. The stamps are formed of small blocks of kantul (artocarpus) wood, with the figures carved in relief. The colouring matter is a red earth imported from Bombay, probably the so-called 'Indian earth' from the Persian Gulf. Though the art is now practised to much perfection in Britain, Indian patterns still retain their own particular beauties, and command a crowd of admirers. This is no doubt due in a great measure to the knowledge which they have of the effect of colours, and the proportions which they preserve between the ground and the pattern, by which a good effect is procured both at a distance and on a near inspection. Printing in gold and in silver is a branch of the art which has been carried to great perfection in India, as well upon thick calico as upon fine muslin. The size which is used is not mentioned, but in the Burmese territory the juice of a plant is used, which no doubt contains caoutchouc in a state of solution.—*Royle, Arts, etc., of India*, p. 483; *Pennant's Hindoostan*, i. p. 132; *M'Culloch's Commercial Dictionary*, p. 215.

CALICUT, a seaport town on the Malabar coast, in lat. 11° 15′ 2″ N., long. 75° 15½′ E., and six miles N. of Beypur. It is not visible from the ocean, the only building to be seen being a tall white lighthouse. Thick groves of cocoanut trees line the shore, and are divided from the sea by a belt of sand, while undulating green hills rise up behind, and a background of mountains is often hidden by banks of clouds. The name is from Colicodu or Colikukaga, a cock crowing, as Cheruman Permal gave his sword, and all the land within cockcrow of a small temple, to the Zamorin, or raja of Calicut, who attained considerable power in the 15th century. Pedro da Covilham, the Portuguese, landed here about 1486, Vasco da Gama in 1498; in 1501 Alvarez Cabral established a factory here, but the colony was massacred, which Da Gama revenged, and in 1510 Albuquerque burnt the Zamorin's palace. The Danish Government established a factory in 1752. In 1766, when Hyder Ali invaded Malabar, the Zamorin shut himself up in his palace and set fire to it, dying with his family in the flames. It has been repeatedly in the hands of the Portuguese, Dutch, French, British, and Mysoreans, and in 1817 it was restored with Mahe to the French. Tipu Sultan destroyed its flourishing trade, expelled from the country the merchants and factors of the foreign commercial houses, caused the cocoanut and sandal trees to be cut down, and ordered the pepper plants in the whole surrounding district to be torn up and hacked to pieces, because these plants, as he said, brought riches to the Europeans, and enabled them to carry on war against the Indians. Besides cocoanut products, coffee, pepper, cardamoms, ginger, cocculus Indicus, gingelly seed, turmeric, arrowroot, croton seeds, and terra japonica form articles of export. There are many of the Tiar and 15,837 of the Moplah race in the Calicut district. The population in 1871 was 48,338, of whom 11,983, or 33 per cent., were Shanars, or toddy drawers from the palms.—*Imp. Gaz.; Horsburgh; Bartolomeo's Voyage.*

CALICUT MANCHE, a trading ship of the western coast of India. See Boat.

CALIF, from the Arabic khalifah, a vicegerent, was the title assumed by the Mahomedan rulers at Baghdad, of whom the first after Mahomed were Abubakr, Umar, Usman, and Ali. Under the Abbas dynasty they attained to great power. In Central Asia, the sultan at Constantinople is even now by most sunni called the Khalif of Rum. They claim that this dignified position was granted to Selim I. by a descendant of Ahmad; and it is through Ahmad and Mutawakkal B'Illah that they claim to have had transferred the right to the office of khalif of Islam. It is, however, an elective office. See Khalif.

CALI-KASTURI. BENG. Abelmoschus moschatus.

CALIMERE POINT, a cape or promontory in the Tanjore collectorate, the Calligicum of Ptolemy, in lat. 10° 17′ N., long. 79° 56′ E., the most southerly point on the Coromandel coast. Two pagodas near each other, are about a mile from the shore.—*Imp. Gaz.*

CALI-NADI. The boundary between Dehli and Kanouj was the Cali-nadi, or black stream,—the Calindi of the Greek geographers.—*Tod's Rajasthan*, ii. p. 9.

CALINGA, an ancient kingdom on the eastern coast of the Peninsula of India, at its upper end. The dynasty ruled at Rajamundry and in the Northern Circars. The meaning of the word is a country abounding with creeks. The town of Kalingapatam alone remains to indicate the rule of that dynasty; but the term Kling or Kalen of Burma, and the Hindu religion of the Javanese, seem to have come from them.

Kalingapatam is in lat. 18° 20′ N., long. 84° 10′ E., a seaport town on the right bank of the Vomshudara river, 15 miles N. of Chicacole. It is in the Ganjam district. Under Mahomedan rule it was a trading port of consequence, and the remains of a large town are still to be seen. There is good anchorage. The exports are rice, wheat, oil-seeds, grain, hides, timber, beeswax.

CALINGULA. TAM. A sluice, a weir, or

waterway, constructed in the bunds or dams of tanks to permit the escape of surplus water, and thus guard against the accumulating waters overflowing the softer parts of the dam.

CALI-SIND. This river comes from Rangri, and its petty branch, the Sodwia, from Raghughur. There are four rivers in India called Sind,—first the Sind or Indus; the Little Sind; the Cali Sind, or black river; and the Sind rising at Latoti, on the plateau west and above Seronge.

CALI YUGA. See Yuga.

CALLAGOUK ISLAND, lat. 15° 34′ 12″ N., long. 97° 38′ E., in the opening of the Gulf of Martaban, is a small granite island rising about 150 feet above the sea, with few trees, and with a small skirting shore with indenting bay, in which mangroves grow. It has also the name of Curlew Island. Stones for the lighthouse at Cape Negrais were quarried here.

CALLIAN, the Kalliara of the Periplus, a town near Bombay. It has all around an extensive series of Buddhist caves, one or two chaitya or waggon-vaulted caves, with the dahgopa; also vihara or monasteries, hermitages, vaulted reservoirs for water. The identity of Callian with Kalliara has been disputed, but is generally recognised, as it is mentioned by Cosmas, who was only acquainted with the western coast of the Peninsula.

CALLIANDRA CYNOMETROIDES. *Bedd.* An interesting tree growing on the Tinnevelly and Travancore mountains at 2500 feet elevation, in the dense, moist forest not far from Courtallum. It is in flower and ripens its fruit in November. Its timber is very good.—*Beddome.* See Inga.

CALLICARPA, a genus of plants of the order Verbenaceæ. Roxburgh described eleven species,—acuminata, Americana, arborea, cuspidata, incana, lanata, longifolia, macrophylla, lanceolaria, pentandra, and purpurea.

C. Arborea, *Roxb.* i. 390, a stout, tall tree of Nepal, Kamaon, Oudh, the Morung mountains, Goalpara, Chittagong, and Moulmein.

C. Incana, *Roxb.* i. 393.

Mashandari, . . BENG.	Bannu, ... JH.

,, tomentosa, *Lam.*	
Massandari, . . BENG.	Tondi; Teregam, MALEAL.
Aroosha fibre of Chittagong	Kat Komul, . . TAM.
Bastra, ... HIND.	

This plant is recommended by Dr. Royle for the fibre of its inner bark, Thondy nar. O'Shaughnessy says it is bitterish, and rather aromatic.

C. Wallichiana, *Walp.*, a very small tree of the western forests generally.—*Royle, F. Pl.* p. 310; *O'Sh.* p. 456.

CALLICHROUS CHECHRA. *B. Ham.* The butter fish of the rivers of India.

CALLIGONUM POLYGONOIDES. *Linn.*

Balanja, . TRANS-INDUS.	Flowers—Phogally.
Berwaja, . ,, ,,	Root—Tirni.
Phok or Phog, CIS-INDUS.	

The shoots of this moderately-sized shrub are greedily eaten by goats and camels; the wood is used as fuel; and in Bikanir the twigs are much used for huts and for linings of shallow wells. In the Cis-Sutlej and Southern Panjab, the fallen flowers are used as largely as in Muzaffargurh for food; they are made into bread, or are cooked with ghi, and eaten as a relish.—*Stewart; Powell.*

CALLINICUS, a surname of the second Seleucus, B.C. 246, and the fourth of the Syrian rulers after Alexander. See Greeks.

CALLIOPSIS, a genus of flowering plants, esteemed in India. In sowing, dig and pulverize 18 inches deep; give abundance of manure. Water before sowing; sow thinly, and press, and cover with fine sand.—*Riddell.*

CALLISTEPHUS CHINENSIS. *Cass.* Chinese star. Several other species are named by Voigt as having been grown near Calcutta.—*Voigt.*

CALLISTHENES, as the friend of Alexander, was permitted access to the Babylonish records. It is stated in the Dabistan, that Callisthenes sent to his uncle a technical system of logic (Nyaya), which was the basis of the Aristotelian system. See Babylon; Calendar.

CALLITRIS QUADRIVALVIS. *Vent.*

Thuja articulata, *Desf.* | Jointed Arbor vitæ, ENG.

The plant coppices readily, and is largely used for fuel; its roots furnish the beautifully-grained Citrus wood for ornamental work. It produces the juniper resin or sandarach of commerce.

CALLOCEPHALON GALEATUM, the Ganga cockatoo of Australia.

CALLUCA, an ancient commentator of the Vedas. His era is not known, but he lived at a time when the religious views were on the change.

CALNEH, an ancient town, on the site of which it is supposed that Ctesiphon was built.

CALOEE or Caloaie. SUMATRAN. The Rheea, China grass, Boehmeria nivea.

CALOENAS NICOBARICUS, the Nicobar pigeon, is of great size and splendour. Its appearance and habits exhibit a near approach to the gallinaceous birds. It lives chiefly on the ground, runs with great swiftness, and flies up into a tree when disturbed. Its nest is of the rude platform construction usual among the pigeon family. Eggs are white.—*Macgillivray's Voyage*, i. p. 244; *Jerdon.*

CALOMEL, the Shwui-yin-fen and Hung-fen-king-fen of the Chinese. A chloride of mercury used in medicine by European and native medical practitioners. It is known in India as Raskapur, but this is rarely free from soluble corrosive sublimate, which is often present in poisonous proportions, unfitting such for medicinal use. It is largely made by the Chinese.—*Powell.*

CALONYCTION GRANDIFLORUM. *Choisy.*

A large-flowered species, whose snowy blossoms

open at sunset and shut at daylight. It is sometimes carried over arbours and pandals. It is

'The white moon-flower, such as shows
On Serendib's high crags to those
Who near the isle at evening sail,
Scenting her clove trees in the gale.'—*Mason.*

CALONYCTION SPECIOSUM. *Choisy.*

Ipomœa bona nox, *Linn.* | Munda Valli, *Van Rheede.*

This species is seen in European gardens.

CALOPHYLLUM (from the Greek Kalos, beautiful, and Phullon, a leaf), a genus of plants belonging to the natural order Garciniaceæ. C. angustifolium, inophyllum, and tacamahaca, grow in S.E. Asia; but in Southern India several species have not as yet been determined. They furnish useful timber,—C. angustifolium yielding one of the poon spars of commerce, and C. calaba, the East Indian tacamahaca, though C. inophyllum is also quoted as the tacamahaca tree. In Tenasserim the house carpenters often use the timber of a species of calophyllum, which also furnishes spars. A species of the Poona marum is a large tree common in the Western Ghats of peninsular India. Its wood is much used in house, and to some extent in ship building. C. angustifolium grows in Penang; C. Blumii, *Wight*, in Java; C. Burmanni, in Ceylon; C. decipiens, in Travancore; C. longifolium, in Bombay; C. Moonii, in Ceylon; C. polyanthum, *Wall.*, in the Khassya mountains; C. tacamahaca, in Madagascar and the Seychelles; C. tomentosum, *Wight*, in Ceylon. C. amœnum, *Wall.*, is a timber tree of the Andaman Islands. C. bintagor grows in the Moluccas. C. bracteatum, *Thw.*, a great tree growing in the Saffragam district of Ceylon by the sides of streams, at no great elevation. C. Burmanni, *Wight, Illust.* i. 129, grows in the hotter parts of the island of Ceylon, and at no great elevation. C. cuneifolium, *Thw.*, a great tree, grows in Ceylon at an elevation of 3000 to 4000 feet at Madamahanewera. C. Moonii, *Wight, Illust.* i. 129, Domba keena-gass, SINGH., a great tree of the Ceylon forests, in the district between Galle and Ratnapura; not uncommon. C. tomentosum, *Wight, Illust.* i. 128, Keena tel, SINGH., is a tree of Ceylon, growing abundantly in the Central Provinces, at an elevation of 3000 to 5000 feet; common; its timber is valued for building purposes; and the seeds are collected in considerable quantities for the oil they contain. C. trapezifolium, *Thw.*, a great tree of Ceylon in the Hunasgiria district, in the Central Provinces, growing at an elevation of 4000 to 5000 feet. C. Walkerii, *Wight, Illust.* i., a tree of Newera Ellia, Adam's Peak, and other of the most elevated parts of Ceylon. An oil is extracted from the seeds of this and the other species of the genus, which is used for burning.—*Thw. Enum. Pl. Zeyl.* i. p. 51; *Choisy; Roxb.; Voigt; Mason; Gamble.*

CALOPHYLLUM ACUMINATUM. Waldombe, SINGH. A tree of the western parts of Ceylon, the timber of which is used for common house-building purposes. A cubic foot weighs 39 pounds. It lasts 20 years.—*Mr. Mendis.*

CALOPHYLLUM ANGUSTIFOLIUM, *Roxburgh*, is said to be a tree of Penang, and to occur also in Coorg, Mysore, Canara, and along the ghats, northwards to Sawuntwari, but rarely of any great size beyond the line of the Nilcoond ghat. It is here that, according to Dr. Cleghorn, poon spars are obtained from this tree. Dr. Gibson also says that, to the best of his knowledge, poon spars are furnished by Calophyllum angustifolium, which is a magnificent tree in the ravines of the Southern Ghats. In habit and appearance it is totally distinct from C. inophyllum. He says that it is from the inland forests of Canara, backed as these are by those of Coorg to the east, that the supply of poon spars is principally drawn. In 1850 Dr. Wight was satisfied that Dillenia pentagynia is a tree which furnishes poon spars.—*Drs. Gibson, Cleghorn, and Wight; Mr. Rohde's MSS.; Dr. Roxburgh; Tredgold; Markham*, p. 452. See Poon.

CALOPHYLLUM CALABA. *Linn.* Calaba tree.

C. spurium, *Choisy.* | C. apetalum, *Willd.*
C. calabioides, *G. Don.* | C. Wightiana, *Wall.*
Bubbe mara, . . . CAN. | Gorrukeenee, . . SINGH.
Tsiru panna, . MALEAL. | Cheru Pinnai, . . TAM.

This is a native of the western provinces of Ceylon, of Travancore, and in Canara and Sunda; it grows on the banks of rivers and streams, chiefly above the ghats, and produces the true East Indian tacamahaca resin. It grows to a height of 60 feet, and its timber is used for bullock carts, staves, cask headings, house-building, and for canoes. Sir J. Herschel seems to think the East Indian tacamahaca to be the produce of C. inophyllum, for he says specimens obtained from C. inophyllum, the tacamahaca of Ceylon, are desirable in order to aid pharmacologists in accurately determining the tacamahaca of European commerce.—*Herschel's Manual of Scientific Enquiry*, p. 414; *Dr. O'Shaughnessy; Mr. Mendis; Dr. Gibson; W. and A.* p. 103.

CALOPHYLLUM DECIPIENS. *Wight.*

Var. α. Foliis obovato-oblongis, basi rotundatis, grows in the Ambagamowa district.

Var. β. Foliis cordato-orbiculatis, grows at Hinidun Corle, at an elevation of 1000 to 2000 feet.—*Thw. En. Pl. Zeyl.* i. p. 51; *Wight, Ic.* 128.

CALOPHYLLUM ELATUM. *Bedd.*

C. tomentosum, *Wight, Hooker.*

Poongoo, . ANIMALLY. | Poon, Poone, . MALABAR.
Siri Poone, . . S. CAN.

A very large, straight tree, with numerous longitudinal cracks down the bark. Grows abundantly in most of the moist ghat forests or sholas on the western coast from Canara down to Cape Comorin, and in similar forests on the lower Pulneys, Anamallai, Coorg, Mysore, and the Sirumallai. It is never found in dry, deciduous forests. Colonel Beddome says it yields the poon spar of commerce. Thousands of these trees have lately been destroyed by the axe of coffee-planters in Malabar, Coorg, and Travancore; quantities still remain, but chiefly in very inaccessible places. In the ghat forests of South Canara they are felled by the Forest Department, and floated down rivers to the coast depots; but the demand for the article does not seem great, though many years ago a single fine spar has fetched as much as Rs. 1000. The wood is scarcely known, except as a spar, though it is occasionally used for building and bridge-work by planters; it is reddish, coarse-grained, but ornamental. The tree has never been planted, and would not succeed except in the moist forests on the mountains at an elevation of 1000 to 4000 feet; it flowers in January and February, and the seed falls early in the rains, and germinates freely in the dense shade of

the shola forests. This tree was for some years supposed to be the Calophyllum angustifolium of Roxburgh, which is from the Prince of Wales' Island.—*Beddome, Fl. Sylv.* p. 2.

CALOPHYLLUM INOPHYLLUM. *Linn.*

C. bintagor, *Roxb.*	Balsamaria inophyllum, *L.*
Phung-nyet, . . . BURM.	Ponna, . . . MALEAL.
Wuma mara, . . CAN.	Domba Gass, . . SINGH.
Alexandrian laurel, ENG.	Tamanu, . . . TAHITI.
Undi; Sultana champa, HIND.	Pinne maram, . . TAM.
	Punnaga chettu, . . TEL.

This beautiful tree, with an appropriate name, grows in the western part of Ceylon, where it is employed for masts and cross sticks of Yettra dhonies and fishing boats, and poles of bullock carts. A cubic foot weighs 40 pounds. In the alpine forests it attains a great size, and it furnishes part of the poon spars so valuable for shipping. This grows to a considerable size on the Malabar coast, but is a still larger tree on the island of Balambangan and along the shores of Banguey and Sampamnangio, where it has got the names of Palo-Maria and Dancawn. It is also common in the Philippine Islands, where, as in Malabar, the natives prepare oil from its fruit. Near the Burman monasteries this fragrant-flowered calophyllum is occasionally seen. It is in flower and fruit most part of the year; it grows well in sandy tracts close to the sea, where few others thrive; it is rare at a distance from the coast. It yields fruit twice a year, in March and September, and frequently attains the age of 300 years. It is cultivated in Java for the sake of its shade and the fragrance of its flowers, and there the wood is much used in house, and to some extent in ship, building. Mr. Dalrymple tells us that no tree is superior to this for knees and crooked timber. A resin is obtained from the roots and trunk, said by some authorities to be identical with the tacamahaca of the isle of Bourbon. The flowers have the odour of mignonette. The seeds yield about 60 per cent. of their weight of oil. In the Samoan islands, the large ava bowl is made from the tamanu, C. inophyllum, and occupies a conspicuous place.—*Roxb.; Capt. Elphinstone Erskine, Islands of the Western Pacific*, p. 46; *Drs. Wight, Gibson, Mason, Ainslie, O'Shaughnessy; Eng. Cyc.; Voigt; Thwaites*, i. 51; *Bennet*, i. 112; *Seeman.* See Oils.

CALOPHYLLUM LONGIFOLIUM. *M'Cl.* Tha-ra-bi, BURM. In Pegu this is found near towns, together with two other species of the same genus, which are of smaller growth. It is abundant in Mergui, Tavoy, and in lesser quantities near the Attaran river and its feeders. Maximum girth, 3 cubits; maximum length, 22½ feet. When seasoned it sinks in water. It has a red wood, adapted to cabinetmaking, and is there used for planking, masts, and yards of junks; it is excellent for helves. Strongly recommended to make models.—*Dr. M'Clelland; Captain Dance.*

CALOPHYLLUM WIGHTIANUM. *Wall., Cat.*

C. spurium, *Choisy.*	C. calobates, *G. Don.*
C. apetalum, *Willde.*	C. calaba, *Linn.*, in part.
C. decipiens, *W. Ic.*	

Colonel Beddome unites all these as the Kal-Poon of S. Canara, a middling-sized tree, common near the banks of rivers on the western sides of the Madras Presidency; in S. Canara it is very common, and its timber is much esteemed; is of a red colour, very hard and heavy, and valuable for engineering purposes.—*Beddome*, p. 90.

CALORNIS METALLICA, the metallic starling of the Aru Islands.

CALOSANTHES INDICA. *Blume, W. I.*

Bignonia Indica, *Roxb.*	Spathodea Indica.
,, pentandra, *Lour.*	
Pana wood, ANGLO-TAM.	Totilla-gass, . . . SINGH.
Khyoung-Sha, . . BURM.	Achi maram; Vanga, TAM.
Shiona, ... HIND.	Dundilapu chettu, . TEL.
Aulantha, . . MALEAL.	Pam-pena chettu, . ,,

This tree grows in Ceylon, Coimbatore, throughout the Konkans, in Malhim, and the jungles of Kandesh. Dr. Wight mentions that it is said to be a very soft and juicy wood, of no value.—*Dr. Wight, Voigt, Thwaites.* See Bignonia Indica.

CALOTES, a genus of reptiles of the family Agamidæ;

C. versicolor, *Daud*, Ceylon, Sind, Martaban.
C. mystaceus, *D. and V.*, Ceylon, Mergui.
C. Emma, *Gray*, Mergui, Martaban.
C. ophiomachus, *Merr.*, S. India, Ceylon, Nicobars.
C. nemoricola, *Jerd.*, Neilgherries.
C. gigas, *Blyth*, Mirzapur, Neilgherries.
C. tricarinotus, *Blyth*, Darjiling.
C. platyceps, *Blyth*, Khassya Hills.
C. Maria, *Gray*, Khassya Hills.
C. Rouscii, *D. and B.*, India.
C. nigrilatris, *Peters.*

The green calotes of Ceylon, in length about twelve inches, with the exception of a few dark streaks about the head, is as brilliant as the purest emerald or malachite. C. versicolor and C. ophiomachus possess in a remarkable degree the faculty of changing their hue. The head and neck, when the animal is irritated or hastily swallowing its food, become of a brilliant red (whence the latter species has acquired the name of the 'blood-sucker'), whilst the usual tint of the rest of the body is converted into pale yellow. The sitana, and a number of others, exhibit similar phenomena.

Dr. Jerdon obtained at Sagur a new species of calotes, with enormous head, short and thick body, the tail not exceeding the body in length, and the toes also short and strong.

Calotes Rouxi (?) *Dumeril and Bibron.* Three adult specimens, and another half-grown, were forwarded by Dr. Kelaart from Newera Elia, in Ceylon. They accord fully with the description as regards structure; but the colouring is remarkable, and different again from that of Dr. Jerdon's supposed C. Rouxi of S. India.—*Tennent*, p. 277; *Jour. B. A. S.*

CALOTROPIS GIGANTEA. *Brown.*

Var. *a.* Alba or white. | Var. *b.* Lilicina or blue.

a. White variety.

Asclepias gigantea, *Linn.*

Gigantic swallow wort.	Racha jilledu, . . ,,
Madar, Akund, . HIND.	Nalla jilledu (purple), ,,

Calotropis is a genus of plants of the natural order Asclepiaceæ. The species produce useful fibres, a cotton wool, an acrid juice, a gutta percha like substance, and a manna. Three species are met with all over Southern Asia, but C. gigantea is that common in the southern, and C. Hamiltonii in the northern parts, and C. procera grows in Persia and Syria (Voigt, p. 540). C. gigantea is, by the Hindus, held sacred to Siva.

Its buds also form one of the five flowers on the darts with which Kama, the Indian god of love, is supposed to pierce the hearts of mortals;

'Infants winged, who mirthful throw
Shafts rose-tipped from nectareous bow.'

Sir William Jones refers to it in his hymn to Kama Deva.

The rope is called Lamb-dor, HIND., Toondee coir, TAM., Galum taroo, TEL. It will grow in barren places, and it has been suggested to plant it as a barrier to drift sands. It yields a kind of manna called Shakar-al-ashur, also Ak or Madar ka shakar (sugar). Its milky juice has been prepared like caoutchouc and gutta percha, and yields 50 per cent. It is evaporated in a shallow dish, either in the sun or in the shade; when dry, it may be worked up in hot water with a wooden kneader, as this process removes the acridity of the gum. It becomes immediately flexible in hot water, but hardens in cold water; is soluble in oil of turpentine, and readily takes impressions. It is, however, a conductor of electricity. The wood is white, tolerably hard and close-grained, and grows to a girth of 12 inches. It is used for gunpowder charcoal, and by firework manufacturers. The silky down of the pods is used by the natives on the Madras side in making a soft cotton-like thread. It is susceptible of being spun into the finest yarn for cambric, and has been used for the manufacture of a light substitute for flannel by Messrs. Thresher & Glennie of London. It works well with either silk or cotton. It is also being tried by Messrs. Cowan & Co. of Edinburgh as a material for paper. In 1856 Major Hollings exhibited carpets manufactured in the jail at Shahpur in the Panjab from the follicle in the seed-pod. He mentioned that the manipulation of the floss was precisely the same as cotton. A carpet 7 feet by 3½ feet cost Rs. 7. Fibres are prepared from the stem and branches. These are dried in the sun for 24 or 36 hours, when they are taken up and the bark peeled from the wooden parts, and the greenish-coloured fibres gathered. A night's bleaching whitens them.

The cleaned fibres are one of the bowstring hemps of India. This fibre possesses most of the qualities of flax, and can be worked with the same machinery, as it splits to almost any degree of fineness with the hackle, and bears dressing and beating well. It was used by wealthy natives for making strong cloths, cambrics, and lawns; and it is employed for fishing lines, nets, gins, bowstrings, and tiger traps. It does not rot readily in water. It is even considered better adapted for cloth than for cordage. The strength exceeds that of all other vegetable substances, as the following experiments made at Coimbatore, of a three-strand ⅜ inch rope, will show:—

1.	Coir, Cocos nucifera,	sustained	224 lbs.
2.	Pooley Manjee, Hibiscus cannabinus,	,,	290 ,,
3.	Marool, Sanseviera Zeylanica,	,,	316 ,,
4.	Cotton, Gossypium herbaceum,	,,	346 ,,
5.	Cutthalay nar, Agave Americana,	,,	362 ,,
6.	Junapum or Sunn, Crotolarea juncea,	,,	407 ,,
7.	Yercum nar, Calotropis gigantea,	,,	552 ,,

Its fibre is valued at £30 to £35 a ton. The follicles are supposed by some to be the apple of Sodom. Its juice and the powdered bark of its roots have long been employed as alteratives by the natives of India in leprosy and other cutaneous affections, also in syphilitic ailments, and are supposed to possess active properties. Dr. Duncan obtained from it a principle which he called Mudarine. In Arabic authors on Materia Medica it is even supposed to have been known to the Greeks. The leaves, smeared with oil, are used in rheumatism.—*Wight's Contributions; Hooker, Him. Journ.* i. 86; *Royle, Him. Bot.* 275; *Drs. Riddell, Hunter, Mason, O'Shaughnessy*, p. 43; *Wight in M. E. Reports of* 1857; *Royle, Fib. Pl.; Simmonds, Com. Prod.; Burton*, iii. 122; *Jour. Agri-Hort. Socy. of India*, viii. 107. 226. See Carbon.

CALOTROPIS HERBACEA. *Carey.*

Asclepias herbacea, *Roxb.* | Chota Akunda, HIND.

The roots are employed to make gunpowder charcoal. The stem yields useful, strong fibres, and the white, silk-like material of the pods has been successfully mixed with silk.—*Voigt; M. E. Proceedings.*

CALOTROPIS PROCERA. *R. Brown.*

C. Hamiltonii, *W.* | C. gigantea, *Andr.*
Asclepias procera, *Ait.* | C. Wallichii, *W. Contr.*

Aka, Madar, . . . HIND. | Pashkand, . . PANJAB.
Spulmei, . . . PANJAB. | Nalla jilledu,
Spalmak, . . . ,, | Jilledu, . . . TEL.

This grows in Palestine, Abyssinia, Arabia, in Hindustan, the Peninsula of India, Peshawur, and the Panjab, is quite arboreous, ten or twelve feet high, and in Sind four and five feet in girth. The bark is stripped and made into halters for cattle, ropes, netting, twine, and fishing lines, all durable. The silky floss of its follicles is used for pillows. A manna, Shakar-al-Ashur and Shakar-at-Tighal, obtained from it, is sold in the shops. Its acrid juice is applied to cutaneous ailments and in leprosy, and is used by Rajputs to poison their infant daughters. The fresh bark of the root, also the powder of the root, are likewise used in leprosy. The bark of the root and the dried milk possess similar properties to those of the C. gigantea; it is, however, far inferior as an emetic remedy. According to Dr. Wallich, this and C. gigantea are the same species. The insect that causes the manna is called Galtigul.—*Royle, Ill. Ind. Bot.* p. 275; *O'Sh.* p. 454; *Stewart; Powell.*

CALPA. SANSK. Creation or formation. In Hindu theogony, at the end of every calpa (creation), all things are re-absorbed in the deity, who, in the interval of another creation, reposes himself on the serpent sesha (duration), who is also termed ananta (endless). Agni savarni, in Hindu mythology, is one of the 14 patriarchs who preside successively over the 14 Manwantara of the calpa. —*Warren's Kala Sanhita*, p. 311.

CALPENTYN ISLAND, south of Cordiva, is a spit of sand which runs off the Ceylon shore on the west coast, and extends from lat. 7° 36′ to 8° 16′ N. The fort is in lat. 8° 14′ 20″ N., and long. 79° 45′ E. A statue of St. Anne is on its N.E. end. The people are industrious; cultivate the cocoanut, and gather Calpentyn moss and the orchilla weed. In the Gobb, or lake behind the peninsula, there is an extraordinary abundance of fish, which are dried and exported. Sharks' fins, trepang, and turtle are also sold. The long tongue of land on the south almost touches the main.

CALPI, a Hindu astronomical term of 4,320,000,000 years. See Calpa.

CALPICARPUM ROXBURGHII. *G. Don.*

Cerbera fructicosa; periwinkle tree.

Sa-lat, ... BURM. | Gutti gunneru, . . TEL.

A handsome flowering shrub, almost constantly covered with blossoms like those of the rosy periwinkle, Vinca rosea, but larger and faintly fragrant.—*Mason.*

CALTURA, a small sea-coast town in Ceylon, in lat. 80° 4′ E., long. 6° 12′ N. A favourite resort of the Dutch and British.

CALUMBA ROOT. Cocculus palmatus, *D. C.*

Jateorrhiza calumba and J. palmata, *Miers.*

A plant of east tropical Africa, which was first made known as a medicine by F. Redi about 1677. Semedus mentioned it before 1722 among medicines from India. In works on Materia Medica in use in India, it occurs by the name of Kalumb. It grows wild in the forests of Mozambique and Oibo in Eastern Africa, and got its name because it was imported indirectly through Colombo in Ceylon.

CALUVERE. SINGH. A tree of the northern and eastern part of Ceylon, furnishing a fine black wood, used largely for buildings and furniture. A cubic foot weighs 71 lbs., and it lasts 80 years. —*Mendis.*

CALYA or Cali-naga, a serpent slain by Krishna.

CALYMERE POINT, on the Coromandel coast, in lat. 10° 18′ N., long. 79° 54½′ E., is low, and covered with cocoanut trees, with two pagodas near each other about a mile inland.—*Horsburgh.*

CALYPTOMENA RAFFLESII, the tampoe tree of Borneo. Its fruit has an agreeable sub-acid flavour, and is largely eaten. The pulp, mixed with rice and fermented, furnishes an intoxicating drink.

CALYPTRÆIDÆ, a family of the mollusca, the bonnet limpets, containing several recent and fossil genera, the genus Calyptræa being the cup and saucer limpet.

CALYPTRANTHES CARYOPHYLLIFOLIA. *Wilde, Swartz.*

Eugenia caryophyllifolia, E. Jambolana, *Roxb.*

Jamoon, ... HIND.	Nawel maram, . . TAM.
Battedombe, . SINGH.?	Neredi chettu, . . TEL.

A large-growing timber tree. The wood is light, and chiefly used for making grain measures, but is also made into carriage frames, cots, etc., and in Ceylon for common house-building; a cubic foot weighs 45 lbs. The bark is astringent, and is used in decoction by the natives for dysentery. The fruit when ripe is of a very dark purple colour, and about the size of a large cherry. In taste it somewhat resembles the sloe, but is much sweeter. A variety of this tree—

Oojla jamoon, . . DUK.	Vullay nawel, . . . TAM.
Sweta jemboo, . . SANSK.	Tella neredi, . . . TEL.

has a fruit nearly similar to it in natural qualities, and has got its names from being of a different colour (white).—*Riddell; Mendis; Ainslie.*

CALYSACCION ANGUSTIFOLIA. *Gibson.*

Soorpunni, ... CAN.	Koolmara, ... CAN.

Grows in Canara and Sunda, in ravines of the ghats, and below in sheltered valleys, but is not common in N. Canara or Sunda. The tree there furnishes one of the poon spars. It produces an excellent edible fruit. It is a tree which ought to be conserved everywhere, and largely increased.—*Dr. Gibson.*

CALYSACCION LONGIFOLIUM. *Roxb.*

Ochrocarpus longifolius, *Benth. et Hook.*
Calophyllum longifolium, *Wall., Cat.*
Mammea longifolia, *B. H.*

Tha-ra-bi, . . . BURM.	Suringel, ... MAHR.
Taringi, ... CAN.	Gardoondy, . . . ,,
Woondy (male tree), MAHR.	Gorgoondy, . . . ,,
Pooney (fem.), . . ,,	

A large tree which grows in the Northern Circars, Konkans, the Kennari jungles, Malabar, and Western Mysore. The flower-buds, Nag-kesur, are used for dyeing silk, and for their violet perfume.—*Useful Plants; Elliot's Flora Andhrica; Roxb.; Beddome.*

CALYSTEGIA SEPIUM. *Smith.* Siuen-hwa, CHINESE. A large and beautiful plant of China, one of the Convolvulaceæ. Its root is boiled and eaten by the Chinese.—*Smith.*

CALYX, the botanical name for the outer covering of the flower of a plant.

CAMA, in Hindu cosmogony, the son of Dharma, the first man.

CAMA or Camadeva, the Hindu god of love, to whom the last days of spring are dedicated. There is no city in the East where the adorations of the sex to Camadeva are more fervent than in Udyapura, 'the city of the rising sun.' On the 13th and 14th of Cheyt they sing hymns handed down by the sacred bards: 'Hail, god of the flowery bow! Hail, warrior with a fish on thy banner! Hail, powerful divinity, who causeth the firmness of the sage to forsake him!' 'Glory to Madana, to Cama, the god of gods; to him by whom Brahma, Vishnu, Siva, and Indra are filled with emotions of rapture!'—*Bhavishya Purana; Tod's Rajasthan.* See Kama; Kammeri deva.

CAMA. HIND. The lotus flower, Nelumbium speciosum. Camala or Camala-devi, a name of Lakshmi as the Hindu goddess of prosperity. See Lakshmi.

CAMACHI-PILLU, also Wassina-pillu. TAM. Andropogon citratum, lemon grass. Camachi-pillu Tylum, lemon-grass oil.

CAMACHYA, a Hindu goddess, a form of Kali in her avenging character. Kali says, 'By human flesh, Camachya, Chandica, and Bhairava, who assume my shape, are pleased one thousand years.'

CAMA-CUMPA. SANSK. The vessel of desire; an ornamental vase on Hindu temples, from which grain is represented as pouring.—*Tod.* See Cumbha-yoni.

CAMADHENU or Surabhi, a cow produced from the churning of the ocean.

CAMAHWAJA. SANSK. The banner of Cupid.

CAMALA DEVI was the wife of a raja of Gujerat, and was celebrated as the flower of India. On the fall of Nerwalla, the capital of Gujerat, her husband became a fugitive, and Camala Devi was taken prisoner and carried to Ala-ud-Din's harem; and, attracted by her beauty, wit, and accomplishments, he made her his queen. Her fascinations soothed that savage Pathan in his moodiest hours, and influenced him to a lenity hitherto unknown to him. Her daughter Dewala Devi had escaped with her father. Her reputation for beauty equalled that of her mother, and the son of Ram-deo, the raja of Deogiri (Dowlatabad), had long sued for her, but her father, proud of his Rajput origin, would not accept a Mahratta, even though a prince. Camala Devi, however, having expressed to Ala-ud-Din a wish to be joined by her daughter, Ala-ud-Din sent a strong army, under a general, to bring Dewala Devi to Dehli. In this extremity, her father accepted the Mahratta prince, and sent off his

daughter to Deogiri under an escort, but the escort was overtaken, the fair maiden seized and carried to Dehli, where Khizr Khan, the son of Ala-ud-Din, married her. Their union was very happy, and the poet Khusru praised them. But Khizr Khan's eyes were put out by Cafoor. A few years from the death of Ala-ud-Din, the throne of Dehli was filled by a converted Hindu, who filled the capital with Hindu troops, put to death all the survivors of Ala-ud-Din's family, and transferred Dewala Devi to his own zanana.

CAMALAPBABHU, a title of Vishnu.

CAMALAPUR, a large village 32 miles north-west from Bellary. Iron ore from the neighbouring hills is largely smelted here.

CAMARI, according to Abul Ghazi, one of the eight sons of Japhet, whence the Camari, Cimmerii, or Cimbri. The Camari are one of the Saura tribes, or sun-worshippers of Saurashtra; claim descent from Garuda, the bird god of Vishnu (who aided Rama to the discovery of Sita), and the Macara or crocodile; and date the fabulous conception from that event, and their original abode from Sancodra Bate, or island of Sancodra. Whether to the Dioscorides at the entrance of the Arabian Gulf this name was given, evidently corrupted from Sanc'ha-dwara to Socotra, need not be inquired into here. Like the isle in the entrance of the gulf of Cutch, it is the dwara or portal to the Sinus Arabicus, and the pearl shell (sanc'ha) there abounds. This tribe deduce their origin from Rama's expedition, and allege that their crocodile mother landed them where they still reside. They seem to be a Scythic race from Sakadwipa and the Dasht-i-Kapchak, and, like the Takshak, Jit, Kat'hi, and Hun, have entered India from the north-west.—*Tod's Rajasthan*, i. p. 604.

CAMBALU, an ancient name of China.

CAMBAY, in long. 72° 51′ E., and lat. 22° 5′ N., in Gujerat, is at the head of the bay which bears its name, on the estuary of the Mahi, between the mouths of the Sabarmati on the west, and the Mahi on the east. It is said to be the town in which Zarmonachegas was born. Marco Polo travelled through it at the close of the 13th century, when on his return to Europe. Cambay or Khambhat is the capital of a feudatory state ruled by a Mahomedan family of Moghul descent, and of the Shiah sect. In 1875 its area was estimated at 350 square miles, and its population at 175,000. Cambay town has 33,709 souls. Near the town, skirting the shore of the gulf, and along the banks of the Mahi and Sabarmati rivers, are vast tracts of salt marsh-land, submerged at high spring tides. The population consists of Mahomedans, Jains, and Parsees, with the wild tribes of Koli and Wagri, and the languages spoken are Gujerati and Hindustani. The name is from Khambha-tirth or Stambha-tirth, the pool of Mahadeva. Vikramaditya is said to have been born here.

Cambay Gulf is formed by the coast of Gujerat on the west, and the Peninsula of India on the east, and extends due north 80 miles, being about 3 miles wide at its entrance. In ordinary springs the rise and fall is 25 feet. Surat lies at the eastern point of the gulf. The gulf receives the two rivers Tapti and Nerbadda.—*Imp. Gaz.*

Cambay Stones.—In 1503, Lewes Uertomenes, a learned gentleman of Rome (See As. Soc. Jl. 1824, vol. xviii.), says, 'In this region is also a mountain where the onyx stone, commonly called the cornelian, is found; and not far from this, another, where chalcedony and diamond are found.' It was visited in 1623 by Pietro de la Valle. Captain Hamilton, who visited Cambay in 1681, says, 'The cornelian and agate stones are found in this river, and nowhere else in the world. Of cornelian they make stones for signets; and of the agates, cabinets entire except the lids. I have seen some 14 or 15 inches long, and 8 or 9 inches deep, valued at £40. They also make bowls of some kinds of agate; and spoons, and handles of swords, daggers, and knives, and buttons, and stone seals and snuffboxes of great value.'

Cambay still enjoys celebrity for its silicious minerals,—cornelians from Ratanpur in the Rajpipla state; agates from Rewakanta, Kapadwauj, and Sukaltirth, on the Nerbadda, and from Rajkot in Kattyawar. The Bhils are the miners. They are worked into every variety of ornament,—cups, boxes, necklaces, handles of daggers, of knives and forks, seals, etc. Cambay stones form a distinct geological formation, derived probably from the amygdaloid trap rocks drained by the Nerbadda and Tapti. They pass in Europe and America for Scotch, Irish, Chamouni, Niagara, Isle of Wight 'pebbles,' according to the place in which they are sold. The Brazils import them as largely as India into Europe, where the terms 'Brazilian' and 'Indian' agates are used indifferently by the trade. The principal varieties sold in Bombay are crystal, milk-quartz, prase, a green variety, moss stone, mocha stone, fortification agate, chalcedony, cornelian, chrysoprase? heliotrope, onyx, obsidian? and very rarely amethyst.

The fragments of a Murrhine cup—the little Cambay stone cup still made in Cambay—were exhibited in the theatre of Nero, as if, adds Pliny, they had been the ashes of 'no less than Alexander the Great himself!' Seventy thousand sesterces was the price of one of these little Cambay cups in Rome in the days of Pompey. The price in Bombay ranges now from Rs. 5 to Rs. 100. Nero paid 1,000,000 sesterces for a cup, 'a fact well worthy of remembrance,' slyly remarks Pliny, 'that the father of his country should have drunk from a vessel of such a costly price!' The stones are sawn or ground down; for the native lapidary's wheel consists of a strong wooden platform 16 inches by 6, and 3 inches thick. In this are two strong wooden uprights. Between these is a wooden roller 8 inches long and 3 in diameter, fastened into a head at the one end. This works on an iron spindle or axle at each end. On the

one end the axle is screwed and fitted with a nut, by which the saw or grinding wheel can be made fast. The saw consists of a thin plate of iron, the cutting material consisting of ground corundum. The lap wheels consist of two circular discs or cakes of lac, with ground koorund, coarse or fine, according to the work, of a copper disc for polishing, and a wooden one for finishing the work. These are spun backwards and forwards by a bow, the string of which passes round the roller. The lapidary sits on his hams, steadying the wheel with his foot, and holding on the stone with his left hand, while he works the bow with his right. For very fine work, a small-sized wheel, similar to the English lapidary's wheel, but of smaller size, is used. It is driven by a multiplying wheel, strap, and pulley. The custom-house returns give the value of the traffic in Cambay stones at an average betwixt £10,000 and £12,000 annually, one per cent. of the stones finding their way to Europe. Gayni or Gajni was one of the ancient names of Cambay, and it was the port of the ancient Balabhipura, the ruins of which are 3 miles from Cambay. Almeyda, when he visited the coast of Cambay, observed a very ancient town, with a large mosque, and near it a spacious place, covered with tumuli.—*Hamilton's New Account of the East Indies*, Lond. 1744; *Report of the Juries in* 1851; *Pennant's Hindoostan*, i. p. 64; *Tod's Travels.*

CAMBESSEDEA OPPOSITIFOLIA. *W. & A.*
Mangifera oppositifolia, *Roxb.*

This indigenous tree of Tenasserim has a reddish-coloured, hard, close-grained wood, said to be durable. It produces a fruit much like a plum. There are two varieties, one bearing an intensely sour fruit, and the other one as insipidly sweet.—*Mason; Voigt.*

CAMBODIA, or the kingdom of Khmer, extends from long. 101° 30′ to 104° 30′ E., and lat. 10° 30′ to 14° N., with an area of 62,000 square miles. It was reduced to its present dimensions in 1862, by two of its provinces being annexed to Siam. It is bounded on the S.W. by the Gulf of Siam, on the S.E. by French Cochin-China, on the N. by Laos, and on the N.W. and W. by Battambang and Angcor. The Mei-kong flows through the kingdom. The population is 1,000,000, of whom four-fifths are the native Kho. The Chinese number 100,000. Buddhism prevails. Its capital is Phnompenh, on the Mei-kong. Cambodia town is nearly 240 miles up the river. It has four provinces, Potisat, Kampong-Suai, Kampong, and Kampot-Son. For the past three centuries its independence has been lost, Siam on the one side, and Cochin-China on the other, having encroached on it. In Cambodia is the great temple of Nakhon-Vat, which seems to have been built in the 10th century. Every angle of the roof, every entablature, every cornice, bears the seven-headed serpent. The outer enclosure measures 570 by 650 feet. It is a towered pyramid more than 600 feet in breadth, and rising to 180 feet at the summit of the central tower. It is built of large stones, beautifully fitted, without cement. M. Delaporte says that the ancient Khmer temples were dedicated to Brahmanism. At Angkor-Wat he detached from the higher parts the chefs d'œuvre of Cambodian sculpture,—bas-reliefs, once brilliantly gilt; pediments,—all the subjects of which M. Delaporte maintains, down to those which decorate the most secluded sanctuary, are devoted to the exploits of Rama and the glories of Vishnu. At Angkor-Tom, M. Delaporte visited several new monuments, on most of which he also finds on the principal pediments the exploits of Rama and Vishnu. He cleared of rubbish and explored the ancient palace of the Khmer kings, a work of magnificent and wonderful sculpture, the rising terraces of which are adorned with superb compositions in bas-relief; the enormous three-headed elephant, Iravati, is there enthroned in all the places of honour, as at the angles of all the gates of the city, where he is shown by the god Indra, accompanied by two apsaras. When the country became subject to the government of Cochin-China, the trade of Cambodia was transferred to Sai-gon, which was occupied by the French in 1863. Cambodia river, also called the Mei-kong, discharges itself into the sea by three principal branches, of which the most western is the best for ships. Its entrance is in lat. 9° 31′ N., and long. 106° 36½′ E. It is one of the largest rivers in Asia, and is said to rise in a lake in Yunnan.—*Chin. Jap. and Phil. Chr. and Der.*, 1881.

Camels are mentioned in 1 Kings iv. 28, Esther viii. 10, and Isaiah lx. 6; and they are still largely used as beasts of burden, or to carry messages, and for war purposes, in Egypt and in all the countries in the south of Asia, from Syria up to the Burmese countries and China. There are two kinds, that with one hump, and another with two humps. The species employed on the European steppes through which the Don and Volga flow to their respective seas, are the two-humped; and Lieutenant Irwin distinguishes two varieties of two-humped camels. Beyond the Jaxartes, he remarks, is the two-humped species, in the Turki language called uzhri, and by British writers Bactrian. His height is far less than an Indian camel, his hair longer; he is not capable of bearing severe heat, and is not easily naturalized even at Bokhara. In Khokan he is the prevalent species. The camel called Baghdadi has also two humps, but his height is equal to that of the Indian. He is found chiefly in the south-west of Khorasan, yet even there is much outnumbered by the Indian species, meaning, we presume, the one-humped camel of Turkestan.

In Arabia there are three varieties of one-hump camels. The largest and clumsiest, called khowas,

are used to carry heavy burdens at the slow and measured pace of a large caravan; the second, called deloul, or saddle camels, are selected when young from the former, and are employed in journeys, singly, or with light caravans consisting of similar animals; the third bears the name of hajin in Arabia, maherry in Africa, hurkary in S. Asia, and is the dromedary of the Hebrew Scriptures. It is lightly formed, and of a very pale brown, approaching a cream colour. Being well trained, its speed with a man on its back and no baggage is between eight and nine miles per hour, and it can accomplish at the utmost 70 miles in 24 hours for two or three days in succession. Wellsted tells us (i. 292) that Nejd is equally the nursery of the camel as of the horse; but the camel of Oman in all ages has been celebrated in the songs of the Arabs as the fleetest. Their legs are more slender and straight, and their eyes more prominent and sparkling. The single hump of the camel of Arabia is round and fleshy whilst the animal continues in good condition, but wastes away when out of condition. Wellsted had known £28 paid for one in Oman; but £6 to £10 is their average price. Depth of chest and largeness of barrel constitute their chief points of excellency. A camel of Hejaz can carry from 250 to 500 lbs.; and an ordinary burden camel can walk about 2½ miles an hour, making daily a march of 20 or 30 miles. M. Fontaine mentions an instance of an Arab on his camel taking and returning with a message from Coseir to Canneh, a distance of 225 miles, in 28 hours, at the rate of 8 miles an hour continually, which seems incredible. Colonel Chesney mentions that he crossed from Basrah to Damascus, 958½ miles, in 19 days, or daily 50 miles. Nizam-ud-Din Ahmad, author of the Tabakat-i-Akbari, while Bakshi of Gujerat, was summoned to Lahore by the emperor (A.H. 998) A.D. 1589-90. The Wakiat-i-Mustakhi says that he took with him a party on camels, and that they accomplished the journey of 600 kos (1200 miles) in twelve days, for which the king bestowed honours on him. General Ferrier tells us that the camels from Turkestan and the country of the Hazara are exceedingly large and strong, but not very active. Those from the Seistan are slenderly formed and wiry, but, though small, are as hardy an animal as can be found, and incredibly swift; they will travel 25 leagues in a day without feeling fatigue, and are never affected by the great heat of the sun. These are generally used for riding, and those of Turkestan as beasts of burden. The Bokhara camel and the two-humped Kirghis camel are only surpassed in strength and swiftness by the Arab, and especially the camel of the Hejaz. Besides the Bactrian camel, the Turkomans have a mule breed between this and the Arabian animal, with a hump which can neither be called single nor double, though more near the latter than the former. This is a large, useful, and highly-prized animal, capable of transporting from 1000 to 1200 lbs. with ease; but the creature is short-lived, and the Arabs do not breed from it, giving as a reason that the progeny are intractable and bad-tempered.

In Colonel Stewart's 'Journey through North-Eastern Persia,' he states that the load of the Khorasine camel is 600 to 700 lbs. A correspondent of the Pioneer writes: 'I have frequently seen Brahui camels go out of the fort at Dadur, in Southern Afghanistan, laden with 12 maunds, about 1000 lbs., the ordinary load being 8 maunds, or 650 lbs. I have also met them frequently on the line of march with these loads, and yet one rarely saw a dead Brahui camel.'

They were used by the British in the wars on the N.W. frontier of 1879-1881, but they died in great numbers.

Camels are extensively bred in Murwut, Meeanwullee, and Esakhail, and are purchased by the Povinda and other itinerant traffickers. In Syria, the rutting season is in spring, and the males then become extremely unruly. The female carries twelve months, and breeds one at a time. The young camels are weaned at the beginning of the second year. Camels are known to attain to the age of 40 years; but after 25 or 30 its activity begins to fail, and it is no longer able to endure much fatigue. In the northern districts of Arabia, the hair is not shorn from the camel, like wool from sheep, but is plucked off, about the time it is naturally shed by the animal, and seldom amounts to more than two pounds. It is woven into stuffs for clothing.

M. Huc, however, tells us that in Chinese Tartary the fur of an ordinary camel weighs about ten pounds. It is sometimes as fine as silk. That which the entire camel has under its neck and along its legs is rough, tufted, and black, but the hair in general is reddish or grey. The Tartars do not take any care of it, but suffer it, when it falls off, to be lost. The milk of the camel is excellent, both for butter and cheese; the flesh is tough, ill-tasted, and little esteemed by the Tartars. They make use, however, of the hump, which they cut in slices and take with their tea. It is said that the emperor Heliogabalus had camel's flesh served at his banquets, and that he was especially partial to the foot; but to modern taste the flesh of the camel is detestable. Like the sheep and goat, their need for water to drink varies with the dryness or moistness of their food. A succulent grass, moist with rain or dew, and near the bank of rivers, of itself furnishes almost sufficient fluid for their wants; but a dry grass, an arid atmosphere, and a burnt-up soil render them very thirsty, and they then readily rush into water. Skinner mentions (ii. pp. 112, 113) that his camels had been 19 complete days without drinking. But they can lay in a large store of food. Pottinger mentions that he allowed his camel 15 lbs. of flour daily, in addition to all the grass it ate. The camels eat the tamarisk and the camel thorn. In parts of the Panjab country, where camels are reared in great numbers, they delight especially in lana, plants of the salsolaceous tribe, which are also useful for burning to get soda. There is often quite a rivalry of interest over a patch of salsola land,—the camel-feeder wants it for his animal, and the soda burner for his furnaces.—*Powell's Handbook; Dr. J. L. Stewart, M.D.; Chesney's Overland Route; Huc's Recollections of a Journey*, p. 130; *Postans' Personal Observations*, p. 108; *Mignan's Travels*, p. 27; *Wellsted's Tra.; Burton's Pil.; Pottinger's Beluch. and Sinde; Fontaine's Egypt; Robinson's Tra.* ii. p. 183.

CAMELEOPARD, or giraffe, a mammal of S. Africa, the Camelopardis giraffa of naturalists. One variety has been named C. Æthiopica, *Ogilby;* another variety, C. Sennaarensis.

CAMELIDÆ. Fossil remains of this family have been discovered in the Siwalik hills and in Burma. See Camel; Camelus.

CAMELINE, the aba cloak of the Arabs, made of camel's hair. The aba, or cameline, as it is called in the Persian Gulf, is worn in Oman by all classes; it is the camel's hair cloak of Arab shaikhs, and is often striped white and brown.

CAMELLIA, a genus of the east of India and China, of the nat. ord. Ternstromiaceæ, and furnishing several species of ornamental flower plants, such as C. Japonica, malliflora, reticulata, drupifera, and thea. C. oleifera of China yields a valuable oil, C. kissi is a tree of Nepal, and C. caudata is a shrub of the Khassya hills.—*Voigt.*

CAMELLIA JAPONICA. The single red variety of this species grows spontaneously in the woods of China, from 20 to 30 feet in height, and with stems thick in proportion. Its elegant flowers are much admired by the Chinese, who enumerate thirty or forty varieties, for each of which they have a separate name. Many of these varieties are unknown out of China, and Chinese gardeners are likewise ignorant of a large proportion of those found in western conservatories. This elegant flower is cultivated solely for its beauty; but there are other species of camellia raised for their seeds, the oil expressed from them being serviceable for many household and mechanical purposes. The camellia bears the same Chinese name that the tea plant does; and the term cha is likewise employed, as tea is with ourselves, to designate any infusion.—*Williams' Middle Kingdom*, p. 285; *Fortune's Residence.*

CAMELLIA THEA. *Link.* China tea plant.

C. theifera, *Griffith.*	Cha, ... HIND.

The Assam tea plant is a shrub with a thin grey bark, and grey soft wood, weighing 56 lbs. per cubic foot. It is cultivated in Kangra, Kuhi, Dehra Dūn, Kumaun, Darjeeling, the Western Duars, Assam, Cachar, Chittagong, Hazaribagh, in Northern India, and also on the Nilgiri Hills and Ceylon.—*Gamble.*

C. vulgaris, *Forskal.*	C. vetus, *Frisch.*
Jamal, ... ARAB.	Arabian camel, . . ENG.
Camel, dromedary, ENG.	Le dromedaire, . . FR.

Its countries are Africa, Arabia, Persia, Baluchistan, Rajputana. It is about 8 feet long, has one hump on the middle of the back, pale brown hair. An instance of great endurance of this camel is mentioned by Captain Smith, who purchased one, named Tipu Sahib, for Rs. 300, that carried him 680 miles in 12 days across the desert of India from Jodhpur to Sukkur in Sind. On another occasion, the same camel carried him 110 miles from Sukkur to Kotri, without a halt, in 30 hours.—*Smith's Nepal*, pp. 20, 26; *Eng. Cyc.* See Camel.

CAMELUS SIVALENSIS, a fossil species discovered by Dr. Falconer and Captain Cautley in the tertiary deposits of the Siwalik Hills of Hindustan. Its crania, jaws, and teeth are in the British Museum. It was nearly related to the existing species, but exceeded them by at least one-seventh in height.—*Eng. Cyc.* p. 733.

CAMEO, the cyamea of Pliny. They are still largely manufactured in Italy from the large red shield shell of the Maldive Islands, the Cassis rufa. It is brought from the Maldives to Ceylon as tribute, and is exported to Italy. It is not a manufacture of India. In 1846 the average value of the large cameos made in Paris was six francs each, giving a sterling value of £32,000; and the value of the small cameos was about £8000, giving a total value of the cameos produced in Paris in 1846 at £40,000. At the same time, in England not more than six persons were employed at the trade. The black helmet, on account of the advantageous contrast of colour in the layers, produces very effective cameos. In 1847 the consumption of shells in France for this purpose was—

Bull's Mouth,	80,000	av. price	1s. 8d.	value	£6400
Black Helmet,	8,000	,,	5s. 0d.	,,	1800
Horned Helmet,	500	,,	2s. 6d.	,,	60
Queen Conch,	12,000	,,	1s. 2½d.	,,	700

The art of cameo-cutting was confined to Italy until 1830, at which time an Italian began cutting cameos in Paris. It might be introduced into India.

CAMERON, JOHN, F.R.G.S., author of Our Tropical Possessions in Malayan India.

CAM-HI, an emperor of China who first subdued the Mongol Tartars, which he effected more by kindness than by the sword.

CAMOENS. Luis de Camoens, a native of Portugal, was born at Lisbon about A.D. 1524, and educated at the University of Coimbra, but, falling in love with Catharina de Atayade, he was banished from court. He joined the army invading Morocco as a soldier, where he was often wounded, and lost an eye, and he describes himself then as with 'one hand the pen and one the sword employed;' but, neglected, he left Portugal A.D. 1553, and landed at Goa, after a voyage of nine months. He joined an expedition against the king of Pimenta, and a year afterwards accompanied Manoel de Vasconcellos up the Red Sea, and returned to Goa, but he involved himself by writing his Absurdities of India, and was banished to the Moluccas. During the five years

that he remained there, he visited some of the islands of the Archipelago, and amassed a small fortune, but, embarking it in trade, he was shipwrecked near the river Mei-kong in Cambodia, saving only the manuscript of his poem, the Lusiad, deluged with the waves, through which, clinging to a plank, he forced his way to the shore. The Lusiad describes the system of modern commerce, founded on the discovery of the Cape route. The geographical descriptions are singularly accurate. He returned to Lisbon, where he lived in great poverty, till his death in the Lisbon hospital, A.D. 1579. His poem, the Lusiad, celebrates the great voyage of Vasco da Gama, and gives a history of the Portuguese in India. The 'Cave of Camoens,' where he is supposed to have written a portion of his Lusiad, is a place of interest at Macao. It is picturesquely situated upon the summit of a small hill on the margin of the inner harbour.—*American Expedition to Japan*, p. 165.

CAMPANULACEÆ, the Campanula tribe of plants, comprising the genera Campanula, Cephalostigma, Cidonopsis, Symphiandra, and Wahlerbergia. The genus Campanula consists of flowering plants, the Canterbury bell, Venus's looking-glass. C. dehiscens and C. lancifolia are noticed by Roxburgh as growing in Bengal. C. edulis is a native of Arabia Felix. Its thick and sapid root contains a considerable quantity of starch, and is eaten by children. C. glauca, its root is used by the Japanese in syphilis. C. grandiflora grows wild amongst the Chinese hills.—*Fortune's Wanderings.*

CAMPBELL, A., M.D., a medical officer of the Bengal army, who was political officer at Darjiling for upwards of a quarter of a century. When he first took charge of the office, there were not twenty families, but by 1853 a population of ten thousand had gathered together. He found it an inaccessible tract of forest, and left it an excellent sanatorium, with a revenue of fifty thousand rupees. He journeyed to the confines of Tartary. He wrote an Itinerary from Phari, in Tibet, to Lhassa, with appendices; Routes from Darjiling to Phari; Report of the Death of Cosmos de Koros, the Tibetan Scholar; The Literature and Origin of certain Hill Tribes in Sikkim; Memorandum on the Bora Chung of Bootan; On the Native Alum or Salagit of Nepal; On the Inhabitants of Sikkim and their Language; Limboos of Sikkim and other Hills.—*Beng. As. Soc. Trans. and Journ.*

CAMPBELL, SIR COLIN. See Clyde.

CAMPBELL, SIR GEORGE, K.C.S.I., a Bengal civil servant, born in 1824, and sailed for India in 1842. In 1845 he was appointed the assistant to the Governor-General's Agent, N.W. Frontier, subsequently Deputy-Commissioner, Cis-Sutlej States. On returning to Britain, he published Modern India; and India as it May Be. He wrote extensively on the ethnology of India generally. In 1854 he was called to the bar; in 1855 he was appointed Commissioner of the Cis-Sutlej States; and in 1867, Commissioner of the Central Provinces. He was Lieutenant-Governor of Bengal; and on retiring from the service, became a member of the Indian Council in London, and subsequently a member of Parliament.

CAMPBELL, LIEUT. J., Assistant Surveyor-General, an officer of the Madras army, wrote on the use of Sir Howard Douglas' Reflecting Semicircle; On the Use of Kater's Altitude and Azimuth Instrument; Suggestion of a Tide Register; Table of Specific Gravities of Aqueous Vapour, and Dry and Saturated Air; Meteorological Journal of Royacottah; On the Advancement of Geological Science in India; On the Construction of the Portable Barometer; On the Formation of the Table-land of Southern India; Plain of Baramahal, 2000 feet above the level of the sea, Soda Soils of; On the Manufacture of Steel in Southern India; Improvement of the Silk manufactured in Mysore and the Salem Districts; Report on the Kaolin Earth of Mysore; Report on the Construction of Philosophical Instruments in India; On the Manufacture of Pottery-ware in Southern India; Meteorological Experiments at the Gumsur Mountains; Journey overland to India; On estimating the distance of Objects of Known Height at Sea. —*Mad. Chinese Camphor tree, Chang-nau, Pien-nau, Shau-nau, Chang-chau-fu, Shau-chau-fu.

Camphor of Borneo, or Barus Camphor, Lung-nau-hiang, Po-luh-hiang, Hoh-po-lo-hiang, Ping-pien, Mei-hwa-p'ien.

The camphor of commerce is obtained from two trees, one of which, Dryobalanops camphora, grows in Sumatra, Borneo, and Labuan; the other, the Camphora officinalis, or Laurus camphora, grows in China. The names for it in many languages of the world, are sufficiently alike to show that a knowledge of the substance came from one source, probably China or Sumatra, and the words Dutch, or Japan, or Tub camphor, Barus camphor, China camphor, Formosa camphor, have been added merely to indicate the place of production. The unrefined or crude camphor of commerce is the product of the Camphora officinalis, and is of two kinds, viz. Dutch or Japan, or Tub camphor, so called from being brought from Batavia to Europe in tubs, containing 1 cwt. to 1¼ cwt., and is in the form of lumps of pinkish grains. The second kind is called ordinary crude camphor, China camphor, and Formosa camphor, much of it being produced in Formosa, shipped to China, and re-shipped to Europe in square chests lined with lead-foil, and containing from 1¼ to 1½ cwt. In this crude state it consists of dirty greyish grains. This crude material is obtained by distillation from the roots and wood of the Camphora officinalis tree, which is chopped up and split up into billets, which are boiled in plenty of water in large boilers, with a conical or round straw cover smeared with clay outside; and, as the water boils, the crude camphor is deposited on the inner straw. Refined camphor is obtained from this product by

distillation, which is carried on in various ways; but the whole process consists in using two round vessels, inverting one above the other, and adding 2 per cent. of quicklime in order to absorb any oil, and distil from one vessel to another. Two earthen pots, luted together, answer perfectly, a very small aperture being left for the escape of air on the first application of heat. It is largely refined in Bombay. In China it is prepared very carelessly, by soaking in water the chipped wood of the root, trunk, and branches, and subliming it.

The *Borneo* or *Barus* camphor, the Lung-naou-hiang or 'dragon's-brain perfume' of the Chinese, is a product of the Dryobalanops camphora, *Colebrooke*. It is much esteemed in China, and is called by the natives and in commerce, 'kapur barus,' or Barus camphor, to distinguish it from the product of the Camphora officinalis, or Japan camphor. It derives its name of Barus from a place in Sumatra where it is produced, and whence it was probably first exported. The tree is found on all the northern parts of Borneo, and is said to be particularly abundant in the country of the Kyan, in the interior, on the Bintulu and Rejang rivers. The produce, though so valued by the Chinese, is not much used by the natives, though it is occasionally taken inwardly as a medicine. The price in China of the Borneo camphor is said to be higher than that of Japan, in the proportion of twenty to one; it has been supposed that this disproportion is caused more by some fancies of the consumer than any real distinction of properties. As not one in ten trees is found to produce camphor, its presence must be caused by a particular state, either of vigour or disease, in the tree; and the camphor collectors cut notches in the trees, in order, before felling, to ascertain whether they are likely to produce camphor. It is said that in those which produce it, the younger and smaller trees are often found to be quite as prolific as the older and larger trees. The camphor is found in a concrete state in the crevices or fissures of the wood, so that it can only be extracted by felling the tree, which is afterwards cut into blocks and split into wedges, and the camphor, which is white and transparent, is then taken out. An essential oil is also found in hollows in the wood, which the natives crystallize artificially; but the camphor thus obtained is not so much esteemed as that found naturally crystallized. From the oldest and richest trees they rarely collect more than two ounces. After a long stay in the woods, frequently of three months, during which they may fell a hundred trees, a party of thirty persons rarely bring away more than 15 or 20 pounds of solid camphor, worth from 200 to 250 dollars. The variety and price of this costly substance are enhanced by a custom which has immemorially prevailed among the Batta race, of delaying the burial of every person who, during his life, had a claim to the title of raja (of which each village has one) until some rice, sown on the day of his death, has sprung up, grown, and borne fruit. The corpse, till then kept above ground among the living, is now, with these ears of rice, committed to the earth, like the grain six months before, and thus the hope is emblematically expressed that, as a new life arises from the seed, so another life shall begin for man after his death. During this time the corpse is kept in the house, enclosed in a coffin made of the hollowed trunk of a durinon, and the whole space between the coffin and the body is filled with pounded camphor, for the purchase of which the family of the deceased raja frequently impoverish themselves. *Camphor oil* is also said to be collected by incisions at the base of the trunk, from which the clear balsamic juice is very slowly discharged. Barus camphor is getting scarce, as the tree must be destroyed to obtain it. About 800 pikuls are annually sent to China. Malay camphor is more fragrant and not so pungent as the Chinese camphor. 983 tubs of camphor were exported from Java in 1843; 625 bales were imported in 1843, the produce of the Japanese empire, and 559 pikuls exported from Canton in 1844. In London in 1880 it was selling at 85s. the cwt. The wood of the camphor tree is good timber, suited for house and ship building. The liquid camphor of the same tree appears of the nature of camphogen. Dr. A. T. Thomson, by passing a current of oxygen gas through it, converted it into camphor. In Spain, a camphor has been obtained from some of the Labiatæ. In Burma considerable quantities have been produced from the Blumea grandis; and a similar chemical product has been obtained in Europe, by passing a stream of muriatic gas through turpentine. It is largely employed in medicine; and to burn camphor before an idol forms part of the ritual of the Hindus.—*Low's Sarawak*, pp. 44–46; *Marsden's Sumatra*, p. 150; *Royle's Mat. Med.*; *Crawfurd's Dictionary*, p. 81; *Simmonds' Comm. Prod.*; *O'Sh.*; *Mason's Tenasserim*; *Tomlinson*, pp. 287–8.

CAMPHORA, a genus of plants belonging to the Lauraceæ, of which three species, C. glandulifera, C. officinarum, and C. porrecta occur in the south and east of Asia.

Camphora glandulifera, *Nees*, is the Laurus glandulifera, *Wall.* It is a tree of the Nepal mountains, with small yellowish-green odoriferous flowers, and pale yellow light wood, smelling strongly of camphor while fresh. It is weak and unfit for furniture. Its bark has been named the sassafras of Nepal. Dr. Royle says (Ill. Him. Bot.) it contains solid grains of camphor in its wood. —*Voigt*, p. 308; *Royle*, p. 324; *O'Sh.* p. 545.

Camphora officinarum. *Bauh.* Laurus camphora, *Linn.*, officinal camphor tree, camphor laurel. A considerable tree of Cochin-China, Formosa, Japan, and China, principally near Chiuchu, in the province of Foh-kien; also in Canton, Hu-peh, Kwang-si, and Foh-kien. The tree furnishes excellent planks, beams, and boards. Camphor is diffused through all parts of the plant; the root, trunk, and branches, when cut into chips, are boiled in water and then sublimed into inverted straw cones contained within earthen capitals. It is thus obtained in the form of crude camphor, chiefly from the province of Foh-kien and the opposite island of Formosa, but some of good quality is also procured from Japan. It is sometimes imported into Britain from Batavia.—*Williams' Middle Kingdom*, ii. p. 137; *O'Shaughnessy*, p. 455.

Camphora porrecta. *Linn.*
C. parthenoxylon, *Nees.* | Laurus pseudo sassafras, *Blain.*
Laurus ,, *Jack.*

A tree of Penang, Sumatra, and Java, furnishing a strong wood, which is durable if kept dry. —*Voigt; Roxb.* ii. 708.

Camphor Oil, Kapur minyak, MALAY; the liquid camphor of the Dryobalanops camphora tree.

Camphor Cup, a cup for use after the manner of the quassia-wood or 'bitter cup.'

Camphor Wood of Sumatra is from the Dryobalanops camphora, of which the wood is hard, compact, and brownish-coloured. The fragrant, light-coloured, soft wood of which the trunks and boxes of China are made, is supposed to be that of the camphor tree of Japan, Laurus camphora, or Camphora officinarum. Camphor-wood is valuable for the construction of chests and almirahs, as its powerful odour protects the contents from the ravages of white ants and other insects. The Martaban camphor-wood, Laurus sassafras, is from a very large tree, scattered sparsely throughout the Tenasserim provinces. Wallich wrote that it was very like Laurus glandulifera, which furnishes the sassafras and camphor-wood of Nepal. The Karens call it the 'tree galanga,' from its fragrance. — *Holtz; Mason; O'Shaughnessy.*

CAMPNOSPERMA ZEYLANICUM. *Thw.* A tree 30 to 40 feet high, not uncommon in Ceylon, growing on the banks of streams at Ratnapura and lower part of the Saffragam district up to 4000 feet elevation.—*Beddome*, p. 168.

CAMPONG. MALAY. A village, an enclosure, a courtyard, the Anglo-Indian compound, the Hindi ăngăn.

CAMRUKH. HIND. Averrhoa carambola.

CAM SING MOON or Cum sing moon, a safe harbour in the Canton river, formed between the southern port of Keeow island, and a point of Macao island called Bluff Head. It was much frequented by opium vessels.—*Horsburgh.*

CAM-WOOD, a dyewood from the Baphia nitida of Africa, used in dyeing the bright red of English bandana handkerchiefs.

CANAAN. This name, according to one authority, is from Chana, the ancient name of Phœnicia. According to another, Canaan or Palestine was called after Canaan, the youngest son of Ham.

CANADA TURPENTINE, or Canada balsam, is obtained from the Abies balsamea in Canada. Between the bark and the wood of the trunks and branches of the trees are vesicles containing the oleo-resin, which exudes when they are broken. Canada balsam is much used by varnish-makers in the manufacture of some of the most transparent varnishes. It is also extensively employed by opticians as a cement. The great value of Canada balsam for optical purposes, depends on its transparency and its refractive power, which is nearly equal to that of glass. When used to connect the pieces of an achromatic lens, it prevents the loss of light by reflection, and excludes moisture and other foreign bodies from the space between the surfaces of the glasses. In Nicol prisms (single image prisms of Iceland spar) it serves the important purpose of transmitting the ordinary ray, and of interrupting the passage of the extraordinary one; its index of refraction being intermediate between that of Iceland spar for the ordinary ray, and that of the same substance for the extraordinary ray.—*Pereira.*

CANAGA. CAN., TEL. Pongamia glabra.

CANALS for irrigation are of the greatest importance in all the tropical countries liable to the calamities resulting from excessive droughts.

The great canal of the world is that of *Suez*, connecting the Red Sea with the Mediterranean, and separating Africa from Asia. It was commenced 25th April 1859, the first ships passed through it in the year 1867, and it was formally opened for traffic in December 1869. It had occupied ten years of labour to bring it to that state, and cost to that period 13 millions sterling = 13 kror of rupees.

In British India the great works are the Ganges Canal, the Eastern Jumna Canal, the Agra Canals, and the Lower Ganges Canal.

The *Multan Inundation Canals* supply the district of Multan between the Sutlej and the Chenab, where rain hardly ever falls, and convert it into a succession of beautiful gardens, shaded by palm trees. There is a burning sun above and canals flowing below.

The rude inundation *canals of Gugaira* and other districts of the Bari Doab above Multan, are of value, and from those in the rich country of Muzaffargarh, between the Chenab and the Indus, the land is made one sheet of cultivation.

The inundation canals of the *Shahpur* district draw their supply from the Jhelum.

The *Derajat Canals* run parallel with the river Indus and fill during the periods of inundation.

The *Khadar* lands of the Bahawulpur State are 10 or 12 miles wide, and border the Indus. They are irrigated by inundation canals from the Sutlej.

The aggregate length of the *Upper Sutlej Canals* is 213 miles.

The *Khanwah Canal* leaves the Sutlej at a point 20 miles below Firozpur, by a mouth 90 feet wide, narrowing to 20 feet at the end of its length of 55 miles.

The *Sohag Canal*, 73½ miles long, leaves the Sutlej a little below the mouth of the Khanwah, and irrigates the country between that canal and the river.

The *Para Nullah* is a continuation of the Sohag, and is connected with the old bed of the Beas by a channel called Nawabbin.

The *Kutora Nullah* is to the north of the Khanwah canal, and it was proposed to bring into it the waters of the Sutlej.

The canals of the *Lower Sutlej* and the *Chenab* fertilize the Multan district, irrigating 120,000 acres, belonging to 120,000 villagers. In 1871–72 they were 39 in number, with an aggregate length of 632 miles; 11 had been made by the British.

The *Indus Canals* include those of Muzaffarnagar and the Derajat. There are 66 in the Muzaffarnagar district, drawing their supplies from the Indus and the Chenab. Those of the Derajat are 592 miles in aggregate length, of which, up to 1871–72, 108 had been constructed by the British.

The *Dera Ghazi Khan* district and the Sind Sagar Doab need irrigation.

The *Peshawur valley*, with the exception of a small opening towards the Indus, is encircled by mountains, and comprises 2400 square miles, divided into two by the river Kābul, which enters the plain at Michni. It is joined midway by the Swat river flowing from the N.W., and entering the plain at Abazai it waters Yusufzai by many channels, the Bara from the S.W. entering the plain at Shaikhan.

Bahawulpur State extends for 300 miles along the left banks of the Sutlej, Chenab, and Indus. In former times, the Ghaggar, the ancient Saraswati, flowed through it from the Siwalik mountains to the Indus, between Rori and Uch, parallel

with the Sutlej, but it dried up; and ruins of old towns are dotted along its banks, and all the once fertile tract is now barren and sandy, drifted from the desert, and is known as the Bahawulpur Bangar. To the west of the Bangar are narrow strips 10 or 12 miles wide, along the left banks of the Indus, Chenab, and Sutlej, called the Khadar. In 1867–70, Major Minchin, political agent, led a canal 105 miles long from the Sutlej, and called it the Ford-wah. He also formed six small canals in the Khairpur district.

Below *Khairpur*, are the Vahind, the Khanwah, Naoranga, Kutubwah, Sultanwah, Mubarakwah, Minchinwah, Baruswah, Sadikwah, and the Hariari or Fertiliser, all of them large channels 100 to 200 feet wide, irrigating a vast area by an endless network of branches, and annually cleared out.

From the *Indus* nine canals lead, two of them excavated by the British; and in July and August the Indus floods the face of the country, the waters reuniting to run into the eastern Narra, a great channel belonging to the Sind system of irrigation.

In the *Bari Doab*, between the Beas and Ravi rivers, there has been a great State canal completed; but canals are still needed for the 7,000,000 of acres unirrigated in the Rechna Doab, between the Ravi and Chenab; the Chuch Doab, between the Chenab and Jhelum; and the Sind Sagor Doab, between the Jhelum and the Indus.

That of the Bari Doab up to 1871-72 cost upwards of £2,000,000, and was irrigating 300,000 acres.

The great *Sirhind Canal*, commenced in 1871–72, was projected to draw its waters from the Sutlej, to irrigate an immense area now desert, and the total cost was estimated at £2,980,427, a third part of which was to be borne by the native states.

After the rivers of the Panjab unite at Mithankot, the Indus flows for 450 miles to the sea, through the arid rainless country of Sind. Here artificial irrigation is essential to cultivation. The river during bygone ages has silted up, and its banks are now greatly above the alluvial plain. When the bed attains a certain height the water falls over, and since historical times the river has been changing its course to the west. The banks are permanent only at Sukkur; at Jharrak, where it is bound by rocky banks; and at Kotri, by hills and deep tenacious clayey soil. The canals are excavations carried away from the river in an oblique direction, so as to secure as great a fall as possible. They vary from 10 to 100 feet in width, and from 4 to 10 feet in depth, and none are deep enough to draw off water from the river except during inundations. The irrigation is carried on by the water flowing into the channels during the inundations, or it is raised by the aid of machinery or Persian wheels. Some of the canals are 70 and 80 miles long. On the western or right bank, the chief canals are the Sind, 66½ miles, Ghar or Larkhana, Bigari, and Western Narra.

On the east or left bank of the Indus river is the Eastern Narra. It was an ancient channel which passed through the Thur, and had near it among the sand-hills, about 400 small dunds or lakes or bottoms. In 1859 a channel from the river at Rori was led into it, and its channel was dammed at places to prevent the escape of water into the large dunds.

Two canals have been led from the Eastern Narra,—the Mitrau, which in 1866 had 190 miles open, and irrigated 156,803 acres, and the Thur canal, irrigating 38,000 acres. Under Sir Bartle Frere's administration, the ancient channel of the Narra, 120 miles long, was reopened on the 7th May 1867, to distribute water over the vast plain of Mirpur.

From Hyderabad southwards, the *Fullali* canal is the main feeder of irrigation channels. Originally it was a natural branch of the Indus, which it rejoined 16 miles below Hyderabad; this was stopped by a dam in the time of the Amirs, and its waters were sent into the Gaja, the Guni, and other canals.

In 1861 the cost of clearances of the main canals was £41,041, but the allotment in 1871–72 was insufficient. Canals of a permanent character, proposed to be led off the Indus from Sukkur, Jharak, and Kotri; and the first of these, from Sukkur, was opened in 1870.

In the *valley of the Ganges*, above its junction with the Jumna at Allahabad, and in the whole length of the country through which the Jumna flows, the rainfall does not exceed 30 inches. Firoz Shah, emperor of Dehli between 1351 and 1388, drew a canal from the Jumna to water his favourite hunting ground at Hissar, but it had long fallen into disrepair, when Akbar in 1568 ordered its restoration. In 1626, Shah Jahan's engineer, Ali Murdan Khan, projected a canal in the Doab, which shortly ceased to flow. He also led one from that of Firoz, to convey water to the city of Dehli. The Dehli canal crossed the lowland by a masonry aqueduct, traversed the Aravalli hills by a canal cut through the solid rock, 60 feet deep at the crest, and flowed through the city in a masonry bed, throwing off innumerable minor streams; but in 1753 this branch ceased to flow. When the British came into possession, all these works had fallen into ruin, and in 1820 the canal of Firoz was restored from where the Jumna issues from the Siwalik hills. At Dehli it separates into a branch which enters the city at the Kābul gate, and part of it flows down the Chandni Chouk; the other branch follows that of Firoz to Hissar, and sends off the Rohtak branch. The united length is 445 miles, and that of the watercourses 728 miles; and the total outlay up to 1871–72 was £282,517, from about 447,171 acres.

The *Ganges Canal*, commenced in 1848, was opened on the 8th April 1854. It is wholly a British project. The water is brought from Ganes Ghat on the Ganges, 2½ miles north of the town of Hurdwar, close to the foot of the Siwalik mountains. The main channel is 348 miles long, and the branches 306 and the distributaries 3078, in aggregate length; and 767,000 acres in 5061 villages are irrigated by them. The principal engineer was Sir Proby Cautley. Commencing at Hurdwar, as the river Ganges issues from the mountains, it runs through the country on the right bank of the river. One of its many branches re-enters the Ganges at Cawnpur, and another joins the river Jumna. The canal is carried by a great viaduct, three miles long, over the river Salani. It is of earth, and is protected by a wall of masonry and a bridge of fifteen arches, each of fifty feet of span, through the volume of another river, and beneath the bed of a third, and was planned to re-enter the Ganges at Benares. The Solani aqueduct leaves a clear waterway of

700 feet, and cost £300,000. The total cost of the canal was not less than two millions sterling (£2,036,000). It takes about 75 per cent. of the water of the Ganges, whose volume, however, is not diminished. It traverses the Doab, and by countless branches, dykes, and channels, irrigates almost every village throughout a tract of country upwards of 800 miles in length, and is supplied to every tiller on payment of a water tax. At Hurdwar, the pass through which it issues, at the lowest ebb discharges about 7000 cubic feet of water every second. Its current was too strong for navigation, and the expected advantages from it for irrigation were not attained. It is carried through Hurdwar, Alighur, Cawnpur, Hamirpur (530 miles), with branches to Futehghur, Bulandshahr, and Koel. A ridge of land rises slightly above the level of the adjacent country, and runs along the centre of the Doab, sloping down on the one side to the Jumna, and on the other to the Ganges. The canal has been constructed on the top of this ridge to the vicinity of Alighur, whence it diverges into two channels, one to Cawnpur, and the other to Hamirpur and Etawa. On the completion of the canal, it was opened in April 1854, and the water admitted on an aqueduct across the Solani river at Roorkee. The engineer, Sir Proby Cautley, on leaving Calcutta, was honoured with a salute from the batteries of Fort William, and was favourably noticed in the Government Gazette.

The *Agra Canal* has been led off from the Jumna below Dehli, to irrigate the lands of Dehli, Agra, and Muttra. It irrigates 350,000 acres. The *Futtehpur Sikri* reservoir may also be mentioned.

The *Rohilkhand Canals* comprise the Nehtore, the Nugina, the Bygool, 180 miles, the Muradabad, the Paba, 13 miles long, and the Kailas canals; and the Kitcha and Dhora watercourses, 32 miles. They irrigate the belt of country along the Terai, where much rice is grown.

There are five canals in the *Dehra valley*, between the Ganges and the Jumna, aggregating 67 miles in length, and irrigating 11,039 acres. There are ten miles of rajbuha.

The tanks in Mhairwara in 1871-72 had a total area of 8675, and irrigated 14,826 acres. They were largely constructed by Colonels Hall and Dixon.

The *canals of the N. W. Provinces* have irrigated on the average 1,065,450 acres.

A dam has been thrown across the *Sone* river, and two main channels lead off from it.

The *Midnapur Canal* was partly open in 1871-72. It is 52 miles long, to irrigate 200,000 acres.

Mention may be made of the *Arrah Canal*, 70 miles long, to irrigate 430,000 acres, and of the *Patna Canal*, 84 miles long, to irrigate 390,000 acres.

The Humirpore and Jhansi irrigation works consist of lakes and reservoirs, partly natural, partly artificial, and are under the direct control of the civil authorities (*Friend of India; Annals of Indian Administration*).

The *Mahanadi river* drains the fertile plain of Chatisgarh, in the Central Provinces, and falls into the Bay of Bengal after a course of 529 miles. Its basin covers an area of 45,000 square miles. It is liable to heavy but short-lived floods, and the province of Orissa at the deltas has long suffered from them. The E.I. Irrigation Company undertook to form a great anicut, and it was commenced in 1862; they failed, and in 1868 transferred their works to the Government for £1,050,000, but the water has never brought remunerative rates.

Canals, as watercourses for cultivation, have only since 1862 been in progress in the Bombay Presidency. A weir of 1550 feet has been thrown across the Girnar river, in Kandesh, and one across the Panjur. In Sultanah a weir 2000 feet long has been drawn across the Kistna, to feed channels 45 miles long. A large tank has been formed at Koorgaum near Barsee, a reservoir at Mukti near Dhulia, and a tank at Hurtola. A reservoir has been constructed near Sholapur at a cost of £90,000. Large works have been planned for Gujerat and the W. Dekhan, and others for the Central Provinces; for works from the Pench river north of Nagpur, and from the Warda river to its south, and for the waters of the Betwa river to be led to irrigate Bundelkhand, which has been fifteen times desolated by famine in the last three centuries. One-third of the water will go to the Patiala State.

In *Madras*, of the native engineering works, those for the application of water to irrigate fields and gardens, wells, tanks, and river channels take the first rank. There are innumerable tanks or artificial lakes of various sizes formed in basins, that near Cummum being seven miles in circumference. The most northern of its rivers, the *Godavery*, at Rajamundry, when about fifty-five miles from the sea, divides into two streams, forming a delta of rich alluvial country. A little above this point the river is 2000 yards broad, but it soon expands at Dowlaishwaram into a width of three times that extent, parted, however, by islands into four branches. An anicut has there been thrown across the channel, the united lengths of the four dams being 3955 yards. Upwards of two miles of stream is blocked up by a solid, well-protected mass of stone, in lime cement, with a breadth at the base of nearly 130 feet, and a height of twelve feet above the natural surface of the water. Along the left bank of the river is one channel, another to Cocanada, and other channels; the total being 840 miles of main channel, irrigating 780,000 acres of land. In 1871-72 there were 56,471 boats and rafts engaged in traffic on this canal.

The rajas of Vijayanagar in 1521 constructed nine dams across the Tumbudra river, and had channels of 89 miles of total length. The old travellers, Conti and Cæsar Frederick, tell of cool streams flowing through the streets of the city. In 1860 the Madras Canal and Irrigation Company undertook to bring a navigation and irrigation canal from the river, throwing an anicut across at Sankasala; its history is useful.

It was intended to provide for the continuous irrigation of the Bellary district, of the Koondey valley and the Nellore district. The weir across the Tumbudra at Sankasala was 1500 yards in total length of clear overfall, which was broken into two lengths by an intervening island. The Hindry Aqueduct carried the canal, 90 feet broad and 8 feet deep clear waterway, over that river, at an elevation of 32 feet, by 40-feet arches, the length between the abutments being 651 feet; the cost of the first 75 miles was £8710 per mile; the next 115 miles cost £2900 per mile; and the whole

canal cost £5260 per mile. It has not produced all the hoped-for benefits for irrigation, and for navigation it has not been applied. Indeed, navigation and irrigation seem incompatible.

At *Baiswara*, 60 miles from the sea, an anicut or dam 1250 yards long, with a base of 305 feet, has been thrown across the Kistna river, and its channels irrigate the Guntur and Masulipatam districts. The delta covers an area of 10,000 square miles. From the E. side the main channel is divided into two branches, one to Masulipatam, the other to Ellora. It was constructed by General Charles Orr. The main western channel divides into the Nizampatam and Commamur branches.

The *Krishna* Canal, in the Bombay Presidency, is excavated from above the dam near Kurvar in the Satara district.

The *Ekruk* tank is four miles north of Sholapur on the Adela, a branch of the river Bhima. Its dam is 7200 feet long, and 72 feet high in the centre, and the lake formed is 6½ square miles. It submerged five villages, two of them in the Nizam's territory, but 35,840 acres are brought under the influence of the tank.

An anicut was completed across the *Pennar* river at Nellore in 1855. It was breached by the hurricane of 1857, but restored in 1861, and in 1863 the irrigated area was 32,874 acres. It is 520 yards in length.

The *Cauvery* and *Colerun* anicuts are the most ancient in Southern India, and those to which the British first directed their attention. At the head of the island of Srirangam, near Trichinopoly, the main river divides into two branches, the southern retaining the name of Cauvery, the northern being called the Colerun; and the tendency was for the Cauvery to silt up, and the whole of the water to pour into the Colerun. The native anicut had been built about the third century of the Christian era, and consisted of a solid mass of rough stone 1080 feet long and 40 feet broad, irrigating 669,000 acres. Sir Arthur Cotton threw a masonry anicut, 750 yards long, across the Colerun, resting it on three lines of wells 6 feet in diameter in the sandy bed of the river, which has thrown the water into the Cauvery and cleared the bed of the Colerun. In 1836 an anicut was thrown across the Colerun to regulate the supply of water for S. Arcot. Colonel Sim was the engineer.

The Mauri Conwai river is in Mysore, with the Nundoor Sreeramadwara and Maseehully reservoirs.

The *Periar* river runs to waste into the Cochin marine lagoon, and it has been proposed to turn it into the eastern districts by a cutting 140 feet deep and a dam 60 feet high, and add to the water supply of Madura and Ramnad, now obtained from the Vaiga.

The *Tambrapurni* river waters the Tinnevelly district. It has been crossed by several dams in very ancient times.

The *East Coast Canal* from Madras to Sadras is for traffic.

The *Grand Canal of China* has been led through and near a series of lakes, some of considerable extent, extending all the way from Nan Wang, in lat. 35° 55′ N., long. 116° 30′ E., down to the Yang-tze-kiang.—*Moral and Material Progress*, 1871–2; *Markham's Embassy; Annl. Ind. Adm.; Report on the Administration of the Panjab; Powell's Handbook, Econ. Prod. Panjab; Jackson's Manual.* See Irrigation.

CANAMBOO. TAM. Crotalaria juncea, *Linn.*

CANARA, a maritime province on the western coast of the Peninsula of India, with an area of 7800 square miles. It is arranged by the British into two revenue districts, North Canara or collectorate of Honore, and South Canara as far south as the Chundragherry river, and from that river commences Malabar. Canara formed part of the Mysore Dominions, and came under British rule after the fall of Seringapatam in 1799. Below the mountains the country is rocky, mountainous, intersected by numerous mountain streams running to the sea, with exceedingly fertile valleys. The Garsuppa falls of the Sherranutty river have four portions. The Grand Fall falls perpendicularly 880 feet. Three languages are spoken, viz., Tulu in the ancient Tuluva country, Malealam as far north as the Chundragherry river, and Canarese in the taluks of Honawar and Cundapore above the Ghats. In the Buntwal taluk are colossal images of Gomata Raya, carved out of single blocks of granite, and placed on the tops of hills. The interior of the Jain temple at Moodbiddery is beautiful. Near Cundapore, close to the sea, is a small fresh-water lake, in which the Hoowana or flower fish is caught.

North Canara, since the 1st Feby. 1862, has been administered by the Bombay Presidency. It lies between lat. 13° 52′ and 15° 31′ N., and long. 74° 10′ and 75° 7′ E., with an area of 4235 sq. m., and in 1872 a population of 398,406 persons, 364,402 of them being Hindus. The Havik Brahmans cultivate betel-nut gardens. The Nanaiti Mahomedans are seamen; they are well to do, and represent the colonies of Arab merchants of whom a remnant still exists along the coast from Gogo southwards. There are Sidi Mahomedans, descendants of African slaves whom the Portuguese held. They have the woolly hair and black skin of the pure African negro; are poor, and cultivate little patches rudely in the forests.

South Canara is under the Madras Presidency. It lies between lat. 14° 31′ and 15° 31′ N. and long. 74° 1′ and 75° 2′ E., and has as its eastern boundary the Western Ghats, through which the Manjarabad, Kolur, and other passes lead up to Mysore and Coorg; its area is 3902 sq. m. The people, about a million in number, consist of Saraswati, Konkani, and Sivalik Brahmans, Bant, Koragar; Portuguese of mixed descent, native Christians, Mopla of Arab descent. The aborigines include the Malekudi, Koragar, Holyar. The Malekudi are a forest race who practise the Kumari cultivation, but labour on coffee estates. The languages spoken are Tulu, Malealam, Canarese, and Konkani, besides Urdu and English. Tulu, the language of Tuluva, is spoken between Udipi and Kumbla by about 180,000 people, south of the Puishwenni river and elsewhere; with Moplas, Malealam is the prevailing tongue. Prior to British rule, the Holyar were the slaves of the Wargdar or proprietors, and even yet continue in a state of modified serfdom.—*Findlay; Imp. Gaz.; Madras Records.*

CANARESE or Karnataka is an ancient classical and a modern dialect, the former containing different inflexional terminations. Hala Kannada, is an ancient written character formerly used by the Canarese people in writing. Canarese is a language in the centre of the Indian Peninsula,

spoken by about nine millions of people, partly under the Hyderabad, the Mysore, and the British Governments of Bombay and Madras. The ancient Hindu term, Karnatica, comprehended all the high table-land in the south of India above the Eastern and Western Ghats, and its rulers seem never to have held sway beneath the Ghats; though in the present day, by a strange fatality, it is now only the countries below the Ghats, the Carnatic on the east and Canara on the west, to which the name of the ancient Karnatica kingdom has come to be applied, and its name is now never given to the Bala Ghat, or country above the Ghats.

The great bulk of the Canarese-speaking people are of one race, who are pure Dravidians. They have adopted the Jangama sectarian faith, the followers of which, by their tenets, ought to have no caste distinctions. Most of their subdivisions are restricted to vegetable products as food; and so carefully do they act up to these, that no one of these vegetarians will even bring any living creature for sale to any one of a flesh-eating people. Their sect is, perhaps, amongst the most exclusive of all in India. It is doubtless this tenderness towards animal life that guides them to their avocations, which are mostly those of civil life, cultivators and shopkeepers, and may have led to their non-resistance to invaders; but in all the great armies which the British have formed during the past century, of the Canarese Jangama sectarians not more than a few thousand men may have become soldiers, and certainly not even one of that portion who abstain from animal food. The Teling and Canarese nations have, till recently, continued equally advanced as to elementary school education; and though, in this respect, both races fall short of the progress made by the energetic, restless, impetuous Tamil people, they are greatly in advance of the Mahratta. For nearly 200 years the inland tract occupied by the Canarese-speaking people had been traversed by great armies, bent on conquest, and since the fall of the great Vijayanagar dynasty all comers seem to have crossed this tract without opposition.

Canarese, properly the Kannadi or Karnataka language, is bordered by the Tamil and the Telugu on the east. It is spoken throughout the plateau of Mysore and in the western districts of the Nizam's territory as far north as the village of Murkundah, lying 30 miles south-west of Beder. Also it is spoken in part of the ancient Tuluva country on the Malabar coast, now long designated as Canara, a name which it acquired from having been subjected for centuries to the rule of Canarese princes. But in Canara, the Malealam, the Konkani, and the Tuluva are also spoken, though less extensively than the Canarese. From A.D. 800 to 1500 it was free from any admixture of foreign words, but since then Sanskrit words have been extensively introduced; and during the supremacy of Hyder Ali and Tipu, Urdu words were largely imported into it in Mysore, while it added Mahratti in the N.W. and Telugu on its N.E. The Canarese character differs slightly from the Telugu, from which it has been borrowed, but the characters used for Tamil, Malealam, and Telugu are quite distinct from each other. The ancient Canarese character, however, entirely differs from that of the modern Telugu, and the Canarese language differs even more widely from the Telugu than it does from the Tamil. There is an ancient dialect of the Canarese language current, as well as modern, the latter differing from the former by the use of different inflexional terminations. The ancient Canarese dialect, however, has no connection with the Sanskrit character to which that name has been given, in which, viz. the Hala Kannada, many very ancient inscriptions in the Mahratta country as well as in Mysore are found.

CANARIUM, a genus of plants of the natural order Burseraceæ. Wight says the resinous juice of C. commune has properties similar to copaiva, while the kernels of the seed afford by expression a bland, edible oil. C. strictum, *Roxb.*, is known in Malabar under the name of the 'black dammer tree,' in contradistinction to the Vateria Indica, which is the 'white dammer tree.' This tree is rather common in the alpine forests about Courtallum in the Tinnevelly district, and is regularly rented there for the sake of its dammer. The dammer is transparent, and of a deep brownish-yellow or amber colour when held between the eye and the light, but when adhering to the tree has a bright, shining, black appearance. The fruit is a very hard, three-celled, oval nut, tapering at each end.

Under the names Dhoop and Googul, Dr. Gibson mentions two species of Canarium in Canara and Sunda, one on the ghats above, and the second species of great size cultivated near Bilgil and at Siddapore. The choice gum-resin afforded by these trees is extensively used in the arts, and exported both inland and to the coast.—*Wight, Ill.; Dr. Gibson.* See Boswellia; Resins.

CANARIUM BENGALENSE. *Roxb.* An immense forest tree of Assam, Sylhet, and the adjacent mountainous countries, flowering in May and June. From fissures or wounds in the bark, a large quantity of very pure, clear, amber-coloured resin exudes, which soon becomes hard and brittle, and is not unlike copal. But in the Calcutta bazar it was only valued at from Rs. 2 to Rs. 3 for seven maunds of eighty pounds each. —*O'Shaughnessy*, p. 285; *Voigt*, p. 149; *Roxb.* iii. p. 136; *Royle's Him. Bot.* p. 177.

CANARIUM BRUNNEUM. *Thw.*

Scutinanthe brunnea, *Thw.*

Maha-bulu-mora, ... SINGH.

A tree 50 to 60 feet high, growing in the Central Provinces of Ceylon at elevations of 2000 to 3000 feet.—*Beddome, Fl. Sylv.* p. 127.

CANARIUM COMMUNE. *Linn.* Java almond.

C. mehenbethene, *Gært.*	Colophonia Mauritiana, *D. C.*
Amyris Zeylanica, *Retz.*	Bursera paniculata, *Lam.*, *Rumph.*
Balsamodendron Zeylanicum, *Kunth.*	
Bois de Colophane, . FR.	Jungli Badam, . . HIND.

Grows in the Mauritius, Ceylon, the Peninsula of India, the Moluccas, and the Indian Archipelago. It was brought from the Moluccas to the Calcutta Botanic Garden, but in Roxburgh's time did not thrive, owing to the coldness of the winter months. The bark yields an abundance of limpid oil, with a pungent turpentine smell, congealing into a buttery, camphoraceous mass. It has the same properties as balsam of copaiba, for which it could be substituted; and is said to yield East Indian elemi. Its nuts are three-cornered

and edible, but apt to produce diarrhœa.—*Roxb.* iii. p. 177; *O'Shaughnessy*, p. 288; *Voigt*, pp. 148-9.

CANARIUM GENICULATUM. *M'Cl.* A large and valuable timber tree found in the Pegu valley, but scarce. The wood is white-coloured, and adapted to house-building.—*M'Clelland.*

CANARIUM NIGRUM. *Roxb.*

Marignia acutifolia, *D. C.* | Dammara nigra, *Rumph.*

A tree of Amboyna and the Moluccas; a reddish, soft, viscid, heavy-smelling substance exudes from wounds in its bark.—*Voigt*, p. 149.

CANARIUM PIMELA. *Smith.* Pimela nigrum.

Luh-lan, Wu-lan, . CHIN.	T'sipg-kwo, . . . CHIN.
Kan-lan, ... „	Chinese olive, . . ENG.

This tree grows in the Chinese provinces of Kwang-si and Foh-kien. Its pointed oblong fruits, from 1¼ to 1½ inch long, are eaten green or shrivelled, and are often preserved in salt. At Amoy the hard kernels are often beautifully carved for heads. Lan-tang, a kind of gum or black dammer, is obtained from its branches, bark, and leaves. The kernels of the Pimela alba (Luh-lan) are similarly used.—*Smith.*

CANARIUM STRICTUM. *Roxb.*

Dammara nigra legitima, *Rumph.*

Manda-dup, . . . BENG.	Thelli mara, . . MALEAL.
Gugal, Dup, . . . „	Kongilam maram, . TAM.
Black dammer tree, ENG.	Karapa Kongilamu, „
Canari, . . . MALEAL.	

This very beautiful, large tree is most abundant in all the moist ghat forests on the western side of the Madras and Bombay Presidencies up to 4000 and 4500 feet, but it does not occur in Ceylon or elsewhere, and it is never seen in dry forests. Its brilliant crimson foliage makes it a most beautiful sight when in young leaf. The leaves of saplings and young trees are very much larger than those of full-grown trees.

This is the black dammer tree of Tinnevelly and Malabar, and is so named in contradistinction to the Vateria Indica, which is called the white dammer tree. C. strictum is common near Courtallum, where it is rented for its dammer. While adherent to the tree, it gives a bright, shining black tint, but by translucent light is of a deep brownish-yellow or amber colour. The balsam exudes in a very fluid state, and trickles down the trunk, where it gradually hardens by exposure to the sun; the fresh resin continuing to flow over that already hardened, gives the stalactitic appearance to the huge lumps of resin, in which form the resin is brought to the market. It is perfectly homogeneous, has a vitreous fracture. It is insoluble in cold, but partially soluble in boiling alcohol on the addition of camphor; when powdered, it is readily soluble in oil of turpentine. Powdered and burnt on the fire, it emits a more resinous smell, and burns with more smoke, than white dammer. The size of the lumps of this resin, together with its colour and the peculiarity of shape already mentioned, suffice to distinguish it from other Indian resins.—*M. E. J. R.; Voigt*, 149; *Roxb.* iii. 138. See Gums and Resins.

CANARIUM SYLVESTRE. *Gærtn.*

C. Sylvestre alterum, *Rum.* | Schinus Bengalensis, *S.*

A tree of Chittagong and Assam. Timber hard, tough, and close-grained, used for furniture.

CANARIUM ZEYLANICUM, *Blume*,

C. Balsamiferum, *Moon.* | Kakoona-gass, . . SINGH.

Occupies the warm, moister parts of Ceylon up to an elevation of 1500 feet. A resinous balsam exudes copiously from the trunk of this tree, which, mixed with paddy chaff, is used by the natives for burning, as the smoke drives away snakes from the domicile. C. coccineo-bracteatum and C. euphyllum are also known.—*Thw.* i. p. 79.

CANARY SEED, Phalaris canariensis, *Linn.* Mainly used to feed caged birds. The annual British consumption may be estimated at about 10,000 quarters, of which about 8000 are grown in England, especially in the Isle of Thanet and Essex.

CANAVALIA GLADIATA. *D. C.* Sword-bean.

Dolichos gladiatus, *Roxb.*	Dolichos ensiformis, *Lour.*
Mekhun, . . . BENG.	Thambatin, . . TAM.
Makhum-shim? . „	Segapu Thambatin? „

CANCHI, the Tamil name of Conjeveram.

CANCHI PANDU. TEL. Solanum nigrum.

CANCHORI VER. TAM. Tragia involucrata.

CANCRA. HIND. Pavetta Indica.

CANDAHAR, a town in Afghanistan, in long. 65° 28′ E., and lat. 31° 37′ N., 3484 feet above the sea. It is the Khenta of the Vendidad. According to Elphinstone (Caubul, p. 425), there has been a city here since the time of Alexander, and the ancient city stood till the reign of the Ghilzai, when Shah Husain founded a new city under

the name of Husainabad. Nadir Shah attempted again to alter the site of the town, and built Nadirabad; at last Ahmad Shah founded the present city, to which he gave the name of Ahmad Shahi, and the title of Ashraf-ul-Balad, or the noblest of cities; but the old name of Candahar still prevails among the people, though it has lost its rhyming addition of Dar-ul-Karar, or the abode of quiet. Ahmad Shah himself marked out the limits of the present city, and laid down the regular plan, which is still so remarkable in its execution. The houses in the town are from 16,000 to 20,000; the population, 45,000 in number, consist of different tribes. Houses as under:—

Aakyi Khel, . 50	Dowlat Shahi, 50	Makuzai, . . 100
Arab, . . . 50	Ghilzai, . . 100	Nurzai, . . 600

Almost all the candles in use in the East Indies are imported from Europe and America. For lighting, the natives use oil lamps of various shapes, often of metal fixed on an iron spike, which they stick into the ground. Wax and tallow candles are, however, made in several parts of India,—in Vizagapatam, Goa, Malabar, Patna, Calcutta, Peddapore, and Berhampur; but the large importations of candles from Europe have caused the manufacture to decline considerably. It is useful to place two thin instead of one thick wick in each, and the wicks should be plaited, not twisted. Wax candles improve with age. The candles used in Japan are made of an oil said to be pressed out of the seeds of the Rhus succedanea? This oil becomes, when concrete, of the consistence of tallow, and is not so hard as wax. The province of Fetsigo, more particularly, produces this tree, and consequently supplies the greatest quantity of this oil. In the eastern parts of China, the product of the tallow tree, Stillingia sebifera, and beef and hog's tallow in the south, are used in the manufacture of candles. Wax is only employed to encase the tallow or lard, which, from the heat of the climate and its unclarified condition, never becomes hard.—*Royle, Arts, etc., of India*, p. 484; *Thunberg's Travels*, iii. p. 188; *Rohde, MSS.*

CANDLESTICKS.

Kandelaars, . . . DUT.	Candellieri, ... IT.
Chandeliers, . . . FR.	Podsweschnikii, . RUS.
Leuchter, . . . GER.	Candeleros, ... SP.

Candlesticks are in general use in the East Indies, but to shield them from the wind are usually covered with glass shades.

CANDLE-TREE, Candle-nut tree, Aleurites triloba. Its nuts are strung together and used for candles. Torches are made from the candle-wood of Demerara.

The Candle-tree, Parmantiera cereifera, might be introduced into India. It is confined to the valley of the river Chagres (Isthmus of Panama), where it forms entire forests. In entering them a person might almost fancy himself transported into a chandler's shop. From all the stems and lower branches of the trees hang long cylindrical fruits, of a yellow wax colour, so much resembling a candle as to have given rise to the popular appellation, 'Palo de velas,' candle-tree. The fruit serves for food to numerous herds of cattle. —*Dr. Seeman.*

CANDY, a province of Ceylon, formed out of an ancient kingdom, subdued in the early part of the 19th century by the British. The town of Candy was taken on the 19th July 1819.

CANDY, Sugar-candy.

Kurri-shakur, GUJ., HIN.	Kal-kandu, . . . TAM.
Gula batu; Batu, MALAY.	Kala kanda, . . TEL.
Nabhat, ... PERS.	

Crystallized sugar was at one time largely imported into India from China, but is now made in many parts of India.

CANDY, a measure of weight equal to 500 lbs. in some places, but it varies in different towns. A candy (khundee) in one place differs very much from the candy of another place. Again, a candy, for instance, of metal, is not the same as a candy of tobacco; and there is a different candy for cotton and sugar. The candy used in buying is not always the same in the same place as the candy used in selling.

CANER. HIND. Nerium odorum.

Canna, bastone, . . IT.	

Canes are the produce of the Calamus genus of palms, of which the species are numerous in the islands of the Indian Archipelago, in the Malayan Peninsula, in the humid parts of the Madras territories, in the forests of the districts of Chittagong, Sylhet, and Assam, along the foot of the Himalaya as far north as the Dehra Doon, where a species is found which Griffith named C. Royleanus; and he applied the name of C. Roxburghii to the plant which Roxburgh called C. rotang, common in Bengal and on the Coromandel coast. Both are used for all the ordinary purposes of cane; as also are C. tenuis of Assam, C. gracilis, C. extensus, and others. But those of the shops

are gathered indiscriminately, and it is not possible to say from what particular species they come. C. rotang has, however, been said to furnish the stouter, and C. Scipionum the slenderer sorts. Mr. Griffith considered C. Scipionum of Loureiro to be the species which yields the well-known Malacca cane, but the plant does not appear about Malacca, and the canes are stated to be imported from Siak, on the opposite coast of Sumatra. Even this does not, however, seem to be correct, as the Malacca Committee for the Exhibition of 1862 sent Malacca canes, as cut from the jungle, previous to being subjected to the process of smoking, which gives the cane the rich brown tint so much admired in Europe. The stem of Calamus verus is described as being 100 feet long; that of C. oblongus, 300 to 400 feet; of C. rudentum, upwards of 500 feet; and of C. extensus, as much as 600 feet. Rumphius even states that one kind attains the extraordinary length of 1200 feet (vol. v. p. 100). In the Tenasserim Provinces there are numerous species indigenous in the forest, and the Karens have different names for seventeen species or varieties, used extensively instead of cordage. The stays of the masts in Burmese boats are usually made of rattans, and they are split up into strings for the innumerable purposes to which cord and twine are usually applied. All that gives stability to bamboo houses, is the rattan which ties them together. The Calamus rudentum of Loureiro is manufactured at Malacca into cables, and is employed for dragging great weights and binding wild elephants. A cane bridge over the Temishang in the Khassya hills is 312 feet long, and 50 feet above the river. It oscillates greatly. —*Mason's Tenasserim; Royle, Ill. Him. Bot.; Royle, Fib. Pl.; Cat. Ex.* 1862. See Calamus.

CANGNI. HIND. Panicum Italicum.

CANGOO. TAM. A Tinnevelly wood of a whitish brown colour, used for handspikes and wheelwright's work.—*Col. Frith.*

CANGUE, a wooden yoke, by which Chinese criminals are punished, and are led about the streets as a spectacle to the people. It consists of two large pieces of wood fitting into each other, and having one to three openings, through which the head and one or both hands are drawn, according to the greatness of the crime. Such a yoke weighs from 50 to 100 lbs., and presses so heavily upon the back and shoulder, that the criminal is unable to feed himself, and must wait till some compassionate person lifts the food to his mouth. Such punishment is inflicted for periods varying from a few days to several months, and in the latter case it is almost always fatal. This instrument of torture makes a man resemble the foot of a huge heavy table.—*Sinnett's Lady's Voyage*, p. 49; *Huc, Chinese Empire*, i. p. 272.

CANHO. SIND. Citrullus cucurbita, *Linn.*

CANIATCHI. Cani, land, and Atchi, heritage. In the south of India, land property. Tod thinks the atchi, like the ote and awut, Rajput terminations, implies clanship.—*Tod's Rajast.* i. 496.

CANIDÆ, the dog tribe, family of mammals, comprising the genera Canis, Cuon, and Vulpes, of which the common dog, Canis familiaris, and its many varieties, the wolf, Canis pallipes, and the jackal, Canis aureus, occur in India. The wild dogs of India have been removed to the genus Cuon, and the foxes belong to the genus Vulpes.

CANIS? in Penang, a large tree, used for door frames.—*Col. Frith.*

CANIS AUREUS. *Linn.* The jackal.

C. aureus Indicus, *Hodgs.* | Lupus aureus, *Kœmpf.*

Siar, sial, . . .	BENG.	Kola Ghidar, HIN.,	MAHR.
Nari, ...	CAN.	Shighal, ...	PERS.
Shighal, . . .	DUK.	Srigala, ...	SANSK.
Jackhals, . . .	DUT.	Nakka, ...	TEL.

The jackal is found in a great part of Asia, Syria, Arabia, Persia, and in all India west of the Brahmaputra. Along the line of the Ganges, in Lower Bengal, they move in packs, and eat indiscriminately. In the Peninsula they are of larger size, and seen singly or in pairs; and in the Dekhan live much on wild fruits; the coffee bean of the plantations is largely eaten by them. Their cry when moving at night is very disagreeable, and even when clicketing their call is unpleasant. Native sportsmen believe that an old jackal, which they call bhalu, is in constant attendance on the tiger, and whenever his cry is heard, which is peculiar and different from that of the jackal generally, the vicinity of a tiger is confidently pronounced. Sir W. Elliot says he has frequently heard the cry attributed to the bhalu.—*Cat. of Mammalia; Jerdon.* See Jackal.

CANIS FAMILIARIS. *Linn. Var.* Indica. The Pariah, Polygar, and Brinjara dogs, and Tibetan mastiff. The Brinjara dog is a large, powerful animal, in shape and with limbs somewhat resembling the Persian greyhound, only much more powerful. The breed seems, however, to be disappearing from amongst the Brinjara tandas, and replaced by the ordinary pariah. In 1868 the editor met a great tanda on the march at Ajunta, but only pariah dogs amongst them. Indeed, between the Brinjara dog and many of the pariah dogs there is so great a resemblance, as to impress with the belief that they are the same variety. In many villages are pariah dogs in no way distinguishable from the Brinjara. The large Brinjara dog is an eager hunter of the larger game, a faithful, intelligent, and good watch-dog, but does not crave attention. The Polygar dog is large and powerful, and is peculiar in being without hair. The Beder race of Zorapore and Ghurghunta hunt the wild boar with a large powerful breed of dogs. A peculiar breed is raised by the raja of Rampur, seemingly between the Persian greyhound and the Tibetan mastiff. The Tibetans have a mastiff, a terrier, and a poodle, and the two last are pets, and the poodle is often fed for the table. The Chinese dogs from Japan, the original of the King Charles spaniel, is sometimes seen in India. The C. Ægyptiacus, C. cauda, C. Dukhunensis, do not need separate remark. See Dog.

Canis laniger, *Hodgs.*, Tibet white wolf.

Tola, ...	CAN.	Nekra, ...	,,
Bhera, Bheria, Byria, Bharya,	HIND.	Hundar, Hurar, .	,,
		Toralu, , . . .	TEL.

The wolf roams in Central and Southern India; they are never seen singly, but always in large or small packs. If a single one appear, it

may be assumed that others of the pack are near. They are bold, even in the vicinity of towns, scarcely moving off from a horseman. Length from muzzle to insertion of tail, 36 to 37 inches; do. of tail, 16 to 17½; height at shoulder, 24 to 26; length of head, 10; circumference of do., 16 to 17; weight of an adult female, 42 lbs. The wolves of the Southern Mahratta country generally hunt in packs, chase the goat antelope (Gazella Arabica), steal round the herd of Antilope cervicapra, and conceal themselves on different sides till an opportunity offers of seizing one of them unawares, as they approach, whilst grazing, to one or other of their hidden assailants. On one occasion, three wolves were seen to chase a herd of gazelle across a ravine, in which two others were lying in wait. They succeeded in seizing a female gazelle, which was taken from them. They have frequently been seen to course and run down hares and foxes; and it is a common belief of the ryots that in open plains, where there is no cover or concealment, they scrape a hole in the earth, in which one of the pack lies down and remains hid, while the others drive the herd of antelope over him. Their chief prey, however, is sheep, and the shepherds say that part of the pack attack and keep the dogs in play, while others carry off their prey; and that, if pursued, they follow the same plan, part turning and checking the dogs, while the rest drag away the carcase, till they evade pursuit. Instances are not uncommon of their attacking man. In 1875, 1061 persons were devoured by wolves; in the next five years, 887, 564, 845, 492, and 347; and from four to six hundred are annually destroyed. Sometimes a large wolf is seen to seek his prey singly. These are called won-tola, and reckoned particularly fierce. In Oudh and the Panjab they destroy large numbers of children. Their ordinary prey are deer, sheep; and in pursuit, they display great sagacity, throwing out flanking parties, and surrounding game. In 1866 the editor witnessed a sambur run close up to a railway train in Berar, halt as the train moved on, and it then fled at speed; looking beyond, a body of wolves were seen in pursuit.

CANJANG-KIRAI. TAM. Basella alba, *Linn.*

CANJARA. TAM., MALEAL. A tree which grows to about 2½ feet in diameter, and from 25 to 30 high, of little use or durability. The natives value its fruit, which is very intoxicating, and used by them as a medicine.—*Edye, M. and C.*

CANJARA. SANSK. Daucus carota.

CANJAROTE POOYA, a river which formed originally the southern boundary of Canara, separating it from Travancore.

CANKRI KAI. MALEAL. Cucumis sativus, *L.*

CANNA, a genus of flowering plants of the order Marantaceæ. C. Indica, or Indian shot, is one species. Voigt enumerates sixteen as having been in the Calcutta Gardens. C. edulis of Peru furnishes one of the arrowroots of commerce.

The hemp plant is grown in Persia, Syria, Arabia, and throughout India, in some places for its fibre; in others, and generally, for its intoxicating products. It is common in waste places in many parts of the Panjab plains, Cis and Trans Indus, and much more abundant and large (reaching 9 or 10 and 12 or 14 feet in height at times) in many places in the Himalaya, up to 10,000 feet. It appears to be more commonly cultivated in Garhwal, etc., than in any part of the Panjab Himalaya, but in the latter it is frequently grown in small patches on the Sutlej and Bias at 5000 to 7000 feet; and Dr. Stewart had seen fields at 10,000 on the Chenab in Lahoul. On the Sutlej the seeds of the cultivated plant are roasted and eaten in small quantity with wheat. The most important product of this plant is the resinous exudation, which does not appear to be produced below a certain elevation in the hills. It is used as a narcotic, as are the dried tops of the plant. The latter are gathered for home use in many parts of the hills, and also occasionally in the plains (they are largely used in Sind, where the plant appears to be grown in the fields for this purpose), but the great source of the charras is Turkestan. Dr. Cayley states that in October 1867 this drug to the value of Rs. 44,760 was imported from Yarkand into Leh, and Rs. 19,422 worth of bhang was exported from the latter to the Panjab in the same month. During 1867, 1830 maunds were imported from Yarkand to Leh, and 817 maunds were sent from the latter southward by various routes. The drug is mostly consumed with tobacco in a hookah, its use extending to Afghanistan, according to Bellew (Dr. J. Stewart, P. Plants, p. 216). In 1859, an experimental consignment of two tons of Himalayan hemp was valued in the English market at from £30 to £32 per ton. The price at Lahore is about £15 or £16 per ton.

The hemp plant secretes the resinous principle in its leaves, on which account these, as well as the charras collected from off the young tops of the stem and flowers, is highly esteemed in all eastern countries, on account of its exhilarating and intoxicating properties. Among the Arabs the hemp has a variety of names, as 'the increaser of pleasure,' 'the cementer of friendship,' etc. By its name of Hasheesh it is often mentioned in the works of travellers in Egypt, Arabia, and Syria; while the name of Bhang is not less known in the far east.

Of the intoxicating products, *Charras* is the concreted resinous exudation from the leaves, slender stems, and flowers, collected in the Himalaya, Yarkand, and Herat. It is eaten in a sweetmeat, or smoked like gauja.

Ganja, the dried hemp plant which has flowered, and from which the resin has not been removed; also the whole plant. It is smoked in a water pipe until a peculiar contraction of the throat is felt.

Bhang, and *Subza*, and *Sidhi*, the larger leaves and capsules without the stalks; also Sukho or Sawia, the small leaves, seeds, and husks ground and made up with water, milk, etc. These are highly aphrodisiac, but often lead to impotency, insanity, delirium tremens, catalepsy.

Majum is a confection made of bhang, ganja, charras, opium, poppy seeds, datura leaves and seeds, cloves, mastic, cinnamon, aniseed, cumin, cardamoms, made up with milk or ghi and sugar.

Tadhal is a preparation from bhang, poppy seeds, and other similar articles. It is believed to have cooling properties. The charras produces visionary ecstatic pleasures, sometimes catalepsy; or the intoxicant, with his arms outstretched, balances on his toes as if soaring. The misuse of bhang is a frequent cause of insanity.—*Materia Medica; O'Shaughnessy*, p. 581; *Powell, Handbook; Cleghorn, Panj. Rept.* p. 66.

CANNA EDULIS. The tubers afford 'Tous-les-mois,' a farinaceous food used by invalids.—*Mason; Ains. Mat. Med.* 142; *Riddell.*

There are several varieties of this, the colours of the flowers scarlet, orange, red and yellow mixed. Varieties are often seen in gardens, and much cultivated by the Burmese for the seeds, which they use for sacred beads.

CANNANORE, a seaport town on the west coast of India, in long. 75° 24′ E., and lat. 11° 51′ N., known to the natives by the name of Kouryal-bandar. In 1871, population 10,265, rainfall 97 inches. It is a military cantonment, and has been known to Europeans from the earliest times. 'Proceeding along the sea-coast, says Bartolomeo, you then arrive at Cannanore, a town with a castle, and subject to the government of queen Collatiri, by the Europeans called Collastri. This city is of great antiquity, and the king of Collatiri belongs to the first class of the Indian princes. The capital of the kingdom of Cannanore, called also Colanada, lies in the latitude of 11° 50′, and is distinguished by the same name. The whole surrounding district, which extends towards the north as far as Mount Delly, is inhabited by the Molandi, who live merely by piracy. These sea-robbers are mentioned by Pliny, Arrian, Ptolemy, and other ancient authors. They unite themselves to other pirates who reside on the Angedib islands, near Goa, and capture all the small vessels which sail from Goa to Cochin. The huts in which their wives and children live, stand on the eastern side of Mount Delly.' This mountain, which forms a cape or headland, lies in the latitude of 12° 5′; and here Malabar or Maleala, properly so called, ends. Cannanore is now in British territory, held by a body of European and native soldiers; it is a place of large trade. There is a fort which was built by the Dutch in 1656, and the cantonment lies to its north. Across the bay from the fort is the quarter occupied by the Mopla race of Mahomedans.—*Imp. Gaz.; Voyage to East Indies.*

CANNIBAL.

Adam-khor, . . PERS.	Kai-tangata, . . MADRI.

Cannibals still exist in several parts of the world. The *Birhor* of the Central Provinces of India are said to eat their aged relatives, who invite their relations to kill and eat them.

The *Aghora*, a disgusting sect of saiva Hindus, are said to have eaten human beings till close to the middle of the 19th century.

Tribes of the *Batta* race in Sumatra, and some of the New Zealanders, continued to do so until towards the latter part of the 19th century.

Mr. Stanley and the missionaries describe many cannibal tribes on the banks of the Congo river in Central Africa, and of other races on the New Calabar river. The *Immithlanga*, a Zulu tribe, and the Moshesh in S. Africa, were cannibals; also the *Fan* of the west coast of Central Africa, and the *Niam* or *Sandeh* in the region of the Gazelle Nile, and the light-coloured civilised *Monbuttoo* race on the Uelle river. In the instance of the Basuto people the habit had newly arisen.

At the time of the Tai-ping insurrection in China, an English merchant in Shanghai met his servant in the street carrying home the heart of a rebel, with the avowed intention of eating it to increase his own courage.

The ancient Mexicans were cannibals.

Papuans of New Guinea, the Solomon Islands, New Hebrides, New Caledonia, and the Fiji group, were cannibals. It is common to all Polynesians, in the Marquesas Islands, the Hawai group, Tahiti, and the Maori of New Zealand. The Australians are not habitual cannibals. The odious rite exists with considerable civilisation. The natives of the Solomon Islands are dwarfish, but they build canoes which are 'perfect gems of beauty,' and they have a fine sense of vocal harmony. The New Hebrideans have a yet more inveterate love than these vocalists for human flesh. In one of the islands, Aneityum, the natives have been cured of the bad habit by the missionaries; but the population, which was 12,000, is now but a sixth part of that total. Epidemic diseases and a sudden change from barbarism to civilisation are the causes. Nowhere was the passion for human flesh more violent than with the Fijians. At great feasts twenty bodies would be served up at once. No solemnity was perfect in the times before British domination without human sacrifices. When a chief died, wives and slaves were buried with him. When a chief's house was built, a slave was buried under each pole which held it up. The Fijian had a firm belief in a future state, in which the actual condition of the dying person is perpetuated. Thus a young man, being unable to eat, was buried alive by his father at his own request, lest he should grow thin and weak. Somewhat luxuriously he asked to be strangled first; but 'he was scolded and told to be quiet, and be buried like other people, and give no more trouble; and he was buried accordingly.'

Anthropophagy has vanished with the people themselves from among the Iroquois and Algonkin; it has disappeared from among the people of the high plains of Anahuac, the Indians of Peru, and most Brazilian races. It is increasingly circumscribed in the Southern Ocean by the dying out of the cannibal races, and the pressure of white settlers. The number of cannibals is still, however, very considerable. The Batta of Sumatra, according to Friedman, may be reckoned at 200,000 souls; the cannibals of the Niger delta at 100,000; the Fan, according to Fleuriot de Langle, at 80,000; the cave-dwellers of the Basuto country (about a tenth of the whole population), at 10,000; the Niam-Niam, at about 500,000; the Miranha and Mesay, according to Marloy, at 2000; other South American cannibals, at 1000; the Australian aborigines? at 50,000; the Melanesians (without including New Guinea), 1,000,000,—a total at the present of 1,943,000 human beings addicted to

anthropophagy. A native paper of British India, in A.D. 1870, stated that a person had been transported for life by the Session Court at Jhansi, on a charge of eating dead human bodies stolen from graves. It was said that he had lived on this fare for a number of years.—*P. M. Gazette; Richard Andre in the Erganzungs blattern; Dalton's Ethnology; Newbold's British Settlements*, ii. pp. 370–373; *Peschel, Races of Man*, p. 161. See Aghora; Batta; Birhor.

CANNING. Charles John Canning was born at Gloucester Lodge, Brompton, in 1812. He was the third son of George Canning, a celebrated statesman, and was educated at Christ Church, Oxford. He entered upon public life in 1836, as member for Warwickshire. In the following year his mother died, and he went to the House of Lords. When Sir R. Peel came into power in 1841, he was appointed Under Secretary for Foreign Affairs. For a month or two, in the reconstructed ministry of Sir Robert Peel, Lord Canning was Chief Commissioner of Woods and Forests; but in July 1846 he resigned with his party, but returned with the Coalition Ministry in 1853. In the government of Lord Aberdeen, Lord Canning was Postmaster-General, and distinguished himself by his administrative capacity. He made many changes in the internal organization of the department, and set on foot the practice of submitting annually to Parliament a report of the work, and especially the progress, achieved by the post office. He held the same appointment for a short time in Lord Palmerston's cabinet. Lord Canning began his rule in India on the last day of February 1856, and in 1857 the army of Bengal revolted, and much of Northern India rebelled, under the guidance of Nana Rao of Bittur, and of the emperor of Dehli. The years 1857-1858 were employed in suppressing the mutiny, in which he displayed great boldness and self-reliance, and when the embers of the insurrection alone remained, he was the first to urge clemency.

On the 3d March 1858 he issued a proclamation declaratory of the policy he intended to pursue with regard to the talukdars of Oudh, which he afterwards modified, on the remonstrance of Sir James Outram, then Chief Commissioner. Oudh had been the centre of the rebellion, and on its suppression the inhabitants were disarmed, and the forts of the petty chieftains dismantled. He was the first Viceroy of India, having been appointed Viceroy and Governor-General 1st November 1858, and 12th March 1862. During his administration, the loyalty of the Sikhs and of the Nepal ruler, Sir Jung Bahadur, was conspicuous; equally so was the perfidy of Nana Rao and the emperor of Dehli. Several servants of Government, Sir Henry Lawrence, Sir John (Lord) Lawrence, Sir Robert Montgomery, Sir Colin Campbell, Sir Nevil Chamberlain, Sir George Balfour, Sir Hugh Rose, Sir Robert (Lord) Napier, Sir Hope Grant, Sir Henry Norman, Sir Bartle Frere, by their labours in war and in peace did the state service, and won honours for themselves. Earl Canning, on his return home, was appointed a Knight of the Garter by letters patent, dated Balmoral, May 21, but he died at London on the 17th June 1862.

CANNON.

Top, ... HIND.	Peringi gul, . TAM., TEL.
Mariam Bad-il, . MALAY.	

The cannon used for war in Eastern and Southern Asia by the eastern nations, or by the Europeans, are either imported from Europe and America, or are cast in the foundries of the several countries. The British have a considerable foundry near Calcutta, but cannon of the more recently invented forms are all imported from Britain. From the Persian term top, is the Hindi term top-khana, a battery of artillery. The British in India have mounted batteries drawn by bullocks, ponies, horses, and mules, also camel batteries and elephant batteries, and mountain trains.

CANOES.

Canot, ... FR.	Canoa, ... SP.
Barchetta, ... IT.	

Canoes are largely used in India as river and ferry boats, and have shapes and forms to suit the rivers and waters. Canoes at Calicut are hewn out of the trunk of the jack-fruit tree, Artocarpus integrifolia. Coast canoes of Point de Galle and the Malabar coast have weather-boards on an outrigger in the form of a smaller canoe; they are sharp at both ends, and beat to windward without tacking. The Jangar of the Malabar coast, for rivers, is a kind of canoe. The rivers of the Northern Circars are crossed by a double canoe, formed out of two pieces of a cocoa-nut or a palmyra tree hollowed, and kept apart by cross ties of wood. Canoes scooped out from single trees are in universal use in Burma, the Malay Peninsula, and the Malay and Eastern Archipelago. Canoes of the Solomon Islands have no outriggers. The practice of standing up to paddle canoes seems to be general throughout the coasts of New Guinea. The brown-coloured natives of the Archipelago all sit, or 'squat,' while paddling their canoes, excepting the Baju Laut, or sea gipsies, who stand like the Papuans, and give as a reason for assuming this posture, the superior facilities it affords them of seeing turtle, and of chasing them when discovered. See Boats.

CANOON-GO. ARAB., PERS. The village clerk; an expounder of the rent terms, literally, rule-teller.

CANOPUS STAR. See Kumbha yoni.

CANOUJ, in the N.W. Provinces, in lat. 27° 2′ 30″ N., long. 79° 58′ E., with a population of 17,093. It is said to have existed from 1000 B.C., and to have been founded by two sons of Cush, who named it Mahadya, afterwards changed to Kanya kubja. It was not unfrequently called Gadhipoora Jye-Chand. It was held by the Rahtor dynasty from the close of the 5th to that of the 12th century, and terminated with Jye-Chand, A.D. 1194. In S. 1268 (A.D. 1212), eighteen years after its fall, Seoji and Saitram, grandsons of Jye-Chand, abandoned Canouj, and with two hundred retainers journeyed westward to the desert,—according to some of the chronicles, on a pilgrimage to the shrine of Dwarica, but according to others, to carve their fortunes in fresh fields. Seoji, on the banks of the Looni, exterminated, at a feast, the Dabeys of Mehwo, and soon after killed Mohesdas, chief of the Gohils of Kherdhur. One of the chronicles asserts that it was Asothama, the successor of Seoji, who conquered 'the land of Kher' from the Gohils; and he established his brother Soning in Eedur, a small principality on the frontiers of Gujerat, appertaining, as did Mehwo, to the Dabey race; it was during the mātūm, a period of mourning for one of its princes,

that the young Rahtor destroyed the clan. His descendants are distinguished as the Katondia Rahtor. The third brother, Uja, carried his forays as far as the extremity of the Surashtra Peninsula, where he decapitated Beekumsi, the Chawara chieftain of Okamundala, and established himself. For this act his branch became known as the Badhail; and the Badhail are still in considerable number in that farthest track of ancient Hinduism. Its wars with Dehli accelerated the ruin of Hindu independence. This kingdom appears to have been called Panchala. It seems to have been a long but narrow territory, extending on the east to Nepal (which it included), and on the west along the Chambal and Banas as far as Ajmir. The identity of Canouj and Panchala is assumed in Menu 11. 19. Its limits, as assigned in the Mahabharata, are made out by connecting notes (vol. iii. p. 135, vol. iv. p. 142) in the Oriental Magazine. These boundaries, enlarged a little on the south and on the west, are the same as those assigned by Colonel Tod to the same kingdom at the time of the Mahomedan invasion. Mr. James Fergusson (p. 735) gives the following rulers in the Christian era—

Vasu Deva.	Reign.	A.D.
Vikramaditya I. of Ujjain,	25	470?
Sri Harsha,	20	495
Vikramaditya II., the Great,	35	515
Siladitya I. of Malwa,	30	550
Prabhu Kara,	25	580
Raja Verddhana,	5	605
Siladitya II. of Canouj,	40	610
Died and troubles commence,		648–650

—*Tod's Rajasthan*, ii. p. 13; *As. Jl.* 1817; *Elphinstone's History of India*, i. p. 402; *Ferg.* p. 735.

CANOUJIA, a clan of Gaur Brahmans. Also tribes in the north-west of India, who trace their origin from the city of Canouj. The Canouj Brahmans are met with from the Himalaya to the Narbada and Bay of Bengal. They have many subdivisions, but the khutkool or six houses—(1) Sandel-got, (2) Oopmun-got, (3) Bharadwaj-got, (4) Bhuradwaj-got, (5) Koteayun or Visvamitra-got, (6) Kusip-got, and (6½) Sakrint-got—are chief. The honour of an alliance with the privileged khutkool is such, that, like the Kulin Brahmans of Bengal, some of them have as many as twenty or twenty-five wives. Amongst them are included the Sunaluk'hee, who are said to have been made Brahmans by Raja Ram Bug'hel, when he was in a hurry to make a sacrifice, but as he could not perform it without assembling a lakh and a quarter of Brahmans, he collected people from all classes and parts, and invested them with the juneoo, or sacred thread. Others say that Manik Chand, the brother of the famous Jye-chand Rahtor, others that one of the Surneyt rajas, others that the redoubtable Ram Chunder himself, was the manufacturer. However this may be, the Sunaluk'hee rank very low in the scale of Brahmans.—*Gloss.*; *Elliot*, *Supp.*

CANRU. HIND. Flacourtia sepiaria.

CANSA, son of Ugra, a tyrant killed by Krishna.

CANTALA. HIND. Agave vivipara and A. yuccæfolia.

CANTHA-JATHI. BENG. Barleria prionitis.

CANTHARIDEÆ, a small tribe of vesicatory beetles, containing eleven genera, among which are Cantharis, Mylabris, and Meloe, species of all of which have been employed as vesicatories. The genus Cantharis does not occur in India, but is largely imported. The genus Mylabris is very common in the Dekhan. Cantharis erythrocephala occurs in Shanghai and Chefoo.—*Royle.*

CANTHARIS VESICATORIA. *Latreille.*

Nalla Regu, . . TEL.	

This is a small or middling sized, very handsome tree with deep green foliage. It is very abundant on most of the mountains in the Madras Presidency, particularly so on all the hills in the Salem district; grows in the Godavery forests, and is very common in Ceylon. A variety was considered by Wight as a distinct species from the Didymum of the eastern coast, but it only differs slightly in the inflorescence, and is not now considered specifically distinct; the wood is close-grained and hard, and mottled and very dark-coloured in the centre, like old seasoned oak.—*Beddome, Fl. Sylv.* p. 221.

CANTHIUM NITENS. *W. Ic.* Malai caurai, TAMIL. Dr. Gibson seems to consider Dr. Wight's C. nitens identical with C. didymum (the Canthium umbellatum, *Wight*), and adds, that if right in this conjecture, the tree is a common one on the Bombay Ghats, and, from its flowers and shining leaves, well worthy a place in gardens. The wood is small, and is said not put to any use.—*Wight; Gibson.*

CANTON, a city and seaport of China, capital of Quang-tong, in the south-west of China, built on a river of same name. At an early date after the Hijira, the Arab Mahomedans established a factory at Canton, and their numbers were so great by the middle of the 8th century, that in 758 they attacked and pillaged and fired the city, and fled to their ships. In their commercial transactions with the Chinese, the natives of Europe were long restricted to this town. The city consists of three sections, divided by high walls; the streets are narrow, paved with small round stones in the middle, and flagged at the sides. Canton river has two tides in the 24 hours, greatly influenced by the moon's declination. At its entrance it is called Choo-keang. It is divided into two channels by the Wan-tong islands, the eastern one of which is the Hoo-mun or Hoo-tow-mun, or Tiger's Head entrance of the Chinese, the Bocca Tigris of Europeans, and Foo-mun of pilots. The channel to the west is called Bremer channel. Canton city is on the N. bank of the river, about

30 miles above the Bocca Tigris, 75 miles from Hong-Kong, and 70 miles from Macao. The wall is 6 or 7 miles in circumference. Canton was captured by the British, and ransomed 25th May 1841.—*Horsburgh.*

CANTOR, DR. THEODORE, a Bengal medical officer, author of valuable contributions, in the Bengal Asiatic Society's Journal, to the knowledge of the mollusca, the fishes, reptiles, and mammals of Southern and Eastern Asia; Notes respecting Indian Fishes, in Lond. As. Trans. v. p. 165; Notice of Skull of a Gigantic Batrachian, Bl. As. Zool. Trans. 1838, p. 172; Spicilegium Serpentum Indicorum, Lond. Zool. Trans. 1839, pp. 31, 39; On Production of Isinglass from Indian Fishes, ibid. p. 115.—*Dr. Buist's Catalogue.*

CANVAS, sail-cloth, tent-cloth.

Zeildock, ... DUT.	Canevazza, . . IT., PORT.
Toile a voile, . . FR.	Parussina, ... RUS.
Segeltuch, . . . GER.	Parussnoe polotno, . ,,
Lona, . . IT., PORT., SP.	Kittan, . . . TAM., TEL.

Canvas woven from hemp is used in Europe as sailcloth for ships' sails, and a finer kind is made for towels and common tablecloths. Canvas is manufactured at Pondicherry and at Cuddalore, and sold in bolts, containing 40 yards, at from 20 to 25 rupees, and a coarser at 8 to 15 rupees a bolt. Canvas of excellent quality is manufactured in Travancore. European canvas, though much dearer, is generally preferred in India to the native material,—Europe material selling at 24, 25, and 26 rupees per bolt, while the ordinary country can be had for 16 rupees. A coarse description of very hard brown canvas has been for some time produced in Bengal. In some parts of the Madras Presidency, cotton canvas of very good quality is produced; two or more threads are placed together, sometimes the threads of the web are twisted either wet or dry. Native vessels have all their sails made of an inferior description obtained in the northern parts of Madras Presidency, at the rate of 6 to 8 rupees a maund of 25 lbs.—*Rohde, MSS.*

CANYA, in Hindu astronomy, the solar sign Virgo.

CANYA KUBJA, an ancient name of the town of Canouj.

India rubber, or caoutchouc, is a vegetable compound which is found in all plants with a milky juice, as in the moraceæ, euphorbiaceæ, artocarpaceæ, apocynaceæ, cichoraceæ, papaveraceæ, campanulaceæ, and lobeliaceæ. India rubber has long been known to the natives of the East Indies and South America. It was not, however, till the expedition of the French academicians to S. America in 1735 that its properties and nature were made known in Europe, by a memoir upon it by M. de la Condamine. And subsequent notices of it were sent to the French Academy in 1751 by M. Fresnau, and in 1768 by M. Macquer. It is used for machinery, in electric and surgical apparatus, weaving, and clothing.

The selling prices in London per lb. are—African, 1s. 5d.; Borneon, 1s. 9d.; S. and Central America, 2s.; and Madagascar, 2s. 3d.

The plants yielding the caoutchouc of commerce are—

Ficus elastica, Assam.	Hancornia speciosa of Pernambuco, in S. America.
Chavannesia esculenta, Burma.	Manihot glazionii, the Ceara tree of S. America.
Urceola, Borneo.	Hevea Benthamiana, *Mull.*, of S. America; also Brasiliensis, discolor, Guyanensis, lutea, pauciflora, rigidifolia, spruceana.
Vahea, Madagascar.	
Landolphia, Africa.	
Castilloa elastica, S. America.	
C. Markhamiana, *Collins*, S. America.	

Caoutchouc is obtained in Borneo from three trees, — manoongan, manoongan putih, and manoongan manga, from 50 to 100 feet high, and about 6 inches diameter,—seemingly three species of Willughbeia.

The American sources of the commercial supply are from the Hevea Braziliensis, H. Gwyanensis, Castilloa elastica and C. Markhamiana, and Hancornia speciosa. The African caoutchouc is got from the Vahea gummifera of Madagascar, and Landolphia Owariensis; and the Asiatic plants are Ficus elastica, Urceola elastica of Sumatra, Borneo, and Penang, Willughbeia edulis, and Chavannesia esculenta. Other plants are named, viz. Siphonia elastica, S. calinchu, Jatropha elastica, and Melodinus monogynus. The banyan tribe generally yields a milky juice, which, for many purposes to which caoutchouc is applied, might be rendered serviceable. So long ago as 1836, Dr. Royle reported fully on the Assam caoutchouc from the Ficus elastica. The Ficus elastica has been introduced into the Tenasserim Provinces, and appears to grow as well as an indigenous plant. Caoutchouc from Ficus elastica was brought to Arakan in 1878 by clans of the Shandoo or Poor race, who receive it in barter from the Lushai. They reside north and south of the Blue Mountains. The plant is indigenous for thirty miles south of the Blue Mountains. In 1873 the Government of India formed plantations of it. It has aerial roots, and grows to a large size, above 100 feet, in the evergreen forests at the foot of the Assam hills.

Chavannesia esculenta, a troublesome creeper in the Burma forests, attains a girth of 11 inches, and its crown covers an area of 300 square feet. Its caoutchouc is similar in quality to that of the Ficus elastica.

Species of Ficus produce the caoutchouc brought from Java; and F. radula, F. elliptica, and F. prinoidos are amongst those mentioned as affording a portion of that brought from America. Next to the Moraceæ, the order Euphorbiaceæ yields the largest quantity of caoutchouc.

Siphonia elastica, a plant found in Gayalla, Brazil, and extending over a large district of Central America, yields the best kinds of India rubber that are brought into the markets of Europe and America. The caoutchouc which is brought

from the islands of the Indian Archipelago is from the Urceola elastica, a climbing plant of very rapid growth and gigantic dimensions. A single plant is said to yield, by tapping, from 50 to 60 lbs. annually. It is also obtained from the juices of Callophora utilis and Cameraria latifolia, plants of South America and Willughbeia edulis, in the East Indies. Caoutchouc, whilst it is in the tissues of the plant, is evidently in a fluid condition; but after its separation from the other fluid parts, it forms a solid mass similar in its external characters to vegetable albumen. In this state it is dense and hard, but may be separated and rolled out so as to form a sheet resembling leather. Caoutchouc is employed to rub out pencil marks made on paper, and largely for waterproofing. When distilled, it yields oils which have a composition similar to oil of turpentine. In N.E. India, an India rubber tree grows to some 70 to 100 feet high. Immense forests of it are found on the west side of the Brahmaputra, extending along the Miri and Abor mountains. The rubber from this tree from some chemical property cannot bear the heat of a passage to Europe. It becomes a fluid during the voyage. Otherwise, in cold climates it is equal to other rubbers.

The Caoutchouc trees of the Bhamo and Mogoung districts are estimated at 400,000. They thrive most in damp moist soil, and in thick forests, shady and cool. They grow to from 75 to 150 feet high, and their roots grow over the ground to some distance. They are fit to tap when from 6 to 10 years old, at which time they are 21 to 30 feet high, and 4½ feet in girth.

In the Tenasserim Provinces, also, a species of Echites, an indigenous creeper, yields caoutchouc not at all inferior to that which is obtained from the elastic fig tree. The Agricultural and Horticultural Society, in reporting on a specimen sent them by Major MacFarquhar of Tavoy, observed: 'With care in preparing, it would be equal to the best South American.' Caoutchouc is also procurable from the Nerium grandiflora, a beautiful climbing shrub often met with in gardens. The Loranthi abound in Malabar; and a similar substance might readily be procured, as obtained from Urceola elastica in Penang and the Archipelago, Ficus religiosa, F. Indica, Hippomane biglandulosa, Cecropia peltata, and the Jintawan of Borneo.

Castilloa, the Ule of South America, belongs to the Artocarpaceæ, and is one of the loftiest of the forest trees of tropical America. There are two known species, Castilloa elastica, *Cerv.*, and C. Markhamia. Which yields the India rubber is at present (1876) disputed. The collectors are called Hulero. C. Markhamia attains to 180 feet in height, with a diameter of 5 feet, and a yield of 100 lbs. of India rubber; wood soft and spongy; leaves 14 inches long and 7 broad.

Hevea Brasiliensis (Siphonia Brasiliana, *Kth.*) grows in the valley of the Amazon. It is the Castilloas of South America. It is the most valuable of the India rubber trees, and furnishes the Para rubber. It was introduced into India in 1873, as it affords the best caoutchouc, exported from Para in Brazil. The juice is obtained by incisions cut through the bark; it falls freely from any wound. The stiffening milky juice is plastered over bottle-shaped clay moulds, the clay being removed, when sufficiently coated, by washing. Other species of hevea yield juice abounding in caoutchouc of various qualities. It is dissolved by turpentine and spt. eth. sulphur. In Britain there are about twenty factories where this article is made into shoes, boots, capes, cushions, elastic bands.—*Poole's Statistics of Commerce; Rohde, MSS.; Royle, Productive Resources of India*, p. 76; *Mason's Tenasserim*; *Bonynge, America*, p. 258; *Reports, Exhibition of* 1851; *Eng. Cyc.; Trans. Royal As. Soc.; Tomlinson*, pp. 296–299; *Captain Strover*, 1873; *Markham, Peruv. Bark.*

CAPA. See Eleusine coracana.

CAPALA. HIND. Rottlera tinctoria. The oil, which is obtained plentifully from the kernels of this fruit after the removal of the celebrated kupli or kamala powder, promises to be of some importance medicinally as a cathartic oil, and deserves a more complete investigation. See Dyes.

CAPE ADEN, a high, rocky, peninsular promontory on the south coast of Arabia, 5 miles long and 3 broad. Its most elevated part, 1776 feet high, is called Jabal Shamsham, and in clear weather is visible 60 miles off. This peninsula was taken by the British in 1839, and has since been fortified. Several parts on and near it are named, as Hejaf, Al-Ainah, Shaikh Ahmid Island, Ras ibn Jarbein, Ras Marbut or Steamer Point, Ras Tarshein, 988 feet; Ras Marshigh.—*Findlay.* See Aden.

CAPE BUNGO, in Japan, in lat. 33° 32′ N., long. 132° 2′ E., at which Ferdinand Pinto landed in 1542. See Pinto.

CAPE COMORIN, in lat. 8° 4′ 20″ N., and long. 77° 35′ 35″ E., is a low, sandy point, with a small white, square pagoda at its extremity. A little to the W. is a large village. Inland, the Cape rises in a gradual slope to the base of the ghats, the nearest of which, at 4 m. N.W., is an isolated, very sharp conical hill, 1403 feet high, often mistaken for the Cape itself. It is the most southerly point of the Peninsula of India. The name is from Kumari, a virgin, the virgin goddess Durgah, and has a legend that a virgin once leaped from it into the sea. It is covered on the eastern ridge with palmyra trees.—*Horsburgh; Imp. Gaz.* See Comorin.

CAPE DALGADO, on the E. coast of Africa, in lat. 10° 41′ 12″ S., and long. 40° 39′ 51″ E.

CAPE GUARDAFUI, a headland on the coast of Africa, nearly opposite Aden.

CAPE HEN, or Sooty Petrel, is the Puffinus major, also Diomedia fuliginosa.

CAPE JASHK is the N.E. limit of the Gulf of Oman.

CAPE LIANT, in the Gulf of Siam, in lat. 12° 34′ N., long. 101° 11′ E., called by the Siamese Lem Samme San. The whole of the coast, from Cape Liant to Kamas in Cambodia, is an uninterrupted archipelago of beautiful islands. One of them, Hin Chalan, is in lat. 12° 27¾′ N., and long. 100° 57¼′ E. See Cambodia.

CAPE MONZE, a cape in the southern part of Baluchistan, in lat. 25° N. It is the most westerly point in India. The mountains of Baluchistan are there only a few miles broad.

CAPE NEGRAIS, its extreme S. point in lat. 16° 1′ 30″ N., and long. 91° 13′ 16″ E., is the termination of the mountain range that runs N. and S. along the Arakan coast.

CAPE OF GOOD HOPE, the southernmost point in Africa. It was rounded by the Egyptians ages before the Portuguese succeeded under the command of Vasco da Gama. Cape Town, the capital of the territory of the Cape, stands on the west side of Table Bay, and rises in the midst of a desert, surrounded by black and dreary mountains, Table Mountain (3315 feet high), the Sugar Loaf, the Lion's Head, Charles Mount, and James Mount, or the Lion's Rump. From these several rivulets flow into Table Bay, False Bay, etc. This town surrendered to the British in 1795, and was restored in 1802 by the treaty of Amiens; it again surrendered to the British in 1806, and was finally ceded to them in 1814. Long. 18° 23′ E., lat. 33° 50′ S.

Cape Gooseberry, Physalis Peruviana, also Brazil cherry.

CAPE PALMYRAS, a projecting land in Orissa.

CAPE PETEL, also Cape Pigeon, the Daption Capense, *Stephen*, also called Pintado, and by sealers the Egli bird.

CAPE RAMAS, in lat. 74° E., and long. 15° 6′ N., on the west coast of India, near Goa, has a small fort on it belonging to the Portuguese.

CAPERS.

Kebbir, ... ARAB.	Capparis, ... LAT.
Kappers, . . . DUT.	Kebbir, ... PERS.
Capres, ... FR.	Kaperszii, . . . RUS.
Kappern, ... GER.	Alcapparrais, . . SP.
Cappari, ... IT.	

The capers of commerce are the unexpanded buds of Capparis rupestris of Greece, C. fontanesii of Barbary, and C. Ægyptiaca of Egypt. Preserved in vinegar, these flower-buds constitute a well-known article of commerce and of luxury at our tables. The quality depends exclusively upon the age at which they are gathered, the smallest and youngest being the dearest and most delicate, and the largest and oldest the coarsest and cheapest. On an average, each plant of the caper bush gives a pound of buds. The consumption of capers in Britain is about 60,000 lbs. a year. Several other species of Capparis possess stimulating properties.

CAPER SPURGE, Euphorbia lathyris.

CAPILLAIRE, a syrup prepared with leaves of the Adiantum capillus Veneris and A. caudatum. The last grows in Ceylon, also amongst the Courtallum hills in the Indian Peninsula, in Cochin-China, and at Amboyna; the first is called by Rumphius, Micca Miccan Uttan.—*Ainslie's Mat. Med.* p. 297.

CAPOETA MACROLEPIDATA, a fresh-water fish of Tenasserim, Penang, and Java, with a large swimming bladder of which isinglass is made. See Isinglass.

CAPOOR KICHLIE. TAM. Curcuma zedoaria. Likewise the root of a plant called also Kakhur, sent to India and Persia for medicinal purposes, and for perfumery, and to preserve clothes from insects. It is about half an inch in diameter, and cut up when brought to market; it has a pungent bitterish taste, and slightly aromatic smell.—*Middle King.* ii. p. 400.

CAPPARIDACEÆ, the caper tribe of plants. Sixty-four species occur in the East Indies, of the genera Gynandropsis, Cleome, Polanisia, Cratæva, Niebuhria, and Capparis. Some American Capparidaceæ are very poisonous, others act as vesicatories, and a few are merely stimulant. To the latter class belongs the Capparis spinosa of the south of Europe.

CAPPARIS APHYLLA. *Roxb.*

Karu, ... HIND.	Doro (unripe fruit), SIND.
Kirrur, ... SIND.	Pukko (ripe ,,), ,,
Karil, ... ,,	Pusse (flowers), . ,,

This small tree grows on the banks of the Jumna, in Tinnevelly, Dekhan, Gujerat. On his journey to Kābul, the Honourable Mr. Elphinstone found it growing in the midst of the desert. All over the Panjab its flower-buds are cooked as a pot-herb; its unripe fruits are gathered, made to assume the acid fermentation, and made into a pickle with pepper, mustard, and oil, and eaten with bread. The fruit is about the size of a marble, and is gathered both green and ripe by great numbers of the natives, who eat it largely. Its wood is durable, and not eaten by insects. Karil fruit is considered by natives useful in boils, eruptions, swellings, piles, and in affections of the joints; also as an antidote to poisons.—*Roxb.; Voigt; Dr. J. L. Stewart; Powell's Handbook.*

CAPPARIS BREVISPINA. *D. C.*

C. acuminata, *Roxb.* ii. 566.

Kalo-kera, . . . BENG.	Palikee, ... TEL.
Authoondy kai, . TAM.	

A scrambling shrub of Malabar and Bengal, common in hedges, with a beautiful red fruit, the size of a small pear; the stem armed with yellow thorns in pairs at the leaves. The green fruit is used in making pickles.—*Jaffrey; Voigt; Roxb.*

CAPPARIS DECAISNÆI. Its buds, Paneero, SINDI, are pickled, and would well replace the ordinary capers of commerce; leaves epipastic.

CAPPARIS DECIDUA. Its fruit, Karil, called also Déle, is gathered from the tree when it is of a bright red colour, and about the size of a cherry; it is used as a pickle.—*Powell's Handbook.*

CAPPARIS DIVARICATA. *Lam., W. and A.*

Pachoonda, . . MAHR.	Budareni, ... TEL.
Toaratti maram, . . TAM.	

A small tree of Coimbatore, and not uncommon on the more arid wastes and in the dry hedges of the interior of the Bombay Presidency. Wood only fit for fuel.—*Wight; Gibson.*

Grows in Bengal and Peninsula, and is a good hedge plant.—*Voigt*, pp. 74, 75.

CAPPARIS SINAICA. The buds of the caper of Mount Sinai are the Filfil-ul-jabl, or mountain pepper of the East.—*O'Shaughnessy.*

CAPPARIS SPINOSA. *L.*

Barari; Ber, . . CHEN. | Kakri; Bassor, . SUTLEJ.
Kabra, . HIND. of LAD. | Kaur; Kiari, . . ,,
Bandar, ... SUTLEJ. | Taker, ... ,,
Bauri, ... ,, | Kabarra, . . TR. IND.

In Europe this plant furnishes the caper. It generally grows in the Panjab, exactly as a recent traveller has described it on Sinai, viz. 'in bright green tufts hanging down from the clefts of the rocks,' and adorned with very handsome large flowers. It is found near Multan, in the Salt Range, along the Trans-Indus hills to Peshawur, and in the valleys of some of the great rivers, ascending to 5000 feet at Wangtri, on the Sutlej 8000 feet, *Thomson*, and on the Indus above Iskardo to about 10,500 feet (*Jacquemont* and *Thomson*), and it occurs to 12,000 near Leh. The ripe fruit is made into pickles by the natives of the Salt Range, etc., but in some places at least eaten only by Hindus. Mr. Edgeworth prepared the buds in the European style as capers, and found them excellent. In Ladakh the leaves are used as greens; they are eaten by goats and sheep; and in Kangra the roots are said to be applied to sores.—*Dr. J. L. Stewart*, p. 616.

CAPPER, COLONEL, Quartermaster-General of the Madras army in the latter part of the 18th and beginning of the 19th century, and his house on the sea-beach is still known by his name. He was the first to put forward the view that the storms of the Indian Ocean are rotatory, and in 1801 he published a book on the Winds and Monsoons, adopting the view that hurricanes are whirlwinds. He took an active part in the troubles of the Madras army, and was embarked for England, but the ship never reached.

CAPRA ÆGAGRUS. *Gmelin, Blyth, Hutton.*

Antilope gazella, *Gmel.* | C. hircus, . *Gray.*
Ægoceros ægagrus, *Pallas, Wagner.* | Hircus gazella, ,,
Capra Caucasica, *Gray.* | Capra Blythi, *Hume.*
Persian wild goat, . ENG. | Borz, ... PUSHTU.
Pa-sang (male), . PERS.? | Ter (male), Sera, SIND.
Boz (female), . . . ,, | Phashin, . . BALUCH.

This has five varieties, viz. :—

Var. a. Capra ægagrus, *Buch.*, lives in the highest Khassya mountains, where they are reared by the people. It has no wool, and is used for food.

Var. b. Capra ægagrus of Changra, *Buch.*

C. ægagrus lanigera, *Desm.* | C. hircus, *var.*, *Desm.*
Shawl goat, . . . ENG. | Cholay, . . . NEPAL.
Bouc de Cachemire, FR. | Camjoo, ... TIBET.
Changra, ... HIND.

This is domesticated in Tibet, and the wool is exported to Kashmir, where it is made into the finest shawls. It has on the body a long coarse hair, intermixed with which is a fine soft wool, which is the article used in the manufacture.

Var. c. Capra imberbes, the Berbura, *Buch.* The Berbura goat is found to the west of the Jumna. Its female is the Berburi, and the Bengali call it Ram Sagul. The body is very like the long-legged goat of the south of India; in manners they are similar. The scrotum of the male externally is separated into two distinct bags.

Var. d. Tibetan goat of Ladakh; has a short tail, and very short ears, scarcely two inches long, and concealed; has long, soft, pendulous hair, but no wool.

Var. e. Tibetan goat of Ladakh; has long, soft, pendulous hair, but no wool.

C. ægagrus, of the mountains of Asia, is believed to be the parent stock of all the goats, mingled perhaps with the C. Falconeri of India. The breeds greatly differ from each other, but they are fertile when crossed.—*Darwin.*

CAPRA MEGACEROS. *Hutton, Blyth, Jerdon.*

Ægoceros Falconeri, *Hugel, Wagner, Schreber.* | H. megaceros, *Adams.*
Hircus Falconeri, *Gray.* | Capra megaceros, *Blyth, Hutton.*
Capra Falconeri, *Hugel, Wagner.* | C. Caucasica, *Jerdon.*
 | C. Blythii, *Hume.*
Hircus ægagrus, *var.*, *Gray.* | C. Jerdoni, ,,
Sind wild goat, Ibex, ENG. | Rapho-chhe, Ra-chhe,
Rass of Wood, . . ,, | Rawa-che.

The *Mar-khor* inhabits the highest parts of the Tibetan Himalaya, also the Suliman range, the Pir Panjal, Kashmir, the Hazara Hills, the hills of the Jhelum and Chenab, and Ladakh.

The Kashmir variety (Capra Falconeri) has openly spiral horns. The horns of the Suliman variety more nearly approach a straight line. The Sind goat or Sind ibex is identical with the wild goat of the Caucasus, Armenia, and Persia, probably of Crete. It is not found east of the Indus. The famed bezoar (pa-zahr, PERS., fa-zahr, PERS.) of commerce is obtained from this goat. It associates in small herds frequenting steep and rocky hills, in winter descending to the bare spots in the wooded region. It is much sought after by sportsmen, and the horns are considered a great trophy.—*Jerdon*, p. 291.

CAPRA SIBIRICA. *Meyer, Blyth.*

C. sakeen, *Blyth.*
C. Pallasii, *Schinz.* | C. Himalayana, *Blyth.*
Himalayan ibex, . ENG. | Kyl of . . . KASHMIR.
Skin (male), Iskin, HIM. | Tangrol of . . KULU.
L'-dmau (female), . HIND. | Buz of . . . . SUTLEJ.

Is found throughout the Himalaya from Kashmir to Nepal; rare in Kashmir. The soft under fleece is called asli-tus, and is used for lining shawls, stockings, gloves, and is woven into a fine fabric called Tusi. No wool is so rich, so soft, and so full. The hair itself is manufactured into coarse blanketing for tents, and twisted into ropes.—*Jerdon*, 292.

CAPRELLA, the phantom shrimp, is found on seaweed sitting upright like a monkey, holding on by its hind claws, and, with ghastly grimaces, mesmerizing all passers-by with its fore-claws. It sits in like guise upon sponges a mile or two deep in the darkness,—there, however, not a quarter of an inch, but three inches long.

CAPRIFOLIUM CHINENSE. *Smith.* Kin-yin-hwa, of the Chinese; a climbing plant with gold and silver flowers; one of the Caprifoliaceæ.

CAPRIFOLIUM SEMPERVIRENS. *R. et S.*

Lonicera sempervirens, *D.C.* | Trumpet honeysuckle.

The honeysuckle occasionally seen in India.

CAPRIMULGIDÆ, the goatsucker family of birds, belonging to the tribe Insessores,—Caprimulgus affinis of Java, C. albonotatus, C. Asiaticus of India, C. atripennis, C. Indicus of Kamaon, Malacca, C. Kelaarti, C. macrouris of Java, C. Mahrattensis of the Dekhan, C. monticolus of do., C. ruficollis, C. Europæus; migratory night-jar of Europe, N. Africa, W. Asia, Siberia, and Kamtschatka.

CAPRINÆ, a sub-family of mammals of the family Bovidæ, comprising goats and sheep, 1st capricorns, or antelope goat or mountain antelope; 2d, the true goats. See Antilopinæ, Bovidæ.

CAPROVIS ARGALI.

Ægocerus argali, *Pallas.*	O. argali, *Pallas.*
Ovis ammonoides, *Linn.*	O. Hodgsoni, *Blyth.*
O. ammonoides, *Hodgs.*	

Hyan, nyan, nyund, nuan, niar, gnow, . . TIB.

Dr. Gray says this species, the Nyan or Bambhera, or wild sheep, seldom or never crosses the Himachal, the Indian side of which range is the special habitat of the Nahoor, while to the north and west beyond Tibet, C. argali is replaced by other species; so that Tibet may be considered as the special habitat of one species (Ovis ammonoides), and the plateaux north of Tibet as far as the Altai of another (Ovis ammon.), cited as types of the true ovine form; and it may be added, that the six sorts of tame sheep of Tibet and the Sub-Himalayas, all without exception exhibit the essential characters of that form. There are several species that may be confounded under this head. The Siberian Argali is found in the most northern part of that country, and it is probably different from the Himalayan animal; but Mr. Blyth had not been able to discover any difference between the specimen received from Mr. Hodgson and those which were sent from Siberia by the Russian naturalist.

CAPROVIS VIGNEI, the Houriar, extends along the eastern spurs of the Salt mountains, but becomes less common as we proceed eastward, and is seldom met with on the ranges beyond the town of Jhelum, or southwards of the Beas river. It is confined to the north and western portions of the Panjab, including the Suliman chain, where it is known by the name of Kuch. It is also a denizen of the mountains around Peshawur, including the Khaibar pass, Hindu Koh, and Kafiristan. The Shapoo or Shalmar of Ladakh, if not identical, is certainly very closely allied; its differences are slight, and such as might result in a great measure from the marked diversity of climate, food, etc., of the two regions. This species is no doubt the Sha of Tibet described by Vigne; and possibly the wild sheep of western Afghanistan, Persia, the Caucasus, Armenian and Corsican mountains, is the same species altered mayhap by climate and other external agencies. The eastern limits of the Shapoo have not been fixed with certainty; but it would seem that, commencing at Ladakh, it proceeds westward towards the Indus into the regions where the Houriar is found; and probably when these regions are explored, we shall find out the relation between what has been supposed distinct, but which Dr. Adams is inclined to consider one and the same animal.—*Adams.*

CAPSELLA BURSA PASTORIS. *Mænch.*

Mullay muntha keeray, *Tm.* | Shepherd's purse, . ENG.

Common on the Neilgherries; also grows in Europe, Persia, Asia, and Japan; used by the natives as a pot-herb.—*Jaffrey; Wight.*

CAPSICUM, red pepper, chillies.

The shell of the fruit is fleshy and coloured, and contains a pungent principle, which also exists in its seed in great activity. On this account both the fruit and seeds of different varieties or species of Capsicum are in request as a condiment; and either in the unprepared state, or ground, when they are called cayenne pepper, form a conspicuous feature amongst the plants affording stimulating substances used by man. In Europe the Capsicum enters largely into the seasoning of food and the preparation of pickles, and in warmer countries it constitutes one of the first necessaries of life, either green or ripe. It is the species of this genus, and not any of the genus Piper, which is the peppery condiment of all the inhabitants of India and the Asiatic islands in Eastern Asia; the latter, indeed, being little used, and mostly raised for exportation. Foreign species or varieties of Capsicum have been introduced into the Archipelago, and are named by the Malays, Chabe China, the Capsicum of China; and Chabe Sabrang, the Capsicum of India, literally, of 'the other side of the water.' There are now numerous varieties of chillies in India, many of which have been introduced. They are raised from seeds that have been kept for one year, for if fresher, the crop is generally a failure. One species, called 'devil's pepper,' introduced by Lord Harris from Trinidad, is so intensely hot that the natives can hardly manage to use it. It is cultivated during the cold months. In the Tenasserim Provinces two or three species enter into all the native dishes, not in the form of pepper, but the fruit, stewed or roasted, is eaten with the food. In India, the dried fruits of several species and varieties of Capsicum usually seen are the C. annuum (common Capsicum), C. frutescens (goat pepper), C. grossum (bell pepper), C. minimum (bird's eye pepper), perhaps only cultivated varieties of one species. They are valued as a digestive condiment, and are raised all over the S.E. of Asia as condiments, and to make cayenne pepper and chilli vinegar.—*Tomlinson; Crawfurd, Dict.* p. 82; *Jaffrey; Mason.*

This is the most acrid and pungent of the species Capsicum.

CAPSICUM PURPUREUM and C. minimum are cultivated in small quantity in Pegu for domestic use.—*M'Clelland.*

CAR, the ruth of India, used at the Hindu temples to convey the idol from one place to another. This is usually preceded by native music, flaring torches, dancing girls, and priests, the deity bedizened with jewels, and carried on a richly-constructed throne, and fanned with gorgeously-constructed fans. While Sir G. Campbell was Lieutenant-Governor of Bengal, twenty people fell while the car at Goopto was being dragged; eight were run over, five were killed on the spot, and three were wounded, of whom one died. The six victims were women.

CARABIDÆ. *Leach.* The family of ground beetles, about 9000 species are known. Almost all possess a very pungent, disagreeable smell; and a few, called bombardier beetles, have the peculiar faculty of emitting a jet of very volatile liquid, which appears like a puff of smoke, and is accompanied by a distinct crepitating explosion. They are mostly nocturnal and predacious. They are chiefly remarkable for brilliant metallic tints or dull red patches, when they are not wholly black, and are therefore very conspicuous by day, but insect-eaters are kept off by their bad odour and taste. They are sufficiently invisible at night, when it is of importance that their prey should not become aware of their proximity. Many species of Carabus, a genus of the family Carabidæ, occur in India. C. cœlestis is a beautiful beetle of China. C. impressus, *Fabr.*, and C. politus, *Fabr.*, occur in the East Indies.

CARAB TREE, Ceratonia siliqua, *W.*

CARACAL, Felis caracal, *Schreber*, the Indian lynx, occurs in Africa and Asia. It has immense speed, runs into a hare as a dog into a rat. It often catches crows as they rise from the ground, by springing 5 or 6 feet into the air after them.

CARAGANA FLAVA. *Smith.* Hwang-tsing of the Chinese. In China its root is eaten as food in times of scarcity. It is obtained from the provinces of Ngan-hwui, Che-kiang, and Hunan.

CARAGANA GERARDIANA is the Tartarian furze. C. arborescens is the tea tree of Siberia.

CARAGANA VERSICOLOR. *Royle.*

Caregana pigmæa, *D.C.*	Dama, ... TIB.

A small shrub which grows in Tibet and Western Himalaya at elevations of 14,800 feet, and is very useful for fuel.—*Drs. Stewart and Thomson.*

CARALLIA CALYCINA. *Benth.* This large Ceylon tree has two varieties,—var. α, Singhe Raja forests, between Galle and Ratnapura, at no great elevation; var. β, Central Province, at an elevation of 4000 to 5000 feet.—*Thw.* ii. p. 121.

C. Sinensis.	Pootia cereopsifolia, *Mig.*
Kierpa, ... BENG.	Punschi, ... MAHR.
Punselu, Andi Punar, CAN.	Dawata, ... SINGH.

A very common tree in the Western Ghat forests, up to 4000 feet, from Bombay down to Cape Comorin, also on the Cuddapah hills; most abundant in S. Canara. In Ceylon it is met with up to 3000 feet, and it is indigenous in Bengal, Burma, Hong Kong, and tropical Australia. It is a highly ornamental tree, on account of its beautiful foliage. The timber is ornamental and of a reddish colour, and is used for furniture, cabinet purposes, and fittings. It is tough and not easily worked, brittle and not durable, and has a pretty wavy appearance, and is peculiar in structure, having a great deal of cellular tissue. A cubic foot unseasoned weighs about 56·60 lbs., and 44 lbs. when seasoned, and its specific gravity is ·684; in Burma, where the tree is known by the name of Maneioga, it is used for planks and rice pounders. In Calcutta it is in use for house-building.—*Beddome, Fl. Sylv.*

CARALLIA LANCEÆFOLIA. *Roxb.* A tree of Sumatra.—*Voigt.*

CARALLIA LUCIDA. *Roxb.*

Carallia integerrima, *D.C.*	Carallia integrifolia, *Grah.*
Kierp, Kierpa, . . BENG.	Dewata gass, . . SINGH.
Maneioga, . . . BURM.	Davette, ... ,,
Phansi, ... CAN.	

This handsome tree grows on the Malabar side of India, in the Konkans, the Circars, Kamaon, Sylhet, Chittagong, Pegu, Mergui, and in Ceylon up to 3000 feet. On the Bombay side it is small, but pretty frequent in the forests of the S. Konkan. Wood hard, close-grained, and might be used in turning. Thwaites says it is rather ornamental, and adapted for furniture. It is a large and common tree north of Rangoon and throughout Pegu. Wood of a peculiar structure, thick medullar rays going through from the centre to the circumference; colour red; used for planks and rice pounders, and may possibly be found useful for cigar boxes. In the southern forests of Pegu it is a plentiful tree of large girth, and in Calcutta is employed in house-building, under the name of Kierpa.—*Drs. Gibson, M'Clelland, Brandis, and Voigt.*

CARALLUMA ADSCENDENS. *R. Br.*

Stapelia adscendens, *Roxb.* | Cullee moolayan, . TAM.

This curious-looking fleshy plant, with angular stems, belonging to the natural order Asclepiaceæ, is used by the natives in making pickles, and sometimes in chatni.—*Jaffrey.* See Vegetables.

CARAMBOLA TREE, Averrhoa carambola. Largely cultivated in the Kwang-tung province of China.

CARAMBU. TAM. Caryophyllus aromaticus.

CARAMBU. MALEAL. Ludwigia parviflora.

CARANA PALM, the Maurita carana. Its leaves are used as a thatch for houses.—*Seem.*

CARANX ROTTLERI. Rudder fish; an inhabitant of the southern seas, from 1 to 2 feet long. C. mate, *C. and V.*, horse mackerel. See Fishes.

CARAPA, *sp.* Taila-oon, BURM. A Tavoy wood used in building.—*Col. Firth.*

CARAPA GUIANENSIS. Its seeds yield a solid oil or vegetable milk. It is a large tree of Guiana. See Dyes.

CARAPA MOLUCCENSIS. *Lam.*

Xylocarpus granatum, *Kœn., Willde.*

Kadul, ... SINGH. | Kandalangha, . . TAM.

This tree is a native of the coast in Malabar, Ceylon, and in the Sunderbuns; is also found in Africa, Australia, Madagascar, and the Malay Archipelago.—*Beddome, Fl. Sylv.* p. 136.

CARAT, from the Greek keration, a kind of vetch. A carat weighs 4 grains French, or $3\frac{3}{4}$ grs. troy. It is used in weighing precious gems, and also in valuing the alloyed precious metals, in this case standing for an imaginary 24th part of the pound troy, the number of carats indicating the pure metal, and the remainder the alloy. Thus the carat standard of the sovereign is 22, or 2 parts alloy; of watch-cases with the Goldsmiths' Hall mark, 18, or 6 alloy. In France the latter is the lowest legal standard.—*King.*

CARAVAN. See Kafilah; Karwan.

CARAVANSARY. These, in Syria, form four sides of a large quadrangular court. The ground floor is used for warehouses, the first floor for guests, and the open court for the loading and unloading of their burdens, and the transaction of mercantile business generally. The apartments used for the guests are small cells opening into a corridor, which runs round the four sides of the court.—*Eothen*, p. 243. See Dharmsala; Serai.

CARAWAY PILLAY. TAM. Bergera Konigii.

CARAWAY SEED.

Keummel, . . . ,,	Alcaravea, . . . SP.

These aromatic seeds are used to flavour cheese, spirits, liqueurs, and articles of medicine.—*O'Sh.*

CARBI or Karbi. BENG. Stalks of Sorghum vulgare, used as fodder.

CARBON, when pure, is diamond; less pure, is plumbago, coal, and charcoal.

CARBONATE OF LEAD, white lead, ceruse.

CARBONATE OF LIME.

Kwang-feu, . . . CHIN.	Carbonate de chaux, FR.
Chalk, ... ENG.	Carbonas calcis, . . LAT.

A very abundant mineral, and embraces several varieties, of which stalactical carbonate of lime is one. All the limestone caves of Tenasserim have stalactites hanging from their roofs, and stalagmites rising on their floors. The Siamese Karens often bring over bits of limestone of the shape of a shell, and, when broken, a shell usually of the genus Melania appears, that has been encrusted with carbonate of lime. Much of the alabaster of which ornaments are made in Burma, is stalagmite; but all the alabaster images of that coast are made of marble, and not of compact gypsum, which they much resemble.—*Mason.*

CARBONATE OF SODA. Impure carbonate of soda, called Sajji or Sajji matti, occurs as an efflorescence in some part or other of almost every district in India. Muriate of soda and carbonate of lime exist in the soil, and the natron is found on the surface of the moist earth or mud. Near Gundycottah, on the banks of the Pennar, common salt is interstratified with the upper schistose strata of the argillaceous limestone on which the sandstone rests; and on the surface of the neighbouring soil, natron, contaminated with much muriate of soda, is collected.

Barilla, an impure carbonate of soda, is prepared by burning plants of the Salsola and other species, and collecting the ashes, which melt into a coloured mass. *Sajji lota* is a somewhat purer kind, but still contains an immense amount of organic and other foreign matter, such as the sulphates of soda and lime, chloride of sodium and potassium, sulphide of sodium, sulpho-cyanide and ferro-cyanide of sodium, together with silica and clay. The *Kangan khar* plant yields the best alkali. The pure sajji from this plant is called lota sajji, and the residue mixed with ashes is called Kangan khar sajji. The other two plants yield only a dirty and inferior substance known as Bhutni sajji, 'devil's soda.' This is black in colour, and sold in pieces like lumps of ashes. The plant burned in the Panjab is termed Khar, or in Persian Ashkhar; its scientific name is Caroxylon Griffithii. There are many square miles densely covered with this last, whereas the Khar is comparatively rare. Khar is applied to various herbs belonging to the natural order Chenopodiaceæ, particularly the Anabasis multiflora and the Caroxylon Griffithii. The ashes, which fuse, run into a pot placed beneath the burning heap.—*Powell; Stewart.*

CARBUNCLE.

Escarboucle, . . . FR.	Carbunculus, . . . LAT.
Karfunkel, . . . GER.	Merah; Dalima, MALAY.
Anthrax, ... GR.	Mastiga, ... ,,
Bareketh, ... HEB.	Carbunculo, . . . SP.
Carbonchio; Carbonchis, IT.	Manikiam, . TAM., TEL.

One of the inferior gems; that variety of the garnet called almandine. Common in Southern India. Carbuncles, from the most ancient times of the Romans, have been set with a backing to enhance their colour. The carbuncles of superior brilliancy are called males, and those of inferior colour, females. Under this term the ancients included all gems of a red colour, such as hyacinths, rubies, garnets. The carbuncle, in Hebrew, Bareketh, signifying flashing stone, or lightning stone, was supposed to fall from the clouds, amid flashes of lightning.

CARCATA, also Carcataca. SANSK. The solar sign Cancer. See Varsha.

CARCHARIAS, a genus of heterocercal fishes, belonging to the Squalidæ or shark family. C. leucas, *Valen.*, is found in the southern seas. It is about 12 feet long. Carcharodon Rondelettii of Australia, a large shark; one of them measured $36\frac{1}{2}$ feet.

CARCHEMISH, the capital of the Hittites, is the modern Kala Jerablus, on the west bank of the Euphrates, 20 miles below Beredjik.

CARDAMOM HILLS, a range of hills in Travancore, rising 2000 to 4000 feet high, and lying between lat. 9° 27′ and 10° 4′ N., and long. 76° 52′ and 77° 17′ E. They are unhealthy and sparsely occupied. The cardamoms grow best at about 3000 feet; and annually about 10 tons, value £30,000, are collected.

Kapol, ...	JAV.		

The cardamoms of the shops are the produce of several genera of plants,—Alpinia, Amomum, Elettaria, and Renealmia. The round seeds of Amomum cardamomum of the Burma forests, Sumatra, and Malacca, are used by the Malay in lieu of the true cardamom. A. angustifolium of Madagascar supplies some of the cardamoms; A. maximum of the Malay Islands, Nepal, and Ceylon, also produces a cardamom of an inferior character. Alpinia cardamomum of the western coast of India in the Travancore forests, produces a cardamom in great request. Amomum grana paradisi of Madagascar and Ceylon yields an inferior sort. Elettaria cardamomum of the hilly parts of Mysore, Coorg, Malabar and Travancore, and Canara, yields the true cardamom, and is both cultivated and wild. In the Travancore forests they are found at elevations of three to five thousand feet. The mode of obtaining them is to clear the forest of trees, when the plants spontaneously grow up in the cleared ground. The average number of candies is about 140 to 300 candies; value, 1000 to 2000 rupees the candy of 600 lbs. Cardamoms are much esteemed as a condiment, and great quantities are annually shipped to Europe from Malabar and Travancore. In commerce there are three varieties, known as the short, short-longs, and the long-longs. Of these the short are more coarsely ribbed, of a brown colour, and are called the Malabar cardamoms or Wynad cardamoms. They are reckoned the best of the three. The long-longs are more finely ribbed, are of a paler colour, and the seeds are white and shrivelled. The short-longs merely differ from the latter in being shorter or less pointed. It is usual to mix the several kinds together, when ready for exportation. Some care is required in the process of drying the seeds, as rain causes the seed-vessels to split, and otherwise injures them; and if kept too long in the sun, their flavour becomes deteriorated. They are chiefly procured from the high lands overlooking the Dindigul, Madura, and Tinnevelly districts. In these mountains the cultivators make separate gardens for them, as they thrive better if a little care and attention be bestowed upon them. Cardamoms are a monopoly in the Travancore State, and cultivators come chiefly from the British provinces, obtaining about 200 to 240 rupees for every candy delivered over to the Government. In the forests on the western slopes of the Coorg mountains, cardamom cultivation is carried on to a great extent. In February, parties from Coorg start for these western mountains, and, selecting a slope facing west or north, mark one of the largest trees on the steepest declivity. A space about 300 feet long and 40 feet broad is then cleared of brushwood at the foot of the tree, which is cut down about 12 feet from the ground, and carries with it a number of small trees in its fall. Within three months after its felling, during the first rains of the monsoon, the cardamom plants in the soil begin to show their heads all over the cleared ground, and before the end of the rainy season, October, they grow two or three feet. The ground is then carefully cleared of weeds, and left to itself for a year, and then, 20 months after the felling of the great tree, the cardamom plants are the height of a man, and the ground is again carefully and thoroughly cleared. In the following April, the low fruit-bearing branches shoot forth, and are soon covered with clusters of flowers, and afterwards with capsules. Five months afterwards, in October, the first crop is gathered, and a full crop is collected in the following year. The harvests continue for six or seven years, when they begin to fail, and another large tree must be cut down in some other locality, so that the light and air may cause a new crop to spring up. The harvest takes place in October, when the grass is very high and sharp, sorely cutting the hands, feet, and faces of the people, and concealing numerous large leeches. The cultivators pick the cardamom capsules from the branches, and convey them to a temporary hut, when the women fill the bags with cardamoms, and carry them home, sometimes to distances of ten or twelve miles. Some families will gather twenty to thirty maunds annually, worth from 600 to 1000 rupees. The cardamom tracts of Travancore are almost all granitic and gneiss. The smaller capsules, or lesser cardamoms, are the most valuable. The Elettaria cardamomum is also cultivated in Ceylon, and a species occurs wild. The Karen forests of Tavoy and Mergui abound with cardamom plants; and, while subject to the Burmese government, the Karen were required to collect the seeds and pay them in as tribute; but they now employ their time more profitably. When they did collect, they were in the practice of mixing a spurious kind of cardamom with the true produce of a plant belonging to the genus Amomum, believed to have been A. cardamomum. The cardamom called by the Chinese Yang-chun-sha, the hairy China cardamom of pharmacologists, is said to be produced in the province of Kwang-tung.—*Madras Ex. Jur. Rep.*; *Drs. Mason, Voigt; Crawfurd's Dictionary; Thwaites, En.; Drury, Cochin; Roxb.* i. 72.

CARDAMOMS, bastard or wild.

Kapulaga,	BALI., JAV., MALAY.	Kurrocha,	GUJ., HIND.
		Hil kilan, . . .	PERS.

Wild or bastard cardamoms are much larger than the true cardamom, more pungent but less aromatic, with a strong camphoraceous taste. They are not much esteemed, and are only used by the poorer classes of natives as a substitute for real cardamoms. They are brought to Bombay from the Malabar coast. The wild or bastard cardamom of Siam is produced by Amomum xanthioides, *Wallich*; the seeds have been imported into England, while the empty capsules found in the drug shops of China are exported from Siam. The plant bearing scitamineous fruit,

to which the name 'large round China cardamom' has been given, and which is known to the Chinese as Tsau-kau, continues unknown; and the same remark applies to the bitter-seeded cardamom, Yih-che-tsze, and ovoid China cardamom, Taou-kau or Qua leu. It is probable that all of them are productions of the south of China, or of Cochin-China.—*Faulkner.*

CARDIADÆ, a family of molluscs, comprising the genus Cardium, the cockle, of which there are known 270 fossil and 200 recent species, with four sub-genera and the fossil genus Conocardium. Many species of Cardium occur in India.

CARDIOPTERIS. At Cachar, in the Assam valley and Chittagong, this remarkable plant covers the trees for upwards of sixty feet, like hops, with a mass of pale-green foliage, and dry white glistening seed-vessels.—*Hooker, Him. Jour.* ii. p. 334.

A plant of China. C. nutans, *L.*, Gul-i-badawurd, flowers large, rich crimson; used medicinally to purify the blood.—*Voigt; Powell*, i. 356.

CAREI, a people mentioned by Ptolemy, who inhabited the southern part of Tinnevelly. Karei, in Tamil, means "the shire."

CARELA. Beng. Momordica charantia.

CARETTA IMBRICATA, a turtle. See Chelonia.

CAREX, a genus of plants belonging to the natural order Cyperaceæ. Several species grow on the sea-shores and near the rivers of India. C. Indica, *Willde*, is a native of Nepal. C. Moorcrofti and *Falc.*, a running wiry sedge in Tibet, binds the sand like the C. arenaria of the British coasts.—*Hooker, Him. Jour.* ii. p. 155.

CAREY, Dr. W., a celebrated missionary at Serampore. He landed in Calcutta on the 11th November 1793. He was the son of a parish clerk. He joined Messrs. Ward and Marshman at Serampore on the 10th January 1800. His whole life was passed in the translation of the Scriptures into the languages of India; his whole career was marked with a passionate desire to reveal Christ to men who knew him not. His strong natural benevolence had been intensified by deep piety. 'I do not know,' says Wilberforce, 'a finer instance of the moral sublime, than that a poor cobbler working in his stall should conceive the idea of converting the Hindus to Christianity, yet such was Dr. Carey.'

Carey translated the Bible into Kashmiri, Multani, Dogri, Sindi, Garhwali, Kamaoni, Kanouji, Kosali, Magadhi, Bhugeli, Bhatti, Jypuri, Bikaniri, Marwari, Harouti, Udaipuri, Ujjaini, Nepali, Palpa, Assamese, Mahratti, Gujerati, Konkani, Manipuri, and Khasi, mostly Hindi dialects.
Carey and Leyden, into Pushtu, Baluchi.
Carey and Newton, into Panjabi.
Carey and Chamberlain, into Braj.
Carey and Sutton, into Assamese.
Carey and Taylor, into Mahratti.
Carey, Lisle, and Jones, into Khasi.

He founded the Agri-Horticultural Society of Bengal in 1820. He advertised that a meeting would be held in Serampore, but at the hour appointed only himself and two brother missionaries were present. But he voted himself into the chair; the proceedings were published, with the secretary and treasurer's names, and the society began. He was author of State of Agriculture in Dinajpore, in As. Res. vol. vi.; Geographical Notices of Serampore, As. Jl. 1835, ii. 55.—*Tr. of a Hindoo.*

CAREYA ARBOREA. *Roxb.*

Kahaatta,	Singh.		

Flowers—Vakhumba; Fruit—Gugaira, Kuhni, Hind.

This large tree grows in most parts of British India, Burma, and Tenasserim, and also in N. Australia and Queensland. It rises to 20 feet. Dr. M'Clelland says that in Pegu the timber is large, the wood red and equivalent to mahogany, and there forms the chief material of which the carts of the country are made; Dr. Mason adding that it is a useful timber for house-building; and Dr. Brandis mentions that it is used for gun stocks, house posts, planks, etc. A cubic foot of the Pegu wood weighs 55 lbs. It sells in Pegu at 12 annas per cubic foot. Dr. Gibson tells us that it is not much used on the Bombay side, but that the timber stands the action of water well. As it is generally crooked, he thinks it merits trial for the crooks of boats, corners of carriages, etc. In Ceylon it is used for the axles of bullock carts and in buildings. Its fibrous bark is used as matches for matchlocks, guns, etc.; and in Ganjam, according to Capt. Macdonald, the scant clothing of the Byragi and other Hindus affecting peculiar sanctity, is made of the fibrous bark of this tree. The bark is astringent, and in Ceylon used in tanning and medicinally. Its large greenish flowers are given by Hindus after childbirth.

Careya sphærica, *Roxb.*, is almost identical with C. arborea. It grows in the Northern Circars, in the mountains at Chittagong, and at Moulmein. Its bark serves as cordage, and is used as a slow match for guns. It has large greenish-white flowers, with some deep red filaments.—*Roxb.* ii. 636.

CARHARAS, in the Konkan. There were human sacrifices here to Renuca Devi.

CARIARI. HIND. Gloriosa superba.

CARICAL or Karikal, a small settlement belonging to France, between Tranquebar and Nagore.

CARICA PAPAYA. *Linn.* Papaw tree.

Papaya vulgaris, *Lam.*	Papaya carica, *Gærtn.*
Gadang-castila, . . BALI.	Papa, Bati, . . MALAY.

Arand Kharbuja, ,,	Madhurnakam, . ,,

This plant, one of the Papayaceæ, is found throughout India, and grows without much care. The fruit is gathered in a green state, is dressed as curry and in tarts, and when ripe it is used as a dessert. Its dark-coloured seeds taste like the watercress. The fruit is large and oblong, suspended upon the leafless part of the trunk, like the jack-fruit; the surface when ripe is a pale orange yellow. A milky juice exudes on incision from the rind; and the rind and seeds are deemed in the Mauritius a powerful vermifuge. Tough meat, rubbed with this juice, becomes tender, without any injurious property being communicated to it. The flesh of animals fed on the leaves and seeds is said also to be remarkably tender, but this seems unlikely. And in Bengal, Mahomedan table servants use the juice with the view of softening beef-steaks and old fowls. The leaves are used by the negroes in washing linen, as a substitute for soap. Pulp of the fruit is eaten with pepper and salt. Juice of the pulp removes freckles.—*Roxb.* iii. 824.

CARICATURE PLANT, or face plant, Justicia picta. The white portions on its green leaves present caricatures of the human face. Graptophyllum hortense of the Indian Archipelago is also so called from the curious variegation of its leaves.

CARIM CORINI. MALEAL. Justicia ecbolium. Carim-gala, Pontedera vaginalis. Carim-pana, Borassus flabelliformis. Carim-tumba, Anisomeles Malabarica.

CARIMON, two small islands, Great and Little, off the Malay coast. They command the entrance to the Straits of Malacca.—*Horsburgh.*

CARINARIA, a genus of Gasteropod molluscs, in Asiatic seas. C. vitrea, C. fragilis, C. Mediterranea, and C. cymbium, are recorded. The shells of this genus are known to collectors under the names of Venus' Slipper and the Glass Nautilus. C. vitrea, *Lamarck*, has a beautiful transparent vitreous shell.

CARIN CHEMBI. TAM. Coronilla picta. Carin kulloo, glass. Carin serigum, fennel flower, nigella seed, Nigella sativa.

CARI NUCHI. TAM. Gendarussa vulgaris.

CARIRAM. MALEAL. Strychnos nux vomica.

A large thorny bush, cultivated for its fruits, but grows abundantly wild in the Kangra and the Kotah jungles, and in March and April fills the air with the fragrance of its blossom; also grows wild in most parts of the Dekhan, bearing a dark blue-coloured berry when ripe; and this is sometimes eaten by Europeans, and in the green state is made into tarts, jellies, and pickles; the jelly is considered inferior to none made of other Indian fruits. The fruit is about the size of a large olive, and when ripe is black, and has a very pleasant taste, somewhat like a damson. This species is a marked exception to the generally poisonous nature of the Apocynaceæ family.—*Roxb.* 1687; *Mason; Dr. Stewart; Capt. Macdonald.*

CARISSA DIFFUSA. *Roxb.*

This shrub is a native of the Ganjam district, and from thence northward to the mouth of the Hoogly, and common throughout the Panjab. Its small white or pink flowers about April perfume the air around. The wood is used for combs, in turnery, etc., and as fuel. A Kangra authority states that the very old wood gets quite black and fragrant, and is sold at a high price as Aggar, or Ud-i-Hindi.—*Roxb.* i. 689; *Dr. Stewart.*

CARIVAN-SARAI, in Persia and India, a halting-place for travellers, generally a house with many apartments, either opening into an open quadrangle or to the outside road. It is from karwan (caravan), a cortege, and sarai, a rest-house; the chattram of the Tamil people, and dharmsala or sarai of N. India. See Sarai.

CARI-VILLANDI. MALEAL. Smilax ovalifolia.

CARLESS, CAPTAIN, I.N., author of a Survey Report of the Mouths of the Indus. He and Lieutenant Grieves carried on important surveys in the neighbourhood of the Indus. He wrote an account of a visit to Beylah, Bom. Geo. Trans. i. p. 304; Memoir on the Gulf of Akaba, ibid. p. 172; Evaporation in the Red Sea, ibid.; State of the Kakewarree Mouth of the River Indus, ibid. p. 876; Account of Hot Springs at Peer Muggun near Kurrachee, ibid. 1840, p. 16; Remarks on the Course of the Hurricane which occurred on the Malabar Coast in April 1847, ibid. 1849, viii. part i. p. 76; Memoir to accompany the Survey of the Delta of the Indus, ibid. part iii. p. 328; Account of the Inscriptions on the Rocks of Shren Waj, near Jedda, Red Sea, *Bom. As. Trans.* ii. p. 273.

CARLI-CAVES, in the Western Ghats, near the Bhor ghat. The wonderful galleries and colossal elephants of its caves are dug out of solid trap. See Architecture; Buddhism; Caves; Karli.

CARLUDOVICA PALMATA, a tree of Panama. Panama hats are made of its leaves; they are made in Veraguas, Western Panama, and Ecuador, and are worn in the W. Indies and Central America. It might be introduced into India.

CARMA. SANSK. The name of one of the Kanda or general headings of the Vedas. This chapter relates to works; the other two, Gnyana and Upashana, relate to faith and worship. See Vidya.

CARMEL, a small range of hills extending six or eight miles inland in a S.E. direction from the

Bay of Acre. Mount Carmel is a termination of the chain of hills commencing at the plain of Esdraelon to the S.E. The valley of martyrs, a very narrow dell open to the sea, is near, as also the garden of Elias. The holy fountain of Elijah is close. The cistern seems to have been hewn in the rock, and is about six feet deep, full of clear, delicious water.—*Skinner's Overland Journey*, i. p. 101; *Robinson's Travels*, i. p. 196.

CARMINATIVES. The following are largely used medicinally and for culinary purposes:—

Pimpinella anisum, common anise.
Illicium anisatum, star anise. Badian khatai.
Anthemis nobilis, chamomile. Baboone.
Lavandula vera, lavender.
Ruta graveolens and other sp., rue. Sudab.
Andropogon iwaranchusa. Roosa.
Anethum graveolens, dill. Sonf.
,, sowa. ,,
,, panmori. ,,
Carum carui, caraway. Zeera seeah.
,, nigrum. ,,
Eugenia pimento, allspice.
Amomum zingiber, ginger. Ada.
Fœniculum officinale, fennel.
Melaleuca cajaputi, cajaput. Kyapooti.
Juniperus communis, juniper. Hoober.
Piper cubeba, cubebs. Kubab chinee.
Caryophyllus aromaticus, clove. Long.
Laurus cinnamomum, cinnamon. Darchinee.
Juniperus sabina, savine.
Ocimum basilicum, basil. Tulsi.
Rosmarinus officinalis, rosemary.
Moringa pterygosperma, sohunjuna.
Mentha piperita, peppermint.
,, pulegium, pennyroyal.
,, viridis, spearmint. Pudina.
Amomum cardamomum, cardamom. Elachee.
Origanum majorana, marjoram.
Sassafras officinale, sassafras.

CARMINE. A beautiful pigment prepared from cochineal, discovered accidentally by a Franciscan monk of Pisa, who, having formed an extract of cochineal with salt of tartar, for the purpose of employing it as a medicine, obtained a fine red precipitate on the addition of an acid. Homberg, in 1656, published a method for preparing it. The makers in some of the principal towns of Europe succeed in preparing different varieties of it of greater or less purity and lustre. Many of their processes are kept secret; and although the chemistry of the art is well understood, yet there are certain details of manipulation, and an empirical knowledge of the effects of temperature, doubtless acquired after long experience and many failures, which confer on the carmines of some makers a greater lustre than on those of others. The use of carmine has of late years been extended to the manufacture of superfine red inks, of artificial flowers, and to silk-dyeing. Carmine is the finest red colour which the painter possesses. It is chiefly used in miniature painting and in water colours. It is made in large quantities in Paris. Carmine is one of those colours called lakes, a term applied to certain colouring substances which behave like acids, and combine by precipitation with a white earthy basis, usually alumina. Carmine is the richest and purest portion of the colouring matter of cochineal, isolated in the manner here alluded to. Various imitations of carmine are prepared for the use of those who exhibit rouge on their cheeks. French carmine is superior to that of English manufacture, and the superiority is said to depend on the influence of light on its formation and precipitation; the clear sky of the south of France being more favourable for the process than the more hazy atmosphere of England.—*Tomlinson.*

CARNAHUBA, a tree of S. America, Havana, and Mexico, which should be introduced into India. Humboldt and Murichi have described it as the tree of life. Cattle eat the heart of the young tree, and at its full growth a fecula is obtained from it. Its fruit is also nourishing. But its chief product is the wax which covers the surface of its young leaves, in the form of a glutinous powder. When melted by heat, it cannot be distinguished from wax of the honeycomb.—*Marius.*

CARNATIC, an ancient name of the table-land in Southern India, above the Eastern and Western Ghats, known as the Balaghat; to this region, though the people speak Canarese, the name is now never applied, but it is now given to the country below the Eastern Ghats, or Paeen Ghat. Its ancient kingdoms were the Pandya, Chera, Chola, and Calinga. In B.C. 75 an expedition left the eastern side of the Peninsula, from ancient Calinga, and formed a colony in Java. The Pandya dynasty ruled in parts of the south of the Carnatic, with varying fortunes, from the 4th or 3d centuries B.C. At present it is a province on the Coromandel coast, about 500 miles long from north to south, and averaging about sixty miles broad. From the 16th to the 18th centuries, it was overrun by Mahratta, Mahomedan, French, and British soldiery. Sadut Oollah was ruler of the Carnatic from 1710 to 1732, and was succeeded by his nephew, Ali Dost. Ali Dost was killed in battle against the Mahrattas, and was succeeded by his son, Sufdar Ali. Of his two daughters, one married Chunda Sahib. Chunda Sahib seized on Trichinopoly in 1736, but the place was taken by the Mahrattas, and Chunda Sahib was made prisoner, and lingered for eight years in prison, where he was murdered by the raja of Tanjore. Sufdar Ali was assassinated by his brother-in-law, Murtuzza Ali, leaving a minor son; but this youth also was assassinated, while Anwar-ud-Din was his guardian, and Anwar-ud-Din succeeded to the throne as Nawab of the Carnatic. During the conflicts for supremacy in Hyderabad and the Carnatic, between the French and British, naval and land battles were fought at Damalachery near Madras, at Amboor on the Pennar river, near Gingee, at Valconda on the Arni, at Cauverypauk, at Vicravandi Bahur, at the Golden Rock, Sugar Rock of Trichinopoly, at Wandewash, also off Negapatam, Tranquebar, and at Fort St. David. Anwar-ud-Din, when about eighty years old, fought and fell at the battle of Amboor, in 1749; his son, Mahomed Ali, fled to Trichinopoly, but he was acknowledged by the treaty of Paris in 1763. From that time till his death in 1795, the Carnatic was occasionally under his rule, and at times under the civil and military administration of the British. In 1795 he was succeeded by his eldest son, Umdat-ul-Umra, who died in 1801, when the British put aside Umdat-ul-Umra's son, and placed his nephew, Azim-ud-Dowla, on the throne. The British, in 1856, on the demise of Mahomed Ghous, grandson of Azim-ud-Dowlah, finally abolished the titular nawab, from which followed long efforts to seat the second son of Azim-ud-Dowla. The people of the Carnatic are of the Dravidian stock, and speak the Tamil and Telugu languages.—*Malleson's French in India.*

CARNELIAN, quartzose minerals so called, be-

cause some kinds are of a flesh colour, from carnis, Latin, though others are white. In Japan they are found in vast quantities; and they are also collected in the province of Gujerat, at Cambay. Many of the antique gems are engraved in carnelian, and it is now much used for seals. Carnelian is very common in Burma, and has been found at Moopoon and Mergui. One of its Burman names means 'fowl's blood.' See Cambay Stones.

CAR-NICOBAR, the most northerly of the Nicobar islands. See Nicobar.

CARNIVAL. This name for the Roman Saturnalia is derived from the sun-god Carneus, the Celtic Apollo, whose shrines were on the coast of Brittany; and one monument remains at Carnac sacred to the manes of the warriors and of the sun-god. The character of this festival was entirely oriental, and accompanied with the licentiousness which belonged to the celebration of the powers of nature. Even now, although Christianity has banished the grosser forms, it partakes more of a pagan than a Christian ceremony.—*Tod's Rajasthan*, i. p. 547.

CARNIVORA, an order of the mammalia constituting flesh-eating animals, beasts of prey. They include the genera felis, hyæna, cuon, canis, vulpes, and others in the families Ursidæ, Melididæ, Mustelidæ, Felidæ, Viverridæ, and Canidæ. The lion and the leopard occur in Asia and Africa, the tiger in Asia only. See Mammalia.

CARNIVOROUS PLANTS are found in both hemispheres. The Drosera rotundifolia or sundew is one. When an insect alights on its central disc, it is instantly entangled by the viscid secretion there, and the surrounding tentacles after a time bend and ultimately clasp it on all sides, and the insect is digested. D. Anglica, D. intermedia, D. capensis, D. spathulata, D. lunata, D. filiformis, D. trinervis, D. heterophylla, and D. binata. Dionæa muscipula, or Venus' flytrap, Aldrovanda vesiculosa, Drosophyllum Lusitanicum, Roridula dentata, Byblis gigantea, have similar functions, as also Pinguicula vulgaris, P. grandiflora, P. Lusitanica, with Utricularia vulgaris, U. neglecta, U. clandestina, U. montana, U. velumbifolia, amethystina, Griffithii, cærulea, orbiculata, multicaula, Darlingtonia Californica, Sarracenia purpurea, and S. flava, with Heliamphora nutans.

CAROB TREE, or St. John's Bread, Ceratonia siliqua, of south Europe and the Levant. Its legumes are used for cattle-feeding. The seed is the original of the jeweller's carat.

CAROLINA PADDY. Rice seed was originally taken from India to North America, and its cultivation has been so successful in Carolina, one of the United States, as to have led to its being re-imported into India as seed.

CAROLINAS, an extensive chain of islands which stretch nearly east through the middle of the Pacific Ocean, betwixt the parallels of lat. 7° to 10° N.

CARON OIL of Chittagong. The crooked tree from which this is obtained, grows in wet places near fresh water, very common in the sides of ditches which surround native dwellings. The seed is bean-shaped, and produced in a flat pod; the pods grow several together. The flower is pink and white, of the shape of a bean flower or blossom. The oil is used for burning in native lamps, and in large quantities for boiling with dammer to soften it for the seams and bottoms of ships. It is also often used by native practitioners for the cure of itch. A maund of seeds costs Rs. 1–8, and the extraction of the oil by heat costs 8 annas; the oil produced amounts to $6\frac{3}{4}$ seers per maund.—*Local Committee, Chittagong.*

CAROOKUVA. TAM. Zizyphus trinervus.

CAROONUCHI. TAM. Gendarussa vulgaris.

CAROOR, in long. 78° 9′ E., and lat. 10° 50′ N., 50 miles from Trichinopoly, on the bank of the Cauvery, has a strong fortress. It was the capital of the ancient Chera kings. See Carnatic.

CAROXYLON GRIFFITHII. *Moq.*

Salsola Griffithii. | Lagkame, Khar, . HIND.

A Central Panjab plant, furnishes by lixiviation some of the sajji or carbonate of soda of commerce. —*Stewart.*

CARP, the genus Cyprinus of fishes. The gold carp of China is the Puntius (cyprinus) auratus, *Linn.* In India carps are habitual filth-eaters.

CARPENTER BEE, Xylocopa tenuiscapa, *Westw.* Another species found in Ceylon is the X. latipes, *Drury.*—*Tennent's Ceylon*, p. 418. See Bee; Beetle; Insect; Xylocopa.

CARPENTERS are one of the five Hindu artisan castes of India, and wear the poitu or zonar. They claim to be Brahmans, and worship chiefly Visvakarma, the artificer of the Hindu gods. Those of Travancore follow the law of descent by the sister. See Hindu; Poitu; Polyandry.

Carpets, either of cotton, silk, or wool, are employed in the eastern countries, from the south of India to Turkey in Europe, for domestic use, for praying on, and for occasions of state. The carpets employed by the ancients are thought to have been of the nature of tapestry, and used for covering couches rather than floors. True carpets seem to have been early employed in Persia; and those called Turkish were probably originally of Persian manufacture, whence the manufacture might have been introduced into Turkey, and where, as well as among the many Turkoman tribes and in Northern Africa, it is still practised. The Persians still remain unrivalled in the happy combination of colour and pattern for which their carpets have long been distinguished, whence the most varied hues and deepest tints are brought into close approximation, and, far from offending the eye, please by their striking, because harmonious, contrasts. The places in India where a regular manufacture and trade are carried on, are Jubbulpur, Bareilly, Lahore, Merut, Rungpur, Benares, Mirzapur, Allahabad, and Gorakhpur in Bengal; North Arcot, Tanjore, Ellore, and Malabar in the Madras Presidency; and also at Mysore, Bangalore, Warangal, Bellary, Masulipatam, as well as at Shikarpur, Khyrpur, and Hyderabad in Sind. Those of Bengal commend themselves by extraordinary cheapness; they are extensively used throughout India, and also somewhat largely exported. In point of texture and workmanship, however, the rugs from Ellore, Tanjore, and Mysore, though they are comparatively much dearer, are greatly preferred.

Kermanshah has a manufacture which adds much to the wealth of its province; none can be more rich, soft, and beautiful. *Persian carpets* are made also at Meshed, in the Turkoman country, and in Khorasan, and are justly celebrated for the beauty of the patterns, the fineness of the wool, and the durability of the colours—vegetable dyes—amongst others, a green not made elsewhere, conjectured to be saffron and indigo. Some of them fetch high prices in the country itself, as £6 or £8 for one of two yards square. The finest are made at Sena, and there is a famous manufacture carried on at Ferahoun, near Teheran. Carpets of any size can be made there. The finest carpets of all used to be made at Herat; and one in the Chahal Minar at Isfahan was 140 feet long and 70 feet wide. Large numbers were formerly exported to England through Trebizond, and they were sold nearly as cheap in London as in Persia, owing probably to the course of trade. Persian and Turkey carpets are most esteemed.

Eastern carpets have attained great popularity in Europe since the middle of the 19th century, but it has not led to any very general diffusion of real knowledge about them. The ordinary buyer knows three classes, and only three, which he roughly distinguishes as Turkey, Indian, and Persian carpets. The expert is, of course, a good deal more exact than this; but even his knowledge is, as yet, vague and confused. The most exquisite products of the loom were frequently destined for the adornment of the holy Kaba, or some scarcely less venerated shrine. Sometimes the whole interior of a mosque, such as that at Meshed Ali, was hung with beautiful carpets; and the Mihrab, or niche towards Mecca, was always a favourite object for such ornamentation, which in this case corresponds to the altar-hangings of Europe. Mats of a less costly nature were spread on the floor; and it is recorded that in 1012 A.D. the mosque of El-Hakim at Cairo was strewn with 36,000 ells of carpeting, at a cost of 5000 dinars, whilst the Azhar required 13,000 ells of striped mats a year. The Kaba at Mecca was covered with hangings in the 'days of ignorance' before Islam was preached, and cloths from the Yemen, or a white Chinese silk carpet, covered the shrine; and later on the famous white and gold fabric of the Copts, or heavy velvet or plush carpets from all parts of the East, were employed in the decoration of the Mecca temple. The rulers of the Mahomedan world vied with each other in presenting the richest covers to the Kaba; the very Mongol Khans of Persia sent gorgeous hangings; and we read of a cover studded with gold and pearls and precious stones to the value of 250,000 gold pieces. Difficult as it is to classify the designs of eastern carpets with any precision, they may roughly be divided into two classes, the floral and the geometrical; and that of these the former is the design affected by the higher and Aryan races, the latter the design of the lower and Turanian. The old woman whom Vambery saw in Central Asia, tracing the pattern of the carpet on the sand for the girls to follow, is the typical designer of the Turkoman and Mongolian races; while the native Indian and Persian work is found in lovely conventionalized flowers and leaves, the 'tree of life' and other symbols. There is always, however, a difficulty of distinguishing between the carpet work of one district and another, from the prevailing custom of pilgrimages in the East. Every pilgrim brings his carpet with him to Mecca, or Kerbela, or Kairwan,—he may take more than one, for an offering, or for sale,—and ultimately these find their way, for nothing or for nominal prices, to the priests and their hangers-on, who re-sell them for exorbitant sums as relics to the outgoing pilgrims. Thus carpets of every style and character pass from hand to hand, and, coming from southern India, make their way to Smyrna or Tashkend, the promiscuous dispersion becoming one of the chief secondary causes of the cosmopolitan character of Saracenic art, and of its diffusion over so vast an area, and at the same time serving to make the origin of that art almost hopelessly obscure. In Northern Africa, it is only in Kairwan that the genuine Tunisian carpets are now manufactured. In all other parts of the regency European designs have been adopted, with the inevitable result of destroying all that was quaint and original, and substituting vulgar and egregious patterns. The old Moorish style of working in iron has thus far escaped contamination, and large Saracen locks and giant keys, charmingly ornamented, may still be procured. The Susanjird kind, among the various sorts of weaving that go by the name of Persian carpet-work, has always held the first place. We read of the Susanjird carpets in the palace of the Abbasi khalifs of Bagdad in the tenth century; and the nobles of the East were emulous of obtaining pieces of this fine work for the floors of their scarcely less magnificent residences. In the sale of the carpets of the Fatimite khalifs in 1067, a carpet fetched a thousand dinars —at a time when dinars weighed more than the present half-sovereign; and a Mameluke prince of the fourteenth century gave 70,000 pieces of silver for a silk carpet wrought with gold. Susanjird work was also highly prized in Europe. Byzantine palaces were found to need these rich carpets as much as the mansions of Bagdad; and the merchants were given carte-blanche as to the price they paid for their commissions. Such luxuries were only for the very rich. Susanjird carpets appear always to have been confined to the houses of the great or the houses of God, which the great chose to honour; but the anarchy which came of the Tartar invasions affected the art of weaving in a disastrous manner. Tamerlane, though his exploits were embroidered on the old tapestry which the Persian ambassador brought to Philip III. of Spain, was a chief destroyer of the skill which depicted him. Whatever the origin of the name, Susanjird designates a loom embroidery which, though it may be of various kinds, possesses a distinct character of its own. Susanjird may be knotted (like plush) or plaited (like Gobelin work), or it may combine both methods; but its essential characteristic is flat relief. The combination of the knotting and plaiting (which was not done as it is at the present day) gave the work a peculiar character. The Susanjird carpet has the effect of a picture; the embroidery is like painting; and the general impression is soft and delicate. The subjects represented are either figures or conventional ornaments; and the figures include, not merely animals, but maps and plans of towns, like mediæval work 'cum historiâ' or 'à ymages.' The ornamental work is chiefly derived from the vegetable world, and corresponds to the European designation 'à arbres.'

In *Persian art* the treatment is essentially symbolic. The lion or the eagle is represented as the symbol of power or rule; indeed, on a gold border in the Vienna Museum the figures are explained by the Arabic word for dominion, and another piece has 'sultan' under a lion's figure. A descending eagle signifies bad luck, but a flying or standing eagle means good luck; while the unicorn welcomes the advent of a good prince. Hounds and leopards for hunting occur in Persian patterns, and stand for fame or increasing honour. More interesting are the ornamental designs derived from trees and flowers,—the embroidery 'à arbres.' Sir George Birdwood remarks that the great source of the majority of Persian carpet patterns is the tree of life, the straight trunk with long regular parallel horizontal branches terminating in buds, which pervades all eastern and much western decorative art. Sometimes on Persian rugs the entire tree is represented, but generally it would be past all recognition but for small representations of it within the larger. In Yarkand carpets, however, it is seen filling the whole centre of the carpet, stark and stiff, as if cut out of metal. In Persian art, and in Indian art derived from Persian, the tree becomes a beautiful flowering plant or simple sprig of flowers; but in Hindu art it remains in its hard architectural form, as seen in temple lamps, and the models in brass and copper of the sacred fig as the tree of life. It is extremely curious to trace the history of the tree of life (and the tree of healing, for there are two kinds in Persian decoration) through its various stages, and to find its head in the knop and flower, or cone and flower pattern, as we recognise it on Assyrian marbles and Egyptian wall-paintings, on Indian monuments, Cashmere shawls and Italian brocades; in the Greek honeysuckle and palmette scroll, and the Renaissance shell; and the tongue and dart, egg and tongue patterns in classical mouldings. The persistence of the tree of life, or the pattern formed from its head, in eastern and western decorative art, is very remarkable, and, it should be added, very admirable. That the Tapisserie de Haut Lisse was derived from the East seems beyond a doubt. At the end of the twelfth century the Paris statutes make mention of 'tapiciers sarrazinois,' in contrast to 'fabricans de tapis nostrez;' and in 1302 we hear for the first time of an 'autre manière de tapiciers que l'on appelle ouvriers en haute lice.' It was probably about the time of the Second Crusade that this oriental high-warp tapestry found its way into France.

Printed calicoes of large size and suitable patterns are used for covering the floors in India; but the most common carpets employed there are made of cotton, called *shatranjis*. These are of different colours, usually blue and white, in red or orange stripes, squares, or stars; some are of large size, and well suited for halls and tents, being thick and strong in texture, the two surfaces alike, smooth, and without pile. They are manufactured in different parts of India, at Murshidabad, Rangpur, Agra, etc., and at many places in the Madras Presidency. Another kind of cotton carpet is that with a pile of cotton, and similar in appearance to a Turkey carpet, manufactured at Sasseram —white, with a centre and border in blue; and they are made also in the Hyderabad country with every variety of coloured pattern.

Cotton carpets for tents are made at Cumbum, Rajamundry, and other parts, the price being under one rupee the square yard. They are generally in broad stripes of red and shades of blue. Small carpets of this description are produced in almost every district, and are used for sleeping on. They are somewhat less in price in proportion than the larger ones. Carpets of a small description, woven with wool, in stripes on a stout cotton web, are made at about the same cost.

Silk is another material of which carpets are made in the East; and the pile, being of silk, imparts both softness and richness to the surface, while the colours are clear and brilliant. They are beautiful as specimens of variety in pattern, brilliancy in colouring, as well as of pleasing harmony in the whole. Silk carpets of small size, are made in Tanjore, Hyderabad, and Khyrpur.

Woollen carpets, of large size, and of beautiful and well-coloured oriental pattern, are made at Mirzapur, Gorakhpur, Bangalore, Vellore, and other parts of Madras. Mirzapur is most famous in India for its carpets, which are frequently sold in Britain as Turkey carpets. The woollen rugs from Ellore are admired for their general characteristics of oriental pattern and colouring; and these, as well as the large carpets from Mirzapur, all in the same style, are well adapted for sale in Europe. At the Madras Exhibition of 1857, there was a large display of carpets and rugs, viz. 1. The imitation Axminster or close-nap woven carpet; 2. The short velvet pile or tapestry carpet and woollen rug; 3. The long velvet pile or imitation Turkey carpet; 4. The silk or velvet pile carpet. Of the Axminster carpets, there were some very good specimens of close-nap carpets from Warangal, the colours clear and bright, but a sameness in the patterns. The carpets were strong, soft, and very close in the weaving. The only one for which Warangal is famed is Persian carpets, which are made there of all sizes, and of worsted, cotton, or even of silk. The weavers are all Mahomedans, and are congregated principally at Mutwara, although there are a few looms within the Warangal fort. The weavers are drunken, turbulent, and ignorant, possessing no capital, and dissipating in excess the little money they may procure on accomplishing a piece of work. Carpets, chiefly of a small size, about two yards long and a little more than a yard in breadth, are made for the Hyderabad market, money being advanced to the weavers by the dealers there. A worsted carpet of this size and shape costs at Warangal from $2\frac{3}{4}$ to $2\frac{1}{2}$ rupees. A cotton carpet there is twice the price of a worsted one. A silk one is very highly priced. A common trick among these weavers is to substitute hemp for worsted.

Of the *velvet pile carpets*, some large and creditable specimens from Ellore were closely woven, bright and harmonious in colour, and the patterns more varied than those from any other locality. Some of the rugs from Tanjore were also very tasteful.—(*Madras Exhibition Juries' Reports*). At Iyempettah in Tanjore they make very handsome carpets of silk.

The *rugs* and *carpets* produced at Ellore vary in price from $2\frac{1}{2}$ to 4 or 5 rupees a yard. They are of dyed wool upon a cotton web. The colours are not so bright as those given in Europe. Commoner descriptions, of the size

of small hearth-rugs, are exported thence to England and Persia.

Dr. Walker (As. Jo. 113) gives the following description of carpet-weaving at Hunumcunda, which is generally applicable:—The carpet loom is nothing more than the common native loom, placed vertically instead of horizontally. The waft is of thick, strong cotton twist, being arranged by no wafting mill, but by one of the workmen going round and round two stakes fixed in the ground, and dropping the thread at each as he passes. In the loom it is kept on the stretch by two strong billets of wood, the threads being attached by separate loops of cotton fixed to a bamboo, which is elevated or depressed at the will of the weaver. The worsted is held in the left hand, and a crescent-shaped knife in the right, the fingers of both being left free. The inner thread of the waft is then seized, the worsted wound round the outer, crossed on itself, and the extremity drawn out, by which it is made to descend in the form of an open figure of eight to be snipped by the curved knife. It is superfluous to say that this is the work of an instant. When the pattern is new or difficult, the order and position of the worsted threads is changed by a reader in a kind of rhyme. On a row being completed, the warp, in the shape of a cotton thread, dyed dark brown by the bark of the Swietenia febrifuga, is forced down by means of an iron-toothed comb, in form something like an adze. The whole is completed by cutting the worsted to its proper length by large scissors held steadily against the waft. Infant labour is employed and preferred in Warangal carpet-weaving, it being averred that their more limber finger-joints are best fitted for the finer parts of the work. Dried sprigs of tulsi (Ocimum sanctum) and bunches of Lepidagathis Indica are attached to the loom frames. The workmen say that these make their labour go on more cleverly. Twelve different worsteds are employed. The blue is produced from indigo; the yellows and the sulphur yellow from boiling the sulphur yellow in water impregnated with carbonate of soda, in which a little turmeric has been mixed. The deepest yellow is produced by dipping the same in the potash ley. The reds are all produced by lac dye dissolved by tamarind juice, with sulphate of alumina and potash as a mordant. The depth of colour depends in three cases upon the original black, brown, or white colour of the wool; in the fourth, on the length of time the last description of wool was allowed to remain in the dye. The greens are produced by immersion in indigo, and then in pulas or turmeric; their degrees also depend on the original colour of the wool. Bengal indigo is always preferred to the home manufactured by the worsted dyers. Cotton carpeting is prepared in the same way as the woollen. As a general rule, the lighter worsteds wear the longest. The red seems to render the wool brittle, and some destructive agent seems to be employed in preparing the wool. If the weavers would wash the wools thoroughly with soap, both before and after dyeing, the carpets would probably be far more durable.

At *Ellore* the wool is cleaned and spun. The former is a rather complicated process, but on its proper performance depends the possibility of afterwards spinning the thread without the hair starting out too much,—which is sure to be the case if very hot water is used,—and the thorough fixing of the dye. When the sheep is sheared, the wool contains a large amount of dirt and grease, sometimes as much as 50 per cent. of the whole weight, and this must be entirely removed before anything else can be done. Steeping in water, hot and cold, washing with soaps and various acids, fumigation, are the plans usually adopted; but the Ellore people keep the process a secret. After this the wool is thoroughly beaten out by filliping it with a line of gut stretched on a bow. This turns the matted, coarse substance cut from the sheep into a beautifully soft wool. The spinning is carried on in the ordinary manner of India. After the spinning comes the dyeing, which is not shown to strangers, and from that the thread is taken straight to the weavers. Ellore carpets are made on upright looms, the operators sitting on the ground, their legs in a hole or trench in front of the work,—not, as in the Gobelin tapestry, behind it. The warp thread is either of hemp, cotton, or wool. In carpets intended for Europe, hempen twine is invariably used; while for India, cotton is sometimes preferred. The woollen warp is mostly confined to the small rugs made up for native consumption. The woof, or cross thread that holds down each successive line of wool, is either hemp or cotton. The warp is always white, the weft frequently coloured. Each little tuft of wool is twisted round two threads of the warp, and thus, as it were, knotted. It is then cut off with a knife to the length of about $\frac{3}{4}$ths of an inch. When one line (horizontal) of the tuft has been completed, the weft is passed through and beaten firmly down on it by means of an iron comb. The whole line is then trimmed down to the proper length with a pair of scissors. And so the carpet proceeds, bit by bit, and line by line, till completed. Some patterns are far easier to work than others, and the value of the carpet varies accordingly. A good workman does $1\frac{1}{2}$ feet in breadth by 6 inches in length from 7 A.M. to 4 P.M. From two to three annas a day is about the sum on which a fair workman can reckon.

The *Indian cotton carpets* most commonly met with are blue, red, and white. Some few, made of cotton and silk for wealthy people, are extremely beautiful.

The *rugs* made in Bengal vary in length from 3 to $3\frac{1}{2}$ feet, their average width being $1\frac{3}{4}$ feet, and their value from 1 rupee to 1 rupee 10 annas. The rugs from Ellore, Tanjore, and Mysore are made of various sizes, and are valued from 2 to 4 rupees each. Those from Shikarpur and Khyrpur, as well as from Hyderabad (Sind), are of a lighter texture, but excellent workmanship; their width is generally uniform, but in length and consequent cost they vary from from 2 to 5 rupees each.

The employment of rugs throughout India is most extensive. It is impossible to form an estimate of the annual value of this manufacture, as only the small portion exported is entered in the official records, and as no steps have hitherto been taken to ascertain the local trade.

The finest articles of this description, however, are the *silk rugs* from Tanjore and Mysore, the blending of colours and workmanship being excellent. They are made of all sizes, even up to squares of ten feet; but, being too costly for

general adoption, this manufacture is very limited. Were the patterns and disposition of colour in the native articles better known in Europe, many useful lessons might be learned from them. Woollen carpets are rarely used by Hindus, and the manufacture is seemingly entirely confined to Mahomedans.

The *Shatranji* is a cotton carpet entirely made of cotton. They are used by every European or native throughout India; and the annual manufacture is consequently very considerable, especially in Bengal, where they form a large and important branch of inland trade. They are of all sizes, from that of the largest carpet to the smallest rug, but generally of one and the same pattern throughout India, the only difference being the colour. Blue and white and red and white stripes constitute the prevalent patterns; but, in some, one colour of darker and lighter hues is employed. In Meerut, Bareilly, and Patna, new patterns have of late been tried, but though preferred by the Europeans, are not so by natives, who like the striped patterns, because they wear better in daily use, and do not lose the freshness of colour by washing. The principal localities where shatranjis are manufactured are Agra, Bareilly, Patna, Shahabad, Birbhum, and Bardwan. Those manufactured at Agra are considered the best, and the value of its annual production is about £10,000. The small ones are valued from 3s. to 15s., and the larger ones (carpet size) from £1, 10s. to £4, the price in many cases being regulated by weight.

The *Shahabad cotton rugs* are almost invariably striped. They are cool and pleasant. The smaller kinds are used as quilts for beds. The manufacturers, called in this district Kalleeun Bap, are almost invariably Mahomedans. The two local seats of manufacture in Shahabad are Bubbooah and Sasseram. In the former place, from 10,000 to 12,000 rupees' worth are yearly manufactured and sold, and in the latter from 30,000 to 40,000 rupees.

Dhurri is the name of cotton carpets generally made for sale, and are of four kinds, 6 yards long and 2 yards broad, thick and strong, of any colour, and are sold at from 6 rupees to 6 rupees 8 annas. A small kind, used as quilts, weigh from two to three pounds each, and are $1\frac{1}{4}$ to $1\frac{1}{2}$ yards broad by about 2 yards long; they sell at from 14 annas to 1 rupee 8 annas each, according to thickness and quality, The hauzhassica is a name of the better kind of carpet, and often displays much taste in the arrangement of the striped colours. It is made of any size to fit any room, and is always sold by weight. The price varies, according to quality, from 1 rupee 4 annas to 1 rupee 12 annas, and sometimes as high as 2 rupees 4 annas per seer. It is sold in all the fairs, and in all the large cities around, such as Patna, Ghazipur, Daadnuggur, Gyah, etc. No merchant's or banker's shop or rich native's reception room is complete without these being spread. This is the kind generally used by Europeans for their drawing and public rooms. The small kind of carpet is made for use in zamindari and other small cutcherries, and is much used from its portability. It is from 3 to 4 yards long and from $1\frac{1}{2}$ to 2 yards broad, and sells at from 3 to 4 rupees each carpet. It is generally made from five colours, from which cause it obtains the name of dhurri panch rangha.

Galicha carpets, manufactured in Sasseram, are almost always woollen, of florid but neat patterns, in imitation of the Persian carpet. They are used to a considerable extent by the rich natives in their zananas, but by Europeans also. The size usually manufactured is 2 yards long by 1 yard broad, and they sell at from 2 rupees to 4 rupees 8 annas per carpet. The European carpet manufacturer could not compete with these as to price and actual value, as the wool costs but little in India, and the native dyes answer admirably for the purpose; while also the coarse local wools, which would not pay for exportation, answer for carpet work. The colours are harmonious, and there is but little doubt that it would pay any enterprising merchant to export these to Europe. The annual manufacture at present in Sasseram is about 10,000 to 12,000 rupees.

Another kind, in imitation of the above, but wholly of cotton, is also made; prices nearly the same. The patterns are pretty, but they rapidly become spoiled by dirt and dust. They are invariably made of only two colours, blue and white. Ornamental carpets of thread, with a woollen and sometimes with a silken pile, are made up in Multan, Peshawur, Amritsar, Bahawulpur, and Kashmir. Those of Multan are perhaps most celebrated. Those of Ellore and other parts of the Northern Circars are largely sold for use and for export.

The carpets from Cocanada are greatly admired; the ground is white. A floral scroll of blue, red, yellow, and brown divide them into regular geometrical spaces like a tesselated pavement; a flowery cone being inlaid in each white space, and the rows of cones thus formed are alternately coloured red, blue, yellow, and brown. The design is Greek in its simplicity; and in its warmth and glow of colour perfectly oriental, charming the attention, 'caught by each colour till the next is seen.'

India produces also *velvet carpets* embroidered with gold, at Benares and Murshidabad. Costly articles of this kind were contributed to the Great Exhibiton of London by the Queen. These rich fabrics are of fine velvet, embroidered with bullion gold. Maharaja Gulab Singh contributed to the Great Exhibition of 1851 a magnificent manufacture of pure silk, nearly an inch thick in the pile, showing to perfection the dyes and the harmonious arrangement of the native artists. In every square foot there were said to be contained ten thousand ties or knots of silk.

In the *colouring* of the carpets of India, full Indian red, broken by flowers or conventional leaves, in which orange predominates, forms a leading feature. A cool, low blue, a green of similar gravity of hue, and soft, creamy white, complete the palette of the Indian designer of these fabrics. Some of the British carpet-dealers had changes effected in this old Indian system. Some white in borders was actually bleached, and one or two garish combinations introduced. Colours have been intensified and made flatly uniform, instead of broken and slightly varying as the masses of red and other colours are left by the native weavers. Linen backs have been introduced to meet the orders of some of the British dealers, and complaints of the wearing qualities followed. Both English and French dealers have had changes, more or less important, introduced

into these oriental designs to suit the bad taste of their buyers,—in all such cases, with losses of the exquisite harmony of the native arrangements of form and colour.

Oriental colouring in textile fabrics seems to result from a gift to the various races that produce them. The native designers proceed in accordance with immemorial traditions, and with a certainty that resembles instinct. Of all artistic powers, that of colour, in its highest harmonies, is the most difficult to teach. Though general principles can be imparted by scientific rules, the power of colouring beautifully is undoubtedly one rarely attained. It seems to prevail in races as a special gift. It exists where the knowledge of form is unknown. It accompanies an unconscious sympathy with nature, and seems more allied with instinct than demonstrable by science. Many actually savage nations colour their cloths or wrappers or mats harmoniously, though absolutely devoid of social or mental cultivation. And, on the other hand, as nations have progressed in scientific attainments, the love of colour, in dress certainly, in other ways generally, is diminished. Europe may cultivate the study of colour, and understand its laws; but in textiles of all kinds, from carpets to gossamer muslins and gold and silver tissues, the traditional taste of oriental nations remains unattainable by Europeans. And of European nations those most old-fashioned, least changed from the rude ages of the past, retain the greatest enjoyment and feeling of colour.

If the civilised nations of Europe do not equal the less advanced and even the savage races in their appreciation of colours, they are even less happy in their application of designs: and in Cashmere and throughout India much injury has been occasioned to the manufacturers, alike to their skill and to their profits, by European purchasers inducing them to undertake designs from Europe. The deep tints of native Indian and oriental dyes generally are at once the aspiration and despair of artistic European dyers; and the beautiful elaboration in colour and design, as shown in the work of the weavers of Persia, Turkomania, Kirman, Cashmere, and British India, can only be injured by interference. The workmen know that for the coarser wool of the Panjab, Sind, Baluchistan, and British India, the fine designs of Persia, or the designs of the dense-piled carpets of Turkomania and Kirman, are equally unsuitable, and that only their own bold patterns can be with advantage used.—*Madras Exhib. Jur. Rep.; Dr. Watson's Report; Mr. J. Rohde, MSS.; Colonel C. Davidson in Report of Hyderabad Committee; Baron Clement A. de Bode; Bokhara and its Amir*, p. 224; *General Ed. Ferrier's Journal*, p. 26; *Sir George Birdwood, Memo.*, 29th Sept. 1879; *do. Handbook Paris Exhibition*, 1878; *Porter's Travels*, ii. pp. 167–201; *Die Persische Nadelmalerei Susandschird, ein Beitrag zur Entwicklungs-Geschichte der Tapisserie de Haute Lisse*, von Dr. Joseph Karabacek.

CARPILIUS, a genus of crabs of the E. Indies, the Cancer of Linnæus. C. convexus, *Edwards*, is a crab of the Red Sea; C. corallinus, *Leach*, and C. maculatus, *Leach*, the latter the blood-spotted crab, are both of Asiatic seas.

CARPINI. Johannes Carpini, a Franciscan friar, was sent, A.D. 1247, by Pope Clement IV. to the Tartar camp on the Volga. Carpini travelled through Bohemia, Silesia, and Poland, and on through the vast regions then known under the name of Comania, and now as the country of the Don Cossacks, watered by the Dneiper, the Don, the Volga, and the Yaik, until he at last came to the standing camp of 'Duke Bathy' (Batou, grandson of Chengiz Khan), which afterwards grew into the city of Sarai or Sara, on the Volga. From here he was sent on to the imperial court, where he arrived by way of Lake Balkash at the moment when Kuyuk was being elected to the Great Khanship of the Tartars, in succession to his father Octai or Okkodai Khan, son of Chengiz Khan. On his return journey, passing rapidly through the camps of 'Duke Bathy' and 'Duke Corrensa,' who guarded the Tartar frontier in Europe from the nations of the west, he reached Kiev in Russia within eight months of leaving the imperial court of Kuyuk Khan. He is the first traveller into Mongolia whose narrative we possess.

CARPINUS VIMINEA. *Wallich.* Hornbeam.

Shirash, ... BEAS.	Charkhre, . . . RAVI.
Cham khuruk, . PANJAB.	Imar, ... SUTLEJ.

This tree is found in Nepal and the Sutlej valley between Rampur and Sungnam, at an elevation of 5500 and 6000 feet. Wood esteemed by carpenters. C. cordata, C. erosa, C. laxiflora, and C. japonica, *Blume*, occur in Japan.—*Cleghorn, Panjab Report*, p. 64; *Stewart.*

CARPOBALSAMUM, an inferior quality of opobalsam, obtained by expression from the fruits of Balsamodendron Berryanum.—*Kunth.*

CARPODACUS ERYTHRINUS, a rare bird in the N.E. of Europe, is a common winter visitant over the greater part of India.

CARPOO COONGILLIUM. TEL. Black dammer.

CARPOO ULANDOO. TAM. Black variety of Phaseolus max.

CARPOPHAGA, a genus of birds of the family Columbidæ. C. luctuosa, a fine cream-coloured pigeon of Celebes; C. oceanica, one of the nutmeg pigeons; many of both sexes are furnished with a large, round, fleshy caruncle on the bill at the base of the forehead; this is said to be present during the breeding season only.—*Macgillivray, Voyage*, i. p. 244.

CARR, MAJOR M. W., of the Madras army, author of Telugu Proverbs. He perished with all in a steamer, in a cyclone on the W. coast of the Peninsula in the beginning of 1869.

CARRAGANA. Hwang-tsing, CHIN. Carrageen moss or Irish moss, Chondrus crispus, *Lngb.*, and C. mammillosus, *Grev.*, from the west of Ireland. Used for cattle-feeding and dietetic purposes.

CARRAY ELLOO. TAM. Guizotia oleifera.

CARRAY KEERAY. TAM. Webera tetrandra.

CARRIABOOLUM. TAM. Aloes.

CARRIAGE of goods and persons, in Southern and Eastern Asia, continues from remote ages of the most varied kind, being by conveyances, man, and quadrupeds. The sledge seems to have been the first kind of conveyance in use. A sledge is sculptured on the temple of Luxor at Thebes, resembling that in use by the

London brewers. And sledges are in common use by the Eskimo, the Laplanders, the northern Russians, and in some winters the people of Holland and Belgium; and in the sandy tracts north of Nellore, also in the sandy tracts of the Peninsula of India. All the earlier carts seem to have been fitted with a pole, and dragged by two animals yoked together. But in India at the present day, many bullocks and buffaloes are used singly, the yoke connecting the shafts being made to pass over the neck. A wheeled carriage or car appears to have been in use in Egypt from very early times. It is called a chariot in the Bible, and is shown in paintings and sculptures 4000 years old. Menu, who lived B.C. 1400, and Homer, in the 5th book of the Iliad, describe the portions of them, the spokes, axes, naves, felloes, wheels, tyres. Jabin king of Canaan had 900 chariots. David took 700 from the kings of Syria, and 1000 from the king of Zobah. Solomon had 1400; and his merchants supplied chariots from Egypt for 600 shekels, equal to £60. The prophet Nahum, who lived B.C. 713, alludes to the chariots of Nineveh, and carriages are figured in sculptures of Nineveh and Babylon in hunting and in war. The Assyrian chariots were larger than those of Egypt.

Chariots were used at the siege of Troy, and the Romans had chariots of two and four wheeled cars. B.C. 170, Emilius, the Roman consul, had 750 waggons in his train, bearing the spoils of Perseus, last king of Macedonia.

The Scythians are mentioned by Herodotus, B.C. 450, as having in use a rough two-wheeled covered platform cart, and the moveable cover was used as a tent.

Porus, when he met Alexander on the banks of the Indus river, had a number of elephants of large size, and several thousand chariots, each of which carried six persons.

The Persian chariot had scythes and swords projecting. On Alexander's return from India towards Persia, he travelled in a chariot drawn by eight horses. And after his death at Babylon, in order to take his body to Alexandria, a four-wheeled car, 8 feet long and 12 feet wide, was built, and dragged by 64 mules.

The *Hackery* of Hindustan, called garry by the people, is on two wheels, with a high axle-tree bed, and a long platform, frequently made by two bamboos which join in front and form the pole, to which two oxen are yoked; the whole length is united by smaller pieces of bamboo, tied together and nailed.

The wheels are often of stone or of solid wood cut from a single tree, or built up. The hackery for the rich has a domed roof; the passenger sits under the dome cross-legged, and the driver sits on the pole. It has wing guards on the wheels.

The *Eka* is a one-horse carriage, resembling an Irish car. It consists of a tray for the body, and has a canopy roof. The driver sits on the fore edge of the tray, and the passenger cross-legged behind him.

Shampong resembles the eka, but larger, and is usually employed for women.

Donga is in use in the Dekhan, and is a two-wheeled conveyance; one pony in shafts, and another pony outside.

Nibs is a palanquin on two wheels, drawn by bullocks.

The *Araba* of the Turks has its sides of lattice work to admit the air. The *Jutka* is similar to the eka. In India with the palanquin, etc., and in China and Japan with forms of the sedan chair, men have been employed as carriers from the most ancient times, but in India and China largely as bearers of burdens. The camel, the mule, the horse, the bullock, the buffalo, yak, and the donkey, have been employed in Egypt, Central and Southern Asia, from prehistoric times for riding, carriage, for burdens, and for ploughing. The hybrids between the female and male yak and the bull or cow carry from two to three maunds; they are sure-footed, hardy, and docile, and are used also for riding in the snows.

In the highest parts of the N.W. Himalaya, sheep and goats are most used. The sheep carry from 10 to 16 lbs., the goats from 12 to 24 lbs.; their day's journey is about five miles, to give them time to browse the pasture, which is their sole food. They are used to carry the borax from Tibet in packs (karbaj) slung over their backs.

During the march upon Kābul, Yakub Khan made over to the British transport service sixty-two magnificent hill ponies, capable of carrying four maunds each=336 lbs. Camels rarely cover the ground at a greater speed than one and a half to two miles an hour, consequently in an enemy's country the troops must be continually halted in order not to leave their baggage in the rear unprotected. The men are thus, even over the shortest marches, kept under arms all day; and when anything over fifteen miles has to be done, the camp cannot be formed until darkness has set in. Mules or ponies keep up with the troops, and the line does not extend to so great a length. Even the longest marches can be performed in the earlier part of the day. The kafilas that come down every year to India in immense numbers, march for two days—perhaps at the rate of 20 to 30 miles—and halt for one good day's grazing. See Camel.

CARRION CROW, Corvus corone of Europe, Afghanistan, Japan (apud *Temminck*), is replaced in India by C. culminatus.

The safflower is grown very abundantly all over India, Burma, and China, and is very largely used in dyeing. The plant is propagated by seed sown in drills at 1½ feet distance from each other. The young plants appear in about a month, and after the second month are hoed and thinned, each plant being left a foot from the other. The richer the land, the larger the proportion of colouring matter afforded by the flower. On the opening of the flowerets, they are rapidly gathered without being allowed to expand fully. They are then dried in the shade with great care. The produce of Paterghauta and Belispore is considered, in the London market, as the best that is exported from India. The Dacca safflower ranks next to that of China, which is reputed to be of a superior quality. Safflower is widely grown on the banks of the Irawadi and Salwin. Its flowers furnish the best yellow dye in the country, and, mixed with other ingredients, they are used to dye red, and to give a variety of tints, and in dyeing pink and scarlet.

This plant yields six or seven distinct shades of red, the palest pink or piyazi gulabi (pink), gulabi surkh (rose colour), kulfi or gul-i-shaftalu (deep-red). In combination with harsinghar flowers (Nyctanthes arbor-tristis), it yields soneri or golden orange, narangi, deep orange, and sharbati, salmon-colour; and with turmeric (haldi, zard chob), it gives a splendid scarlet, gul-i-anar, and other tints; again, if combined with indigo, Prussian blue, etc., a series of beautiful purples, known as lajwardi, uda, nafarmani, sosani, kasni (a delicate mauve), falsai, kokai, and the deep-purple baingni. All these tints are more or less beautiful, but scarcely one of them will stand washing.

The yellow principle is worthless as a dye. It is soluble in water, is removed by washing, and thrown away as the first step in the preparation of the valuable red product. The red dye is an acid resinous substance of superb colour, insoluble in water and in acid solutions, little soluble in alcohol, and not at all in ether. It is dissolved freely by aqueous alkaline solutions, which it neutralizes. Its salts (carthamates) are crystalizable, and quite colourless; acids precipitate the carthamic acids from solutions of these salts. To obtain it on a large scale, after the separation of the yellow matter, the dried flowers are treated by a solution of carbonate of soda, and lemon juice added; the carthamic acid precipitate is collected by subsidence, washed, and carefully dried at a gentle heat. The most lovely tints are imparted by this dye to silk and cotton; rouge is a mixture of the dry carthamic acid and finely powdered talc. The pink saucers used for giving a flesh tint to silk are prepared from this dye, with a small portion of soda. 8 oz. of the prepared petals and 2 oz. carbonate of soda are acted on by 2 gallons of water. 4 lbs. of prepared chalk are added, and the colour precipitated upon this by citric or tartaric acid. The Chinese card-rouge is a carthamate of soda, colourless when rubbed on, but by the salt being decomposed by the acetic acid secreted by the skin itself, the carthamic acid separates in the most perfect rosy tint which can be imagined. The seeds yield abundance of fixed oil, which is used as an external application in paralytic affections, and for bad ulcers; and small seeds are reckoned by the Vytians amongst their laxative medicines. The dye of the 'Kong-wha,' a variety of safflower or Carthamus tinctorius which grows in China, is held in high esteem by the Chinese, and is used in dying the red and scarlet silks and crapes which are so common in the country, and so much and

justly admired by foreigners of every nation. Large quantities are annually produced in the Che-kiang province near Ningpo.—*Powell's Handbook*, i. p. 457; *Ains. Mat. Ind.* p. 195; *O'Shaughnessy*, p. 411; *Drs. Mason, M'Clelland.*

CARTICA or Kartika, in Hindu astronomy the seventh Hindu solar month, when the sun is in the sign Tula, answering to the Tamil Arpesi. In the southern parts of the Peninsula the Tamil month Cartica is the eighth of the solar year. Lastly, Cartica is also the eighth lunar month of the luni-solar year. This month is peculiarly sacred to Lakshmi, the goddess of prosperity, the Juno Moneta of the Romans. The 13th is called the Dhunterus, or thirteenth day of wealth, when gold and silver coin are worshipped, as the representatives of the goddess, by her votaries of all classes, but especially by the mercantile classes. On the 14th all anoint with oil, and make libations thereof to Yama, the judge of departed spirits. Worship (puja) is performed to the lamp, which represents the god of the lower regions, and is thence called Yamadipa, the lamp of Yama; and on this day partial illuminations take place.—*Tod; Warren; Kala Sanhita; Cole, Myth. Hind.* p. 379.

Carum carui and C. gracile, if distinct, both grow in profusion in many of the more arid tracts on the Sutlej, Chenab, etc., in Kashmir, and in Western Tibet, from 9000 to 14,500 feet.—*Dr. J. L. Stewart.*

CARVING.

Sculpture, gravure, . . FR.	Scultore, ... IT.
Schnitzen, Vorschneiden, GER.	Escultura, ... SP.

Carving in wood, horn, and ivory must have been practised in India from very early times, for the idols which the people worship, and for calico-printing, for which they have long used wood-blocks. They are fond of carving on many of their ordinary utensils, as spinning-wheels, etc. Their skill is shown in carving the blackwood and ebony furnitures of Bombay and Madras, especially in the elegance of the patterns of the backs of the chairs and sofas, in the sideboards and book-cases. Carvings in ivory of different parts of India are much to be admired, whether for the size or the minuteness, for the elaborateness of detail, or for the truth of representation. Among these the ivory carvings of Berhampore are conspicuous. A set of chessmen from India, at the Exhibition of 1851, carved from the drawings in Layard's 'Nineveh,' were excellent representations of what could only have been seen in the above work, and showed that they are capable of doing new things when required; their representations of an elephant and other animals were true to nature. The carvings in the same material in a state chair sent from Travancore were greatly admired; and for the truth of representation on a minute scale, where an elephant was enclosed in the shell of a pea, chouries or fly-flappers from Calicut, where the ivory or sandal-wood was cut into long hair-like threads, were also specimens of their mechanical skill. Their skill in wood-carving is conspicuously displayed in the elaborate details of the sandal-wood boxes from the Malabar coast, and is also shown in the beauty of the figures and buildings in the pith-like stems of the marsh-plant called shola, the Æschynomene aspera. In the latter, all the elaborate detail of the richly ornamented Hindu architecture of the south of India is carefullly brought out. For this work only two tools seem to be employed,—one a large and heavy knife, and one with a fine sharp cutting edge. Besides these, cocoanut shells and gourds are carved and made into cups, vases, and snuff-boxes; also the kernel of the cocoanut is variously cut, for making garlands for state occasions. The natives of India also display skill and neatness, as well as habitual taste, in their work-boxes, etc., of ivory, horn, or porcupine-quill, ebony, and sandal-wood, their fans and umbrellas, chouries, and khus-khus or other baskets, hookah-snakes, imitation fruits and flowers, toys and puzzles. The skill is remarkable with which the unyielding substance of the hard, thick chank shell is converted into necklaces for men and into bracelets for women. The manufacture of shell bracelets is one of the indigenous arts of Bengal, in which the Sankari caste at Dacca excel. The chanks of which they are made are the large species of Turbinella, from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Ramnad and South India, opposite to Ceylon, and from the Maldive Islands. The ivory for the Chinese carvers reaches China principally from Cochin-China and Africa, via Bombay, and always finds a ready sale at Canton; the largest and best tusks weigh from 16 to 25 pounds each, decreasing to five or six pounds. The cuttings and fragments also form an article of trade, as the workmen can employ the smallest pieces. Bones and horns, especially the long horns of buffaloes, are in China worked into handles, buttons, etc. Rhinoceros' horns are brought from Burma, from Sumatra, and from Africa through Bombay; they are highly valued by the Chinese, from a notion that cups made from them sweat whenever a poisonous mixture is poured into them. A perfect horn sometimes sells as high as 300 dollars; but those that come from Africa do not usually rate above 30 or 40 dollars each. The principal use of these horns is in medicine and for amulets, for only one good cup can be carved from the end of each horn; and consequently the parings and fragments are all preserved. The hard teeth of the walrus, lamantin, and other cetaceous animals, also form articles of import into China from the Pacific, under the designation of sea-horse teeth; they weigh one or two pounds a piece, and the ivory is nearly as compact, though not so white, as that of the elephant. The delicate carving of Chinese workmen is well known, and has often been described; many specimens of it are annually sent abroad. Few products of their skill are more remarkable than the balls, containing ten or twelve spheres cut out one within another; but the manner of cutting them is simple. A piece of ivory or wood is first made perfectly globular, and then several conical holes are bored into it in such a manner that their apices all meet at the centre, which is usually hollowed out an inch or less after the holes are bored. A long crooked tool is then inserted in one of the conical holes, so

bent at the end and stoppered on the shaft that it cuts the ivory at the same distance from the surface when its edge is applied to the insides of the cone. By successively cutting a little on the insides of each conical hole, their incisures meet, and a sphericle is at last detached, which is now turned over and its faces one after another brought opposite the largest hole and firmly secured by wedges in the other holes, while its surfaces are smoothed and carved. When the central sphere is done, a similar knife, somewhat larger, is again introduced into the holes, and another sphere detached and smoothed in the same way, and then another, until the whole are completed, each being polished and carved before the next outer one is commenced. It has been supposed by some that these curious toys were made of hemispheres nicely luted together, and they have been boiled in oil for hours in order to separate them and solve the mystery of their construction. Fans and card-cases are carved of wood, ivory, and mother-of-pearl in alto-relievo, with an elaborateness which shows the great skill and patience of the workman, and at the same time his bad taste in drawing, the figures, houses, trees, and other objects being grouped in violation of all propriety and perspective. Beautiful ornaments are made by carving roots of plants, branches, gnarled knots, etc., into fantastic groups of birds or animals, the artist taking advantage of the natural form of his materials. Models of pagodas, boats, and houses are also entirely constructed of ivory, even to representing the ornamental roofs, the men working at the oar, and women looking from the balconies. Baskets of elegant shape are woven from ivory splinths; and the shopmen at Canton exhibit a variety of seals, paper-knives, chessmen, counters, combs, etc., exceeding in finish and delicacy the same kind of work found anywhere else in the world. The most elaborate coat of arms, or complicated cypher, will also be imitated by these skilful carvers. The national taste prefers this style of carving on plane surfaces; it is seen on the walls of houses and granite slabs of fences, the woodwork of boats and shops, and on articles of furniture. Some of it is pretty; but the disproportion and cramped position of the figures detract from its beauty. Their porcelain is good. The ivory carvings, ebony and other hardwood ornaments, and the bronzes, are all exquisitely worked; the value attached to them in England varying from £4 to £5. Burmese carpenters carve in a rough but bold style, and find employment principally in carving for the exteriors of monasteries.—*Williams' Middle Kingdom*, ii. pp. 141, 408; *Yule's Embassy*, p. 59; *Hodgson's Nagasaki.*

CARWAR or Sedashigarh, a sheltered seaport on the western coast of the Peninsula of India.

CARYOCAR BUTYROSUM.

C. nuciferum. | Pekea butyrosa.

The souaria, sawarrow, or surwha tree of Guiana and Demerara. It yields the sawarrow nut. It might be brought to India with benefit to the country.

CARYODAPHNE DENSIFLORA. *Blume.* Kiteja of JAVA. A tree sixty to eighty feet high; leaves gratefully aromatic, used in infusion like tea against spasms of the bowels, and in puerperal convulsions.—*O'Shaughnessy*, p. 547.

Unexpanded Flower-buds. Mother Cloves; Cloves.

Dried Berries. Clous de girofle, FR.

This small tree of the Moluccas grows in Amboyna and Ternate, but is cultivated in the Malay Peninsula, the south of India, Mauritius, Bourbon, Cayenne. It is an elegant evergreen about 18 ft. high, and has a smooth grey bark. The best cloves are obtained from the Moluccas; they are unexpanded flower-buds, and three pounds weight of cloves contain about 5000 flowers. They are used as a spice, and the valuable oil obtained by distilling them is used in medicine. — *Royle; O'Shaughnessy; Voigt.*

CARYOTA HORRIDA. *Gardn., Moon's Cat.*

Areca horrida, *Thw., Hooker.* Katu kittul, SINGH.

A tree of Caraccas, introduced into Ceylon and into the Calcutta Gardens. In Ceylon it often rises to a height of fifty feet, and has a coating of thorns for about six or eight feet from the ground, each about an inch in length, and so densely covering the stem, that the bark is barely visible.—*Voigt; Thwaites.*

This very ornamental palm grows in Ceylon and in Malabar, Canara, Sunda, on the Godavery, in Ganjam, Gumsur, Assam, Sumatra, and Borneo. It grows to a height of forty feet, with a ringed, tall, and slender stem of more than a foot in diameter. It is found on the sea-shore, and ascends the mountains of Sikkim to the height of 5000 feet. Its outer wood (outside the pith) is nearly as hard as flint. Where it grows in abundance, it is one of the most useful of trees. The root is hollowed for the buckets used in irrigation; and the trunk, when hollowed, by freeing it from the inner pith, forms a convenient and economical water conduit. In Ceylon, Sumatra, and Borneo, it is used for rafters, reepers, window bars, posts, etc., but is little durable, rarely lasting above three or four years. Its pith or farinaceous part is filled with starch granules equal to the best sago, which are extracted by the people, and made into bread or pottage. Its spathes yield a toddy or palm wine, Koondel panai kallu, TAM.; and during the hot season a single tree will yield at the rate of a hundred pints in the 24 hours. This is used as an intoxicating liquor, also as yeast in baking bread, and is converted into the spirit called Bhyni arrack, and into sugar or the jagari called Koondel panai vellum, TAM. Its cabbage is preferred to that of the cocoanut. Its leaves are very large, measur-

ing 18 or 20 feet in length, and from 10 to 12 across; from their fibre, the kittul fibre of commerce, ropes of great strength, brushes, brooms, caps, and similar articles are manufactured; the woolly material found on the petioles is used as oakum for caulking ships. In Ceylon the black fibre from the leaf-stalks is manufactured into rope of great strength and durability, and is used for tying wild elephants. The Rodyahs, a forest race among the Kandyans, make this rope generally with considerable skill. The fibre is much used by the natives for making fishing lines and bowstrings; is very strong, and resists water for some time, but is liable to snap if suddenly bent or knotted. It resembles black horse-hair, and might be employed similarly. Dr. Gibson says it is one of the most useful trees in the country; and he had heard that the farm of this tree, throughout the single district of Yellapore in Soopah, yielded Rs. 30,000 per annum.—*Drs. Wight, Gibson, Roxb., Royle, Hooker, Marsden, and Ainslie; Mr. Mendis; Captain Macdonald; M. E. J. R.; Seeman; Mr. Low; Mr. Ondatjee, Veg. Prod. of Ceylon.*

CAS. HIND. Saccharum spontaneum.

CASA-CASA. TAM., TEL. Poppy seed.

CASA CHITTY, of Ceylon, author of the Tamil Plutarch, containing a history of the lives of the poets of Southern India in a chronological arrangement.

CASA-ELLE. TAM. Leaves of Memecylon tinctorium.

CASANDI. HIND. Cassia sophora.

CASARA-KAIA. TEL. Cucumis tuberosus; C. canabina.

CASARCA, a genus of swimming birds of India; there are several species. In C. cana, *Gm.*, the under tail-coverts are paler, and the black on either side of them at base of C. rutila, is, in C. cana, replaced by dusky, minutely freckled with whitish. C. rutila, the Brahmany goose, is met with above Sukkur. The male is a fine-looking bird, and measures about 29 inches; the general colour of the plumage is rufous, with brilliant green on the wing-coverts. It is shy and wary. See Chakwa.

CASEARIA CANZIALA. *Wall.*

Samyda canziala, *Buch.* | Ana vinga, . . MALEAL.

A large tree growing in Assam and Bengal, very bitter. Its leaves are used in baths, and the pulp of its fruit as a diuretic. The Casearia genus is of the order Samydaceæ. The species are found in the Himalaya, S. India, Assam, Ceylon, Penang. Voigt (p. 78) mentions six species, shrubs or small trees of N. India; and Thwaites mentions two moderate-sized trees of Ceylon,—C. coriacea and C. championi.

Casearia pentandra, tha-byai-ywet-kya, BURMESE, found in the Pegu district, but scarce. Timber strong and close-grained, adapted for fancy work and cabinetmaking.—*Dr. M'Clelland.*

Casearia tomentosa, *Roxb., D. C.*, chilah, chilla, HINDUSTANI, a small tree of Kangra, the Panjab, Jaffna, and Sigre. It is not uncommon in the Siwalik region at from 2000 to 3000 feet, up to near the Indus. The timber is whitish, soft, and brittle, and is only used for small woodwork by natives; but is said to furnish good fuel. In some places the fruit is used for poisoning fish.

Casearia elliptica, bhogara, MAHR., klaare maram, TAM., in Coimbatore, a large shrub. On the Bombay side it is a small tree, not uncommon near the ghats. The wood is smooth, fine-grained, and yellow-coloured, but from its small size can only serve as an ornamental wood.—*Drs. Wight, J. L. Stewart, and Gibson.*

Casearia esculenta. *Roxb.*

Jiru kaneli, . . MALEAL. | Konda pragara, . . TEL.
Konda junguru, . . TEL. |

A large shrub, growing in the mountains of the Northern Circars. Its leaves are eaten by the people, and its roots are employed by the hill people as a purgative.—*Useful Plants.*

Casearia ovata, *Roxb.*, Peda-kal-mesura, TELUGU, is a large tree of the Godavery; has wood of a light colour, hard, does not warp, and is worthy of attention. Fruit used to poison fish. —*Captains Beddome, Macdonald.*

Casearia varians. *Thw.*

C. coriacea, *Thw.* | C. championi, *Thw.*

This is a lofty tree, very common in all the Western Ghat forests and in Ceylon, and it grows to a very large size in the dense moist forests at 2000 to 3000 feet elevation. C. coriacea, *Thw.*, a form with very coriaceous leaves, is very common on the higher ranges of the Animally, 6000 to 7000 feet elevation, and on the Ceylon mountains at the higher altitudes. In drying, the leaves turn very black on the upper side.—*Thwaites*, p. 19; *Beddome, Fl. Sylv.* part xviii. p. 208.

Casearia Zeylanica. *Thw.*

C. ovata, *Willd.?* | Wal-wareka, . . SINGH.

A middle-sized tree of the hotter parts of Ceylon, very common up to an elevation of 1500 feet.—*Thw. En. Pl. Ceylon.*

CASGAI, a wandering tribe in the south of Persia, between Shiraz and Darab.

CASH or Kas, in the old Madras currency, a small coin of which 10 = 1 doodie, now valued as 2 pice, and 80 cash going to a fanam; 45 fanams being equal to 1 star pagoda. According to the old Madras system, accounts were kept in star pagodas, fanams, and kas.

8 kas = 1 fanam
336 ,, = 42 (silver) fanams = 1 pagoda.

The E.I. Company reckoned 12 fanams to the rupee, and three and a half rupees to the pagoda. But the bazar exchange fluctuated between 35 and 45 silver fanams per pagoda; fanams were also coined in a base gold.

Copper 1, 5, 10, and 20 kas pieces were coined in England, by contract, for Madras, so lately as 1797. The 20 kas was also called 'dodo' and falus. The star pagoda weighed 52·56 grains, and was nineteen one-fifth carats fine. It was therefore intrinsically worth 7s. 5¼d. sterling, but it was commonly valued at 8s. Many varieties of the pagoda used to circulate on the Coromandel coast, but since 1833 they have been only obtainable when sought for.

In 1811 a coinage from Spanish dollars took place, consisting of double rupees, rupees, halves, and quarters; and pieces one, two, three and five fanams; the rupee weighed 186·7 grains. A silver coinage of half and quarter pagodas, of dollar fineness, also then took place; the half pagoda weighed 326·73 grains troy, and was equal to 1¾ arcot rupees. By a proclamation of 7th January 1818, the silver rupee of 180 grains was constituted the standard coin, and all accounts and public engagements were ordered to be converted at the exchange of 350 rupees per 100 pagodas.

The proportion between the old and new currency then became 3½ rupees per pagoda, and in copper 75 kas old currency equals 14 paisa new currency.

Kas may be a corruption of the Sanskrit word Karsha, which is mentioned in Colebrooke's Essay on Indian Weights, as the same with the word pan. A karsha, or 80 raktika (rati) of copper, is called a pana or karsha-pana. It is now the eightieth part of a pan; but the simple word is all that can be identified as having survived the changes of system.

In Britain, 'cash' has come to mean ready money, also copper or silver money. In India it is still, along with the cowrie, used to indicate a small sum.

CASH. CHIN. A Chinese coin about eight to a halfpenny. In 1872, 1700 cash were exchanged for a tael of silver, and nearly four tael go to a pound sterling. In China, a cash of iron is the 5320th part of a dollar, and it is a saying, 'For as many beads make the necklace, so many cash make a cobang,' a gold coin equal to four dollars and a third.—*Edken.*

CASH, the ancestors of the Chasdim or Chalybes of the mountainous territory in Central Armenia, a little to the north of Erzerum. The Sabæan followers of Cash are to be distinguished from those descendants of Shem who at a later period occupied part of the mountains of Assyria. See Chaldæa.

CASH BALANCES, a financial term of the Government of India for the balances in their several treasuries. They have ranged between thirteen and twenty-four kror of rupees in the years 1857 to 1880; but anything below thirteen kror is considered unsafe.

CASHCUTTEE. —? Gambier.

CASHEF or Kasheb, of the Mahomedans of Kashmir, the grandfather of Kasyapa, who drained the valley. See Kashmir.

CASHEW NUT TREE, Anacardium occidentale, yields several useful products. One edible part is the swollen, pear-shaped stalk (peduncle) which supports the nut. The kernel also is eatable when roasted.

Cashew Apple Oil is powerfully vesicating; and it is obtained from the pericarp of the cashew apple. It resembles in its properties the acrid oil obtained from the marking nut, Semecarpus anacardium.

Cashew Gum. The trunk and branches, on being wounded during the ascent of the sap, yield a transparent gum similar in appearance to gum-arabic, for which it is a good substitute. This gum is sub-astringent, and is particularly adapted for use where the depredations of insects require to be guarded against.

Cashew nuts are kidney-shaped, attached to the under part of the fruit; they are articles of food, and an ingredient in chocolate.

Cashew Nut Oil.

Kaju ka tel, . . . HIND.	Munta mamidi nuna, TEL.
Mundri cottay yennai, TAM.	

A light yellow, sweet-tasted, and edible oil obtained from the nut of this tree by roasting. It is in every respect equal, if not indeed superior, to either olive or almond oil. It is very seldom prepared, the nuts being used as a table fruit.—*M. E. J. R.* See Gum; Oil; Resin.

CASHGAR, Khoten, Turfan, and Yarkand, according to Lassen, the old original inhabitants of these places, and of the adjacent highlands, are the Tajak, who speak Persian, and are all agriculturists. The Swedish chronicles bring the Swedes from Cashgar, and the affinity between the Saxon language and Kapchak is great.—*Bunsen; Tod.* See Kashgar.

CASHMERE. The Cashmere territory at present comprehends Jammu, Cashmere, Kishtwar, Zangskar, Ladakh, and Balti. A chronicle exists which was composed in A.D. 1125, but gives a general historical account of Cashmere from B.C. 1182. The Abissares chief, who with rich presents conciliated Alexander as he approached the Indus, is supposed to have ruled about Cashmere. The rajas of Cashmere of the line of Kuru in the Lunar race, were worshippers of the Naga or Snake. The early chronology of Cashmere is full of doubts, though Professor Wilson, Captain Troyer, and Major Cunningham all coincide in regard to the proper period of the initial date of the Naga dynasty. The line is taken from the raja Tarangini, which commences with an account of the desiccation of the valley by Kasyapa muni, supposed to allude to the Deluge. Cashmere was colonized by Kasyapa B.C. 2666. There were many dynasties of Cashmere—kings of the Kaurava race, 1266 years, with one of whom, Gonerda, authentic history commenced in B.C. 2448. Lava, in 1709 B.C., was the Loo of Mahomedan historians.

Surendra, B.C. 1600, was contemporary of Bahman of Persia.
The Gonerdiya dynasty, 1013 years, or 378 years after adjustment.
The Aditya dynasty, 192 years.
The Gonerdiya line restored, 592 years, or 433 adjusted.
The Naga or Karkota dynasty, 260 years 5 months.
The Utpal dynasty, 84 years 5 months.
The Bhota dynasty.
The Mahomedan kings.

Cashmere was annexed to the Moghul empire under Akbar in 1586 A.D., but it has since been ruled from Afghanistan by the Durani and Barakzai chiefs; was taken from them in 1819 by Ranjit Singh, and is now held by a Dogra Rajput, chief of Jammu. After the Sutlej campaign, the treaty of Lahore, dated 9th March 1846, left the British Government in possession of the country, hill and plain, between the rivers Beas and Sutlej, and of the hill country between the Beas and the Indus, including the provinces of Cashmere and Hazara. The British Government conferred on raja Gulab Singh, territories on the hills, and recognised his independence. Gulab Singh began life as a horseman in a troop commanded by jemadar Khooshal Singh, then the favourite chamberlain of Ranjit Singh. He soon raised himself to an independent command, in which he distinguished himself by making prisoner Agur Khan, chief of Rajaori. For this service the principality of Jammu was conferred on his family, and Gulab Singh took up his residence in Jammu, whence he soon extended his authority over his Rajput neighbours, and eventually into Ladakh. He took an important part in the negotiations which followed the battle of Sobraon. A

separate treaty (No. cxxiv.) was concluded with him at Amritsar on 16th March 1846, which put him in possession of all the hill country and its dependencies between the Indus and the Ravi, including Chamba, and excluding Lahoul, on payment of 75 lakhs of rupees, and in exchange for the Cis-Ravi portion of Chamba. By a subsequent arrangement in 1847, Chamba came again entirely under the British Government. In 1857, maharaja Gulab Singh died, and was succeeded by his son, Runbir Singh, to whom the right of adoption was guaranteed to the maharaja by a sunnud.

The general level of the valley of Cashmere is about 5500 feet above the sea, but at the Waler lake and gardens of Srinuggur is only 5146 feet, in lat. 34° 46′ and long. 74° 48′.

Cashmere has always been subject to earthquakes. The great bulk of the people profess Mahomedanism; but they are of Aryan descent, of the Hindu stock, and all classes are remarkable for their physical symmetry. The chief town, Srinuggur, on both banks of the Jhelum, has 40,000 people. Islamabad, on the Jhelum, is a seat of the shawl manufacture. The fruits which attain maturity are the apple, pear, quince, peach, apricot, plum, almond, pomegranate, mulberry, walnut, hazel nut, pistachio, and melon. The 'gilas' cherry is indigenous, and is cultivated in orchards. The bullace, Prunus insititia, is found nowhere else in a wild state. The vine is extensively cultivated. In 1878-79 the British Indian trade with Cashmere amounted to Rs. 81,61,169, viz. imports, Rs. 55,85,369, and exports, Rs. 25,75,800.—*Elphin. Caubul*, p. 506; *Prinsep's Antiquities, by Thomas; Cleghorn, Panjab Report*, p. 171; *Aitcheson's Treaties, etc.*

CASHMERE, a very beautiful woollen fabric, formerly manufactured solely in the kingdom of Cashmere, but now in other towns, in the form of shawls, coats, scarfs. The manufacture of Cashmere shawls was long peculiar to that province. Formerly the shawls were exquisitely woven, with unrivalled elegance and chasteness of design, softness and finish in quality, arrangement of colours and use of dyes, which the finest Paisley and French shawls did not approach. The exquisite shawls of Cashmere become rarer and rarer every year, and their place has been usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Panjab and in Dehli, of late years, workmen have commenced to embroider Cashmere cloths and net with floss silk and braid, but solely for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Cashmere shawls, as also in the Dehli work, wooden needles of hard wood are used, slightly charred, with a hole in the centre of the needle to receive the yarn. Cashmere weavers have settled at Amritsar and Jellalpur and other places, and have flourished. The great Panjab mart for Cashmere is Amritsar. The largest import is of pashmina goods, consisting of shawls, needle-worked goods (amlikar), embroidered chogas, etc., and plain pashmina cloth.—*M. E. J. R.; Dr. Watson.* See Shawls; Wool.

CASI, the Hindu name of Benares, a city which lies in 25° 18′ 31″ of N. lat., and according to Hindu geography, 4° 37′ E. of Lanca. See Benares.

CASPIAN SEA, a large salt-water inland sea of Central Asia, lying between lat. 36° 55′ and 47° 30′ N., and long. 46° 48′ and 55° 25′ E., 730 miles long, 150 to 270 miles broad, with an area of 140,000 square miles. The chief affluents are the Atrak, Gurgan, Kizl-Ozan, Kuma, Kur-Terek, Ural, and Volga; but there are nearly a hundred torrents besides. It has no outlets and no tides. It has valuable fisheries of sturgeon and other large fish; sterlet, porpoise, perch. It has twice been surveyed, and once declared to be 81·4 feet below the Black Sea, but at another time only 38½ feet. It is known to the Mahomedans as the Daria-i-Kulzum, also Daria-i-Hasleta Khan, and Daria Khizr, and by the Armenians as the Sūf, by the Georgians Sgwa, and by the Russians Gualenskoi. According to Strabo (lib. xi.), all the tribes east of the Caspian were called Scythic. The Dahæ were next the sea; the Massa-getæ and Sacæ more eastward; but every tribe had a particular name. All were nomadic; but of these nomades the best known are the Asi, the Pasiani, Tachari, Saccarandi, who took Bactria from the Greeks. The Sacæ made irruptions in Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia, called after them Sacasenæ.

The whole of the N. part of the barren highlands on the E. coast is inhabited by Kirghiz Kazzaks, that to the S. by the Turkoman and Khivali, all of them in tents, carrying on the coasting trade. About 80 ships, called shootes (Razchiva, Aslam), trade from port to port. The waters give employment to about 10,000 fishermen; yield abundance of fish, classed as *red fish*, which includes the beluga, sevringa, and sturgeon, yielding isinglass, and made into caviare; *white fish*, such as the salmon trout, bastard beluga, sterlet, carp or sazan, soudak, and silure; *the third class* have the general names chistia and riba or kooaya. The sturgeon fishery alone yields 2,000,000 roubles annually. The take in 1828 was 43,033 sturgeons, 653,164 sevringa, 23,069 beluga, also 8335 soudak, and 98,584 seals. Canals connect this sea with the Baltic.

The first attempt to open a trade route from the Caspian eastward was made by Antony Jenkinson, Queen Elizabeth's envoy to Shah Tamasp of Persia. In 1557 he travelled through Russia to Bokhara, returning by the Caspian and the Volga in 1560. From the king of Shirvan he obtained leave to establish a factory at that place. In 1579 Christopher Burroughs traded in a ship of his own building across the Caspian to Baku, but the ship got stranded in the ice, and his cargo of raw silk was carried in a boat to Astracan. After 160 years, in 1738, Mr. John Elton, who had been employed by the Russians on the Orenburg frontier, sailed from Astracan with a cargo of goods for the Persian market. He reached Enzeli, the port of Resht, in May 1739, and, proceeding to Resht itself, exchanged his English broadcloth for raw silk. He got leave to trade in Persia, and to plant a factory at Meshed, with a branch at Resht. Returning to Persia with a large cargo of broadcloth, he entered the service of Nadir Shah, and undertook to build for him a fleet capable of protecting the Persian shores of the Caspian. The *Averse*, carrying twenty three-pounders, was the first-fruits of Elton's energy and resourcefulness. But Russian jealousy brought

the new-born English trade in the Caspian to an untimely end in 1746. Two English vessels had to be sold at a great loss to Russian merchants in Astracan, and soon afterwards Elton himself was murdered in Ghilan during the anarchy which followed on the death of Nadir Shah in 1747. Among those who had embarked in the Caspian trade, was Jonas Hanway, who fell on one occasion into the hands of the Kajar chief, Muhammad Husain, ancestor of the present Shah of Persia. He escaped with the loss of his property in Astrabad, and obtained from Nadir Shah an order for the payment of all his losses. But Hanway soon went home, to write a charming account of his travels and a life of Nadir Shah. By the treaty of Gulistan between Russia and Persia in 1813, no Persian man-of-war was thenceforth allowed to navigate the Caspian.

CASSA-CASSA. TEL. Poppy-seed.

CASSAREEP, the concentrated juice of the bitter cassava, forms the basis of the West India dish pepper-pot. Meat placed in it is preserved longer than by any other process of cooking.

CASSAVA. The sweet cassava is Manihot aipi, *Pohl.* The bitter cassava, or tapioca plant, is M. utilissima, *Pohl.*

Cassava flour or meal, from which Cassava bread is made, is obtained from the M. aipi, the sweet Cassava, the Jatropha manihot, *Linn.*, by grating the root, expressing the juice by pressure, and then drying the residual cake and pounding. It is called Moussache by the French.

Cassava starch, called also Tapioca, is prepared from the starch of M. utilissima, the bitter Cassava, by washing and granulating on hot plates, by which the concretions are formed, as seen in commerce.—*Hogg; Birdwood; Von Mueller.*

CASSAWA OIL of Moulmein. Out of this oil dammer is made, and a kind of torch, used by the poor classes instead of a lamp.—*Local Committee.*

CASSIA, a genus of plants belonging to the natural order Fabaceæ of Lindley; 24 species belong to the East Indies, and 35 have been grown near Calcutta. Important products are obtained from species of this genus. Dr. Royle was unable to distinguish the three kinds of senna from C. elongata, C. lanceolata, and C. acutifolia, and these were all included by him in his C. officinalis.

CASSIA ABSUS. *Linn.*

Grows abundantly in the sterile tracts of the Madras Presidency, and in all parts of the Dekhan. In China the bark is used for tanning, and the stems to make native tooth-brushes; with the bark a soft and durable leather may be turned out. It is perhaps the best of the indigenous astringents of Southern India for this purpose. All parts of the plant have much astringency, and seem to possess no other property. In the south of Ceylon its leaves are infused as a substitute for tea. In China it is eaten as a vegetable. Its twigs are held in the hand, or applied to the head, for the coolness they impart.—*O'Sh.* p. 309.

CASSIA BERRIES, or Dalchini berries, are produced in the Nuggur districts of Mysore from the same plant as the cassia buds. The berries are an article of trade in the Nuggur division of Mysore.—*Dr. J. Kirkpatrick; Rohde, MSS.*

CASSIA BICAPSULARIS. *Linn.*

Senna bicapsularis, *Roxb.* | Six-leaved cassia, . ENG.

A shrub of the West Indies and South America, domesticated in India.

CASSIA BUDS.

Cassia buds are the immature fruits of a species of cassia or Cinnamomum, a native of Cochin-China; and an inferior kind of cassia buds, known as Lavunga-pu, is found in Malabar. The genera or species that afford it are as yet undetermined. The cassia buds of China, Yueh-Kwei-tsze, are said to be the immature flowers of Cinnamomum Malabathrum and of C. aromaticum. They are collected in Kiang-nan and Cheh-kiang and Kwang-si, and are used as a spice. They are packed with the bark, and exported to India and Europe. Cassia buds are now being largely exported from the western coast of India. It is a spice growing in favour, but still less known than it deserves.—*Simmonds; M. E. J. R.; Cleghorn.*

CASSIA ELONGATA. *Lam., Lisane.*

C. lanceolata, *Royle.* | C. senna, *Roxb., H. B.*
C. officinalis, *Gærtn., Roxb.* | Senna officinalis, *R. Fl. Ind.*
Suna mukhi, . . ARAB., HIND.

This senna plant, or Tinnevelly senna, is found in many parts of India; and the general opinion is that the plant is indigenous, but others believe it to be only naturalized, and are of opinion that this is identical with the Cassia lanceolata of Forskal. Dr. Royle cultivated this plant at Saharunpur, Dr. Gibson near Poona, Dr. Wight near Madras, Mr. Hughes near Tinnevelly, and Dr. Burns noticed it near Kaira. The plants in these situations yield a drug quite equal in value to the best senna. Dr. Royle remarks that C. elongata, C. lanceolata, and C. acutifolia seem the same.

The senna of commerce is obtained from several plants, viz. :—

1. Cassia officinalis, called Bombay senna, also Suna mukhi.

Cassia lanceolata, *Forskal.* | Sennæ Meccæ Lohajæ,
C. medica, „ | *Forskal.*

Cultivated in Arabia and Northern India.

The three following plants, *a*, *b*, *c*, seem the same, viz. :—

(*a*) Cassia elongata, Indian senna, Tinnevelly senna.

Cassia lanceolata, *Royle.* | Cassia officinalis, *Gærtn.*
Sona-pat, . . . BENG. | Nelapoona, . . . TAM.
Suna mukhi, Nilaveri, ... TAM. | Nela tangedu, . . „

Cultivated by Dr. Royle at Saharunpur, Dr. Gibson near Poona, Dr. Wight near Madras, Mr. Hughes near Tinnevelly, and noticed by Dr. Burns near Kaira.

(*b*) Cassia lanceolata, *Auctor*, Alexandrian senna.
C. acutifolia, *Heyne, Nees, Eber.*

This grows in the valley of the desert south of Syene.

(*c*) Cassia acutifolia, *Delille, Esen., Eberm.*, Bombay senna. Grows in Arabia and Africa.

Senna Sumatrana, *Roxb. Fl. Ind.* ii. p. 347.

May-za-lee, . . . BURM. | Manje konne, . . TAM.
Waa, ... SINGH.

This middling-sized tree is common in a wild state in the jungles quite at the south of the Madras Presidency and in Ceylon, also as a planted tree in avenues, topes, gardens, etc. It is of rapid growth, and ornamental. The trunk is pretty straight, and covered with olive-coloured bark. The wood is of a yellowish-brown colour, sometimes beautifully marked with irregular black streaks, close-grained, hard, and durable, but not stiff; works kindly, with a smooth surface, and stands a good polish. A cubic foot unseasoned weighs 68 to 70 lbs., and when seasoned, 58 lbs.; and its specific gravity is ·928. It is well adapted for furniture, but seems to be little known or used in the Madras Presidency. In Burma it is used for mallets, helves, and walking-sticks. In Ceylon it is principally used for fuel for the locomotives; and it is said to have as good caloric powers as any wood known in the island.—*Drs. Brandis and Mason; Colonel Beddome, Fl. Sylv.*

CASSIA FORSKALII.

C. lanceolata, *Lind.* | C. ligustrina, *Batka.*
Suna, . . ARAB.

Grows in the valley of Fatme.

Cassia, an aromatic bark, is mentioned in Exodus xxx. 24, Ps. xlv. 8, and Ezek. xxvii. 19, under the words kiddah and ketsioth. Dr. Wight was of opinion that coarse barks of the cinnamon tree, which could not be passed as true cinnamon, are classed as cassia. The Chinese cassia is from Cinnamon aromaticum, *Nees ab Esenb.*, and C. Zeylanicum. Dr. Royle (p. 542) concurs as to the Chinese cassia being one of the producing plants, but adds that there are several distinct sources. At present this bark is produced in Java, on the Malabar coast, in the south of China, and in Cochin-China. Pereira's Materia Medica says—

'1. *China Cassia-lignea*, sometimes called China cinnamon, is the best kind. It is usually imported from Singapore, rarely from Canton direct. Mr. Reeves says vast quantities of both cassia buds and cassia-lignea are annually brought to Canton

from the province of Kwang-si, whose principal city (Kwei-sin-tu), literally the city of the forest (or grove) of cassia trees, derives its name from the forests of cassia around it.

'The Chinese themselves use a much thicker bark (which they call Gan Kwei-pi), unfit for the European market, but they esteem it so highly as to pay nearly ten dollars per pound for it. A very fine quality is occasionally met with, and commands the enormous price of 100 dollars per catty (one pound and three-quarters). A specimen of it furnished by Mr. Reeves is straight, semi-cylindrical, eleven inches long, rather more than an inch wide, and about one-sixth or one-eighth of an inch thick. Externally it is warted, and covered with crustaceous lichens. Internally it is deep brown; its odour and flavour are those of cassia. Mr. Reeves also mentioned that the best cassia-lignea is cut in the third or fourth moon, the second sort in the sixth or seventh moon.

'2. *Malabar Cassia-lignea* is brought from Bombay; it is thicker and coarser than that of China, and is more subject to foul-packing; hence each bundle requires a separate inspection. It may, perhaps, be coarse cinnamon, for Dr. Wight states that the bark of the older branches of the genuine cinnamon plant is exported from the Malabar coast as cassia.

'3. *Manilla Cassia-lignea* is usually sold in bond for continental consumption. He had received a sample of bark ticketed "Cassia vera from Manilla," the epidermis from which was imperfectly removed.

'4. *Mauritius Cassia-lignea* is occasionally met with.'

The Kwei-pi, Juh-Kwei, Kwan-Kwei, and Tung-Kwei of China are the products of species of Cinnamomum. The Juh-Kwei, or fleshy cassia, is exceedingly pungent and spicy, and its price is quadruple that of the Kwei-pi, or skinny cassia.—*Royle*, p. 542; *Harris, Nat. Hist. of Bible; Hassall's Food and its Adulterations; Smith.*

CASSIA OBOVATA. *Merat.*

Cassia Æthiopica, *Guibourt.* | Senna of Tripoli. Sene de Tripoli.

Grows in Nubia and Fezzan; one of the species yielding the senna of commerce.

CASSIA OBTUSA. *Roxb., W. and A., W. Ic.*

Cassia obovata, *Wall.* | Senna obtusa, *Roxb.*
C. Burmanni, *Wall., Wight.* | Nela tangedu, . . TEL.

It is indigenous in Mysore, Egypt, Suez, Nubia, and Central Africa. The leaves furnish the Aleppo and Italian drug. C. obtusa is common on the dry uncultivated lands of Mysore. Aleppo senna has obovate very blunt leaflets and curved pods, with a very slight covering of down. The flowers are pale yellow.—*O'Shaughnessy*, p. 307.

CASSIA OBTUSIFOLIA.

Chakowar, . . . HIND. | Jangli-powar, . . HIND.

According to Dr. Irvine (Gen. Med. Top. p. 131), the seed of this plant is used in medicine. The plant is scarce about Ajmir; is prescribed to cleanse the blood, in an entire state. When the seeds are pounded and then swallowed, vomiting is produced. The leaves of the young plant are eaten as a vegetable; are also applied in itch cases. It is very common in the Dekhan. Goats and sheep are fond of the seed; one seer of the seed costs one pice.—*Irvine.*

CASSIA OCCIDENTALIS. *L., W. and A.*

Senna occidentalis, *Roxb.* | Cassia fœtida, *Roxb.*
Cassia sophora, *Wall.*

Ka lau, ... BURM. | Peya veri, . . . TAM.
Paya vera, . . . MAL. | Kashanda, Kasinda, TEL.

Common in Bengal; smell very offensive, used in cutaneous maladies, and also aperient. Roxburgh gives it no native name. Mr. Mason has occasionally noticed it in Tenasserim, in native cultivation for medicinal uses. It was originally introduced into India from the West Indies.—*Mason; O'Sh.* p. 309.

CASSIA OFFICINALIS. *Gœrtn., Royle.*

C. lanceolata, *Forsk., Royle.* | C. elongata, *Lem., Lisane.*
C. medica, *Royle.* | C. lanceolata, *Royle.*
Sennæ medicæ Lohajæ, *Royle.* | C. senna, *Roxb., H. Buch.*
Senna officinalis, *Roxb.* | C. acutifolia, *Heyne, Nees, Eberm., Delille, Esen.*

Dr. Royle remarks that C. elongata, C. lanceolata, and C. acutifolia seem the same plants. He describes C. officinalis as cultivated in Arabia and Northern India, and, with the C. acutifolia, known in commerce as Bombay senna, Suna mukhi. The C. elongata, known as Tinnevelly senna, was cultivated at Saharunpur, Poona, near Madras, near Tinnevelly and Kaira, and C. lanceolata as growing in the valleys of the desert south of Syene, and known as the Alexandrian senna. See Cassia.

CASSIA OIL, volatile oil of cassia bark.

Tuj-ka-tel, . . . HIND. | Kulfa-ka-tel of MALABAR.

Cassia bark yields a pale yellow volatile oil, the finer kind of which differs but little in its properties from that of cinnamon, for which it is generally substituted; it has a specific gravity of 1·071 (1·095). The best is manufactured in China, where the wood, bark, leaves, and oil are all in request. The cassia oil is rated at 150 dollars per pikul; and the trade in this article reached about 250,000 dollars (Simmonds, p. 396). When pure, its pale wine-yellow colour does not deepen with age. It has in a remarkable degree the cassia odour and taste. Cassia oil is imported into Bombay from China; and in Surat the oil is expressed from both China and Malabar cassia. The latter kind, which is of a dirty-brown colour, is chiefly exported to the Persian and Arabian Gulfs, Zanzibar, etc., under the name of Koolfa-ka-tel.—*Faulkner.*

CASSIA ROXBURGHII. *D. C., W. and A.*

C. emarginata, *Roxb.* | Ratu-waa, . . SINGH.

This is a small or middling-sized tree, very common in a wild state in the South Arcot, Trichinopoly, Tanjore, and Tinnevelly districts. It is extensively planted in gardens for ornamental purposes, and is to be seen in most compounds at Madras. When in flower it is exceedingly beautiful; it is also wild in Ceylon. The wood is close-grained, hard, and durable, works smoothly, and stands a good polish. When fresh it is deep rose-coloured, but eventually turns reddish-brown. A cubic foot unseasoned weighs 78·80 lbs., and when seasoned 63 lbs.; and its specific gravity is 1·008. It is well adapted for articles of turnery, such as naves of wheels and handles of instruments.—*Beddome, Fl. Sylv.* p. 180.

Chakunda,	Hind.	Tantepu chettu,	Tel.

The seeds—Kiueh-ming-tsz, . . Chin.

Common all over the plains of India, and, in Tenasserim, it is one of the most abundant weeds. Its leaves are fetid, mucilaginous, and gently aperient. They are much used for adulterating senna, and in various external applications. The seeds, ground with sour butter-milk, are used with excellent effect in itchy eruptions; and they are used in preparing a blue dye, generally fixed by lime-water. The root, rubbed to a pulp with lime-juice, has almost specific powers in the cure of ringworm.—*O'Shaugh.* p. 309; *Roxb.* ii. 340.

CASSIS, a genus of shells; many species occur in the E. Indies. C. rufa, the great red shield shell of the Maldives, is brought as tribute to Ceylon, and is re-exported to Italy for the manufacture of cameos.—*Tennent's Ceylon.*

CASSOWARY BIRD. See Casuarius; Emu.

CASSYTA FILIFORMIS. *Linn., Roxb.*

Calodium Cochin-Chinense, *Lour.*

Akash bulli,	Beng.	Kottan elle,	Tam.
Akash-wail,	Bombay.	Antara valli tige,	Tel.
Kottan ka paat,	Dukh.	Nulu tiga, Pachi tige,	,,
Akatsja bulli,	Maleal.	Pane tiga,	,,

The leaves are put into butter-milk as seasoners, and are chiefly in use amongst the Brahmans in the southern parts of the Peninsula.—*Ainslie.*

CASTACALA. Sansk. A division of time equal to the $\frac{1}{3750}$th part of a vicala.—*Warren.*

CASTANEA, a genus of plants of the natural order Corylaceæ,—C. Chinensis, C. Indica, C. Roxburghii, C. tribuloides, and C. vesca inhabiting the colder parts of S.E. Asia. Dr. Mason says an indigenous chestnut tree grows in Burma on the uplands, which yields abundantly, and whose fruit is sold in the bazar; but they will not compare with the French chestnuts, nor even with the American chincapin. Two species are cultivated on the China hills. One somewhat like the Spanish, produces fruit quite equal, if not superior, to Spanish chestnut. The other is a delicious little kind, bearing fruit about the size and form of the common hazel-nut. Large quantities of both kinds were procured by Fortune, and sent on to India in Ward's cases, and many hundreds of plants reached India. The Chinese chestnut may now be considered naturalized on the hills of India, and in a few years will no doubt make its appearance in the markets amongst other fruits.—*Fortune's Residence; Mason; Voigt.*

CASTANEA INDICA. *Roxb.* Theet khya, Burmese. A tree of Nepal and the Himalaya, of Chittagong, Khassya, Rangoon, Pegu, and Tounghoo. The edible nut, Nikiri, Hind., is compared to indifferent filberts; the wood is red, and equivalent to mahogany.—*Drs. Royle*, p. 345, *M'Cl.*, *Mason*, *Voigt*, p. 276, *O'Sh.* p. 607.

CASTANEA MARTABANICA. *Mason.*

Theet khya; Zi-tha,	Burm.	Norne of	Tavoy.

This tree of Moulmein and Martaban grows all down to the sea-shore of Tenasserim. The fruit is eaten like chestnuts.—*Mason; Cal. Cat. Ex.*

CASTANEA TRIBULOIDES. *Lindley.* Wet-theet-kya, Burmese. A tree of the Nepal and Khassya hills, and of Burma.

CASTANOSPERMUM AUSTRALE. Moreton Bay chestnut. Has been introduced into India from Australia. It is of rapid growth; rises to 70 to 100 feet high. Its wood is used for cask staves. It is indigenous in Moreton Bay. Some of its pods are 10 inches long and 8 round. They contain several seeds, in size and colour resembling horse-chestnuts, but in flavour between a Spanish chestnut and a fresh-opened bean, with a slight degree of bitterness. The natives roast them and soak them in water, to prepare them for food.—*J. Backhouse, Visit to Moreton Bay, Australia.*

CASTE is a term obtained from the English cast, and that from the Portuguese or Spanish Casta, a breed, race, lineage, or class. It is applied to the separate sections of the Hindu races, who now usually employ the word Jat or Zat, meaning birth or descent, though the Sanskrit term Varna, meaning colour, has been in use from the most ancient times till now. Caste is the first institution of Hindu society which forces itself upon the attention of the stranger. Bunsen says that the system of caste seems to have become completely formed B.C. 3000, during the formation of the kingdom of Puru; and, he adds, was in full force when the Code of Menu was composed. In the Vedic hymns nothing appears of a priesthood, properly so called. In some, Brahmans officiate, but are evidently subject to the Kshatriya, as chaplains to the noblemen. The allusion to castes is very vague, as when the five classes of beings are mentioned, which may mean the four castes of Aryans and a fifth of the barbarians. But there is one hymn in the Veda, known as the Purusha Sakta, which represents the Brahman as superior, though it does not correspond with the legend on that subject in its later form. It is given in Dr. Muir's Sanskrit Texts (p. 7), and is a mystical description of existences from original being, under the similitude of a sacrifice or as a mental sacrifice.

Sir Henry Elliot says that about the 6th and 7th centuries the divisions of castes were secular, not religious. In former times, he says, the four classes existed equally amongst the Buddhists

and Hindus of India, as they do at this day amongst the Buddhists of Ceylon, and amongst the Jains of the Peninsula, in whose temples even Brahman priests may be found officiating.

A minute division of labour is a very marked feature in Hindu civilisation. Every employment is apportioned to a separate class. This minuteness of appointment is generally the result of a very far advanced stage of society, but seems to have obtained among the Hindus from very early times.

In ancient Hindu writings, four great divisions are recognised,—the Brahman, or learned; the Kshatriya, or warrior; the Vaisya, or merchant; and the Sudra, or labourer,—all others being M'hlecha. But in practice, at the present day, the minute differences of race, of native country, of avocation, and of religion, are sufficient to form differences of castes, in most of which no man may lawfully eat with any individual of any other caste, or partake of food cooked by him, or marry into another caste family; but he may be his friend, his master, his servant, his partner. As a rule, it may be said that the Aryan or 'twice-born' castes adhere most closely to the ethnical principle of division; the 'once-born' or distinctly non-Aryan to the same principle, but profoundly modified by the concurrent principle of employment; while the mixed progeny of the two are almost entirely classified in modern times according to their occupation.

The Brahmans are popularly divided into ten great septs, according to their locality,—five on the north, and five on the south of the Vindhya range. But the minor distinctions are innumerable. Thus the first of the five northern septs, the Saraswata, in the Panjab, consist of 469 classes. Mr. Sherring enumerates 1886 separate Brahmanical tribes.

Their sectarian religious views are now also sources of separation. In the physiological worship of the Hindus, for instance, while two classes of sectarians, the Saiva and the Lingaet, worship the form of the lingam, another set of sectarians, the Sakta, worship the yoni, in accordance with the doctrine of the Tantras. The Sakta are divided into two classes, the Dakshinachari, or right-hand Sakta, and the Vama chara, or left-hand Sakta. The right-hand worship is public, and addressed to the goddesses usually adored, but especially to the forms of Durga, Bhawani, and Parvati, also to Lakshmi and Maha Lakshmi, and others. But in the worship of the left-hand divisions, the Tantraka impersonations of Durga as Deva, Kali, Syama, etc., or a living woman representing the Sakta, the worship is private, and said to be impure, and is said to have the most numerous followers. The Vira Saiva, who are known as the Jangam, also as the Lingaet or Linghadari, from always wearing the lingam, and who are very numerous in the Canarese-speaking tract, ought not, according to the tenets of their sect, to have any caste distinctions; but they are the most bigoted of all the Hindu sects, and their caste distinctions are those of trade and avocation, and are rigidly adhered to. Among the Jains, whose religion consists principally in the practice of austerities, and in avoiding to destroy life, caste restrictions are not prescribed; nevertheless they too retain the practice of caste divisions, and the Sarawak practise many usages common to other Hindus.

The distinction of right and left hand castes is peculiar to the south of India. It is supposed by Professor Wilson to be of modern origin, and to have been introduced at Conjeveram as a part of civil policy to divide the people and destroy their power. But Sir Walter Elliot is of opinion that the separation into right and left hand castes had its origin in the violent conversion of the ancient races from Buddhism to Hinduism; and he has been shown a figure of Buddha, which the artisan caste worship. At present they appear to worship Visvakarma, but the bulk seem to recognise Siva as their supreme deity. They all bury their dead, and in a sitting posture, like that of Buddha, sitting, with the head of the corpse close to the surface, and looking to the north; and their dislike to Brahmans is intense. In Southern India, the goldsmiths strenuously resisted the rule of the Brahmans, and for ages claimed to be the true spiritual guides, styling themselves Acharyas, 'religious teachers,' and wearing the sacred thread. The Dattas, a sept of the Kayasth or writer caste, formally renounced the position assigned to them in the Brahmanical classification of Hindu society. They claimed to rank next to the Brahmans, and thus above all the other castes. They failed; but a native author states that one of their body, within the memory of men still living, maintained his title, and wore the sacred thread of the pure 'twice-born.' In the Peninsula, caste had certainly nothing to do with religion, but related solely to race. Amongst the Tamilian people the right and left hand sections appear. The Idan-kai or Idan-gai are the left-hand caste, and the Valan-gai are the right-hand caste; and, according to Professor Wilson, the names and appellations of Right-hand castes vary in different parts of peninsular India, but are usually supposed to be eighteen in number. He names them—

1. Banijaga or trader.
2. Okhaliga or cultivator.
3. Jotiphana or oil-maker, employing one bullock.
4. Rangajiva, dyer or calico printer.
5. Ladaru, Mahomedan traders and artificers.
6. Gujerati, bankers from Gujerat.
7. Komati, merchant shopkeepers of the Vaisya.
8. Jaina.
9. Kurubar, shepherds.
10. Kumhar, potters.
11. Agasa, washermen.
12. Besta, fishermen employed as palanquin-bearers.
13. Padma Shalaysa, weaver.
14. Naindu, a barber.
15. Upparanu, a tank-digger.
16. Chitragara, a painter.
17. Golla, a cowherd.
18. Wallia, or Pareyan, or Paria, who is the champion for the right-hand caste, as is the Madaga or Sakoli for the left-hand caste.

The Left-hand castes—

Edagai; Edagai kula; Eddayai, . . . KARN.	Idangai; Idam; Idakai, TAM.

1. Panchala or artisans.
   - *a.* Kammaramu, blacksmiths.
   - *b.* Badage, carpenters.
   - *c.* Kansagar, braziers.
   - *d.* Kallurtiga, stone-cutters.
   - *e.* Akasale, goldsmiths.
2. Berisethi, traders.
3. Devangada, weavers.
4. Ganigar, oil-makers.
5. Gollur, money-carriers.
6. Paliwan and Palawan, cultivators.
7. Beda, hunter, fowlers.
8. Madiga, tanners, curriers, and shoemakers.

The right and the left hand sections are known in the Bellary district as the Davachary and Dowanga. Their enmity has been a constant source of anxiety to the police of the Madras districts.

The artisans intermarry and eat together, and all wear the zonar. They claim to be a prior Brahman race,—and learned Europeans recognise their claim. The intermarriages of castes in ancient times, and the descendants of illegitimate children, have been known as mixed castes, the Varna sankra, to whom Menu allotted suitable avocations. The ancient marriage code recognised as lawful, unions of men of higher castes with females from any of the lower ones, and their offspring had a quite different social status from the progeny of illicit concubinage. In bygone times, individuals and even races have been raised to castes of higher rank, and others have been lowered. There have been occasions of rulers of the Dekhan and of Hindustan raising great numbers to the rank of Brahmans, others to the rank of Kshatriya; and many of the races now ranked as Sudra Hindus have been comparatively recent converts. Other instances are known of Brahmans as individuals and clans being degraded. In Bengal, the Ahir, Kunbi, Lohar, Mali, Tumboli, Kumar, Hajam, and Kahar are considered unclean. The Veluthaden of Travancore are said to be descendants of a Brahman who was seen to wash and starch a friend's cloth, and was in consequence thrown out of caste. Cloths washed by them are, however, received into pagodas. The ancestors of the Urila parisha Musinmar of Travancore, who accepted gifts of land from Parasu Rama; the ancestors of another subdivision, who countenanced the murder of Bhutarya Pandi Perumal, a sovereign of Malabar; and the ancestors of the villagers of Panniyur, who offered insult to the idol Varaha, an object of worship of other Brahmans,—all of these have lost their castes; and although claiming still to be Brahmans, they cannot associate on equal terms, cannot eat nor intermarry with other Brahmans. There are religious mendicants who accept alms only from certain castes. The caste ideas of ceremonial uncleanness are very peculiar. A Hindu visitor to a European house changes all his clothes, and uses the secretions of the cow on his return home from the visit; or, on being visited by a European, has the floor spread with fresh cow-dung. Every workman is clean in his own trade; but no Hindu will use any article of earthenware which a M'hlecha has polluted by his touch; all earthen vessels are immediately broken, and brass or copper utensils are scoured with sand to free them from impurity. There are places where water is given to the natives as they walk along the road. Small brass pots are kept for the caste people, but there is no pot kept for the Pariah. So, if a Pariah wish to quench his thirst at some of these water pandals, a long hollow bamboo is provided, one end of which the thirsty man holds. Water is then poured down the tube, and he has to catch the water in his mouth after it leaves the tube. He is not allowed to put his lips close to the bamboo, for fear of defilement.

If a Jain come into contact with an outcaste, he, like the Hindu, touches fire or water to purify himself; if he have occasion to receive anything from a Pariah, he causes the Pariah to set it down on the ground, and purifies it with fire or water before he takes it up. Even shepherds and Koli incur pollution by touching the Dher race, which they remove in a similar manner. In the course of evidence before a criminal court in Gujerat, in August 1853, a Koli said, 'The shepherds Bhugwen and Rodo came to me, and said they had both touched Dhers, and become impure, and asked me to give them fire. I took a lighted coal out of my hookah, and each of them touched his forehead with it. I threw it down, and they then took my hookah and smoked.' In other words, they were then purified, otherwise he could not have given them his hookah. This is a very ancient Asiatic purificatory rite. Isaiah (vii. 5, 6, and 7) says: 'Woe is me, . . . I am a man of unclean lips. . . . Then flew one of the seraphims unto me, having a live coal in his hand, . . . and he laid it upon my mouth, and said, Lo! this hath touched thy lips, and thine iniquity is taken away, and thy sin purged.' If a Sudra Hindu ask a drink of a Brahman, it will be given in a brass vessel, but from a distance, the Brahman stretching forwards and placing the pot between. It is returned similarly, but before receiving it back, water is poured over to purify it. No one of the helot races can enter the house of a Hindu, but he will stand at a distance and shout out his message. These are all illustrations of the usual operation of caste in India, which has held its own in the religious, social, and political changes of 3000 years. Since railways and steamboats have been running, and the educational system of the British has equalized all classes, much of the dread of caste defilement has disappeared, but it is still the prominent feature in everyday Hindu life.

All the great Hindu reformers have proclaimed the brotherhood of man, and have denounced castes, but their followers are only free amongst themselves.

A line in the Mahabharat is—

'Na Visesho'sti varnānām;
Brāhman idam jagat,
Brahmanā pūrva srishtam hi;
Karmabhir varnatām gatam:'

'There is no distinction of castes; the whole of this world is Brahmanical, as originally created by Brahma. It is only in consequence of men's actions that it has come into a state of caste divisions.'—*Growse*, p. 502; *Forbes' Rasamala, or Hindu Annals; Wilson's Glossary; Sir H. Elliot's Supplementary Glossary; Sir Walter Elliot in Ethnological Society's Journal.*

CASTILLOA ELASTICA and C. Markhamiana of S. America, introduced into India in 1876 by Mr. Cross and Mr. Markham, are valuable caoutchouc plants.—*Peruv. Bark.*

CASTING OF METALS in S.E. Asia is very largely practised, and the processes are of great simplicity. The workmen generally prepare a model in wax, which is embedded in moist clays, which, after being dried in the sun, is heated in the fire, the wax run out, and the metal run in. A much better plan, where accuracy is required, as in casting a brass nut or box for a large screw, is to cast the model in lead, and, having bedded it in clay, it may, when the mould is dry, be melted and run out, and the metal run in. Wax models allow the moulds to shrink in drying, and the thread of a screw-box so formed of course does not correspond. In Manbhum, much ingenuity

is displayed in the mode of casting articles of this kind in hollow network, etc. A core is made of plastic clay, all carefully shaped to the internal form of the fish or other object to be imitated. This core is then baked and indurated. On this, the pattern designed to be represented is formed with clean beeswax. This done, and the wax having cooled, it becomes tolerably hard. Soft clay is moulded over all. The whole is then baked, the heating indurating the outer coating of clay, but softening the wax, which all runs out of the mould, leaving empty the space occupied by it. The mould being sufficiently dried, the molten brass is then poured into the empty space, and, when cool, the clay is broken away, when the figured casting is seen. These are untouched after the casting, excepting on the smooth and flat surfaces, which are roughly filed.—*Mr. Rohde, MSS.; Cal. Cat. Ex.* 1862.

CASTOR.

Ashbutchegan,	Arab.	Castora zibetto,	It.
Bivergeil,	Dut.	Jabat,	Malay.
Hai-kau-shin,	Chin.	Dedes, Kasturi, Rase,	,,
Castoreum,	Fr., Lat.	Castoreo,	Port., Sp.
Bibergeil,	Ger.	Babuwaja struga,	Rus.
Gond-badustar,	Hind.	Kasturi, Munai,	Tam.

A concrete substance obtained from two small glands in the beaver, Castor fiber, of both sexes. 'The glands' consist of two oval pyreform sacs of unequal size, which open into the preputial groove by two large orifices. Those of the adult animal are at least three inches in length, sometimes five. Those of the female are somewhat less developed. In the living animal the castoreum is an almost fluid unctuous substance of a strong penetrating and even fetid odour; when dried, the sacs have a dark-brown colour and wrinkled appearance. Both American and Russian castoreum are known to commerce, and are imported into India. In Eastern medicine, castoreum is supposed to affect especially the uterus, and is given also in hysteria and apoplexy; it was formerly used in European practice. A kind of castor is also obtained from the civet cat in the Archipelago. Hai-kau-shin, the Chinese name, means sea-dog kidney, and the kidney of a dog is often substituted. — *O'Sh.* p. 614; *Smith; Moquin Tandon.*

CASTOR and POLLUX. Their representatives in the Hindu mythology are the Aswini Kumara. See Aswin; Hindu; Saraswati.

CASTOR-OIL.

Zeit ul khurwa,	Arab.	Linga jarak,	Jav.
Ky et taut shi,	Burm.	Miniak jarak,	Malay.
Pi-ma,	Chin.	Roghan bed-anjir,	Pers.
Huile du Ricin,	Fr.	Ricinsoel,	Sp.
Rizinus ohl,	Ger.	Chittamanak yennai,	Tam.
Arrandi-ka-tel,	Hind.	Chitta amudam,	Tel.
Olio di Ricino,	It.		

Castor-oil is obtained by expression from the seeds of the Ricinus communis or Palma christi, which grows in all the warmer countries of the world. It is often described as 'cold-drawn castor-oil,' which is understood to express that the oil has been obtained without the aid of heat; and hot-drawn castor-oil, when the seed is subjected to slight dry heat, and then pressed; but it may be doubted if any of the castor-oils of commerce are ever expressed from the seeds without prior dry, or subsequent water, heating. There are, however, two varieties of the castor-oil plant grown in India, the large and the small, and the mode of obtaining their respective oils may perhaps vary in different districts. One mode of obtaining the oil is to separate the seeds from the husks by children throwing them against a wall, then to bruise them by tying them up and beating them in a grass mat. In this state they are put into a boiler and boiled until all the oil is separated, which floats at the top, and the refuse sinks to the bottom; it is then skimmed off, and put away for use. The purest oil is said to be obtained by crushing the seeds in horse-hair bags by the action of heavy iron beaters; as the oil oozes out, it is caught in troughs, and conveyed to receivers, whence it is bottled for use. Castor-oil is used medicinally, also for lamps in the East Indies; and the Chinese are said to have some mode of depriving it of its medicinal properties, so as to render it suitable for culinary purposes. The plant is very extensively propagated by the Karens, to obtain the seeds to mix with their dyes, and fix their colours. The oil obtained from the large-seeded variety is sometimes drawn cold, and its straw-coloured specimens are scarcely distinguishable in quality from the oil of the small-seeded variety. It is, however, more usually extracted by heat, and forms the common lamp-oil of the bazar. The roasting process gives it a deeper red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1.10.0 to Rs. 3.13.6 per maund of 25 lbs. As with other coloured substances, filtering and light soon decolorize the coloured castor-oil. The best filtering material is animal charcoal, and the sun's rays finally remove all shade of colour.

Castor-oil seeds, Pi-ma-tsz, Chinese, crushed, are applied externally in Chinese medicine in a great multitude of diseases.—*Rohde, MSS.; Cal. Cat. Ex.* 1862.

CASTRO. Don Juan de Castro, captain in the fleet, and author of the history, of Don Stephano de Gama, which in 1540 sailed from Goa to Suez, with the intention of burning the Turkish galleys there.

CASTURI-MUNJIL. Tam. Curcuma zedoaria.

CASUARIA POMANDRA, Tha-byai-ywet-kya, Burmese, is found in the Pegu districts, but scarce. Timber strong and close-grained. Wood white-coloured, adapted for fancy work and cabinet-making.—*M'Clelland.*

CASUARINA. Several species of this genus of trees grow in India, — distyla, equisetifolia, modiflora, muricata, and torulosa, and in Australia, as C. Decaisneana, C. quadrivalvis or Australian oak, C. torulosa or forest oak, C. paludosa or swamp oak or fir, and C. suberosa or cork-bark oak, from the peculiar appearance of its bark. Others, as the C. distyla, C. Fraseriana, C. glauca, are from their resemblance also called firs. The Madagascar name is Filaof. The wood of some species is extremely hard, and used by the Pacific islanders for war-clubs. Whilst every other kind of vegetable and meat was eaten with the fingers, cannibal food was touched only with forks, generally made of the wood of the Nokonoko (Casuarina equisetifolia, *Forks.*) or the vesi (Afzetia bijuga, *A. Gray*), bearing curious, often obscene names, and having three or four long prongs. The reason given for this deviation from the general mode of eating was a widely-spread belief, that fingers which have touched bokola are

apt to generate cutaneous diseases when coming in contact with the tender skin of children.

Kayu aru, the C. littorea, is often termed a bastard pine, and as such gave name to the Isle of Pines discovered by Captain Cook. By the Malays it is usually called Kayu chamara, from the resemblance of its branches to the ornamental cow-tails of Upper India. It delights in a low sandy soil, and is ever the first that springs up from land relinquished by the sea. In Australia there occur about eight species. — *G. Bennett; Von Mueller; Galton's Vacation Tourists*, p. 268.

CASUARINA EQUISETIFOLIA. *Forst.*

Sarv ka jhar, . . DEK.	Arau tree, ANGLO-MALAY.
Beef-wood, . . . ENG.	Iron-wood of the S. SEA IS.
Fir tree, . . . ,,	Chouk maram, . . TAM.
Filaof of MADAGASCAR.	Serva chettu, . . TEL.

This tree was introduced into India about the beginning of the nineteenth century, and grows freely, ripening its seed in great abundance. In general appearance it much resembles the larch fir. It grows in 10 years to the height of about 30 feet, generally very straight, and, where the main shoot is broken or lopped off, throws out secondary shoots readily, which are usually erect. It thrives best in sandy tracts along the sea-shore. The wood is very hard, is reddish in colour, and in density and appearance it somewhat resembles Trincomalee. It bears a great strain, is well adapted for posts, and is said to bear submersion in water very well. The bark contains tannin, and a brown dye was extracted from it by M. Jules l'Epiné of Pondicherry. It is a favourite avenue tree, and, if kept stunted, forms a beautiful hedge. It has been very extensively planted in various parts of the Madras Presidency, on the coast and inland, but the larva of a large species of Acheta has caused much injury to plantations near Madras. It appeared suddenly in September 1867. The larvæ burrow in the sand in subterranean passages, and during the night emerge from the sand and crawl up the young trees, generally biting off the young shoots. The wood is burned in Tahiti to produce a ley for soap.—*M. E. J. R.*

CASUARINA MURICATA. *Roxb.* Fir tree.

C. littorea, *Rumph.*	C. littoralis, *Salisb.*
H'ten-roo, . . . BURM.	Hari, ... HIND.?
Tinian pine; Beef-wood.	Kayu aru, . . . MALAY.

This is grown in all parts of the Dekhan, where it was introduced about 1830. It is a native of Chittagong, is the only species indigenous to the Tenasserim coast, and has been diffused over Bengal. In Tenasserim, it is found only in the loose sandy soil of the seaboard, and never inland. In general outline it resembles the pine, but it is of a more slender figure, and more elegant in appearance. Growing eighty feet high, and spreading out, without a leaf of covering; its numerous fine-knotted branchlets, mantled with brilliant green, and hanging in drooping bunches, or floating out lightly upon the breeze like long skeins of green silk, adorn it with the most graceful drapery, and make it one of the most desirable trees for embellishing a Tenasserim park. Trunk 3½ feet in circumference 4 feet above the ground. The wood is very hard and durable; and the Tahitians in their war days chose it for the manufacture of their ingeniously carved war-clubs; hence they termed it the club-wood. They also fashioned fishing-hooks from its roots. It is imported into the United States in considerable quantities, for various purposes where a hard, heavy wood is required. The natives of Tenasserim call it by the same name as the pine. —*Drs. Roxb.* iii. p. 59; *Riddell and Mason.*

CASUARIUS, the cassowary, a genus of great birds belonging to the section Struthionidæ. Three species are known,—C. galeatus, a native of Ceram, C. Australia, inhabiting the Cape York district of Australia, and C. Bennettii, whose domicile is New Britain. The Malay name is Suwari, from which the European one is taken.

Casuarius galeatus inhabits the island of Ceram only, and, like the cockatoos, crown pigeons, and birds of paradise, was made known to the inhabitants of the west through the Malay and Javanese, who have immemorially carried on a trade with the country of the Papuans. It is a stout, strong bird, standing five or six feet high, and covered with long hair-like feathers. Its head has a large horny casque or helmet.

Casuarius Bennettii, *Gould*, is the cassowary of the island of New Britain, near to New Guinea, where it is called Mooruk. The height of the bird is three feet to the top of the back, and five feet when standing erect. Its colour is rufous, mixed with black on the back and hinder portions of the body, and raven black about the neck and breast. The loose wavy skin of the neck is beautifully coloured with iridescent tints of bluish purple, pink, and an occasional shady green, quite different from the red and purple caruncles of the Casuarius galeatus. The feet and legs, which are very large and strong, are of a pale ash colour. This bird also differs from the C. galeatus in having a horny plate instead of a helmet-like protuberance on the top of the head; which callous plate has the character of and resembles mother-of-pearl darkened with black-lead. The form of the bill differs considerably from that of the emu, Dromaius Novæ Hollandiæ, being narrower, larger, and more curved, and in having a black or leathery case at the base. Behind the plate of the head is a small tuft of black hair-like feathers, which are continued in greater or lesser abundance over most parts of the neck. The egg is about the same size as that of the emu, and is of a dirty pale yellowish-green colour. The bird appeared to Dr. Bennett to approximate more nearly to the emu than to the cassowary, and to form the link between these species. In its bearing and style of walking it resembles the former, throwing the head forward, and only becoming perfectly erect when running; it also very much resembles the apteryx in its body, in the style of the motion, and in its attitudes. Its bill presents a great deal the character of that of a rail; it utters a peculiar chirping whistling sound, but also a loud one resembling that of the word Mooruk, whence, no doubt, is derived its native name. The male is selfish and easily irritated. It kicks always in front, its legs sometimes reaching as high as a man's waist.

Casuarius galeatus, *Gould*, the helmeted cassowary of Ceram, is so called from the horny helmet which surmounts the head. Its rudimentary wings consist of five long bristles like blunt porcupine quills. It runs swiftly with a bounding motion. It feeds on fruits, birds' eggs, insects, crustacea, and tender herbage. It is a stout and strong bird, standing five or six feet high, and covered with long, coarse black hair-like feathers.

The head has a large horny casque or helmet, with bright blue and red colours on the bare skin of the neck. These birds wander about in the vast mountain forests that cover the island of Ceram. The female lays three to five large and beautifully shagreened green eggs, on a bed of leaves. The male and female sit alternately on the eggs for about a month.

Dromaius Novæ Hollanditæ rises to a height of seven feet. It lives on fruits, eggs, and small animals.—*Crawfurd's Dictionary*, p. 84; *London Athenæum*, Dec. 12, 1857, p. 1551; *Wallace*, ii. p. 86; *Dr. Bennett in a letter dated Sydney, 10th Sept.* 1857; *G. Bennett*, p. 260.

CASVINI, the name in history of Zacaria ibn Mahomed bin Mahomed al-Kousi al-Kazvini. He wrote the Ajaib-al-Makhlukat, or the Wonders of Creation, in the Arabic tongue. It treats of natural history, of the qualities of animals, vegetables, and minerals, as also of waters, aerial spirits, fairies, genii, and talismans; but all with a view to confute the Jewish rabbins. His work is much esteemed by Mahomedans. It has been translated out of Arabic into the Turkish language, and also into Persian. There seems to have been another Casvini, who is the person meant by Abd-al-Latif, author of the book called Lubb at Tawarikh. He is cited by Golius in his Notes on Alfargani, pp. 4, 5, 6, and 22.—*History of Genghiz Can*, p. 418.

CAT, puss, pussy-cat, kitt of the Arabs.

Billi, ...	HIND.	Si-mi, ...	SOKPA.
Min-khyeng, . .	KAMI.	Pone, ...	TAM.
Maida, ...	PERS.	Pilli, ...	TEL.

Cats are found throughout the south and east of Asia. The name of the wild cat in many languages seems to be related to puss. The Persian is Puschak; Afghan, Pischik. Even the Kurd keeps his Psiq, the Lithuanian is attached to his domestic Piije, and the Turk has a kindly feeling for the Puschik. They are mentioned in a Sanskrit writing 2000 years old, and there are figures of them on the monuments of Egypt of a much prior age. Mummy cats have been identified with the Felis chaus, and with F. caligulata, F. bubastes, both still found in Egypt, wild and domesticated. No mention of the cat occurs in the Bible, or in any Assyrian record. Even in India Professor Max Müller is quoted as saying that it was but recently known as a domestic animal. Its Sanskrit name is Mârjâra, from a root meaning to clean, from the creature's habit of licking herself at her toilet. Her mousing habits were well known to the Romans, and even to the Etruscans, as shown by antique gems and even wall-paintings. The mouse-killer domesticated among the Greeks, called γαλῆ, described by Aristotle, has been shown by Professor Rolleston to have been our white-breasted martin (Martes foina). The γαλῆ ἀγρία or ἴκτις was a polecat, a foumart, larger, and a great lover of honey as well as a killer of birds. Pallas, Temminck, and Blyth believe that the domestic cats are descendants of several wild species which readily intermingle. F. sylvestris is wild in Scotland. F. lybica is the wild cat of Algiers; in S. Africa, F. caffra is wild. In India are four wild species, of which F. chaus has a lynx-like tail. F. ornata or torquata occurs at Hansi, and F. manul in Central Asia. In the Isle of Man cats are tailless, and have long hind legs. The domestic Creole cat of Antigua is small, with an elongated head, and that of Paraguay, also small, has a lanky body. In the Malay Archipelago, Siam, Pegu, and Burma, all the cats have truncated tails with a joint at the end. In China a breed has drooping ears. The long silky-furred Angora cats are annually brought to India for sale from Afghanistan, with caravans of camels, even so far as Calcutta. These animals are currently known as 'Persian cats;' but Mountstuart Elphinstone remarks that 'they are exported in great numbers from Afghanistan, but are not numerous in Persia, whence seldom or never exported.' Lieut. Irwin also notices that 'they are bred in Kābul and some parts of Turkestan, and very improperly called "Persian," for very few are found in Persia, and not any exported. The Kabulis call this cat baruk or burak, and they encourage the growth of its long hair by washing it with soap and combing it.' It is supposed to be the descendant of the F. manul of middle Asia. It breeds freely with Indian cats. There is a wild cat in Borneo. In Australia there was no feline animal, no apes, monkeys, cats, tigers, wolves, bears, or hyenas; no deer or antelopes, sheep or oxen; and no elephant, horse, squirrel, or rabbit; but it has marsupials only, kangaroos, opossums, and the duck-billed platypus. In Europe, cats play a considerable part in folk-lore; they appear and disappear unexpectedly, they haunt the paths of the night, and they are the only friends of old women with a repute for necromancy. Whittington, so long the hero of a favourite nursery-tale of England, is rivalled by the story of the Florentine Messer Ansaldo degli Ormanni. In a letter of Conte Lorenzo Magalotti in the Scelta di Lettere Familiari, published by Nardini, London 1802 (p. 139), are described his two cats, 'due bellissimi gatti, un maschio, una femmina,' which soon relieved the king of an island (Canaria), on which he had been cast by a violent tempest, from the plague of mice, and he was recompensed 'con richissimo doni.'—*Earl*, p. 233; *Darwin's Animals and Plants; Sair-ul-Balad in Ouseley's Tr.* i. 171.

CATABENI, an ancient mercantile race, who made Okelis their seaport. See Okelis.

CATALAPTA BUNGEI. *Smith.* Ts'in, Hia, CHIN. A large timber tree of China. Its wood is used for chessmen, chess tables, and weighing-scale frames. Formerly in China its leaves were worn as an ornament at the beginning of autumn. C. syringifolia, *Sims*, a timber tree of Japan, of Ohio, and the Mississippi. Its wood used similarly to that of C. bungei.—*Smith.*

CATALLI-KAI. TAM. Capparis horrida.

CATAMARAN. ANGLO-TAM. The Kattay maray of the Tamil people. A boat-shaped raft on which the natives of the Coromandel coast, for fishing, etc., cross the surf that continuously washes their shores. It is composed of three logs of wood pointed in front, made still more prow-form by wedge-like sharpened timber, and widening to the stern. The catamaran rides lightly on the sea, and rises to an ordinary surf, but is overwhelmed and tossed and rolled about by a great breaker, and the natives usually dive away to avoid the advancing angry mass of water. See Boat.

CATAPA. MALEAL. Terminalia catappa.

CATARACTS. Of these there are several in India. Where the river Shirhawti falls into the Gulf of Arabia it is about one-fourth of a mile in width, and in the rainy season some thirty feet in depth. This immense body of water rushes

down a rocky slope for 300 feet at an angle of 45°, at the bottom of which it makes a perpendicular plunge of 850 feet into a black and dismal abyss, with noise like the loudest thunder. The whole descent is therefore 1150 feet, or several times that of Niagara; but the volume of water in the latter is somewhat larger than in the former. The principal cataracts or waterfalls in India are near Simorri, in Rohilkhand; at Gokak, on the Gutpurba; on the Gairsuppa, where from top of fall to surface of basin is 888 feet, and the depth of basin is 300 feet=1188 feet, and from 300 to 600 feet across during the rains; Yena, in Mahabaleshwar, 600 feet; Cauvery, 370 and 460 feet; cataracts of Subunreka, Chutia Nagpur, and Hurrori Ghat,—the falls 15, 20, and 400 feet respectively, about 500 feet across crest.—*Cur. of Sc.; Buist's Cat.*

CATCALEJI or Catcaranja. HIND. Guilandina bonduc.

CATECHU, Terra japonica, cutch.

Several astringent extracts prepared from the woods, barks, and fruits of various plants are known as catechu, cutch, terra, terra japonica, and gambier. They form articles of commerce, and are employed in tanning and dyeing. That called kut or kutch by the natives of the East, and *cutch* and *terra japonica* in commerce, is an extract prepared by cutting into chips the inner brown-coloured wood of the Acacia catechu, and making a decoction, which is afterwards evaporated to a proper consistence. The extract from the Uncaria gambier is also known in the market as cutch, as also is the extract from the nuts of the Areca catechu. At the Madras Exhibition of 1855, catechu was seen in the form of—1. Circular flat cakes from Travancore, covered on both sides with paddy husks. 2. Large flat cakes from the Northern Division, varying in colour from brick dust to dull yellow. 3. Round balls of a dark brown colour, the size of a small orange, from Mangalore, where a large manufacture takes place. These sorts appeared to vary only in shape. The manufacturers from the Acacia catechu work in Burma, Canara, the western Dekhan, Behar, and Northern India. They move to different parts of the country in different seasons, erect temporary huts in the jungles, and, selecting trees fit for their purpose, cut the inner wood into small chips. These they put into small earthen pots, which are arrayed in a double row along a fireplace built of mud; water is then poured in until the whole are covered. After a considerable portion has boiled away, the clear liquor is strained into one of the neighbouring pots, and a fresh supply of material is put into the first, and the operation repeated until the extract in the general receiver is of sufficient consistence to be poured into clay moulds, which are generally of a quadrangular form. Before the extract is quite dry, it is placed in cloths, strewed over with the ashes of cow-dung, cut into small lumps, and again exposed to the sun. This catechu is usually of a blood-red colour, and is considered there to be of the best quality. Catechu has long been employed in India for tanning skins. Its tanning properties are stated to be so great that skins are tanned by it in five days; but the leather is light, spongy, permeable to water, and of a dark reddish-fawn colour. The light-coloured variety of catechu produces a softer leather than that tanned with cutch. Catechu produces but little of the deposit of bloom which is yielded by oak-bark, valonia, and divi. A pound of catechu is said to be sufficient for the production of about a pound of leather. Bombay catechu or cutch is the richer in tannin; it is of a dark brownish-red colour, internally as well as externally, and of sp. gr. 1·38. Bengal catechu or terra is of a light-brown colour internally; its sp. gr. is 1·28. It has also been used in India to give a brown dye to cotton, and has been very extensively employed in the calico-printing works of Britain. The salts of copper, with sal-ammoniac, cause catechu to yield a bronze colour, which is very permanent. The proto-muriate of tin produces with it a yellowish-brown. A fine deep bronze hue is also produced from catechu by the perchloride of tin, with an addition of nitrate of copper. Acetate of alumina gives a brown, and nitrate of iron a dark-brown. For dyeing a golden coffee-brown, catechu has entirely superseded madder, one pound of it being equivalent to six pounds of that root.

A catechu prepared from the nuts of the Areca catechu is used solely as a masticatory. The nuts, however, yield two astringent preparations, both of which are known as catechu, and both of a very inferior quality. The preparations are respectively called, in Tamil, Katha kambu and Kash katti; in Telugu, Kansi; and in the Dekhan, Khrab katha and Acha katha. Katha kambu is chewed with the betel leaf; the latter, Kash katti, is used medicinally. For preparing this substance, the nuts are taken as they come from the tree, and boiled for some hours in an iron vessel. They are then taken out, and the remaining water is inspissated by continual boiling. This process furnishes kassu, or the most astringent terra japonica. After the nuts are dried, they are put into a fresh quantity of water and boiled again; and this water being inspissated, like the former, yields the best or dearest kind of catechu. Sir H. Davy, in analyzing the dark and pale catechu, or the Bombay and Bengal, as they were called, obtained in 200 parts from

	Tannin.	Extract.	Mucilage.	Insol. residuum.
Dark catechu,	109	68	13	10
Pale do.	97	73	16	14

When of good quality, catechu is a more powerful astringent than kino. Catechu is much used in medicine as an astringent and tonic, being usually given in combination with aromatic and earthy substances.—*Simmonds; Malcom's Tr.* i. 187; *M'Clell. Repts.; Mad. Exh. Jur. Rep.; O'Sh. Disp.* p. 302; *Royle; Mat. Med.* p. 351; *Faulk.; Kerr, Med. Obs. and Inquiries*, v.; *Hamil. Mysore*, iii. See Acacia catechu; Areca catechu; Uncaria gambier.

CATERPILLAR. Uskul, ARAB.; Chasil, Heb. Some Ceylon caterpillars sting. A greenish one, that occupies the Thespesia populnea (Suriya, Singh), at a certain stage in its growth descends by a silken thread, and hurries away. The moth of this is supposed to be a Bombyx, near Cnetho-

campa, *Stephens*. Another, short, broad, and pale green, with fleshy spines, that feeds on the Carissa jasminiflora, and stings with fury, is of the moth Necœra lepida, *Cramer* (the Limacodes graciosa, *West*). The larvæ of the genus Adolia are hairy, and sting with virulence. Many exactly resemble in tint the leaves they feed upon. Others are like little brown twigs; and many are so strangely marked or humped, that when motionless they can hardly be taken to be living creatures at all.—*Tennent's Ceylon*. See Insects; Larva.

CATGUT, in Hindi, rohda, of various qualities, is in general use in India for bowstrings, the strings of musical instruments. A kind of rope somewhat resembling catgut is made by the chucklers or tanners of the sinews of animals. It answers tolerably for lathe bands, drill bow-strings, etc. Catgut is imported from Herat into the Panjab.

CATHA EDULIS. *Forskal.* Khat, ARAB. The Abyssinian tea, one of the Celastraceæ, grows in Arabia, where its leaves are eaten green, and are supposed to give such increased wakefulness that a man could watch all night. The Arabs carry a twig about with them as an antidote against plague infections. Playfair says it is much used by the inhabitants, furnishing a drug which forms a pleasurable excitant. The leaves and tender shoots, when chewed, are said to produce hilarity of spirits and an agreeable state of wakefulness.—*Playfair's Aden; Hogg.*

CATHARTOCARPUS FISTULA. *Pers.*

Cassia fistula, *Linn.*

The genus belongs to the Fabaceæ. This is a tree from twenty to forty feet high, met with up to 4000 feet elevation all over Southern Asia, with a girth of three or four feet, and the height to the first branch ten to fifteen feet. It is uncommonly beautiful when in flower, few trees surpassing it in the elegance of its numerous long pendulous racemes of large bright yellow flowers, intermixed with the young lively green foliage. It bears a striking resemblance to the laburnum. It varies in size in different localities,—in Coimbatore being too small for useful timber, but in Malabar it attains sufficient size to be adapted for the spars of native vessels. The wood weighs 66 lbs. to the cubic foot, is close-grained, red-coloured, heavy, brittle, and of moderate strength; in Coimbatore used for tom-toms. In Ganjam and Gumsur, where it is tolerably common, it is made into ploughshares and rice-pounders. It is common on the hills and plains of Pegu, where it is used for bows, axles of carts, etc. It has long cylindrical pods, from nine inches to two feet in length, internally divided into partitions, each with a flat seed, surrounded by a soft pulp. Two pounds weight of the fruit yield eight ounces of the concrete pulp, which forms an article of commerce. Its bark is used in tanning. The bark of the root is a strong purge.—*Drs. Wight, Gibson, Irvine, Roxb.* ii. p. 333, *Stewart, Thompson, and Brandis; Mr. Rohde; Powell.*

CATHARTOCARPUS JAVANICUS. *Pers.* The Cassia Javanica, or horse cassia, is a native of Java and the Moluccas, with legumes above two feet in length, containing a black cathartic pulp, used in India as a veterinary medicine.—*Eng. Cyc.*

CATHARTOCARPUS NODOSUS. *Roxb.*

Cassia nodosa, *Buch.* | Gnu-thei-ni, . . BURM.

Remarkable for its large pink-coloured flowers. It is highly esteemed in Bengal, and is found in the Tavoy forests.—*Mason; Voigt.*

CATHARTOCARPUS ROXBURGHII. *D.C.*

Cath. marginatus, *G. Don.* | Cassia marginata, *Roxb.*

A highly ornamental tree, in form much resembling the weeping ash. It is a native of Ceylon and of the south of India, frequent in the jungle between Trichinopoly and Dindigul, and is found in Indian gardens. The wood is hard, and handsomely marked.—*Roxb.* ii. p. 338.

CATHAY, a name of Western China.

CATHI or Catti, the Katheri of Diodorus Siculus, are supposed to be the race which so manfully opposed Alexander. They were then located about Multan, at this period occupied by the Langa race. A portion of them gave their name to Kattyawar, in the Saurashtra peninsula. The Cathi claim descent from the Balla, an additional proof of northern origin, and strengthening their right to the epithet of the bards, Lords of Multan and Tatta. At the time of Alexander's advance they were confined to the country near the Panjnad, and their own traditions fix their emigration from the south-east part of the valley of the Indus about the eighth century. Colonel Tod describes the genuine Cathi as of a fine manly form, open countenance, and independent gait. Captain M'Murdo says, a character possessed of more energy than a Cathi does not exist. With an athletic frame, their height often exceeds six feet. They have light hair and blue eyes, evidence of a Scythic origin. Burnes describes the Cathi (or Katti) as a tall, stout, and handsome race. They live in scattered villages, and move their houses from place to place, rearing immense herds of buffaloes and camels, but scarcely ever condescending to cultivate the soil. Their habits are likewise predatory.—*History of the Panjab*, i. pp. 38, 39; *Travels in Western India*, p. 306; *Tod's Rajasthan*, ii. p. 246.

CATODON, a genus of mammalia, one of the Cetacea. The species known are C. colneti, C. macrocephalus, C. polycyphus, and C. australis. The last is a sperm whale of the ocean near Australia. It is about 35 feet long.

CAT'S EYE.

Chashm-i-maidah, . PER.	Zmilaces, ... LAT.
Bel occhio, ... IT.	Zmilampis, ... ,,
Beli oculus, . . . LAT.	Mata-kuching, . MALAY.

The cat's eye gem is chiefly found in Ceylon, but also obtained from Quilon and Cochin, and in the neighbourhood of Madras; also in Burma. Cat's eye is not much valued in India. It is a transparent quartz full of minute fibres of asbestos, and is cut in a highly convex form. It is of a yellow hue, slightly tinged with green, and is often set in rings. In the Moulmein market a small one

may be purchased for two rupees, and one of ordinary size for five, while ten rupees is the highest price given for the best. Ceylon produces the finest cat's eyes in the world,—indeed, the only kind that is highly esteemed, and that bring a high price. The best specimens have been found in the granitic alluvion of Saffragam and Matura.

CAT-SKINS are used chiefly dyed, and sold as false sable. The fur of the wild cat is more esteemed than that of the domestic cat.—*Faulkner.*

CATTI-MUNDOO. Tel. Euphorbia catti-mundoo, a plant of the Northern Circars. Its sap is highly cohesive, and is used for fastening knives into handles, hence its name.

CATTLE, horned cattle.

Ἴαν, ...	Gr.	Gai Goru, . . .	Hind.
Faihu, .	Old High Ger.	Pecu, ...	It.
Faihu, ...	Ger.	Para, ...	Sansk.

This term is applied chiefly to domesticated bovine quadrupeds, oxen and buffaloes, but is often made to include sheep and goats. The gaur, Gavæus gaurus, the bison of sportsmen, still remains wild in all the large forests of India, as also does the gayal or mithun, Gavæus frontalis, in the hilly tracts to the east of the Brahmaputra and at the head of the valley of Assam. Likewise the buffalo, Bubalus arni, of the forests of the Peninsula, as also the yak, Poephagus grunniens, of the snowy Himalaya, continue wild; but the domestic buffalo is extensively used both for draught and as milch kine, and its milk is richer than that of the cow. The breed on the Neilgherries is very fine, resembling the wild buffalo; and many along the crests of the Western Ghats and other places are seen with white legs like the gaur. In the Himalaya, the domesticated yak, the Chaori gao, is much used in all the elevated tracts, both as milch cattle and for burden, and breeds freely with the common cattle. Its milk is very rich, and it is the best carriage for rugged hill work, as they can ford a rapid stony torrent in a way that no other animal dare attempt, and can scramble up and down rugged hills in a perfectly wonderful manner.

The taurine group of cattle comprise the zebu or humped domestic cattle, the taurus, humpless cattle with cylindrical horns, and Gavæus, humpless cattle with flattened horns, peculiar to S.E. Asia. Small herds of the zebu, in Mysore, Nellore, Oudh, Rohilkhand, Shahabad, and the Doab near Muzaffarnagar, have run wild.

Varieties of the humpless taurus cattle occur in almost every district. Nellore and the Kistna districts produce excellent milch cows, the best of which sell for Rs. 200 to 300, and they stand 15 to 17 hands high. As draught cattle a yoked couple draw 1500 to 2000 lbs. on a fair road. The Nellore breed in Cuddapah are tall, bulky, clumsy, flat-sided animals, but possess great strength.

The Mysore bullock is 12 to 15 hands, and is celebrated as draught cattle, and for their spirit and powers of endurance, and sell for Rs. 70 to 150 each, and Rs. 150 to 200 the pair. This breed furnishes cattle for the Madras gun-carriages and karkhana. The Salem cattle are of this breed. Draught cattle in India are chiefly bullocks, and they are driven from the horns, or by means of the reins led through the nose cartilage. Iago says in Othello, 'He will as tenderly be led by the nose as asses are,' indicating that in Shakespeare's time a similar mode prevailed of driving asses. The bulk of the farmers of India do not find it advantageous to be cattle-breeders, and fodder is not provided.

In the middle of the 19th century, a severe cattle plague carried off vast quantities of cattle in Europe, and shortly after a similar plague in India carried off great numbers. The characteristic symptoms were drooping, cold ears, hair standing on end, frequent weak pulse, running at the eyes and nose, scanty high-coloured urine and purging, terminating in a bloody flux. As the disease advanced the body became covered with pustules, the disease generally proving fatal in a few days; but when the membranes of the brain were affected, the animal died in a few hours with the symptoms of apoplexy.

The bullock and the cow are not of equal value in India. In the parts of the country where the one sex is particularly valuable, the other sex may be of small value. The excellence of the Marwar bullock for draught is proverbial, but we never hear of the Marwar cows' milk. The male of the Gujerat buffalo was esteemed of so little use, that in the early part of the 19th century they were for the greater part not even reared. The males of the Mahoor breed were said to be so fierce as to be useless except for reproduction.—*L.* The male buffalo of the Surat breed is of great size and weight. The milch buffalo of Surat is of great value. Lands bordering upon hills are of comparatively greater value to cattle grazers, over plain districts which are put under the plough. In these the working cattle fall off miserably in the three concluding months of the fair season. There is no grazing; and were it not for the purchased food they get in the house, they would die.

CATTRA-BANGHA. Sansk. Aristolochia bracteata.

CATTU. Maleal. Wild or uncultivated; hence

Cattu-Carua, Cinnamomum iners.
Cattu-Casturi, Abelmoscus moschatus.
Cattu-Elupa, Terminalia bellerica.
Cattu-Paeru, Phaseolus rostratus.
Cattu-Siragam, Vernonia anthelmintica.
Cattu-Tirpali, Chavica Roxburghii.

CATTY or Kati. Malay. In the Eastern Archipelago and China, a weight equal to 1⅓ lb. or 16 tale; 10 mace equal to one liang; 16 liang make one catty; 100 catty are equal to 1 pikul, 133⅓ lbs.—*Wils.*

CATU KAMRIGA RAKTA, dragon's blood.

CATURUS SPICIFLORUS. *Linn.*

Acalypha hispida. | Watta tali, . . Maleal.

A plant of Travancore; its flowers are given in diarrhœa in the form of decoction or as a conserve, and its leaves are beaten up with green tobacco leaf and infusion of rice, and applied to inveterate ulcers.

CAUA-THENTHI. Hind. Clitoria ternatea.

CAUBUL, a town in Afghanistan, in long. 69° 12′ E., and lat. 34° 7′ N. See Kābul.

CAUCASIAN, a term applied by ethnologists to a race of which the European is the type, also to a class of languages. In the Caucasian race, there is a fine forehead, high brow and nose, long beard, tall, lithe, powerful frame, and light colour of skin.

CAUCASUS. The main chain of the Caucasus crosses obliquely, from north-east to south-west, the great isthmus which lies between the Black Sea and the Caspian, separating Europe from Asia. The chain extends on a line of more than 1000

miles from the neighbourhood of Anapa, at the entrance of the Sea of Azof, almost in a straight line to Baku and the peninsula of Apscheron jutting out into the Caspian. The crest averages a height of about 11,000 feet. The valleys on both sides are steep and narrow, and the Terek pass, 7977 feet. The principal range boasts the gigantic Elburz, 17,746 feet, and Kasibeck, 16,546 feet. The heads of these two celebrated mountains are almost always obscured with clouds; and the snow-line on them is 11,000 feet, and cereals grow up to 7000 feet.

The whole of the Caucasian region consists of the old territories of Daghestan and Circassia, north of the main chain, and of the old kingdom of Georgia on the south, to which Russia added at various epochs the Armenian districts of Erivan, Elisavetpol, and Alexandropol, and more lately those of Kars and Batoum. The Caucasus is of importance to Russia as the channel through which her trade can be extended to all parts of Central and Southern Asia, her commercial enterprise rather outstripping than following close her territorial aggrandizement. The Caucasus is like a great wedge thrust between Persia and Asiatic Turkey. It is the highway which is to lead the merchandise as well as the arms of Russia to the shores of the Persian Gulf and the Indian Ocean, sooner than any of her roads or railroads across the Ural, *via* Perm or Orenburg,—sooner than her almost exclusive navigation of the Caspian Sea. The whole of the Caucasian regions is ruled by a Russian lieutenant, residing at Tiflis. It is divided into 12 governments or provinces, exclusive of Kars and Batoum. It has, in round numbers, an area of half a million square kilometres, with a population of 5,000,000. In Tiflis, the capital, out of 104,000 there are at least 20 races of men. Russians muster 30,823; but the Armenians outnumber them by 6787. Next come 22,152 Georgians of various tribes; and the rest is made up of Tartars, Persians, Turks, Jews, Assyrians, and Chaldæans, besides various mountain tribes deemed indigenous, the Ossets, Ingush, Aisors, Khefsurs, Lesghians, etc., with 2741 Poles, 2135 Germans, 257 French, 163 Italians, 52 English. With respect to creeds, 52,392 Russians and Georgians belong to the orthodox or Greco-Russian Church; 36,000 are Gregorian Armenians; 871 Armenian Catholics, with 3698other Roman Catholics; 2177 Lutherans, 1276 Jews, and 4338 Mahomedans. Petroleum, in enormous subterranean lakes and reservoirs, underlies the Caucasian region from sea to sea. It is largely found beneath the steppes both north and south of the mountain chain. At Baku, at its southern end, on the Caspian, naphtha bursts forth in copious springs, sending up tall liquid columns not unlike the geysers of Iceland.—*M'Gregor's Persia; Wheeler's Hist. of India; Porter's Travels*, i. p. 152.

CAULIFLOWER. Brassica oleracea, *var.* An excellent vegetable. In the Dekhan the seed should be sown at the latter end of August. Removing the plants occasionally, prevents their quick growth. In England the market gardeners seldom water cauliflowers, and once in four days is amply sufficient in the Dekhan; no injury will accrue even if watered less frequently. In India, white broccoli is often taken for the cauliflower. Broccoli, both red and white, should be cultivated in the same manner as cauliflower.—*Riddell.*

CAUTLEY, SIR PROBY THOS., K.C.B., entered the Bengal Artillery in 1819. He was employed in the field during the years 1820 and 1821, in the reduction of numerous forts in the kingdom of Oudh. In 1825 and 1826 he served at the siege of Bhartpur. He was subsequently employed as a civil engineer on the eastern Jumna Canal in the N.W. Provinces, and was the projector and the executor of the great Ganges Canal Works, which were opened 8th April 1854. He carried on extensive researches, in conjunction with Dr. Falconer, in the fossil remains in the Siwalik hills, and he presented to the British Museum an extensive collection of fossil mammalia from the Panjab. He wrote on a submerged city, 20 feet under ground, near Behut, in the Doab, Bl. As. Tr. 1834; On Fossil Quadrumana, ibid.; Use of Wells, etc., in Foundations, as practised in the Northern Doab; Structure of the Sevallick Hills; Notice of a Fossil Monkey from the Sevallick Hills; Coal and Lignite in the Himalayas; Description of Sivatherium giganticum, the Fossil Crocodile, Giraffe, Ghurial, Hippopotamus, Camel, Tiger, and Bear; Gold Washings in the Goomti River, in the Sevallick Hills, between the Jumna and Sutlej Rivers; On a New Species of Snake; Mastodonta dentetroites; Mastodons of Sevallicks; Manufacture of Tar in the Sevallick Hills; Panchukki or Corn Mill; Dam Sluices; Remarks on the Fortress of Aligurh; Caramssa Bridge. On leaving Calcutta for Europe, he was honoured with a salute from the batteries of Fort William, and was favourably noticed in the Government Gazette.—*Gleanings of Soc. Beng. As. S. Tr.* 1834; *Parlby's Military Repository*, Lond.; *Geol. Soc. Tr.* 1840.

CAUVERY, the Chaberos of Ptolemy, a river of the Peninsula of India, which rises in the mountains of Coorg, 50 miles from Mangalore, in lat. 12° 25′ N., and long. 75° 35′ E., and, after an easterly course of 472 miles, it disembogues into the Bay of Bengal, receiving the Magunmurchy, 40 miles; Bhawani, 120 miles; Noyel, 95 miles; Seringapatam, Trichinopoly, Tanjore, and Tranquebar are on its banks. It passes through and from Mysore to the coast; at Trichinopoly it forms the island of Srirangam; and a mound at Coiladdy prevents the rejunction of the two forks of the Cauvery and Colerun, and the stream is led into numerous large irrigating channels that are conducted all through Tanjore. The largest of these are the Vettar, the Vellar, and Arselar, all of which enter the Bay of Bengal. Navigable for craft through the low country during the inundation. A waterfall occurs in its course. It is deemed by the Hindus a sacred river, and is called by them the Dakshini Ganga, or Southern Ganges. At its source at Tala Kaveri and at Bhaga mandla, where it receives its first tributary, are ancient Hindu temples which are largely frequented by pilgrims in the Tulemasa (October to November).

The Cauvery drains an area of about 28,000 square miles. The area of its delta is 2760 square miles, and its irrigation system supplies about 835,208 acres, yielding a revenue of Rs. 35,30,336. Its delta has the largest area of artificial irrigation in the Madras Presidency. About 10 miles west of Trichinopoly, the Agunda Cauvery divides at the head of the island of Seringham into two branches, the Colerun and the Cauvery. Colonel Sim and

Sir Arthur Cotton, about 1834–6, constructed a weir across the Colerun, which has given great benefits to the people of Tanjore. The head of the Cauvery branch is 1950 feet wide, and the bed level is regulated by a dam. After a course of 16 or 17 miles, the Cauvery bifurcates into two principal streams, called the Cauvery and the Vennaur, which irrigate nearly equal areas, and which give off numerous branches, and regulating works have been constructed at all the bifurcations. Prior to British rule, the native princes had connected the Cauvery with the Colerun at the east end of the island of Srirangam, about 20 miles from the upper Colerun anicut, and across this channel they had constructed the Grand Anicut. In the northern delta, the whole of the distribution of water has been artificially carried out by canals, but in the Cauvery delta the principal distribution has been effected naturally by the numerous branches thrown off by the Cauvery and Vennaur. The chief work left to be done by the British was to render the water supply more reliable, and this was secured by the Upper Anicut in 1836, at an expenditure of Rs. 1,83,000.

CAUVERYPAK, a place midway between Conjeveram and Arcot. Clive gained a battle here in February 1752, and the place surrendered to him.

CAVA or Kava, also called Ava pepper, is from the Macropiper methysticum of the Pacific. Its root produces a stimulating liquor. See Ava.

CAVAGNARI. Major Sir Pierre Louis Napoleon Cavagnari, K.C.B., son of General Adolphe Cavagnari, of a noble Parmese family. He entered the service of the E. I. Company as 'direct cadet,' and served with the 1st Bengal Fusiliers in the Oudh campaign of 1858–59, also with the 3d Gurkhas throughout the Ambala campaign of 1863, and the Hazara campaign of 1868. He received the Victoria Cross, for the daring capture of a band of murderers in connection with the Swat Canal outrage in December 1876, near the English fort of Abazaie, where many workmen were killed. He accompanied Sir Neville Chamberlain on a mission to the Amir Sher Ali, and was in advance with a small body of the escort, when he was stopped by the Afghans at Ali Musjid, and compelled to turn back, an incident which was the immediate cause of the Second Afghan War. He accompanied General Sir Samuel Browne as Political Officer, and at the termination of the campaign was appointed Plenipotentiary, and in that capacity negotiated the peace with Yakub Khan at Gundamuk. He and all his guard were killed at Kābul, which led to the re-occupation of Kābul, Kandahar, and Ghazni.

CAVATUM PILLOO. TAM. Andropogon schœnanthus.

CAVE. Ghar, ARAB., PERS.; Koo, BURMESE. Chambered rocks occur in many parts of Afghanistan, also in a mountain S. of the Deo Hissar, near Singlah, and are probably of Buddhist origin. The small chambers were intended for the abode of the ascetics of the sect. There are some fine remains of this class in the upper valley of the Urgandab. At Karaftu, in the Suj Bolak district of Azarbijan, is a series of ancient caves. There are numerous chambered rocks at Bamian; and the Afridi tribe in the Khaibar pass live in chambered rocks.

CAVE TEMPLES and monasteries of India consist of stupendous excavations and monolithic structures, made for religious and monastic purposes. There are in India at least 1000 distinct caves. Some are opposite Prome in Burma; there are a few in the Madras Presidency; about 900 in the Bombay Presidency; several in the Hyderabad Dominions; also in Orissa, in Behar, in Malwa, in the valley of the Indus, among the mountains of Baluchistan, Afghanistan, and Bamian. In Western India alone, including the Nizam's dominions, there are at least thirty series of cave-temples which have been examined by Europeans. Cave inscriptions discovered are seventeen in number, viz. six about 15 miles from Gya, in Bahar, viz. three in the hill of Barabar, three in the hill of Nagarjuni, nine in the hill of Khandagiri, in Cuttack, and two in Ramgarh in Sirguja.

The *Cave Temples* in the southern part of India are classed by Mr. Fergusson into—

(*a*) The vihara or monastery caves, which consist of (1) natural caverns or caves slightly improved by art. These are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack. Next (2) a verandah opening behind into cells for the abode of priests, as in Cuttack, and in the oldest vihara caves at Ajunta. The third (3) has an enlarged hall supported on pillars. The most splendid caves are those of Ajunta, though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Junnar.

(*b*) Buddhist chaitya caves form the second class. These are the temples or churches of the series, and one or more of them are attached to every set of caves in Western India, though none exist on the eastern side. Unlike the vihara, all these caves have the same plan and arrangement, and the Karli cave is the most perfect in India. All these consist of an external porch or music gallery, an internal gallery over the entrance, a central aisle which may be called a nave, roofed by a plain waggon vault, and a semi-dome terminating the nave, under the centre of which always stands a dahgopa or chaitya. In the oldest temples, the dahgopa consists of a plain central drum, surmounted by a hemispherical dome crowned by a Tee, which supported the umbrella of state of wood or stone. These two classes comprehend all the Buddhist caves in India.

(*c*) The third class consists of Brahmanical caves properly so called. The finest specimens are at Ellora and Elephanta, though some good ones exist also on the island of Salsette, and at Mahabalipur. In form many of them are copies of and a good deal resemble the Buddhist vihara. But they have not been appropriated from the Buddhists, as the arrangement of the pillars and position of the sanctuary are different. They are never surrounded by cells, as all viharas are; and their walls are invariably covered or meant to be covered with sculpture, while the viharas are almost as invariably decorated by painting, except the sanctuary. The subjects of the sculpture of course always set the question at rest.

(*d*) The fourth class consists of rock-cut models of structural and Brahmanical temples. To this class belong the far-famed Kailas at Ellora, the Saivite temple at Dhumnar, and the Raths at Mahabalipur. This last is cut out of isolated blocks of granite, but the rest stand in pits.

The Indra Subha group at Ellora should perhaps form a fifth.

(*e*) The fifth or true Jaina caves occur at Khandagiri in Cuttack, and in the southern parts of India, but are few and insignificant. In the rock of Gwalior Fort there are cut in the rock a number of colossal figures, some 30 to 40 feet high, of one of the thirthankara, some sitting, some standing. Their dates are about the 10th or 12th century before Christ.

The greater number of the viharas seem to have been grouped around structural topes. Their façades are generally perfect. Nine-tenths occur in S.W. India, in the Bombay Presidency, with a group in Behar, another in Cuttack, one at Mahabalipur, and two or three in the Panjab and Afghanistan. Asoka, B.C. 250, excavated the first of these in Behar, at Rajagriha, and till the 8th century they continued to be excavated by Buddhists, Hindus, and Jains. It is in Behar that the oldest caves have been found, in the neighbourhood of Rajagriha, which was the capital of Bengal at the advent of Buddha; and one, a slightly improved natural cave, the Satapanni, is said to be that in front of which the first convocation was held B.C. 543.

The most interesting group is at Barabar, 16 miles N. of Gaya. An inscription on the Karna Chopa cave there, records its excavation in the 19th year of Asoka (B.C. 245). Another, called Sudama or Nigope, bears an inscription by Asoka in the 12th year of his reign. The Lomas Rishi is an interesting cave, as also is the Milkmaid's cave, which is probably the most modern, as it was excavated by Dasaratha, grandson of Asoka. Their dates appear to range from B.C. 260 to 200. The rock in which they are excavated is a hard, close-grained granite.

Chaitya halls have also been excavated in several of the rocks of Western India. The oldest of these has been excavated at Bhaja, four miles south of the great Karli cave in the Bhor Ghat. It is supposed to have been before the Christian era. Another group is to be seen at Bedsa, 10 or 11 miles south of Karli, which has two pillars with capitals, surmounted by horses and elephants, and more like the Persepolitan than any others in India. A third chaitya cave is at Nasik, and an inscription over its doorway states that it was the gift of a citizen of Nasik, in the reign of Krishna, one of the Andrabritya kings, who reigned just before the Christian era. Another inscription under the pillars states it to have been excavated in honour of Badrakaraka, supposed to have been the fifth king of the Sunga dynasty, B.C. 129.

Karli, on the road between Bombay and Poona, has the largest, finest, and most complete of the chaitya caves. Inscriptions ascribe its excavation to the Maharaja Bhuti or Deva Bhuti, who reigned B.C. 78.

There are four chaitya caves in the Ajunta group. The oldest and lowest down, No. 9, is 45 feet by 23 feet in width. The next, No. 10, higher up, is 94½ by 41¼ feet internally. A third is cave No. 19, and in it Buddha in all his attitudes is introduced everywhere. Hitherto in all sculptures mortal men and women had been absent, and Buddhism was a pure theism or atheism, but at the date of this cave Buddhism has become changed into an overwhelming idolatry.—*Fergusson*, p. 124.

The last chaitya of Ajunta (No. 26) was excavated about the year A.D. 600.

At Ellora, the celebrated Viswakarma cave is a chaitya. Its age also is about the year A.D. 600. It is 85 feet by 43 feet.

The Kenheri cave, on the island of Salsette, in Bombay harbour, is 88½ feet by 39 feet 10 inches, and was excavated about the early years of the 5th century, when Fa Hian was travelling in India. It is a literal and a coarse copy of the Karli cave.

At Dhumnar, about halfway between Kotah and Ujjain, are a series of about 60 or 70 caves, cut in coarse laterite conglomerate. One is a chaitya cella, in the midst of a vihara; its date probably is the 6th century A.D.

At Kholvi, not far from Dhumnar, is the most modern group of Buddhist caves in India. One called Arjun's house is a highly ornamented dagoba. Inside is a cross-legged seated figure of Buddha. The only excavation here is a chaitya hall 26 feet by 13 feet.

Some of the vihara were three or four storeys in height, and containing up to 1500 cells, as at Mahabalipur, 30 miles south of Madras, and at Nalanda, 7 miles north of the old capital of Rajagriha, and 34 miles south of Patna, at which, in the first century, Nagarjuna resided. In Hiwen Thsang's time 10,000 priests and neophytes resided here; religion and philosophy were taught from a hundred chairs, and that pilgrim resided there as a student for five years. He says there were thousands of viharas, but none equal to this. It was to Central India what Cluny and Clairvaux were to France in the middle ages. Some at least of the many viharas, as that cleared out by Captain Kittoe and Mr. Thomas, seem to have been destroyed by fire.

On the western side of India, viharas have been described at Ajunta, near Aurangabad, at Bagh on the Tapti, at Bedsa, Bhaja, Daraseo or Darasinha, Ellora, at Hazar Kotri in the Nizam's territories, at Junir, halfway between Nasik and Poona, and at Salsette. At Nasik are three great viharas, the oldest that of Nahapana, A.D. 100; next, Gautamiputra, A.D. 300; and the third, Yadnyasri, A.D. 400. They are a purely Buddhist group. The façades of the first and second are richly ornamented, and were formed during the rule of the Andhrabritya dynasty. At Ellora numerous viharas are attached to the great Viswakarma chaitya. The great vihara is known as the Dherwara, 110 feet by 70 feet. In the sanctuaries of most of these caves are figures of Buddha. In the Das Avatara the sculptures are all Brahmanical.

In the neighbourhood of Peshawur, there are monasteries at Jamalgiri, Takht-i-Bahi, Shah Dehri, and Sahri Balol. The sculptures and architecture are highly classical,—Ionic pillars, Corinthian capitals; and some antiquaries regard them as acquired from the Bactrian Greeks, while others attribute them to western influence after the age of Constantine. There are many figures of Buddha, and numerous other figures with nimbus or glories or circular discs at the backs of their heads; they are on the base of the altars or stupas, on the walls and in the cells.

The Brahmanical caves of India were excavated after those of the Buddhist and Jains. The more prominent are as follow:—

1. Saiva cave at Aihole, in the Kaladgi district, S. of Bijapur, A.D. 500 to 550.

2. Badami caves, one Saiva and two Vaishnava, A.D. 550–579.
3. Karusa caves, between Ausa and Kalyana in the Hyderabad territory, A.D. 500–700.
4. Amba Jogi Saiva cave near Mominabad and Bhamburde cave near Poona, A.D. 550–600.
5. Dhokeswar, between Junnar and Ahmadnaggur, A.D. 550–600.
6. Rameswara cave at Ellora.
7. Ravana ka Khai and Das Avatara at Ellora, A.D. 600–700.
8. Dumar Lena and Ellora caves, N. of Rameswara, A.D. 650–725.
9. Mahavallepur Ratha, S. of Madras, A.D. 650–700.
10. Undavalli, Vaishnava cave on the Krishna at Bezwara, A.D. 650–700.
11. Elephanta, Jogeswari, and Mandapeswari caves near Bombay, A.D. 725–775.
12. Patur in Bera, Rudreswara, near Ajunta, Patna in Kandesh, and caves near Satara, A.D. 700–800.
13. Kailasa monolithic Saiva temple at Ellora, A.D. 725–800.
14. Dhumnar Brahmanical caves, A.D. 750–800.

The *Behar caves* are in the neighbourhood of Rajagriha. The Milkmaid's cave and Brahman Girl's cave have inscriptions in the Lat character. They are of about 200 B.C., and are the most ancient caves of India. The Nagarjuni cave and Haft Khaneh or Satghur group are situated in the southern arm of the hill at some little distance from the Brahman Girl and Milkmaid's cave. Another group is the neighbouring Karna chapara and Lomas Rishi cave.

The caves of Udyagiri and Khandagiri hill, about 20 miles from Cuttack, and 5 from Bhuvaneswara, are next in antiquity to those of Behar. They are built on the hills of Udyagiri and Khandagiri. The former are Buddhist and the older; the latter, probably, are Jaina. Many of the inscriptions are in the Lat character, and this gives their age as anterior to the Christian era. The frieze sculpture in the Ganes gumpha is superior to any in India, and resembles that of the Sanchi tope at Bhilsa. In it there are no gods, no figures of different sizes, nor any extravagance. On the Buddhist caves here, there are no figures of Buddha, or any images. In a Jaina cave in Khandagiri, the twenty-four thirthankara, with their female energies, are sculptured.

The *Ajunta* are the most complete series of Buddhist caves in India, without any mixture of Brahmanism, and contain types of all the rest. They are in a ravine in the ghat south of the Tapti. At Bang, also in a ravine or small valley in the ghat, on the north side of the valley of the Tapti, are three ancient Buddhist caves.

Those of *Karli* are not so extensive as the Ajunta, but still purely Buddhistical, and containing the largest and finest chaitya cave in India. Karli is about halfway between Poona and Bombay on the right-hand side of the valley as you proceed towards the sea.

The *Salsette* or *Kenheri* caves in the island of Salsette are also purely Buddhist, but very inferior to the former. The Kenheri caves are excavated in a hill situated in the midst of an immense tract of forest country, and Mr. Fergusson supposed their date about the 9th and 10th century of the Christian era. The monastic system of the Buddhists has its finest illustration in the series of dormitories, chapels, halls, and temples at Kenheri.

Dhumnar, about 40 miles south-east from Nemuch, but close to Chundivassa, contains Buddhist caves with a Brahmanical rock temple behind.

The *Ellora* caves are excavated in a porphyritic greenstone or amygdaloid. The Kailas at Ellora is a wonderful work of art—is a small hill cut into a temple. The caves of Elephanta overlook the harbour of Bombay. The Elephanta caves are cut in a harder rock than those at Ellora. Those of Dhumnar and Ellora contain a strong admixture of Brahmanism, and those of Elephanta are entirely Brahmanical, though perhaps of the same age as those of Ellora.

The *Orissa cave temples* are in two isolated hills of sandstone rock, about 20 miles from Cuttack, and 5 from Bhuvaneswar. The oldest are in the hill called Udayagiri, the more modern in that portion called Khandagiri. They became Jaina about the 10th or 11th century, and at the close of the 18th century a Jaina temple was erected in Khandagiri hill. The oldest cave is called Hat'hi Gumpha. The Aswatama rock near by has on it a copy of Asoka's edicts; and there is another at Aska, near the N. end of the Chilka lake. They are supposed to have been excavated about the time of Asoka. Another natural cave is stated in an inscription to be that of Chulakarma; and others the Pawan Garbha, Jodev Garbha, the Ganesha, Ananta Garbha, and the Rani Gumpha. In the last-named the sculptures represent hunting scenes, fighting, dancing, drinking, and love-making. The sole emblems which can be regarded as Buddhistic are the swastika, the trisul, and shield.—*Fergusson*, pp. 105, 132, 143; *Fergusson and Burgess*, pp. 403, 484; *Cunningham's Archeological Report.*

CAVIARE.

Cavial; Caviar, . . FR.	Ikra, ... RUS.
Kaviar, ... GER.	Caviario, . . . IT., SP.
Caviale, ... IT.	

Caviare, a substance prepared in Russia, consisting of the salted roes of large fish. The best, which is made from the roe of the sturgeon caught in the Volga, in the neighbourhood of Astracan, appears to consist entirely of the eggs. It is packed in small kegs, and exported; but the inferior sort is made into the form of dry cakes. It is highly esteemed in Russia, and also forms an article of considerable export,—30,000 barrels having been exported from Astracan in a single season. The manufacture consists in separating the roe from its membranes, then washing in vinegar or white wine, and drying by spreading it out on a board in the air. Salt is then well rubbed in, and it is next put in a bag and the liquor pressed out. It is then packed in kegs for sale. During the three annual seasons of fasting in Russia, the consumption of caviare is very great, as it is also in Italy during the fasts of the church. It is eaten on bread, with oil and lemon juice or vinegar. Professor Rawlinson says caviare was known to the Greeks as Tarichos anta-kaion. The sturgeon of the Borysthenes, according to Herodotus, were called Antacæi.—*Tomlinson*, 354.

CAWA-ARANG. MALAY. A light brown or pale brown coloured wood of Penang, from a very large tree; used for furniture and ornamental work.—*Frith.* (Qu. Kayu arang.)

CAWNEE, from Kani, KARN., TAM., TEL. In Cuttack, a hand's-breadth. In the south of the Peninsula of India, a land measure. At Madras the standard cawnee is 24 manai or grounds, each

of 2400 square feet. The cawnee is therefore 57,600 square feet = 1·322 of an English acre. Another measurement, however, makes it somewhat less than an acre. The cawnee, in several districts in the Madras Presidency, is subdivided into 100ths; and in the re-survey of the southern districts of Madras, the decimal subdivision of the acre has been authorized.—*Wilson.*

CAWNPORE or Cawnpur, a large cantonment and town in the Allahabad division, situated on the right bank of the Ganges, in lat. 26° 28′ 15″ N., and long. 80° 23′ 45″ E., and 580 feet above the sea. Its civil population is about 112,000, and is 685 miles from Calcutta by rail. It gives its name to the district of Cawnpur in the N.W. Provinces of India, in the Doab, a great alluvial plain between the Ganges and the Jumna. The district is bounded on the N.E. by the Ganges, on the S.W. by the Jumna, on the N.W. by Etawa and Farrakhabad, and on the S.E. by Futtehpur, and extends between lat. 25° 55′ and 27° N., and long. 79° 34′ and 80° 37′ E. A small colony of Chinese settled in Cawnpur, and introduced a manufacture of leather, for which the town was long famous. During the mutiny of the Bengal army, on the 26th June 1857 Cawnpur capitulated to the rebels under Dandhu Punt Nana Rao, under promise of safe escort, but the garrison, under General Wheeler, were all destroyed; and on the 15th and 16th July, all their wives and children were destroyed and thrown into a dry well. In and above the well at the entrenchment, and in the well of the slaughter-house, lay the bones of no less than 420 civilians, military officers, and their wives, 400 private soldiers and their wives, and musicians, besides infants. If to these be added the Futtehghur party and those who perished outside the entrenchments, there were not less than a thousand Christians, the majority of whom were murdered in cold blood by order of Nana Rao. Seven Christian men, including Delafosse and Thomson, twelve women and six faithful natives, who entered the entrenchment, alone ultimately escaped. Nineteen Christians and five children, who remained in Cawnpur, escaped by aid of the natives, besides a few drummers. Nana Rao seems to have died in the forests of Nepal. Cawnpur was retaken by General Havelock on the 17th July 1857. On the 15th July General Havelock fought the battles of Aung and Pandu Nadi; on the next day took Cawnpur by storm; on the 17th and 18th recovered the city; and on the 19th took and destroyed Nana Rao's palace at Bit'hur. On the 27th November the Gwalior mutineers and others took possession, but Lord Clyde retook it next evening, and on the 6th December he routed them with great loss. The district was pacified after the fall of Kalpi in May 1858. The district is essentially Hindu. Of the total population, 1,156,055 in 1872, the Brahmans, Rajputs, and Banyas numbered 313,278 souls; the Kayasth, 15,169; the Ahir, 113,053; the Kurmi, 58,359; the Chamar, 122,932; the Mahomedans of the Sunni sect being only 64,797 souls.—*Imp. Gaz.*

CAYLEY, DR. HENRY, a Bengal medical officer who entered the service in January 1857. In May 1867 he went to Leh in Ladakh as Political Agent, in the territories of the Maharaja of Kashmir, to protect and encourage commercial intercourse through Ladakh between India and Central Asia, and watch political events in Central Asia and Eastern Turkestan.

CAZI, a Mahomedan judge, religious and civil.

CEDAR, the sarwat of Arabia, is a commercial term given to the woods of several distinct kinds of forest trees, the timbers of which are distinguished as red and white cedar, Barbadoes and Bermuda cedar, cedar of Lebanon, pencil cedar, bastard cedar, etc., some of them growing in America, some in Europe, and some in Asia. The cedar of Lebanon, so often noticed in Scripture, is usually supposed to be Pinus cedrus, called Cedrus Libanus, or cedar of Lebanon. The lofty deodara, a native of the Himalayas, with fragrant and almost imperishable wood, and often called the Indian cedar, has been sometimes referred to the genus Pinus, and sometimes to Abies, Cedrus, or Larix, with the specific name of deodara; and Dr. Hooker is of opinion that the deodar and the cedar of Lebanon are identical. The cedar wood of Scripture is supposed to be the sandarach tree, Thuja articulata. The woods of several of the conifera are called cedars. In India, the term bastard cedar is applied to the Guazama tomentosa; and the Hymenodictyon excelsum, Chickrassia tabularis, and Cedrela toona are all called cedars. In New South Wales the term white cedar is applied to Melia azaderach, and red cedar to that of Flindersia Australis. In China, a kind of cedar, probably a cypress, called Nan-mah, or southern wood, which resists time and insects, is considered peculiarly valuable, and is especially reserved for imperial use and buildings; and the cedar wood of Japan, according to Thunberg, is a species of cypress. The cedar of Guiana is the wood of Icica altissima. The white wood or white cedar of Jamaica is Bignonia leucoxylon. The word 'cedar,' in the United States, is applied to various genera of the pine family. The white cedar of the southern swamps is a cypress; the wood of Juniperus Virginiana is called red or pencil cedar, that of J. Bermudiana is called Bermuda cedar, and that of J. Barbadensis is called Barbadoes cedar, while the juniper of the north of Spain and south of France and of the Levant is from J. oxycedrus. The white cedar of North America, a less valuable wood than the red cedar, is yielded by Cupressus thyoides. The cedar of New Zealand is Hartighsea spectabilis. The cedar of the Amazon is from the Cedrela odorata of Von Martius. Under the term cedar, Colonel Frith described a reddish-coloured wood of Palghat, specific gravity 0·507, as a large tree, wood aromatic and used for furniture; and under the name of cedar-root he mentioned a very

aromatic wood, used for ornamental furniture in Palghat. These two are possibly from the Cedrela toona. The wood of the cedar of Lebanon, as now met with, is not in much esteem; but that of the Cedrus deodara of the Himalaya really possesses all the good qualities for which those of Lebanon were praised. Specimens of the wood of the Indian cedar, Cedrus deodara, and of the cypress, Cupressus torulosa, from the Himalayas, were shown by Dr. Royle at the Exhibition of 1851; the former has been introduced into England as a beautiful ornamental tree, but appears to promise well as a useful timber tree, as the wood works well and freely. The bastard cedar are woods of Cedrela toona, *Roxb.*, and of Guazama tomentosa, *Kunth;* and the Goa cedar is the Cupressus Lusitanica.—*Faulkner; Dr. Hooker; Holtzapfel; M'Culloch; Williams' Middle Kingdom*, p. 275; *Burton's City of the Salt Lake; Harris, Nat. Hist. of Bible.*

CEDED DISTRICTS, a territory under the Madras Presidency, in the centre of the Peninsula, now apportioned into the Bellary, Cuddapah, and Kurnool collectorates. This tract of country belonged to the Mysore sovereign Tipu, and after his death fell to the share of the Hyderabad state. Shortly afterwards, under the treaty of 1803, this share was ceded to the British on their undertaking to provide a subsidiary force of about ten thousand soldiers. Their numbers in 1868 did not exceed 5000, stationed at Secunderabad, six miles from Hyderabad, in the Dekhan. There is one large military cantonment at Bellary, and a sanatorium, 37 miles distant, at Ramandrug. The people of the districts are partly Canarese, partly Teling, the linguistic boundary being a little east and south of Bellary. The minerals are iron ore, lead, antimony, manganese, diamonds, alum, muriate of soda, natron or native soda, saltpetre, gun-flints, and marble. The same term is applied to the districts ceded in 1801 by the Nawab Vizir of Oudh, which now form the eastern portion of the N.W. Provinces, and include Allahabad, Azimghur, Farrakhabad, Etawa, Gorakhpur.—*Newbold.*

CEDRELACEÆ, the toon-tree tribe of plants, comprising the genera Cedrela, Chickrassia, Chloroxylon, Flindersia, Soymida, and Swietenia; several species of these grow in the East Indies. Besides the species of Cedrela below, Kurz names Cedrela multijuga of Pegu.

CEDRELA ODORATA. *Macfadyen.*

Ch'un-shu, Chu-pi, Hiang-ch'-un, Chun-pi, . . CHIN.

A timber tree of China; its wood resembles mahogany, and is used in cabinet work. The bark of the trunk and root and the fruit are used internally as an astringent. The tender spring leaves are eaten, and the silkworm is fed upon them, and also on the leaves of the ailanthus. The leaves are mixed with those of the catalpa, and made into a wash as a remedy for baldness, and they are taken internally as an antiscorbutic. The timber is particularly recommended for wainscoting rooms, and for chests and the inside work of clothes presses and drawers, from the circumstance that vermin are not known to breed in it, and for splitting into shingles to cover houses. They are very durable.—*Macfad.; Smith.*

CEDRELA SERRATA. *Royle.*

Hill toon, ... ENG.	Drava, Drawi, . . PANJ.
Tuni, ... HIND.	Drab, Dimri, . . ,,

This tree is found in most of the valleys of the N.W. Himalaya, in Kulu, Kanawar, the Murree Hills, Kangra, and Kaghan, from 4000 to 8000 feet above the sea, up to near the Indus. Its wood is often very red, and has a strong fetid smell when fresh; it is lighter and of more open texture than C. toona, for which it is often sold. It stands water well, is well suited for bridges, and is made into sieves. A cubic foot weighs 31 lbs.—*Dr. Cleghorn, Panj. Rept.; Stewart, Panj. Plants; Powell, Handbook.*

CEDRELA SINENSIS. *A. de Jussieu.* An elegant tree of Europe and China; wood like that of Cedrela toona, *Roxb.*, used for cigar boxes. —*Mueller.*

CEDRELA TOONA. *Roxb.* Toon.

C. hexandra, *Wall. in Roxb.*

This large and valuable tree grows at the foot of the Himalayas, and to the south, in Bengal and both Peninsulas of India, in varying abundance. Abundant 25 miles north-east of Trevandrum; is found in the Mysore and Salem jungles in large quantities; also along the crest of the ghats from Travancore to Goa. In Coimbatore it is a valuable timber tree of large size. In the raees of S. Konkan and Lower Canara, the tree is more common. It grows abundantly in some of the deep ravines in western Kandesh, and it grows in the ravines of the Konkan. At the Tambur river, in East Nepal, Dr. Hooker measured a toon tree (Cedrela) 30 feet in girth at five feet above the ground. The wood is a choice one for cabinet purposes, but is not used for any others, except for house beams when it is procurable in sufficient quantity. It is called bastard cedar from an aromatic resin exuding from it, resembling that of the American cedar. It is often sold in Madras under the general name of Chittagong wood, and is the most valuable of the woods known by that commercial name,—the true Chittagong wood, however, being Chicrassia tabularis. Cedrela toona has an erect trunk of great height and size, with smooth grey bark. The flowers are very numerous, small, white, and fragrant, like honey. The seeds are numerous, imbricated, winged. It seems probable that the trees known commercially as toon are at least different species; but the woods sold under this name are all red-coloured, of varying hues. The Gumsur Mahalimbo wood, said to be this tree, and to be tolerably common, is described as not liable to be attacked by insects, and is on that account used for making boxes, etc. The fruit and bark are used medicinally in fever and rheumatism. The bark is powerfully astringent, but not bitter; native physicians use it in conjunction with the powdered nut of the Cæsalpinia bonducella, an intense bitter. M. Nees von Esenbeck has published an account of some experiments on the bark, which indicated the existence of a resinous astringent, a brown astringent matter, and a gummy brown extractive matter resembling ulmine. The bark was used in Java by Blume in epidemic fevers, diarrhœa, and other complaints. Horsfield gave it in dysentery, but only in the last stage, when inflammatory symptoms had disappeared. Its flowers, in conjunction with

safflower, are used by the inhabitants of Mysore for dyeing the beautiful red colour called there Gul-i-nari. A cubic foot weighs 28–41 lbs.—*Drs. Roxburgh*, i. 635, *Hooker*, *Mason*, *Gibson*, *Cleghorn*, *Stewart*; *Beddome*; *Voigt*; *Powell*.

CEDRUS DEODARA. *Lambert.* Deodar.

Pinus deodara, *Roxb.*

Sacred Indian fir,	ENG.	Kelu,	HIMAL.
Himalayan cedar,	,,	Kilei, Killar,	,,
Devadara,	HIND.	Kelmung, Keling,	TIBET.

Cedrus deodara is a magnificent tree growing on the mountains of Kedar Kantha, Nepal, and Tibet, up to heights of 7000 and 12,000 feet; as also in the woods of Almorah, at Kullu, Kangra, and Kaghan. The resinous wood is very durable, lasting from 200 to 400 years. The tract in the Sutlej valley producing deodara lies between long. 77° 59′ and 78° 31′ E., and lat. 31° 23½′ and 31° 40′ N. (Panj. Rep. p. 4). The deodara is not abundant in Hazara (except in Kaghan), and is becoming scarce. Dr. Cleghorn only observed it on the north side of the Mochpura range, towards the Jhelum, and sparingly on Thandiani. Mr. Strong measured a deodara tree in the deodar forest at Nachar after felling, 122 feet long, the butt end girth 14 feet 6 inches, and the top 12 feet 4 inches; another standing about 150 feet high, girth at bottom 18 feet 4 inches. Some he measured 26 feet in girth. The average, taking the whole forest, is not less than 15 feet girth at bottom. The trees are full of turpentine. Cedrus deodara timber is very useful for railway purposes, and 12,000 tons were sent down the Chenab in one year. Deodara was abundant in Bussahir. In the territories of Mandi and Sukhet, and in the hill states of Koti Kamharsen, and Bagi, which overlook the Lower Sutlej, all the good deodar trees (Kelu) have of late years been removed from within three miles of the river; but the interior hills of Bussahir are extensively clothed with the finest deodara, particularly on the upper parts of the northern slopes, commencing at Nachar, and terminating near the Hangarang ridge, which forms the northern limit of this beautiful tree, and indeed of all arboreous vegetation, except birch and junipers. In travelling along the Hindustan and Tibet road, many cedars may be seen 20 feet in girth, and 100 to 130 feet in height. It is supposed to be identical with the cedar of Lebanon. Its wood is fragrant, of a reddish-yellow colour, highly resinous and inflammable; very durable; yields valuable timber, not subject to warp. The natives of the hills venerate the groves surrounding their temples and religiously conserve them, whilst to the State the wood is of the greatest importance for house and bridge building.—*Eng. Cyclop.*; *Cleg. Rept. on Panj.*; *Kulu and Kangra*, pp. 4 to 190; *Hook. Him. Journ.* ii. p. 41; *Hodgson's Nagasaki*, pp. 342–3; *Royle's Ill. Him. Bot.* p. 350; *Powell*; *Gamble*.

CEDRUS LIBANI. *Barr.* Cedar of Lebanon, a native of Lebanon and Taurus; attains to 60 or 100 feet in height. The largest in the latter part of the 19th century measured thirty feet in diameter, and covered a circumference of about 120 feet. Their number has gradually been diminishing. In 1550 Bellon reckoned 30. In 1600 only 24 remained. In 1650 only 23. In 1700, 16; and in 1800, 7; and these seven trees are perhaps the sole witnesses from biblical times. The cones of the deodara are identical with those of the cedar of Lebanon; the deodara has generally longer and more pale bluish leaves and weeping branches, but these characters seem to be unusually developed in English gardens; for several persons, well acquainted with the deodar at Simla, when asked to point it out in the Kew Gardens, have indicated the cedar of Lebanon, and when shown the deodar, declared that they never saw that plant in the Himalaya. C. Atlantica, *Manetti*, is the Atlas cedar.—*Hooker's Him. Journ.* p. 41.

CELASTRACEÆ, spindle trees. The English name is derived from the use made of its very compact wood. In India the genera of this order are Celastrus, Elæodendron, Euonymus, Kurrimia, and Microtropis, with the sub-orders Hippocratea and Trigonieæ. Celastrus spinosus, *Royle*, is a thorny shrub.

CELASTRUS EMARGINATUS. *Willde.* Chennee chintoo, TEL. This shrub, which grows on the Coromandel coast, makes good fences and fuel.—*Roxb.* i. 622.

CELASTRUS MONTANA. *Roxb.*

C. paniculatus, *Wight.*		C. Senegalensis, *Lam.*	
Malkanguni,	HIND.	Gaja Chinno,	TEL.
Kanguni,	MAHR.	Gi-changi,	,,
Danti chettu,	TEL.	Pedda danti,	,,

A scrubby, crooked shrub, found on the Coromandel coast and in barren hills, chiefly of the Dekhan. The wood, hard and durable, is sought after as a choice dunnage for roof tiles, said to last for forty years, a duration greatly exceeding that of any other dunnage material.—*Roxb.* i. 621; *Gibson*; *Voigt*; *Rohde*.

CELASTRUS PANICULATUS. *Willde.*

C. nutans, *Roxb.* C. Rothiana, *Schultes.*		Ceanothus paniculatus, *Heyne.* Scutia paniculata, *Don.*	
Staff tree,	ENG.	Bavungi,	TEL.
Malkanguni,	HIND.	Gundu meda,	,,
Valuluvy,	TAM.	Maneru,	,,
Mal kang kanni,	,,	Mai erikata,	,,
Mala-erikata,	TEL.	Maiyala erikat,	,,

A large scrambling shrub, grows in most parts of India. The red seeds are given to cattle, and are officinal, being considered hot, and administered for rheumatism. The leaves also are officinal; and a deep scarlet-coloured oil, obtained by expression from the seeds, is rubbed externally and given internally in rheumatism. The oleum nigrum, an empyreumatic black oily fluid, is obtained by the destructive distillation of the seeds, but it does not differ in any sensible degree from the empyreumatic products of the distillation of the common fixed oils, containing naphtha and other carburets of hydrogen. Large quantities would doubtless yield paraffin and creosote. The seeds have a hot biting taste; and the oleum nigrum obtained from them was at one time largely employed in Beriberi. In Ajmir the seed is imported from Marwar and Godwar; is there considered sudorific, and generally heating, and is swallowed whole in rheumatism. It is used in horse mesalihs.—*O'Sh.* p. 271; *Gen. Med. Top.* p. 146; *Dr. J. L. Stewart*; *Malcolmson*, p. 312; *Gamble*.

CELEBES is called by the natives Wugi. It is an island in the Eastern Archipelago. In configuration it has been compared to a star-fish, from which the radiating limbs on one side have been removed; and this very singular form also distinguishes Gilolo, an island not far distant from it to the eastward. Celebes occupies the centre of the tropical zone, and lies in the Molucca sea. It is

composed of four peninsulas, with an area of 3578 miles. Its coast presents a great number of bays, gulfs, and capes of eccentric outline. The surface is lofty, with considerable hills, and towards the north are several active volcanoes. Some of the mountains rise 7000 feet above the level of the sea, usually with round or flat tops. Along the borders of the sea are wide plains covered with verdure; and beautiful valleys, some of which enclose magnificent basins of limpid water, raised on a smooth plateau, encircled by a rim of low hills. Thick forests cover the hills and large tracts of the level country with oaks, maples, sycamores, cedars, teak trees, and the upas. Two southern prongs form the Gulf of Boni, which stretches three degrees northward into the centre of the island. Its entrance is about 80 miles wide, but narrows to 30 miles, till at its head it again expands to 45 miles. Celebes, on its eastern coast, is fronted by islands; and many islands are scattered over the bays of Tolo and Tominie, or Gunong Tella. Celebes, on its north coast, is in general high, bold land. Its extreme point is called Cape Coffin; and the whole of the islands that stretch from it to Menado Bay are sometimes called Banca islands. The tongue of land in the north of Celebes, known administratively under the name of the Dutch Residency of Menado, comprehends all the northern extent of the island, from the bay of Palos in the west to the cape of Taliabo in the east, and comprises the great bay or arm of the sea of Gunong Tella, which stretches in a westerly direction between the two peninsulas. The Residency of Menado includes under its jurisdiction the whole federative states of Minahassa; the small kingdom of the northern coast; also the very extensive districts in the west part of the peninsula, where Government exercise sway, besides the islands of Sangir and Talaut to the north, as well as the lesser island of the west coast and the large gulf of Tomini. In 1842 its population was estimated about 180,000 souls, exclusive of the Alfura race. In 1881 it was 379,795.

In the S.W. Peninsula, two languages are spoken, the Mangkasa or Mangkasara (which gives its name to the Netherland capital Macassar), and the Wugi or Bugi, which originally was more particularly limited to the coast of the Gulf of Boni. North of Macassar, in the most western part of the island, is another people, the Mandhar, who speak a third language. On the island of Buton, which may be regarded as a part of the Peninsula east of the Gulf of Boni, a fourth tongue is spoken. In the northern Peninsula are the people speaking the Gorontalo and the Menado languages (Bikmore, p. 97). Minahassa is in the northern extremity of Celebes. In the interior are a people whom the coast tribes call Turaju, who are said to be cannibals and head-hunters (Bikmore). Macassar is the most notorious place in the Eastern Archipelago for the Bugi people to run amok. It is in fact the national mode of committing suicide amongst the natives of Celebes, and is therefore the fashionable mode of escaping difficulties. Ten or twenty persons are sometimes killed and wounded at one of the amok. Stabbing and killing all he meets, the amok runner is at last overpowered, and dies in all the excitement of battle. It is a delirious intoxication, a temporary madness, absorbing every thought and action (Wallace, i. p. 174). Macassar men is a common name of the Bugi race. The Macassar people were taught Mahomedanism in the early part of the 16th century, but the Portuguese arrived A.D. 1525, and they embraced Christianity (Bikmore, p. 99). The Bugi are now the great navigators and traders and the most enterprising race of the Eastern Archipelago. In the beginning of the western monsoon they go in great numbers to the Aru islands, which is the principal rendezvous for the people of Ceram, Goram, the Ki islands, Tenimber, Baba, and the adjacent coast of New Guinea, a distance from Macassar of upwards of 1000 miles. They carry English calicoes, cotton goods of their own manufacture, Chinese gongs, and arrack; and the return cargoes are tortoiseshell, mother-of-pearl shell, pearls, birds of paradise, and trepang, the Malay term for all the kinds of holothuriæ or sea-cucumbers. Of trepang alone about 14,000 pikuls are yearly shipped from Macassar, of the value of 600,000 dollars, or £150,000. It is estimated that the annual value of goods carried by the Bugi to the Aru islands from Macassar alone is 80,000 dollars, or 200,000 guilders; and of those taken to the Aru group from other places, 20,000 dollars, or 50,000 guilders.—*Bikmore*, 101.

The people of Minahassa differ much from all the other people in the Archipelago. They are of a light brown or yellow tint, often approaching the fairness of a European, of a rather short stature, stout, and well made, of an open and pleasing countenance, with the usual long, straight, jet black hair of the Malays, but disfigured, as age advances, with projecting cheek-bones. The coast people, where there has been intermixture, are coarse; but in inland villages, where the race is pure, both men and women are remarkably handsome. They are quiet and gentle, submissive to authority, and are easily induced to learn and adopt the habits of civilised life; they seem capable of acquiring a considerable amount of intellectual education, and they are clever mechanics. Since 1822, from the introduction of coffee planting and a settled government, the people, though still speaking different tongues, have become the best clothed, best housed, best fed, and best educated in the Archipelago. Much of this has been due to the tractable nature of this people, for near Menado is a race called Bantek, strong, but intractable, who have hitherto resisted all efforts to improve them. Some of the less civilised tribes have semi-Papuan features and hair, while in some villages the true Celebes or Bugi physiognomy prevails. The plateau of Tondano is chiefly inhabited by people nearly as white as the Chinese, and with very pleasing semi-European features. The people of Siau and Sangir much resemble these, and Mr. Wallace believes them probably to be immigrants from some of the islands of north Polynesia. The Papuan type will represent the remnant of the aborigines. The languages contain a Celebes-Malay element and a Papuan element, along with some radical peculiarities derived from the Siau and Sangir islands further north, and therefore probably derived from the Philippine Islands.

Celebes has iron, tin, and copper. It has about 16 species of land mammals, and about 191 species of birds, 94 of which are peculiar to it. Professor Bikmore says (p. 378) gold in great quantities occurs over all the northern peninsula

from the Minahassa south to the isthmus of Palas. Livistonia rotundifolia is supposed by Mr. Wallace to be the fan-palm, and the people make water buckets and baskets of the leaf. Celebes has the Carpophaga luctuosa, a fine cream-coloured pigeon, also the Coracias Temminckii, and Phænicophaus callirhyncus, one of the finest known cuckoos. Its bill is of a brilliant yellow, red, and black. Ornithoptera remus, the largest and most beautiful of all the butterflies, is found in Celebes. Accipiter trinotatus, a beautiful hawk with elegant rows of large round white spots on the tail; Strix Rosenbergii and S. Javanica, the latter in all the islands up to Lombok. Phlegænas tristigmati is the ground dove of Celebes. The Maleo, or Megacephalon rubripes, deposits its eggs in the loose sand of the sea-beach, in holes just above high-water mark; the female lays one large egg, which she covers over and returns to the forest; but many birds lay in the same hole. A dozen eggs are often found together. One egg fills an ordinary teacup, from 4 to 4½ inches long, and 2¼ to 2½ wide. They are very good to eat, and much sought after. The hen-bird takes no further care of the eggs, which the young bird breaks through about the 13th day, and runs at once to the forest. Each hen lays six or eight eggs in a season of two or three months. Cittura cyanotes, the forest kingfisher. Meropogon Forsteni (Carpophaga Forsteni) is a fruit pigeon of North Celebes. Buceros cassidix, the great horn-bill of Celebes. Trichoglossus ornatus, a beautiful brush-tongued parrakeet. Corvus advena, a rare black and white crow. Anoa depressicornis (Sapi utan, MALAY) is the wild cow of Celebes; it is smaller than other wild cattle, and is found in the mountains. Cynopithecus nigrescens, the black baboon monkey. Tachyris zarinda, a rare butterfly, with cinnabar red wings. Idea tondana, a semi-transparent butterfly of Celebes. Papilio androcles, one of the largest and rarest of swallow-tailed butterflies. Cicindela heros and C. gloriosa also occur, the latter of a rich velvety green colour.—*Quarterly Review*, No. 222; *Bikmore's Travels*, pp. 101–378; *Crawfurd's Dictionary*, i. p. 243; *St. John's Indian Archipelago*, i. p. 351; *Wallace's Malay Archipelago; Horsburgh; Temminck, Coup d'Œil sur les Possessions Neerlandaises*, iii. p. 5; *Journ. Ind. Arch.* 1850, p. 764; *Jameson's Ed. Journ.* 1822, p. 402.

CELERY. Apium graveolens.

Kurufs, ...	ARAB.	Kin-tsai, ...	CHIN.
Ku'kin, ...	CHIN.	Ye-kin-tsai, ...	,,

Celery is a hardy biennial found wild in various parts of Europe, in the southern hemisphere, and in California, by the side of ditches near the sea, where the water is brackish. It is rank and coarse, but by cultivation it is transformed into a sweet and wholesome esculent. When the plants grow in moist ground they are poisonous. The cultivated plant grows best in a rich, well-drained soil. The process of excluding the light, by covering the stems with earth, also tends to render the poison, peculiar to the wild plant, inert. The seeds are sold in every Indian bazar, and used as stimulants by the native practitioners. The roots are also employed in medicine. The essential oil, dissolved in strong spirit, gives an essence a drop of which will communicate a strong and fine flavour of celery to a tureen of soup. Celeriac is a variety of celery, and managed similarly; root used for stews.—*Riddell; Jaffrey; O'Shaughnessy*, p. 357.

CELIBACY is the rule with all the Buddhist priesthood, with the gurus of most sects of Hindus, also with the men and women of the Manbhow sect; the Phoongyes, Talapoins, Lamas, and nuns of the Buddhists; the Jain priesthood also are celibates, as also since the 11th century all the priesthood of the Romish Christians. The Sherif families of Mecca affect marrying female slaves, thereby showing the intense pride which finds no Arab noble enough for them. Others take to wife Bedouin girls; their blood, therefore, is by no means pure. The worst feature of their system is the forced celibacy of their daughters: they are never married into any but Sherif families; consequently they often die in spinsterhood. The effects of this custom are most pernicious, for though celibacy exists in the East, it is by no means synonymous with chastity. Here it springs from a morbid sense of honour, and arose, it is popularly said, from an affront taken by a Sherif against his daughter's husband. But all Arabs condemn the practice. —*Burton's Mecca*, iii. p. 33.

CELOSIA ALBIDA. *Linn.*

Booroondie, . .	SANSK.	Gurugu kura, . . .	TEL.
Pannay keeray, .	TAM.		

This genus of plants is of the order Amarantaceæ. Roxburgh (i. pp. 678–9) mentions C. argentea, C. cernua, C. comosa, and C. cristata. C. cernua, drooping cockscomb, is cultivated as a flower.—*Irv.*

CELOSIA ARGENTEA. *Linn.*

Tsing-siang, . . .	CHIN.	Chil-chil, Sil, . .	HIND.
Ts'au Kiueh-ming,	,,	Salyara, ...	,,
White cockscomb, .	ENG.	Deo-koti, ...	,,
Safed murghkes, .	HIND.	Gurugu, ...	TEL.
Sarwari, Sar-pankha,	,,	Panche chettu, . .	,,

It grows all over China. It is a troublesome weed amongst flax, but the Chinese gather and eat it as a vegetable. Its black seeds are used internally as a medicine. A double variety is cultivated. The single variety, both white and pink, is very common in the rains in the cultivated fields of India, and cattle eat the plants, especially buffaloes.—*Genl. Med. Top.* p. 185; *Smith.*

CELOSIA CRISTATA. *Linn.* Var. *a.* rubra.

Kyet mouk, . .	BURM.	Taj i Khurus, . .	HIND.
Ki-kwan, . . .	CHIN.	Kanju, ...	,,
Crested cockscomb,	ENG.	Erra-kodi juttu tota	
Pila Murghkes, .	HIND.	kura, ...	TEL.
Lal Murghkes, . .	,,	Kodi juttu tota kura,	,,

Both white and yellow varieties are cultivated in gardens. The Hindi, Telugu, and Burman names signify cockscomb, like the English.—*Mason.*

CELSIA COROMANDELIANA. *Vahl.* Kukshima. A garden weed in India, growing in waste places in the Dekhan, on the banks of rivers, and near still waters. The inspissated juice of the leaves is given in dysentery, acting as a sedative and astringent.—*Drury.*

CELT implements of manufacture, agriculture, and for domestic purposes, used by ancient prehistoric races of the world. They have been discovered in Europe and India. Mr. Allan Hume, C.B., discovered many in Hindustan, and Colonel Meadows Taylor others at Lingasugur in the Raichore Doab. They are of flint or chalcedony. Mr. W. Theobold and Captain Fryer found celts or stone weapons in the country extending upwards of 200 miles east of the Toris river, and

accumulated at Karo in Kirwee. Dr. Mason found them in Burma almost identical with those found in Europe. The celt chipping or hewing stone, the thunderbolt, the coin de foudre, laierre de tonerre, the Til hugger steen of the Germans, may have been the moen sourons of Brittany, a hatchet, axe, chisel, adze, or wedge. They are numerous in the Channel Islands. Those found in the Karnatic are of fibrolite, those of the Swiss lakes are of jade. The natives of Kirwee have adorned some of the celts with a daub of red paint as Siva. Most of the Andamanese stone chips seem to be arrow-heads for shooting fish, or intended to be used with the fingers in dividing fish and flesh. Flint and chert chippings have been discovered at Kaleyzur, Jubbulpur, and Kutturea. Polished celts occur in Central India. Cores have been found near the Indus, and flakes and cores near Jubbulpur.

CELTIS, a genus of plants belonging to the Ulmaceæ. C. australis and C. Caucasica are the Batkar, HIND., of Kaghan. C. dysodoxylon, *Thw.*, the Guranda gass of the Singhalese, is a small tree which grows up to 5000 feet in the Central Provinces.—*Cleghorn's Report; Thw. Zeyl.* p. 267.

CELTIS AUSTRALIS, the lotus tree of N. Africa, S. Europe, and S. Asia, ascends the Himalaya to 9000 feet. It attains a height of 50 feet, and lives to a thousand years. Berries edible, wood hard and dense, suited for turnery and carving. The stem-wood is fine-grained, easily cleft, and of a splendid yellow tinge. The branch-wood is excellent for whip-sticks.—*Von Mueller.*

CELTIS CAUCASICA. *Willde.* Nettle tree.

Bigni, Bingu, . CHENAB.	Brimdu, Brumij, . KASH.
Kharg, Wattaman, ,,	Brimla, ... ,,
Batkarar, . . . JHELUM.	Takhum, Tago, TR.-IND.

Fruit—Kangal mirch, Indarba, HIND.

This fine tree is common, wild, from 2500 to 8500 feet in the Panjab Himalaya, and occurs in Trans-Indus down to 1500 feet; and Dr. Griffith says it is cultivated in Afghanistan. It attains 16½ feet in girth; and trees of seven or eight feet are not uncommon. Its timber is white, light, soft, weak, and subject to the attacks of insects. It is chiefly used for farmer's work, charcoal and fuel. Dr. Bellew mentions that in the Peshawur valley it is often made into charms to keep off the evil eye from man and beast, and Dr. Cleghorn states that its bark is used for sandals.—*Dr. Bellew; J. L. Stewart, M.D.*, p. 209; *Cleghorn.*

CELTIS ERIOCARPA, nettle tree, koo of the Panjab, is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 6000 feet. Bark used for making shoes.—*Cleghorn.*

CELTIS NEPALENSIS. *Planch.* Batkar, Tago, of the Trans-Indus and Panjab. Dr. Stewart found it in parts of the Jhelum basin and Trans-Indus at about 2500 to 3500 feet. The Pathans are said to use its tough wood for churn-sticks.—*Dr. J. L. Stewart.*

CELTIS ORIENTALIS. *L.* Indian nettle tree.

Sponia orientalis, *Commers.*

Tubunna, Chakan, BENG.	Gadda nelli, . . . TEL.
Mallam toddali, MALEAL.	Urn kanija nalika, . ,,
Karak, . . . PANJ.	

A tree which is pretty common all over India, and in Kullu is planted in avenues. Dr. Buchanan Hamilton says the under bark of this tree, like that of the West India kind, consisting of numerous reticulated fibres, forms a kind of natural cloth, used by the Garo (Lin. Trans. xvii. p. 209) as a kind of rug. The Garo make several such cloths of different colours from various barks. The Garo who come to the plains, generally buy some small ends of cloths from the Bengalis, to attend the hauts (fairs) in, not as clothing to protect them from wind and weather.—*Roxb.* ii. 65; *Royle, Fib. Pl.* 317; *Cleghorn; Kullu*, 80.

CELTIS TRINERVIA. *Roxb.* iii. 65. C. Roxburghii, *Planchon.* This good-sized tree grows in Eastern Bengal, is met with on the Eastern Ghats of the Madras Presidency, Golconda hills near Vizagapatam, at 3000 feet elevation; also on the Bombay Ghats.

CELTIS WIGHTII. *Wight, Ic.* Not uncommon in the hot, drier parts of Ceylon.—*Th. Zeyl.*

CEMENT.

Chuna, ... HIND.	Smalto, ... IT.
Mortel, Kitt, Band, GER.	Chunambu, . . . TAM.

Lime, septariæ, dolomite, magnesite, gypsum, and other substances are used in manufacturing cements. The shell lime of Sooloorpett is a pure carbonate of lime. The kankar or nodular limestones of India are more durable, though not so white. Septariæ, or Parker's cement stones, accompany the strata of blue and white potter's clay and kaolin that are so common in the Madras Presidency. The best hydraulic septariæ occur at Awady near Madras, at Bangalore and Chingleput. A very fine hydraulic cement on the banks of the Godavery was extensively used in the construction of the Godavery and Kistna anicuts. A very good hydraulic limestone occurs along with the blue slate of Cuddapah, and the dolomites of the Ceded Districts and the Northern Circars make good cements. The magnesite of Salem, Bangalore, and Vizianagram acquires great hardness of surface, but is deficient in adhesiveness. It possesses some good hydraulic properties, but has disappointed the expectations at first formed of its usefulness.

The ordinary Indian cement is lime in its various forms; a cement capable of bearing a pressure of 650 to 1000 pounds and upwards is produced from ordinary kankar, combined with a certain proportion of pure limestone. *Kankar* is a limestone mostly nodular, always freshwater and recent,—in most cases in the act of being formed under our eyes. It is sometimes found in thick stratified beds like the travertine near Rome, and seems in this case to have been formed by calcareous springs; more generally it is met with in clay or alluvial soil, in the shape of small pieces from the size of peas or filberts to that of the hand. In the blue clay which stretches along the Indian shores it is found in vast abundance, generally assuming the most fantastic forms; indeed, it abounds in every rice field and open soil all over the country. The more recent varieties seem to be formed by the agency of the rains; when the earth abounds with vegetation, the tepid waters are charged with fixed air, and dissolve the lime prevailing in the soil everywhere around, the mineral being again thrown down as the advancing season dispels the excess of gas. It in this state absorbs the clayey matter around, and cements it into kankar. This is collected by the lime-burner, placed with firewood in small-sized conical kilns, and burnt in the usual way. It contains 72 of carbonate of lime, 15 of sand, and 11 of clay and oxide of iron. Mixed with half its weight of river sand, it makes an excellent mortar; burnt in pieces of a cubic

inch or so in size, and then powdered without slaking, it forms a first-rate water cement, setting in a few minutes, and becoming as hard as stone. At Poona the finer varieties of kankar are burnt with charcoal, in neat kilns 2½ feet high and in diameter at the base. These hold about a cubic foot of material, or about 36 lbs. of charcoal and kankar in equal parts. When burnt, it is slaked and then made up into bricks, which are sold in the bazar for the purpose of whitewashing. The finer kinds of lime and cement on the Coromandel coast are made from shells. A piece of ground about ten feet square is laid down even, and floored over with clay; an upright pole is placed at each end of this, and a sheet stretched out with back-stays spread between the poles, which are steadied with strings. On the floor a bed of shells and rice-chaff alternately, about ten inches thick and eight feet by six, is spread neatly out. Some firewood is placed along the windward side of this, and when the sea breeze sets in the wood is kindled. As the heat extends to leeward, and the shells become calcined, the lime-burners draw off the fore-parts of them with a stick, and so soon as they have cooled on the floor sufficiently to allow them to be handled, they are placed in a scoop basket, and the dirt and epidermis winnowed from them. The shells, now white and pearly, are next thrown into a small-sized vat partially filled with water; here they for some time boil from the effects of the heat and slaking. The whole in a short time settles down into a fine semi-fluid mass, which is taken out and slightly dried, and is now ready for use. A good hydraulic cement is formed of the blue clay of Madras and shell lime.

Bitumen or asphalte seems to have been employed as cement in Babylon. The works of salt and bitumen even yet around Hit, give a most singular appearance to the country; and the most learned geographers are of opinion that the town of Hit is the Is of Herodotus, whence the Babylonians drew the bitumen in which they set their bricks.

All over the East an exceedingly hard cement, which they use as mortar and to form the lining of baths and reservoirs, is made with equal parts of wood ashes, thoroughly sifted, and powdered lime, and by others with two parts of lime to one of ashes, but in either case these materials are well mixed. Water is then poured upon them, and they are well kneaded, after which the mass is beaten for six days by two men with large sticks, uninterruptedly, except at night; when it becomes a little solid on one side, it is turned over and beaten on the other, care being taken to moisten it occasionally, lest it should become too dry. When thus well mixed, it is folded and turned, and beaten again and again till the sixth day, when it is ready for use. In building, this cement is laid between the bricks, which are tightly pressed upon each other; for lining it is laid upon the surface that is to be covered, and spread with a flat and polished flint, for it must not be touched with the hand, as it would burn. Three layers are put on successively, and the third is washed over with oil, but of what kind is immaterial; when it is dry, nothing can equal the beauty and solidity of this cement, which is called 'sarooj.' There is another description, called 'sarooj maghrebi,' but it is not so much used; this is composed of one-third of hot lime, one of sifted sand, and one of pounded brick.—*Ferrier, Hist. of Afghan.* pp. 296–9; *Skinner's Overland Journey*, ii. p. 113; *Dr. Buist in Bombay Times.*

CENOBITA, a genus of hermit crabs in molluscs. C. clypeata, *Edws.*, Asiatic seas; C. rugosa, Indian Ocean; C. spinosa, Asiatic seas; C. perlata, South Seas.

CENSUS. A rough census of the population, called 'Khana-shumari,' was always made under the Indian princes. The dislike to a census in the East appears to arise from the necessity of mentioning their women, also a vague fear that Government is plotting some mischief against them, and a superstitious aversion to assist in rousing divine wrath by what they consider such a display of pride as that of numbering the people. Since the year 1867, the British Indian Government has had a census of several provinces, followed in 1871-72 and 1881 by a general census of all India. That of 1881 was estimated to cost twenty lakhs = £200,000.

CENTAUREA BEHMEN. *Linn.*

Behmen-abiad, . ARAB. | Suffaid behmen, . . BY.

Centaurea is a genus of ornamental flowering plants common in India. The flowers are fragrant, and of different shades of colour—purple, blue, yellow, white, red, brown, etc. C. atropurpurea is the sweet sultan. C. Behmen root is brought from Kābul, and is used in special diseases as a bitter tonic and purgative. The red kind, Behmen lal or Behmen surkh, is said by some to be the root of the Salvia hæmatoides.—*Powell*, i. 355.

CENTETES ILLIGER. *Smith.*

Wei; Wei-shu, . CHIN. | Ten-rec or Tend-rec, ENG.

Several species of this genus of mammals are said to occur in China. The bristles are made into brushes.—*Smith.*

CENTIPEDES are very common in the East Indies two to six inches long. They are generally supposed to be poisonous, but such is not the case.

CENTRAL ASIA is a term used differently by geographers, ethnologists, and politicians; by the last of these it is usually applied to the region intervening between Russia in Asia on the north, and Persia and Afghanistan on the south, and lying to the west of Chinese Tartary, its chief western boundary being the Caspian Sea. The Russians often restrict the term Central Asia to the second great division of the Central Asiatic highlands of their Asiatic possessions, which is mainly comprised within the Aralo-Caspian depression. The vast plateau of Central Asia proper has on its east the lofty table-land of the Bolor mountains, which form the western boundary of Chinese Turkestan and Dzungaria, and the river Irtish; the northern boundary is Western Siberia, and Afghanistan lies south-east. The northern half of Central Asia consists of the Kirghiz desert, which is mountainous and rugged on the east, and full of saline steppes on the west. In the midst of the southern half lies the Sea of Aral, on the western side of which, up to the Caspian Sea on the west, there stretches a broad tract of desert. But on its eastern side is a fertile tract, watered by the Syr Darya and Amu Darya, the Jaxartes and the Oxus, and it is in this fertile tract that the conquests of Russia were made between 1864 and 1868. After long years spent in fortifying posts, in 1864 Russia made a sudden irruption into the upper valley of the Jaxartes, and took three forts of Khokand, viz. Aoulietta, Turkestan,

and Chemkend. In the spring of 1865 the chief of Khokand fell in battle; and in June 1865 the city of Tashkend was stormed. On the 20th May 1866 they fought and won the battle of Irdjar against the Bokhariotes, and later in the year captured the forts of Oratepe and Juzak, within 40 miles of Samarcand. On the 13th May 1868 a great battle was fought under the walls of Samarcand, and the city surrendered; and later in the year Bokhara yielded (Fortnightly Review, July 1868). In these operations the Russians used only 2000 and 3000 men, and never had more than 15,000 in all Turkestan. Russian Turkestan has a population of two millions, viz. Bokhara, 1,000,000; Khokand, 900,000; Khiva (less the independent Turkoman tribes), 300,000. During the fifteen years, 1867 to 1882, that General Kaufman was governor-general of Turkestan, Russia became paramount in Khiva (1873), took Kuldja from the Chinese, and again restored it, and subdued the Tekke Turkoman. Kuldja was important to Russia so long as the advance upon India lay through Turkestan; but directly the line of aggression was shifted to the Trans-Caspian region, it was seen at once how relatively inferior any annexations in the direction of Kashgar were to those by way of Akhal and Merv. Russian rule in Turkestan is harsh, but it is far ahead of Chinese administration in Kashgar, particularly in the extreme respect and tolerance accorded to the Mahomedans in the exercise of their religion.

The south-eastern boundary line, along the Afghan frontier, was accurately laid down by agreement with the British Government in 1873. The south-western boundary line, along the Persian frontier, under agreement with the Persian Government in 1882, now runs from the south-east corner of the Caspian up the Atrek valley to Chat, at the junction of the Sumbar, thence eastwards along the water-parting to a point south-east of Askabad.

The Caspian Sea is the lowest part of the Aralo-Caspian depression, and all the streams of Central Asia ought to disembogue into the Caspian; but the river Emba alone reaches that outlet. All the rest run dry, like the Tajand, Murghab, Zar-afshan, Chui, Talas, and Sari, or else, like the Oxus and Jaxartes, become absorbed in the Aral.

The mountain ranges in this region comprise the Karakorum, Kouen Lun, Pamir, and Tian Shan. The Pamir forms the nucleus of the whole Central Asiatic highland system. Here converge the Hindu Kush and Himalaya from the south-west and south-east, the Kouen Lun from the east, the Tian Shan from the north-east; while the plateau itself merges westwards in the snowy highlands and ice-fields about the sources of the Zar-afshan, between the valleys of the Amu Darya (Oxus) and Syr Darya (Jaxartes). It consists of a vast plateau formation, some 30,000 square miles in extent, with a mean elevation of at least 15,000 feet, culminating in the east with the Tagharma, 25,500 feet. Northwards its limits are the Alai and Trans-Alai ranges, skirting the south side of Farghana (Khokand), and forming the water-parting between the valleys of the Syr Darya and Zar-afshan rivers. Its southern limits seem to be marked by the ridge connecting the Karakorum with the Hindu Kush, and forming the water-parting between the Upper Amu Darya and Indus basins.

The range seems to run north-west and south-east, between the Kashgartagh and the Karakorum, at a mean elevation of 20,000 feet, culminating in Mount Tagharma (Taghalma), 25,500 feet.

The Trans-Alai, seen by Kostenko in 1876, he describes as an alpine chain 10,000 to 12,000 feet high, forming the northern boundary of the Pamir, which stretches thence southwards, and which is crossed in every direction by ridges, all rising above the snow-line, and dividing it into a number of upland plains. The whole region is destitute of trees and shrubs, and even the grass grows only in isolated patches along the banks of the streams.

The great *Central Asiatic plateau* consists of several distinct sections, grouped round the central basin of the Tarim, which is little over 1600 feet above sea-level. South of it the land rises in successive stages from 3000 to 6000, 10,000, and 15,000 feet, the probable mean altitude of the Tibetan plateau. Above this vast table-land the intersecting ranges attain altitudes of from 20,000 to 25,000 feet, culminating in the southern scarp of the Himalaya, with peaks ranging from 26,000 to 29,000 feet. North of the Tarim basin, also, the land rises in terraces of 3000, 6000, and 15,000 feet, here culminating with the Tengri-Khan (25,000), central and highest point of the Tian Shan. Beyond the Tian Shan the ground again falls gradually to about 1500 feet in the Zangarian depression (Tian Shan Pe-lu), north of which it attains a height of 7000 or 8000 feet in the Kobdo plateau. This elevation is maintained in North Mongolia eastwards to the head waters of the Amur, but in the central parts of the Gobi desert stretches from Lob Nor at a mean height of about 3000 feet to the Khingan range. Lastly, the closed basin of the Koko Nor, between the Nan Shan and Burkhan Buddha ranges, stands at an altitude of not less than 10,500 feet above sea-level.

Central Asia has a hardy peasantry dwelling in the mountain region, with its vast upland downs well suited for summer pasture, partly descendants of the original inhabitants, and in part composed of the many races who have swept through the country. At the foot of the mountains, in tracts of surpassing fertility, Uzbak, Turk, Bokhariot, Kalmuk, Kirghiz, Kara-Kalpak, Tajak, Sart, Russians, Ouigur, Manchu, Chinese, Armenian, and Indians dwell in the well-watered plains. Beyond these, in every direction, are the pathless lands, which have been tenanted by pastoral nomades ever since the earth was peopled. They have dark complexions, and dark colour of hair. The Mongol race is represented by the Kalmuk, who have dark hair, olive complexions, oblique eyes, flat faces, high cheek-bones, thin lips, and flat noses. The remaining races, such as the Mongolo-Turk and those of Turko-Finnish extraction, present a strange admixture of types and shades of complexion. One remarks among them fair men, with a regular Roman nose. Generally speaking, however, in the physical appearance of these tribes, there is observable a mixture of the Caucasian race with the Mongolian.

Its people are from two distinct sources, viz. the

settled races, descendants of Semitic and Iranian conquerors from the south; and the races who have been occupying the country from prehistoric times, and are in their habits the same as they were 2000 years ago.

I. TURKI STOCK.

Uzbaks, viz. Kungrad, Naiman, Kipchak, Jalair, Andijani, in Bokhara, Farghana, and Khiva,	2,000,000
Kara Kalpak, viz. Baymakli, Khandelki, Achamayli, Ingakli, Shaku, and Ontoturuk, mainly on the south and south-east shores of the Aral,	50,000
Kirghiz-Kazak, viz. Great Horde (Ulu-Yuz), Middle Horde (Urta-Yuz), Little Horde Kachi-Yuz), Inner Horde (Bukeyeoskaya), in the steppes between Lake Balkash and Lower Volga,	2,750,000
Kara Kirghiz (Buruts), of Tian Shan and Pamir,	400,000
Turkomans, viz. Tekke, Goklan, Yomud; Sarik; Salor, Kara-Ali, Eli; Ersari, Chaudor of Ust-Urt, Khwarezm, Daman-i-Koh and left bank of Oxus,	600,000

II. IRANIC STOCK.

Tajak, Sart, Persians, in Khiva, Bokhara, and Farghana,	1,000,000

III. GALCHA STOCK.

Maghian, Kshtut, Falgar, Macha, Fang; Yagnaub and Karateghin in Farghana, Zar-afshan, Karateghim highlands and Upper Oxus valleys,	250,000

The Turko-Tartaric race stretches from the Polar Sea to the Hindu Kush, and from the interior of China to the shores of the Danube. Vambery divides the Turks who from east to west occupy this extent, into Burut, Kara-Kirghiz black, or pure Kirghiz, properly Kazak, Kara Kalpak, Turkoman, Uzbak. The name by which Vambery designates these people is Turko-Tartars, from amongst whom came the warrior peoples known in the west as the Hun, the Avar, the Utigur, the Kutrigur, and Khazar. But the manner of living, the customs and physical conditions as then described, of the Tartar tribes whose arms reached from the Jaxartes to the heart of Rome and Gaul, have much resemblance to those of the present inhabitants of Turkestan, and the people of Central Asia, particularly the nomade tribes, are in their social habits the same as they were two thousand years ago. In the tent of many a nomade chief a similar life is observable as that described by Priscus as prevailing at the court of the king of the Huns. Attila, Chengiz Khan, and Timur in historical characters resemble each other; and Vambery is of opinion that energy and good fortune could now almost produce on the banks of the Oxus and Jaxartes one of those warriors whose soldiers, like an avalanche carrying everything before it, would increase to hundreds of thousands, and would appear as a new example of God's scourge, if the powerful barriers of our civilisation, which has a great influence in the East, did not stop the way.

The *Turk*, wherever met with, is ever heavy and lethargic in his mind and body, but in his resolves firm and stedfast, not from principle, but from apathy and aversion to change. And it is from these characteristics that his appearance is earnest and solemn,—a profound seriousness, a marble, cold expression of countenance, with a great inclination to pomp and magnificence. An *Uzbak* or Turkoman has a proud bearing, as if possessed with a self-consciousness of greatness and power. The *Osmanli Turk's* love of independence is boundless. He considers himself born to rule, and that hunting and war alone are worthy of him, and husbandry is considered ignominious. In Central Asia, agriculture is exclusively in the hands of the Persian slaves, commerce and business with the Tajak, Hindu, and Jew. The Turk is intellectually the inferior of the Iranian and Semitic nations. This defect is noticed by other nations, who apply the terms Turkluk (Turkdom), Kabalik (coarseness), and Yogunluk (thickness), Sadeluk (simpleness); and with these qualities, as the Osmanli is easily taken in by the Armenian, Greek, and Arab, the Turk is as easily so by the Tajak and Hindu. In transactions the Turk are regarded as possessing more honesty, frankness, and confidence, plainness, simplicity, and uprightness. Compared with the Persians, the Turk is a faithful servant, attached soldier, and upright man. They are more brave, persevering, and love more to rule than any other Asiatic people. They are unpolished, wild, and uncultivated, but seldom cruel out of malice. They crave riches, but only to expend them. They exact much labour from their subordinates, but protect and deal liberally with them. The Turk is innately a nomade, and, like others, is distinguished for hospitality. The Burut is the wildest and most savage and most superstitious of them, but less malicious than the Kirghiz and Turkoman. The Burut has not wholly abandoned shamanism, and knows little of Islam.

The *Kazak Kirghiz* are less brave and warlike, though readily engaging in a pillaging expedition. They form the bulk of the Turkish nomades, and are for the most part devoted to a wandering life. In very few instances have they settled.

The *Kara Kalpak* are considered dull and foolish. They are even less warlike than the Kirghiz. They have seldom appeared as conquerors, and are even less employed as mercenaries. They are largely occupied as cattle-breeders, and they are active, benevolent, and faithful.

Many of the *Turkoman* dwell in a half-settled state along the left bank of the Oxus as far as Char Jui, and in Khiva. They are notorious amongst all the races of Central Asia as the most restless adventurers. Throughout the whole globe it would be difficult to find a second nation with such a restless spirit and untameable licentiousness as these children of the desert. To rob, to plunder, to make slaves, is to the Turkoman honourable. They are always poor, and are dirty and avaricious. Their country is the wildest and most savage, where even keeping a few cattle gives only a scanty income.

The *Uzbak* are honest, upright, with much Turkish open-heartedness, and are proud of their education, and represent all the best side of the natural character of the Turks.

The nomadic races of High Asia are so essentially predatory, that, according to Abul Ghazi (p. 106), they have a proverb, 'Atang yortin jan Chapsa'—If the enemy attack thy father's tent, join him and share the plunder. The people are chiefly gathered about the fertile tracts. Merv, destroyed in 1784 by the Amir of Bokhara, is now a mere collection of mud huts. Khiva, in 1874, had only 5000 inhabitants. Urganj is near it. Bokhara, in 1830, had 140,000 inhabitants, but in 1880 only 7000, of

whom two-thirds are Tajak; the loss of water from the Zar-afshan is the cause of its decay. Samarcand, on the other hand, has risen from 8000 in 1834 to 30,000 in 1880.

The double-humped camel belongs properly to high Central Asia south of the Gobi desert, and would even appear still to exist there in a state of nature. Its western boundary, where bred, seems to be among the Kazak (or Cossacks), north of Bokhara. Lieutenant Wood, of Sir A. Burnes' party, who explored the Oxus to its source in the Sir-i-Kol lake in Pamir, in Wakhan learned that it is bred only among the Kirghiz of Pamir and Khokand. Burnes remarks that the Bactrian camel, which has two humps, abounds in Turkestan; they are bred by the Kazak of the desert north of Bokhara. In its proper and more elevated habitat, this animal is employed together with the yak, as observed in an easterly direction by MM. Huc and Gabet.—*Porter's Travels*, i. p. 112; *Fortnightly Review*, 1868; *Dr. Jackson in Transactions of the Beng. As. Soc.* iii.; *Russians in Central Asia, Captain Valikhanof and M. Vemukof; Malcolm's Persia*, i. p. 20; *Staunton's Narrative; Vambery, Sketches in Central Asia*, pp. 283–312; *Vambery, Bokhara*, p. 247; *Asia, by Mr. Keane and Sir Richard Temple.*

CENTRAL INDIA is the designation for a geographical and political division of British India. It is a table-land of uneven surface, from 1500 to 2500 feet above the sea, bounded by the Aravalli mountains on the west, by those of the Vindhya on the south, supported on the east by a lower range in Bundelkhand, and sloping gradually on the north-east into the basin of the Ganges. It is a diversified but fertile tract. The Patar or plateau is about 700 miles long. Its breadth very various, greatest from Amjherra to Ajmir, 250 miles; from Mhow to Mokundurra, 150 miles; at Saugor and Dumoh, 75 miles; afterwards very narrow. It is highest towards S. and W.; average of Udaipur, 2000 feet; Malwa, 1500 to 2000; Bhopal, 2000; Bundelkhand, about 1000; Shahabad, 700; plain of Ajmir, 2000; Udaipur town, 24° 37′, 73° 49′, 2064. It slopes to N.E., the Banas river flowing in that direction; gradual fall also to the valley of the Chambal river, where it rises to Malwa; Mhow, 2019 feet; Dhar, 1908; Indore, 1998; crest of Jaum ghat, 2328; Ujjain, 1698; Adjygurh, 1340; Amjherra, 1890; Saugor, 1940; Rhotasgurh, 700; Sonar river, at source, 1900. From the Vindhya range the surface has a generally gradual but in some places abrupt descent, as at Mokundurra and the Bindyachal hills, where the rivers occasionally fall over the brow in cascades. Shahabad district is very rocky and uneven.

This region is ruled by about 131 princes and chiefs,—Rajput, Bhil, Mahomedan, Mahratta, and Brahman,—over subject races of non-Aryan, Scythic, Aryan, Arab, Afghan, and Persian and Moghul descent, over Hindus, Baghel, Bhil, Gond, Jat, Koli, Mair, Mena, Rajput, and cultivating tribes of Kunbi, Kurmi, and Mali. Their political relations with British India are superintended by the Central Indian Agency stationed at Indore, with subordinate agencies for Baghelkhand, the Bhil, Bhopal, Guna, Gwalior, Indore, and Western Malwa. The states and chiefships in Central India form a political, and are in a natural, division of British India, and include an area of 83,600 square miles, and a population of about eight millions.

The people of Rewa are indolent and untrustworthy, and they and the country generally are certainly far less civilised than the neighbouring state and people of Bundelkhand. The country and people vary greatly in their character. Nothing can be a greater contrast than the desolate wilds and jungles of the Western Satpura hills and parts of the country extending from them to the Vindhya, with their savage inhabitants, the Bhil tribes, who abhor field, or indeed any other manual labour, and the adjoining richly-cultivated plains of Malwa, extending, with occasional intervening tracts of hill and jungle, from the Mhye on the west to Bhilsa on the east, a stretch of close on 200 miles, and from the crest of the line of the Vindhya to Mundissore and Oomutwarra, a distance of from 100 to 120 miles, and populated by a thrifty agricultural people. This is succeeded by the more hilly and jungly land of Oomutwarra, Seronje, and Keechiwarra, with their scanty population. Northwards towards Gwalior, the country becomes more open, except on the wild border tracts of Kotah of Bundelkhand, till we come to the carefully cultivated plain of Gwalior, stretching for a distance of 140 miles between the Chambal, Pahooj, and Sind rivers. A vast portion of Bundelkhand is hilly and unproductive, forming the northern slope of the table-land of the Vindhya, but the scenery is strikingly grand (Ann. Ind. Adm. xi. p. 341). Raja Rama, Baghel, protected Humayun's wife, mother of the emperor Akbar. The Baghel are of the Solunki rajput race. The four Agnikula, or fire-born Rajput tribes, the Chauhan, Solunki, Powar or Pramar, and the Purihar, are now mainly found in the tract from Ujjain to Rewa, near Benares. And Mount Abu is asserted to have been the place of their miraculous birth or appearance.

Though widely different in other respects, there is one characteristic common to the Baghel of Rewa, the Bundela of Bundelkhand, and the Rajput of Gwalior and Malwa,—a dislike to labour or service away from their homes, so that they do not generally take an active part in the business of tilling the soil, such being, as a rule, left to servile classes. They are throughout the territory generally regarded as the local heads of society or of the village communities to which they belong, and many of them possess much influence amongst those around them as the representatives of the ancient families of the respective clans. In Malwa the principal trade marts are Indore, Bhopal, Ujjain, Mundissore, Rutlam, Dhar, Jowra, Augur, Nemuch, Shoojawulpur, and Bhilsa. Opium chiefly is sold in Rewa; its chief is of the Baghel race. Tin and copper are found in Udaipur.—*Treaties, Engagements, and Sunnuds; Tod's Rajasthan; Pioneer; Ann. Ind. Adm.* xi. pp. 312, 353.

CENTRAL PROVINCES form an administrative portion of British India, lying between lat. 17° 15′ and 24° 27′ N., and long. 76° and 85° 15′ E. During Lord Canning's rule, the provinces of Nagpur and of Saugor and Nerbadda were united under a Commissioner. They consist of perhaps the grandest plateau on the face of the globe, more than half of it covered by the densest jungle, where the wild beast finds its lair and the Gond savage a precarious subsistence. For revenue purposes it has been arranged into the four dis-

tricts of Nagpur, Jubbulpur, Nerbadda, and Ch'hattisgarh.

The Nagpur province and the Saugor and Nerbadda territories occupy almost all the old territorial division of Gondwana.

Saugor and Dumoh districts are on the Vindhyan table-land.

Mandla, Jubbulpur, Narsinghpur, Hoshungabad and part of Newar are in the Nerbadda valley.

Baitool, Chindwara, Seoni, and Balagahat are on the Satpura table-land.

Nagpur, Warda, Bhandara, and Chanda are on the Nagpur plain, in the valleys of the Warda and Wainganga.

Raipur and Bilaspur are on the Ch'hattisgarh plain, and Sumbulpore is in the valley of the Mahanadi.

Upper Godavery is on the left bank of that river.

The plateau is in the very centre of the Peninsula. From it, as from a focus, radiate great rivers. To the north flow the Son into the Ganges, the Cane, the Betwa, the Sind, and the Chambal into the Jumna. To the west are the Tapti and Nerbadda, and to the east the Wainganga, Warda, and Peinganga, which join the Godavery. What the Kuen Lun mountains are to the river system of Central Asia, and the Himalaya to Northern India, that is the Mahadeo range to the Dekhan. To the east of Bhandara and parts of the Chanda districts is an irregular expanse of water, the largest portion at Nawagan being 17 miles in circumference, with a depth in places of 90 feet, and many Hindu temples have been erected at the scenic spots. On this wide table-land there is soil of surpassing fertility; its woods are inexhaustible; and it has coal, iron, precious stones, and gold. Here all the emigrants of Great Britain for the next decade might settle and grow rich. The area is 112,912 square miles, of which 47,299 are unculturable, and in 1868 about half of the remainder was under cultivation. Between the Census of 1872 and 1881, the population increased in the districts from 8,173,824 to 9,838,791, an increase of 1,664,967; and in the Feudatory States from 1,049,710 to 1,709,720, an increase of 660,010; or a total increase of just twenty-five per cent.

The Native States are—

	Area. Sq. miles.	Pop. in 1872.		Area. Sq. miles.	Pop. in 1872.
Bamra,	1,988	53,613	Nandgaon,	..	..
Bastar,	13,062	78,856	Patna,	2,399	98,686
Chutia Nagpur, 15 mahals,	..	..	Rairagarh Bargarh,	1,486	63,304
Kanker,	639	43,542	Raira Khol,	832	12,660
Karond,	3,745	133,483	Sarangarh,	540	37,091
Kawarda,	887	75,462	Sonpur,	906	130,713
Khairagarh,	940	122,264	Sakti,	115	8,394
Khondka,	174	29,590			
Makrai,	215	13,648	Total,	28,834	1,049,710

In 1872 the non-Aryan tribes numbered 2,014,731, of whom 1,669,835 inhabited British territory. Most of the Gond chiefs have a Rajput ancestry mixed with aboriginal blood.

The *Satpura* plateau runs nearly east and west for 600 miles. It is the true barrier between Northern and Southern India, and is the line on which the settlers from Hindustan met the emigrants from the Dekhan and Maharashtra, each of them pressing the prior races into the great natural fastnesses of the mountain range. The Satpura mountain range, extending from Rajpiplah to Asirgarh, is a belt of mountainous country 40 or 50 miles in breadth, with an average height of 2000 feet.

In *Gondwana* there are now only two millions of aborigines, out of a total population of nine millions. The remaining seven millions almost amount to a microcosm of the people in India, and justice is administered in the Central Provinces in five different languages, viz. Urdu, Hindi, Mahratti, Uriya, and Telugu. In round numbers, the seven millions may be thus classified:—1½ millions speak Mahratti; 1½ do. speak Uriya; 4 do. speak Hindi.

Dr. W. W. Hunter gives the following as the languages peculiar to Central India:—

Ho (Kol).	Mundala.	Kolami.	Khond.
Kol (Singbhum).	Rajmahali.	Madi.	Savara.
Santali.	Gondi.	Madia.	Gadaba.
Bhumij.	Gayeti.	Kuri.	Yerukala.
Uraon.	Rutluk.	Keikadi.	Chentsu.
	Naikude.		

Kolarian tribes occupy the broad belt of hilly country that runs almost continuously across India from the Santal tracts to the Kurku settlements. The Santal in the east, and the Kurku in the west, speak a language substantially the same.

The Central Provinces Kolarian tribes are:

Bhil.	Byga.	Kol.	Nahur?
Bhilala.	Dhangar.	Kurku.	Aguria?
Bhunjiah.	Gudba.	Mahto.	Goli?
Bhumia.	Kawar.	Manji.	Soura?
Binjwar.			

The aboriginal Dravidian tribes are:

Gond.	Hulba.	Aguria?
Bhuttra Gond.	Khond.	Dhunwar?
Durweh ,,	Koi.	Nahur?
Maree ,,	Maria or Gotawar.	Punkah?

Other occupants of the Central Provinces are:

Lodhi.	Chamar.	Ooryah.	Mahratta.
Parwar.	Kunbi.	TilingKomati.	Jharia.
Kachi.	Relees.		

with a sprinkling of Rajputs, Brahmans, and Mahomedans in almost every district.

In the extreme west in Nimar are the Bhil.

From thence, going to the north-east, we find along the Satpura range the Kurku and Gond,—the Kurku belonging to the Kolarian family, and the Gond to the Dravidian.

The Kurku are not numerous, and are chiefly to be found in the hilly part of the Hushungabad, and the adjoining northern part of the Chindwara district. In these localities they meet with the Gond, and a few Kurku are also found in Baitool.

The Gond are numerous in the plateau district of Son and in the south of Jubbulpur, and they are found also in the hilly parts of Jubbulpur.

The Gond, Byga, and Kol form a large section of the population of Mandla, and the Gond and Byga are also in the hilly parts of Balaghat south of Mandla.

The Ooriya occupy entirely the Sumbulpore district.

The Khond dwell in the country surrounding the Ooriya in Sumbulpore and to the south.

The Hindu races are numerous in Raipur and Belaspur, but a number of Gonds are scattered about, and the Gond are numerous in the wild parts of Nagpur and Chanda, and on the Pranhita and Godavery river the Mahratta and Teling races meet.
